*Library of Congress Cataloging-in-Publication Data*

Names: Rivkin, Julie, editor. | Ryan, Michael, 1951– editor.

Title: Literary theory : an anthology / edited by Julie Rivkin, Michael Ryan.

Description: Third edition. | Hoboken : John Wiley & Sons Ltd., 2017. |

Includes bibliographical references, glossary, and index.

Identifiers: LCCN 2016014427 | ISBN 9781118707852 (pbk.) | ISBN 9781118718384 (epub)

Subjects: LCSH: Literature—Philosophy. | Literature—History and criticism—Theory, etc.

Classification: LCC PN45 .L512 2017 | DDC 801—dc23

LC record available at <https://lccn.loc.gov/2016014427>

A catalogue record for this book is available from the British Library.

Cover image: Barbara Kruger: *Untitled (No Radio)*, photograph 51" × 68," 1988.

Set in Ehrhardt 10.5/12.5pt by SPi Global, Pondicherry, India

# Contents

Preface	ix
A Short History of Theory	xi

## Part One Russian Formalism, New Criticism, Poetics

1 Introduction: Julie Rivkin and Michael Ryan, Formalisms	3
2 Viktor Shklovsky, Art as Technique	8
3 Cleanth Brooks, The Formalist Critics	15
4 Cleanth Brooks, Keats' Sylvan Historian: History Without the Footnotes	21
5 Monroe Beardsley and W. K. Wimsatt, The Intentional Fallacy	29
6 Sean O' Sullivan, Broken on Purpose: Poetry, Serial Television, and the Season	42
7 Herman Rapaport, Tools for Reading Poetry	55
8 Theory in Practice: Michael Holahan, "Look, Her Lips": Softness of Voice, Construction of Character in <i>King Lear</i>	80
9 Theory in Practice: C. K. Doreski, Romantic Rhetorics (from Elizabeth Bishop: <i>The Restraints of Language</i> )	105

## Part Two Structuralism, Linguistics, Narratology

1 Introduction: Julie Rivkin and Michael Ryan, The Implied Order: Structuralism	131
2 Jonathan Culler, The Linguistic Foundation	134
3 Ferdinand de Saussure, <i>Course in General Linguistics</i>	137
4 Claude Lévi-Strauss, The Structural Study of Myth	178
5 Roland Barthes, Mythologies	196
6 Mikhail Bakhtin, Discourse in the Novel	205
7 Michel Foucault, What Is an Author?	217
8 David Herman, Scripts, Sequences, and Stories: Elements of a Postclassical Narratology	230
9 Michael Newman, From Beats to Arcs: Towards a Poetics of Television Narrative	248
10 Theory in Practice: Bridget Gellert Lyons, The Subplot as Simplification in <i>King Lear</i>	270
11 Theory in Practice: Susan Lohafer, The Stories of "Passion": An Empirical Study	283

## **Part Three Phenomenology, Reception, Ethics**

1	Introduction: Julie Rivkin and Michael Ryan, Situations of Knowledge/Relations with Others	297
2	Immanuel Kant, Transcendental Aesthetic	299
3	Georges Poulet, The Phenomenology of Reading	305
4	Kathleen McCormick, Teaching, Studying, and Theorizing the Production and Reception of Literary Texts	318
5	Pierre Bourdieu, Distinction	331
6	Emmanuel Levinas, Ethics and the Face	348
7	Kuisma Korhonen, Levinas and Literary Interpretation: Facing Baudelaire's "Eyes of the Poor"	366
8	Martha Nussbaum, Cultivating Humanity: The Narrative Imagination	382
9	Theory in Practice: Kent Lehnhof, Relation and Responsibility: A Levinasian Reading of <i>King Lear</i>	402
10	Theory in Practice: Naomi Morgenstern, The Baby or the Violin: Ethics and Femininity in the Fiction of Alice Munro	422

## **Part Four Post-Structuralism**

1	Introduction: Julie Rivkin and Michael Ryan, The Class of 1968 – Post-Structuralism <i>par lui-même</i>	445
2	Friedrich Nietzsche, The Will to Power	466
3	Gilles Deleuze, What Is Becoming?	471
4	Jacques Derrida, Différance	474
5	Jacques Derrida, That Dangerous Supplement	496
6	Roland Barthes, The Death of the Author	518
7	Roland Barthes, From Work to Text	522
8	Barbara Johnson, Writing	528
9	Theory in Practice: John Joughin, Lear's After-Life	536
10	Theory in Practice: Miriam Marty Clark, Allegories of Reading in Alice Munro's "Carried Away"	555

## **Part Five Psychoanalysis and Psychology**

1	Introduction: Julie Rivkin and Michael Ryan, Strangers to Ourselves: Psychoanalysis	567
2	Sigmund Freud, The Interpretation of Dreams	575
3	Sigmund Freud, The Uncanny	592
4	Sigmund Freud, Group Psychology and the Analysis of the Ego	615
5	Jacques Lacan, The Mirror Stage as Formative of the Function of the I as Revealed in Psychoanalytic Experience	618
6	D.W. Winnicott, Transitional Objects and Transitional Phenomena	624
7	Lisa Hinrichsen, Trauma Studies and the Literature of the US South	636
8	Theory in Practice: Jeffrey Stern, <i>King Lear</i> : The Transference of the Kingdom	650
9	Theory in Practice: Lee Zimmerman, The Weirdest Scale on Earth: Elizabeth Bishop and Containment	660
10	Theory in Practice: Ildiko de Papp Carrington, The Uncontrollable: The Underground Stream	677

## **Part Six Marxism, Critical Theory, History**

1	Introduction: Julie Rivkin and Michael Ryan, Starting with Zero	711
2	Karl Marx, The Philosophic and Economic Manuscripts of 1844	717
3	Karl Marx, The German Ideology	730
4	Walter Benjamin, Theses on the Philosophy of History	736
5	Pierre Bourdieu, Structures and the Habitus	745
6	Louis Althusser, Ideology and Ideological State Apparatuses	768
7	Michel Foucault, Right of Death and Power over Life	778
8	Giorgio Agamben, <i>Homo Sacer</i>	792
9	Louis Montrose, New Historicisms	809
10	Theory in Practice: Rosalie Colie, Reason and Need: <i>King Lear</i> and the Crisis of the Aristocracy	832
11	Theory in Practice: Isla Duncan, Social Class in Alice Munro's "Sunday Afternoon" and "Hired Girl"	858
12	Theory in Practice: Betsy Erkkila, Elizabeth Bishop, Modernism, and the Left	869

## **Part Seven Gender Studies and Queer Theory**

1	Introduction: Julie Rivkin and Michael Ryan, Feminist Paradigms/Gender Effects	893
2	Gayle Rubin, The Traffic in Women	901
3	Adrienne Rich, Compulsory Heterosexuality and Lesbian Experience	925
4	Hélène Cixous, The Laugh of the Medusa	940
5	Judith Butler, Imitation and Gender Insubordination	955
6	Inderpal Grewal and Caren Kaplan, Global Identities: Theorizing Transnational Studies of Sexuality	963
7	Chandra Talpade Mohanty, Women Workers and Capitalist Scripts	976
8	Jasbir Puar, "I Would Rather Be a Cyborg Than a Goddess": Becoming Intersectional in Assemblage Theory	1000
9	Eve Kosofsky Sedgwick, Epistemology of the Closet	1014
10	Queer Nation, Queers, Read This	1024
11	Lauren Berlant and Michael Warner, Sex in Public	1034
12	Myra Hird, Naturally Queer	1050
13	José Esteban Muñoz, Cruising Utopia: "Introduction" and "Queerness as Horizon: Utopian Hermeneutics in the Face of Gay Pragmatism"	1054
14	Theory in Practice: Michael Ryan, Queer Lear: A Gender Reading of <i>King Lear</i>	1066
15	Theory in Practice: Betheny Hicok, Elizabeth Bishop's "Queer Birds": Vassar, Con Spirito, and the Romance of Female Community	1079

## **Part Eight Ethnic, Indigenous, Post-Colonial, and Transnational Studies**

1	Introduction: Julie Rivkin and Michael Ryan, English Without Shadows: Literature on a World Scale	1099
2	Edward Said, Orientalism	1107
3	Chinua Achebe, An Image of Africa: Racism in Conrad's <i>Heart of Darkness</i>	1137

4	Gayatri Chakravorty Spivak, Three Women's Texts and a Critique of Imperialism	1147
5	Toni Morrison, Playing in the Dark	1163
6	Jamaica Kincaid, A Small Place	1174
7	Arjun Appadurai, Disjuncture and Difference in the Global Cultural Economy	1180
8	Stuart Hall, Cultural Identity and Diaspora	1191
9	Lawrence Venuti, Translation, Empiricism, Ethics	1202
10	Theory in Practice: Jaecheol Kim, National Messianism and English Choreography in <i>King Lear</i>	1210
11	Theory in Practice: Sylvia Henneberg, Elizabeth Bishop's "Brazil, January 1, 1502" and Max Jacob's "Etablissement d'une communauté au Brésil": A Study of Transformative Interpretation and Influence	1227
12	Theory in Practice: Katie Trumpener, Annals of Ice: Formations of Empire, Place and History in John Galt and Alice Munro	1239

## **Part Nine Cognition, Emotion, Evolution, Science**

1	Introduction: Julie Rivkin and Michael Ryan, In the Body of the Text	1255
2	F. Elizabeth Hart, Embodied Literature: A Cognitive-Poststructuralist Approach to Genre	1265
3	Suzanne Keane, Narrative Empathy	1284
4	Sara Ahmed, Affective Economies	1312
5	Joseph Carroll, Human Nature and Literary Meaning	1329
6	Patrick Colm Hogan, Literary Brains: Neuroscience, Criticism, and Theory	1360
7	Ted Underwood, Digital Humanities: Theorizing Research Practices	1373
8	Franco Moretti, Planet Hollywood	1380
9	Theory in Practice: Donald C. Freeman, According to My Bond: <i>King Lear</i> and Re-Cognition	1389
10	Theory in Practice: Carrie Dawson, Skinned: Taxidermy and Pedophilia in Munro's "Vandals"	1405

## **Part Ten Animals, Humans, Places, Things**

1	Introduction: Julie Rivkin and Michael Ryan, Matters Pertinent to a Theory of Human Existence	1419
2	Nigel Thrift, Non-Representational Theory: Life, But Not as We Know It	1423
3	John Urry, Complexity	1452
4	Bruno Latour, On Actor Network Theory: A Few Clarifications	1458
5	Jennifer McDonell, The Animal Turn, Literary Studies, and the Academy	1471
6	Tobin Siebers, The Aesthetics of Human Disqualification	1486
7	Pippa Marland, Ecocriticism	1507
8	Michael Parrish Lee, Eating Things: Food, Animals, and Other Life Forms in Lewis Carroll's <i>Alice Books</i>	1529
9	Theory in Practice: Jayne Elisabeth Archer, Richard Marggraf Turley, and Howard Thomas, The Autumn King: Remembering the Land in <i>King Lear</i>	1547
10	Theory in Practice: Kim Fortuny, Elizabeth Bishop's "Pink Dog"	1567
	Glossary of Terms	1581

# Preface

This book began, as one might guess, in the classroom. We have been teaching courses in contemporary literary theory for the past two decades, and we have each had the familiar experience of not being able to match the design of our courses to any anthology currently available. The move from awkwardly assembled xerox packets to an actual anthology has been both a natural outgrowth of our teaching and an astonishingly complex process of research, selection, and projection. For although the germ of the book was our own classroom(s), its destination has always been many classrooms, courses no doubt much different than any we ourselves might teach, and yet ones that our selections would ideally work both to accommodate and to enrich.

The scale of the volume is one expression of its projected flexibility; we felt that an anthology of literary theory needed not only to cover the range of theoretical perspectives or approaches that characterize the era “after the New Criticism,” the era that we take to be that of contemporary literary theory, but also to represent those perspectives with reasonable depth and range. The effect of such a decision, we hope, is that many kinds of courses will find a home in these selections, that a course that takes as its focus Structuralism, Post-Structuralism, Post-Colonialism, or Psychoanalysis and Gender Studies will find this anthology as useful as one that makes a more extensive survey of theoretical perspectives.

The anthology opens with formalisms – both Russian and American – in a gesture that marks its organization as partly chronological and partly heuristic. That is, we take formalism – at least in its American avatar of New Criticism – to mark the condition of students’ theoretical awareness before beginning the journey into “theory.” To the degree that they have been taught a form of “close reading” as the basic task of literary analysis, they are practicing formalists, though the practice may be, like that of the prose-speaking M. Jourdain in Molière’s *Bourgeois Gentilhomme*, an unself-conscious one. Exploring the theoretical premises of a New Critical practice, placing those in conjunction with a historically unrelated yet theoretically cognate predecessor, Russian Formalism, seems like an appropriate way to initiate an exposure to “theory” in its less familiar guises.

The parts themselves have undergone many evolutions; the issue of where to draw the lines, what denomination to use, and where to locate certain selections has been as theoretically complex as it has been practically consequential. While “Deconstruction,” for example, enjoyed a separate life in literary critical history in the US in the 1970s and 1980s, we felt it more appropriate to place it within its historical and intellectual French context, and so you will find Derrida amongst Deleuze and Guattari, and Baudrillard under “Post-Structuralism.” The question of how to categorize some kinds of theory,

regarding gender, for example, was also difficult, and we opted for a big tent: A separate section could easily have been devoted to any number of theoretical projects, each of which has already produced its own “classic” texts, and while attending to these developments has been one goal of the anthology, we wished as well to embrace both the heterodox and the newly canonical. Some of the names in our table of contents may not be readily recognizable for this reason, and our inclusion of these texts is less a sign of presumption regarding future canonicity than it is an indicator of our desire to locate the anthology as much in the contemporary realm as possible. That has meant guessing, and we based our guesses on what we felt would be exciting or helpful in the classroom.

In a desire both to be as inclusive as possible and to represent works not commonly anthologized, we have done a certain amount of excerpting. Our principle has been to represent the core of a given work, and if, to that end, we have sacrificed portions of texts that readers will deem necessary, we can only suggest that our selections constitute a useful beginning to a more extensive acquaintance. We apologize in advance for any such textual editing deemed brutal.

A final word about our cover illustration. The words “No Radio” refer to a sign people put in their cars in New York City. It means “don’t bother breaking into the body of this car; the radio has already been either stolen or else removed by the owner.” We asked Wiley-Blackwell to use this image because it speaks to the reservations many still feel about “theory” and about its association with the ideology of mastery through critical analysis that murders to dissect. It also speaks, of course, to our hesitations as editors engaged in the compilation and dissemination of such theories. We would not summon the image (and we would not engage in the work) if we did not feel that “theory” is itself filled with doubt regarding the objectivist ideal the image so carefully mocks. Some theories do indeed fulfill the aspirations of the man with the heart in his hand, but we hope you will feel that there are many others in this book that adopt the perspective of the woman on the table.

# A Short History of Theory

The first recorded human story, something that might be called “The Hunt,” appears on the walls of the caves at Lascaux, France. It was made either by children or for children, judging from the hand and feet impressions on the floor of the cave, and it represents not just a hunt but also a remarkable shift in human cognition that occurred, according to archeologist Richard Klein, around 42 ka. From this point forward, humans become more “human” in our modern sense. They invent new tools, everything from plows to currency, that expand the reach of human culture. They evidence an ability to picture abstract mental concepts and to imagine a spirit world. They slowly switch from a hunting existence to an agricultural existence. They stop living in small kin-based bands and organize large settled communities. The early human tendency to commit rampant genocide against his cousins slowly diminishes, and humans live together in relative peace. The emergence of this new way of life can be accounted for by the change in human cognition that is expressed in “The Hunt.” The mimetic ability one sees in the paintings for the first time was essential to emergent sociality. A capacity for mental representations is linked to control over rapid-fire, automatic negative emotions such as prejudice and fight-or-flight that aided survival on the savannah but were inimical to a settled social existence. That new mimetic cognitive ability was also crucial to imagining others’ lives empathetically so that communities of kin and non-kin could be built. The capacity for story-telling is thus connected in an essential way to the cognitive abilities that aided the emergence of modern human life. We did not so much begin to tell each other stories because we started living together in large communities; rather, we were able to build such communities because we were able to tell each other stories.

Story-telling likely also played a more direct role in the emergence of modern human life. Stories allowed early humans to store and to transmit information that was crucial to the social learning upon which humans’ new culturally mediated civil existence depended. Stories are memory banks that record lessons from the past and are easily transmissible. Some ethnologists believe a greater capacity for short-term memory was a key change in the human cognitive revolution around 42 ka. Early human stories were probably initially accounts of remembered events, simple documentaries. Those documentary accounts with time became fictional narratives as real characters were replaced by imaginary ones (some of whom would be taken from the surrounding nature, such as Crow or Turtle). Memory stories were also narratives that projected a future, the unknown part of the story yet to be told but anticipated in the mind. Such narrative graphing of life’s actions in terms of past, present, and future meant humans could also plan ahead and foresee events more so than before. Their lives were no longer limited to

the satisfying of physical needs in an immediate and short-term manner. “The Hunt” gave way to “The Trip to Whole Foods.”

Story-telling would have aided the building of more complex social networks, the integration of diverse people into a uniform culture, the training of minds in a communally beneficial empathy, and the evolution of common norms. Early human stories often possessed a normative dimension. One purpose of telling them was to instruct the young in the life-sustaining norms and practices of the community. Our earliest recorded verbal stories – Homer’s epics – teach norms of appropriate behavior towards others in one’s community such as hospitality and respect. And the tragedies of the fifth-century Greek enlightenment caution against norm-breaking behavior.

Literary theory came into being at a time when the normative function of story-telling was felt quite strongly. One of the first theorists, Plato, argued that literature should educate the young in good behavior. He lived and taught in Athens 2600 years ago, and he founded the first institution of higher learning in the West, the Academy. That is important because one consequence of the evolution of human cognition is the creation of a need for nurturing environments or niches to sustain the new cognitive abilities. Those nurturing environments were possible in cities and took the form of institutions such as schools and practices such as writing. Psychologists now know that the mind’s advanced cognitive abilities as well as the mind’s ability to live in a civil, sociable way with others depend on training and modeling. External prompting is required to allow full cognitive powers to emerge and full emotional abilities to grow. That humans’ ability to think in certain ways happened at the same time that nurturing institutions such as schools came into being should therefore be no surprise. The advance in human cognitive powers allowed humans to use external instruments such as writing and book-making to preserve past human cognitive achievements (as an external hard drive does today for a computer). Other tools and techniques could now also be used to train minds to replicate the achievements of the past so they would not be lost. Humans became capable of using what today we call cultural and social construction to maintain human civilization.

The new cognitive power of abstraction that began to emerge around 42 ka divided knowledge between sense impressions and the abstract ideas the new cognition made possible. Plato built his philosophy around this distinction. He felt the abstract ideas the mind could now imagine were more true than sense impressions. The world around one did not offer many examples of perfectly formed beautiful things, but in one’s mind one could imagine an ideal beauty. Plato mistakenly thought these abstract concepts – Beauty, Truth, Justice – were actual things in the world, a kind of spirit realm of pure forms or ideas. We now know that he was simply describing the new cognitive ability of the human brain, its new capacity to picture non-sensory objects in the mind’s eye. All around Plato in his world, that new cognitive ability was helping his human companions to build a new civilization using new cultural tools such as currency, laws, and rhetoric. He felt, correctly, that the new cultural forms such as the enactment of fictional human events would serve an important function in the building of that new civilization. Empathy, an ability to live together in peace by imagining others’ lives and feeling them as similar to one’s own, was crucial to the new human capacity for sociality and civility, and literature and theater fostered it by obliging audiences to imagine others’ lives as if they were their own. Only a few hundred thousand years earlier, members of the *Homo* line had been hunting each other for food. Athens was clearly an improvement, but getting there required a new way of thinking whose normative function Plato correctly saw.

**Plato:** If the prospective guardians of our community are to loathe casual quarrels with one another, we must take good care that battles between gods and giants and all the other various tales of gods and heroes coming to blows with their relatives and friends don't occur in the stories they hear and the pictures they see. No, if we're somehow to convince them that fellow citizens never fall out with one another, that this is wrong, then that is the kind of story they must hear, from childhood onwards, from the community's elders of both sexes; and the poets they'll hear when they're older must be forced to tell equivalent stories in their poetry.... All things considered then, that is why a very great deal of importance should be placed upon ensuring that the first stories they hear are best adapted for their moral improvement.

If Plato's belief in rational ideas such as Justice, Beauty, and Truth that existed in a purely ideal or rational realm apart from sensory experience reflects the emergence of a brain capable of abstraction, of separating mental concepts from sensory data, the ability to construct mental representations also made possible more refined observation of sensory objects by separating the adaptively evolved mind from the world around it. Prior to this point, the human brain, in order to help preserve life, needed to be vigilant and keenly focused on sense impressions for signs of danger. Living in the emerging civil communities allowed the brain to evolve further and to adapt to social life by developing new communicative and emotional skills that required less immersion in or fusion with the sensory world around it. With the diminishment of danger and the growth of sociality came a greater separation of mind from world through the development of a capacity for mental representation that allowed the world to be perceived and studied more like an object. Civil existence and science became possible at the same time.

Plato's student Aristotle studied the structure of literature and its effects in this manner, treating literature as an object in the world that is as worthy of study as geology. He therefore described the structure of stories and noticed, for example, that the sequence of events in narrative is organized around moments of reversal and recognition. He differentiated between narrative perspectives and examined the traits that distinguish one genre like comedy from another like tragedy. He also analyzed the way literature provokes reactions in audiences. Tragedy inspires empathetic suffering with the fictional characters. His focus on empathy is especially important given how essential that emotion now was to the sustaining of human civilization. Without an ability to empathize with others grounded in the new power to imagine mental objects, humans would not have been able to form the newly complex societies that had come into being.

**Aristotle:** Tragedy is a representation of a serious, complete action which has magnitude, in embellished speech, with each of its elements used separately in the various parts of the play; represented by people acting and not by narration, accomplishing by means of pity and terror the catharsis of such emotions....

Clearly, each of the kinds of representation we mentioned will contain these differences and will vary by representing objects which vary in this manner.... Tragedy too is distinguished from comedy by precisely this difference: comedy prefers to represent people who are worse than those who exist, tragedy people who are better. Again, a third difference among these kinds is the manner in which one can represent each of these things. For one can use the same media to represent the very same things, sometimes by narrating (either by becoming another person as Homer does or remaining the same person and not changing or by representing everyone as in action and activity). Representation, then, has these three points of difference, as we said at the beginning, its media, its objects, and its manner.

The Greek example suggests how important the feedback loop from mind to culture to mind had become in human life. The new sociality and the new civility one sees in Greece during its Enlightenment were dependent on a nurturing environment, and schools played a prominent role in Athenian life. The early cognitive abilities of the Athenians were sustained by that cultural niche. It is no wonder, then, that the conquest of Greece by Rome 2100ka interrupted the progress of human culture and of human cognition at least in the West. With the disappearance of the nurturing niche the Greeks had built, the cognition it sustained also declined. Authoritarianism, brutality, and pillage – versions of the primitive automatic instincts the mind's new capacity for mental representations helps regulate – became the norm in political and social life for six centuries. After the fall of Rome, the cultural ecosystem the Greeks evolved disappeared almost entirely. But the capacity for symbolic thought did not wane entirely. In the West, the Catholic Church preserved some of the cognitive abilities that emerged in Greece, especially the ability to think in abstract mental representations that stood apart from sensory experience or perception. Church thinkers became fascinated with allegory, the idea that religious texts especially contained hidden meanings. A biblical story about a man's treatment of his wife or children would be interpreted to have a second, other meaning having to do with religious doctrine.

Church thinkers also retained the Platonic idea of a culture that instilled norms of good behavior. Even without Aristotle's texts to serve as examples, some Church thinkers such as Augustine continued the analytic tradition and examined how logic and language worked. They developed a theory of language as signs that would prove important for future cultural analysts.

**Augustine:** There are two reasons why written texts fail to be understood: their meaning may be veiled either by unknown signs or by ambiguous signs. Signs are either literal or metaphorical. They are called literal when used to signify the things for which they were invented: as, for example, when we say *bovem* [ox], meaning the animal which we and all speakers of Latin call by that name. They are metaphorical when the actual things which we signify by the particular words are used to signify something else: when, for example, we say *bovem* and not only interpret the two syllables to mean the animal normally referred to by that name but also understand, by that animal, “worker in the gospel,” which is what scripture, as interpreted by the apostle Paul, means when it says, “You shall not muzzle the ox that treads out the grain.” ...

As well as this rule, which warns us not to pursue a figurative (that is, metaphorical) expression as if it were literal, we must add a further one: not to accept a literal one as if it were figurative. Generally speaking, it is this: anything in the divine discourse that cannot be related either to good morals or to the true faith should be taken as figurative. Good morals have to do with our love of God and our neighbor, the true faith with our understanding of God and our neighbor. The hope that each person has within his own conscience is directly related to the progress that he feels himself to be making towards the love and understanding of God and his neighbor.

Around 700ka humans began to relaunch the Greek project as they rediscovered lost Greek texts. With the return of a secular culture during the Renaissance, thinkers could once again study literature as a form of moral instruction and as a cultural object with many dimensions meriting analysis. Dante Alighieri was both a leading poet of the Renaissance and an astute theorist of literature who described the different kinds of meaning a literary text could possess. This emphasis on interpretation or hermeneutics

derived from the allegorical study of religious texts, but it soon would acquire a secular use in literary analysis.

**Dante Alighieri:** [W]ritings can be understood and ought to be expounded principally in four senses. The first is called the literal, and this is the sense that does not go beyond the surface of the letter, as in the fables of the poets. The next is called the allegorical, and this is the one that is hidden beneath the cloak of these fables, and is a truth hidden beneath a beautiful fiction. Thus Ovid says that with his lyre Orpheus tamed wild beasts and made trees and rocks move toward him, which is to say that the wise man with the instrument of his voice makes cruel hearts grow tender and humble and moves to his will those who do not devote their lives to knowledge and art; and those who have no rational life whatsoever are almost like stones. Why this kind of concealment was devised by the wise will be shown in the penultimate book. Indeed the theologians take this sense otherwise than do the poets; but since it is my intention here to follow the method of the poets, I shall take the allegorical sense according to the usage of the poets.

The third sense is called moral, and this is the sense that teachers should intently seek to discover throughout the scriptures, for their own profit and that of their pupils; as, for example, in the Gospel we may discover that when Christ ascended the mountain to be transfigured, of the twelve Apostles he took with him but three, the moral meaning of which is that in matters of great secrecy we should have few companions.

The fourth sense is called anagogical, that is to say, beyond the senses; and this occurs, when a scripture is expounded in a spiritual sense which, although it is true also in the literal sense, signifies by means of the things signified a part of the supernal things of eternal glory, as may be seen in the song of the Prophet which says that when the people of Israel went out of Egypt, Judea was made whole and free. For although it is manifestly true according to the letter, that which is spiritually intended is no less true, namely, that when the soul departs from sin it is made whole and free in its power. In this kind of explication, the literal should always come first, as being the sense in whose meaning the others are enclosed, and without which it would be impossible and illogical to attend to the other senses, and especially the allegorical.

With a vibrant secular educational system, Italy in the Renaissance was an ideal niche environment for the development of human cognitive skills and for the reemergence of several branches of speculative thought, from literary theory to political theory. Renaissance discussions of literature down through the eighteenth century were dominated by Greek ideas, however, since the educational system favored those texts in the education of young women and men. Religious authorities did not smile on the Humanist argument that the reading of literature constituted a form of moral instruction. Writers such as Philip Sydney responded by arguing that literature portrays a second more ideal nature to the existing one and therefore suggests how things should be. It teaches by imaginative example.

Another debate regarding aesthetics during this period concerned what was called Classicism – the idea that art should follow the rules set down by Plato and Aristotle. Aristotle's notion of mimesis – that art imitates life – became the injunction that art must imitate life or “Nature.” The writer should follow Nature and write as simply as possible, without self-aggrandizing artifice.

One of the most innovative thinkers of the Humanist era was Giambattista Vico. His *New Science* foreshadows twentieth-century linguistic philosophy in its recognition of the essentially metaphoric character of all language.

In the eighteenth century, a new way of thinking emerged, and that often is called rationalism because it emphasized the conceptualizing operations of the mind (or “Reason”).

Rational ideas are transcendental (they stand outside the ordinary world of everyday perceptions) and universal (they concern what is general to all tulips rather than just to the specific one before our eyes). Theorists of literature such as Samuel Johnson therefore began to argue that literature is important not for how it portrays individual events or characters but rather for how it “rises to general and transcendent truths, which will always be the same.”

Germany’s educational system became quite sophisticated during this period, and a group of German thinkers were especially important in advancing rationalist literary theory: Gotthold Lessing, Immanuel Kant, and Georg Hegel. Writing at a time when the ideal of the classical examples of Greek and Roman art still was influential, Lessing focused on the essential characteristics of poetry and painting. Many assumed poetry should resemble painting, but Lessing differed. He noticed that poetry is consecutive in execution and emphasizes time, while painting favors simultaneity and is more a work based in space.

**Gotthold Lessing:** I reason thus: if it is true that in its imitations painting uses completely different means or signs than does poetry, namely figures and colors in space rather than articulated sounds in time, and if these signs must indisputably bear a suitable relation to the thing signified, then signs existing in space can express only objects whose wholes or parts coexist, while signs that follow one another can express only objects whose wholes or parts are consecutive.

Objects or part of objects which exist in space are called bodies. Accordingly, bodies with their visible properties are the true subjects of painting.

Objects or parts of objects which follow one another are called actions. Accordingly, actions are the true subjects of poetry....

But the objection will be raised that the symbols of poetry are not only successive but are also arbitrary; and, as arbitrary symbols, they are of course able to represent bodies as they exist in space. Examples of this might be taken from Homer himself. We need only to recall his shield of Achilles to have the most decisive instance of how discursively and yet at the same time poetically a single object may be described by presenting its coexistent parts....

[But] Homer does not paint the shield as finished and complete, but as a shield that is being made. Thus, here too he has made use of that admirable artistic device: transforming what is coexistent in his subject into what is consecutive, and thereby making the living picture of an action out of the tedious painting of an object. We do not see the shield, but the divine master as he is making it. He steps up to the anvil with hammer and tongs, and after he has forged the plates out of the rough, the pictures which he destines for the shield’s ornamentation rise before our eyes out of the bronze, one after the other beneath the finer blows of his hammer.

Kant distinguished between higher and lower mental faculties. The higher are capable of abstraction, of thinking in pure ideas. The lower were more practical and sensory, tied to specific judgments or perceptions. The best human behavior accorded with a universal idea of higher reason. The concepts of reason must, for Kant, be disinterested and law-like. To regulate human affairs impartially, they must serve no particular end or interest, such as the enrichment of an individual or the pursuit of sensory pleasure alone. Art, because it works on the senses rather than pure reason, is not capable of attaining such a high standard of disinterestedness. The most it can offer is “purposiveness without purpose,” a semblance of universality. Kant also noticed something one might have expected to be the case, given how the human brain evolved, and that is an overlap of

faculties, especially of the faculty for appreciating beauty and the moral faculty for knowing what is good. To judge something beautiful is to claim it resembles a moral that should be valid for all.

**Immanuel Kant:** Now I say that the beautiful is the symbol of the morally good, and also only in this respect (that of a relation that is natural to everyone, and that is also expected of everyone else as a duty) does it please with a claim to the assent of everyone else, in which the mind is at the time aware of a certain ennoblement and elevation above the mere receptivity for a pleasure from sensible impressions, and also esteems the value of others in accordance with a similar maxim of their power of judgment.... 1) The beautiful pleases immediately (but only in reflecting intuition, not, like morality, in the concept). 2) It pleases without any interest ... 3) The freedom of the imagination (thus of the sensibility of our faculty) is represented in the judging of the beautiful as in accord with the lawfulness of the understanding (in the moral judgment the freedom of the will is conceived as the agreement of the latter with itself in accordance with universal laws of reason). 4) The subjective principle for judging of the beautiful is represented as universal, i.e. valid for everyone.

Georg Hegel believed the mental and the physical or natural worlds were one. The logical processes of the mind, which he called “dialectic” after the logic of the Greeks, could be found at work in human history and human society as well as in nature. The natural and social world followed the same course of development as the mental world of logic. In a logical dialectical process, one moves from simple concrete observation (“Socrates is a man”) to universal idea (“All men are mortal”) to a conclusion that unifies concrete instance and universal idea in a single synthetic proposition (“Therefore, Socrates is mortal”). In human history, the idea of a just society is at first only partly fulfilled; it takes the form of simple rules without any coherent idea of justice informing them. Justice at this stage of human history resembles a simple concrete proposition in the dialectic. But as history progresses, the universal idea is integrated increasingly into juridical institutions until, after a long process of combined sociohistorical and logical development, the universal idea of justice and the concrete institutions that embody it are merged completely in an ideal government of law that is informed by universal principles that apply equally to all. In such a government or state, the practical concrete institutions are saturated with the ideas of reason or mind.

Something similar happens in art. Early art consists of simple sensory images without universal meaning. They are merely mimetic pictures of actual objects. They have no idea in them. But over time, as art evolves, following a logical process of development, art achieves a complex totality in which universally valid idea and sensory object, mind and concrete worldly form are merged and are one.

**G. W. F. Hegel:** Because the universal idea is in this way a concrete unity, this unity can enter art-consciousness only through the unfolding and the reunification of the particularizations of the universal idea, and, through this process, artistic beauty acquires a totality of particular stages and forms. Therefore, after studying artistic beauty in itself and as itself, we must see how beauty as a totality decomposes into its specific forms. This is the second part of our study, the doctrine of the forms of art. These forms find their origin in the different ways of grasping the universal idea as content.... Thus the forms of art are nothing more than the different relations of meaning and form, relations that proceed from the universal idea and therefore provide the true basis for the different forms of this sphere.

The ideas of Kant and Hegel – especially the distinction between the world of sensory experience and the ideal world of Reason – influenced the Romantic movement and writers such as Friedrich Schiller, William Wordsworth, Samuel Taylor Coleridge, and Ralph Waldo Emerson. For Schiller, artistic accounts of the rational spirit realm educated the mind and made it more civil. Art had a broad public purpose. While that idea may seem odd to modern secular ears, there is a way of understanding its accuracy, and that is to think of the spirit realm as a projection of the mind's capacity for abstraction. That capacity is connected to the mind's ability to use mental representation to control negative emotions, and reading fiction is now known to increase empathy. Writers like Schiller may have been correct, then, to think a literary education might make humans more civil.

The idea that literature might “elevate” the mind remains popular with literary theorists down through Matthew Arnold in the late nineteenth century. Arnold believed literature served an educational purpose. It elevated the mind to a higher rational realm above and separate from practical consciousness and natural emotional impulses.

**Matthew Arnold:** At first sight it seems strange that out of the immense stir of the French Revolution and its age should not have come a crop of works of genius equal to that which came out of the stir of the great productive time of Greece, or out of that of the Renascence, with its powerful episode the Reformation. But the truth is that the stir of the French Revolution took a character which essentially distinguished it from such movements as these. These were, in the main, disinterestedly intellectual and spiritual movements; movement in which the human spirit looked for its satisfaction in itself and in the increased play of its own activity. The French Revolution took a political, practical character. The movement which went on in France under the old regime, from 1700 to 1789, was far more really akin than that of the Revolution itself to the movement of the Renascence; the France of Voltaire and Rousseau told far more powerfully upon the mind of Europe than the France of the Revolution. Goethe reproached this last expressly with having “thrown quiet culture back.” Nay, and the true key to how much in our Byron, even in our Wordsworth, is this! – that they had their source in a great movement of feeling, not in a great movement of mind. The French Revolution, however, – that object of so much blind hatred, – found undoubtedly its motive-power in the intelligence of men, and not in their practical sense; this is what distinguishes it from the English Revolution of Charles the First’s time. This is what makes it a more spiritual event than our Revolution, an event of much more powerful and worldwide interest, though practically less successful; it appeals to an order of ideas which are universal, certain permanent. 1789 asked of a thing, Is it rational? 1642 asked of a thing, Is it legal? ... But what is law in one place is not law in another ... [T]he prescriptions of reason are absolute, unchanging, of universal validity....

It is of the last importance that English criticism should clearly discern what rule for its course, in order to avail itself of the field now opening to it, and to produce fruit for the future, it ought to take. The rule may be summed up in one word – disinterestedness. And how is criticism to show disinterestedness? By keeping aloof from what is called “the practical view of things”; by resolutely following the law of its own nature, which is to be a free play of the mind on all subjects which it touches. By steadily refusing to lend itself to any of those ulterior, political, practical considerations about ideas.... Its business is, as I have said, simply to know the best that is known and thought in the world.

Yet equally influential during this period was an aesthetic philosophy that privileges sensory experiences and the impressions of the mind as it contemplates art. Writers such

as Charles Baudelaire and Walter Pater emphasized the value of the surface of experience, the physical pleasures of the world, and a concept of artistic experience as an end in itself. Art should be enjoyed for art's sake alone; there is no need to refer to a spiritual meaning, an ideal rational realm, or a moral purpose. Baudelaire also rejected the Romantic ideal of Nature and celebrated instead the pleasures of artifice.

**Charles Baudelaire:** In the window of a coffee-house there sits a convalescent, pleasantly absorbed in gazing at the crowd, and mingling, through the medium of thought, in the turmoil of thought that surrounds him. But lately returned from the valley of the shadow of death, he is rapturously breathing in all the odours and essences of life; as he has been on the brink of total oblivion, he remembers, and fervently desires to remember, everything. Finally, he hurls himself headlong into the midst of the throng, in pursuit of an unknown, half-glimpsed countenance that has, on an instant, bewitched him. Curiosity has become a fatal, irresistible passion!

Imagine an artist who was always, spiritually, in the condition of that convalescent, and you will have the key to the nature of [the ideal artist].

Now, convalescence is like a return towards childhood. The convalescent, like the child, is possessed in the highest degree of the faculty of being keenly interested in all things, be they apparently of the most trivial. Let us go back, if we can, by a retrospective effort of the imagination, towards our most youthful, our earliest, impressions, and we will recognize that they had a strange kinship with those brightly coloured impressions which we were later to receive in the aftermath of a physical illness, always provided that that illness had left our spiritual capacities pure and unharmed. The child sees everything in a state of newness; he is always drunk. Nothing more resembles what we call inspiration than the delight with which a child absorbs from color and form. I am prepared to go even further and assert that sublime thought is accompanied by a more or less violent shock which has its repercussion in the very core of the brain. The man of genius has sound nerves, while those of the child are weak. With the one, Reason has taken up a considerable position; with the other, Sensibility is almost the whole being. But genius is nothing more nor less than childhood recovered at will – a childhood now equipped for self-expression with manhood's capacities and a power of analysis which enables it to order the mass of raw material which it has involuntarily accumulated.

The crowd is his element, as the air is that of birds and water of fishes. His passion and his profession are to become one flesh with the crowd. For the perfect *flâneur*, for the passionate spectator, it is an immense joy to set up house in the heart of the multitude, amid the ebb and flow of movement, in the midst of the fugitive and the infinite.... Thus the lover of universal life enters into the crowd as though it were an immense reservoir of electrical energy. Or we might liken him to a mirror as vast as the crowd itself; or to a kaleidoscope gifted with consciousness, responding to each one of its movements and reproducing the multiplicity of life and the flickering grace of all the elements of life. He is an "I" with an insatiable appetite for the "non-I", at every instant rendering and explaining it in pictures more living than life itself, which is always unstable and fugitive....

Everything beautiful and good is the result of reason and calculation. Crime, of which the human animal has learned the taste in his mother's womb, is natural by origin. Virtue, on the other hand, is artificial, supernatural, since at all times and in all places gods and prophets have been needed to teach it to animalized humanity, man being powerless to discover it by himself. Evil happens without effort, naturally, fatally; Good is always the product of some art. All that I am saying about Nature as a bad counsellor in moral matters, and about Reason as true redeemer and reformer, can be applied to the realm of Beauty. I am thus led to regard external finery as one of the signs of the primitive nobility of the human soul. Those races which our confused and perverted civilization is pleased to treat

as savage, with an altogether ludicrous pride and complacency, understand, just as the child understands, the lofty price and complacency of make-up. In their naive adoration of what is brilliant – man-colored feathers, iridescent fabrics, the incomparable majesty of artificial forms – the baby and the savage bear witness to their disgust of the real, and thus give proof, without knowing it, of the immateriality of their souls....

Fashion should thus be considered as a symptom of the taste for the ideal which floats on the surface of all the crude, terrestrial and loathsome bric-a-brac that the natural life accumulates in the human brain: as a sublime deformation of Nature, or rather a permanent and repeated attempt at her reformation. And so it has been sensibly pointed out (though the reason has not been discovered) that every fashion is charming, relatively speaking, each one bearing a new and more or less happy effort in the direction of Beauty, some kind of approximation to an ideal for which the restless human mind feels a constant, titillating hunger.

Walter Pater was a professor of aesthetics at Oxford University who influenced a generation of artists and writers through his scholarly publications. The “Conclusion” to his *Studies in the Renaissance* caused a scandal by urging good Victorians to enjoy life and art as ends in themselves. No need for a “higher” spiritual meaning or a moral purpose. The experience of art itself was a sufficient reward.

**Walter Pater:** The service of philosophy, of speculative culture, towards the human spirit, is to rouse, to startle it to a life of constant and eager observation. Every moment some form grows perfect in hand or face; some tone on the hills or the sea is choicer than the rest; some mood of passion or insight or intellectual excitement is irresistibly real and attractive to us, – for that moment only. Not the fruit of experience, but experience itself, is the end. A counted number of pulses only is given to us of a variegated, dramatic life. How may we see in them all that is to be seen in them by the finest senses? How shall we pass most swiftly from point to point, and be present always at the focus where the greatest number of vital forces unite in their purest energy?

To burn always with this hard, gem-like flame, to maintain this ecstasy, is success in life. In a sense it might even be said that our failure is to form habits: for, after all, habit is relative to a stereotyped world, and meantime it is only the roughness of the eye that makes any two persons, things, situations, seem alike. While all melts under our feet, we may well grasp at any exquisite passion, or any contribution to knowledge that seems by a lifted horizon to set the spirit free for a moment, or any stirring of the senses, strange dyes, strange colours, and curious odours, or work of the artist’s hands, or the face of one’s friend. Not to discriminate every moment some passionate attitude in those about us, and in the very brilliancy of their gifts some tragic dividing of forces on their way, is, on this short day of frost and sun, to sleep before evening. With this sense of the splendour of our experience and of its awful brevity, gathering all we are into one desperate effort to see and touch, we shall hardly have time to make theories about the things we see and touch. What we have to do is to be for ever curiously testing new opinions and courting new impressions, never acquiescing in a facile orthodoxy, of Comte, or of Hegel, or of our own....

One of the most beautiful passages of Rousseau is that in the sixth book of the *Confessions*, where he describes the awakening in him of the literary sense. An undefinable taint of death had clung always about him, and now in early manhood he believed himself smitten by mortal disease. He asked himself how he might make as much as possible of the interval that remained; and he was not biased by anything in his previous life when he decided that it must be by intellectual excitement, which he found just then in the clear, fresh writings of Voltaire. Well! we are all *condamné*s, as Victor Hugo says: we are all under sentence of death but with a sort of indefinite reprieve . . . ; we have an interval, and then our place knows us

no more. Some spend this interval in listlessness, some in high passions, the wisest, at least among “the children of this world,” in art and song. For our one chance lies in expanding that interval, in getting as many pulsations as possible into the given time. Great passions may give us this quickened sense of life, ecstasy and sorrow of love, the various forms of enthusiastic activity, disinterested or otherwise, which come naturally to many of us. Only be sure it is passion – that it does yield you this fruit of a quickened, multiplied consciousness. Of such wisdom, the poetic passion, the desire of beauty, the love of art for its own sake, has most. For art comes to you proposing frankly to give nothing but the highest quality to your moments as they pass, and simply for those moments’ sake.

In the nineteenth century, revolutions occurred against the reactionary monarchies that ruled much of the Continent. Only some succeeded, but the thinking of those concerned with literature turned to thoughts of the social and political role of literature. The realist and naturalist writers such as Émile Zola felt literature, using the new tools of science, should seek to promote change by questioning existing norms and established patterns. Russian critics such as Vissarion Belinsky felt literature should play a role in making their country more modern.

Karl Marx began as a philosopher, but he was moved to radical politics by the revolutions in Europe in the 1840s. Europe was awash in the ideas of utopian socialism, and those merged with the uprisings against monarchy across Europe and eventually gave rise to the communist and anarchist movements, which sought to create a post-capitalist democratic society in which workers would no longer be the slaves of capitalists and wealth would be shared equally. Forced into exile, Marx ended up in England, where he was able to analyze the emerging social order created by industrialization and capitalist free market economics. He saw literature as immersed in its social, historical, political, and economic context. One could not know the meaning of a work of literature without knowing the world in which it was made and the social forces out of which it emerged. Often literature served a political purpose and gave expression to the “ruling ideas of the ruling class.”

**Karl Marx:** The production of ideas, of conceptions, of consciousness, is at first directly interwoven with the material activity and the material intercourse of men, the language of real life.... In direct contrast to German philosophy which descends from heaven to earth, here we ascend from earth to heaven. That is to say, we do not set out from what men say, imagine, conceive, nor from men as narrated, thought of, imagined, conceived, in order to arrive at men in the flesh. We set out from real, active men, and on the basis of their real life-process we demonstrate the development of the ideological reflexes and echoes of this life-process. The phantoms formed in the human brain are also, necessarily, sublimates of their material life-process, which is empirically verifiable and bound to material premises.

Morality, religion, metaphysics, all the rest of ideology and their corresponding forms of consciousness, thus no longer retain the semblance of independence. They have no history, no development; but men, developing their material production and their material intercourse, alter, along with this their real existence, their thinking and the products of their thinking. Life is not determined by consciousness, but consciousness by life. In the first method of approach the starting-point is consciousness taken as the living individual; in the second method, which conforms to real life, it is the real living individuals themselves, and consciousness is considered solely as their consciousness.

The ideas of the ruling class are in every epoch the ruling ideas, i.e. the class which is the ruling material force of society, is at the same time its ruling intellectual force. The class which has the means of material production at its disposal, has control at the same time

over the means of mental production, so that thereby, generally speaking, the ideas of those who lack the means of mental production are subject to it. The ruling ideas are nothing more than the ideal expression of the dominant material relationships, the dominant material relationships grasped as ideas; hence of the relationships which make the one class the ruling one, therefore, the ideas of its dominance. The individuals composing the ruling class possess among other things consciousness, and therefore think. Insofar, therefore, as they rule as a class and determine the extent and compass of an epoch, it is self-evident that they do this in its whole range, hence among other things rule also as thinkers, as producers of ideas, and regulate the production and distribution of the ideas of their age: thus their ideas are the ruling ideas of the epoch. For instance, in an age and in a country where royal power, aristocracy, and bourgeoisie are contending for mastery and where, therefore, mastery is shared, the doctrine of the separation of powers proves to be the dominant idea and is expressed as an “eternal law”.... [W]e can say, for instance, that during the time that the aristocracy was dominant, the concepts honour, loyalty, etc. were dominant, during the dominance of the bourgeoisie the concepts freedom, equality, etc. The ruling class itself on the whole imagines this to be so.

Taking literary theory in the opposed direction were the French Symbolists led by Stéphane Mallarmé. These writers believed that poetry especially provided access to an ideal spiritual truth. Poetry served no moral purpose and had no social use. It was instead a privileged way of capturing the Ideal. Attention in literature should be on technique, language, and meaning. Instead of real natural flowers, the poet writes of “the flower that is absent from all bouquets.”

Friedrich Nietzsche is now better known for his radically perspectival epistemology than for his theory of art, but in *The Birth of Tragedy* (1872) he advanced a theory of tragedy that foreshadowed in certain ways the emphasis in twentieth-century philosophy on discontinuity and contingency. Most philosophers believe Being is something easily known using the categories of Reason, but Nietzsche saw Being as becoming, as a process more akin to a fiery flow that had no knowable unity. Traditional philosophy suppresses this radical becoming by manufacturing lies to cover up the instability of the world. Nietzsche reached back to an alternative tradition that originated in Greece and that emphasized the ungraspable flow of life and conceived of Being as active becoming that eluded conceptual stabilization.

He makes a theme of that philosophic distinction in *The Birth of Tragedy* where he describes the Apollonian principle in art in terms of the philosophic quest for a knowable Being behind the play of appearances, a ground of unity and coherence. This principle of stability and unity is opposed by the Dionysian principle, which he defines in terms of play, mutability, and becoming.

**Friedrich Nietzsche:** The Dionysiac, with the primal pleasure it perceives even in pain, is the common womb from which both music and the tragic myth are born.

Could it be that with the assistance of musical dissonance, we have eased significantly the difficult problem of the effect of tragedy? After all, we do now understand the meaning of our desire to look, and yet to long to go beyond looking when we are watching tragedy; when applied to our response to the artistic use of dissonance, this state of mind would have to be described in similar terms: we want to listen, but at the same time we long to go beyond listening. That striving towards infinity, that wing-beat of longing even as we feel supreme delight in a clearly perceived reality, these things indicate that in both these states of mind we are to recognize a Dionysiac phenomenon, one which reveals to us the playful construction and demolition of the world of individuality as an outpouring of

primal pleasure and delight, a process quite similar to Heraclitus the Obscure's comparison of the force that shapes the world to a playing child who sets down stones, here, there, and the next place, and who builds up piles of sand only to knock them down again....

Music and tragic myth both express, in the same way, the Dionysiac capacity of a people, and they cannot be separated from one another. Both originate in an artistic realm which lies beyond the Apollonian; both transfigure a region where dissonance and the terrible image of the world fade away in chords of delight; both play with the goad of disinclination, trusting to their immeasurably powerful arts of magic; both justify by their play the existence of even the "worst of all worlds". Here the Dionysiac shows itself, in comparison to the Apollonian, to be the eternal and original power of art which summons the entire world of appearances into existence, in the midst of which a new, transfiguring semblance is needed to hold fast within life the animated world of individuation. If you could imagine dissonance assuming human form – and what else is man? – this dissonance would need, to be able to live, a magnificent illusion which would spread a veil of beauty over its own nature. This is the true artistic aim of Apollo, in whose name we gather together all those countless illusions of beautiful semblance and thereby urge us on to experience the next.

At the same time, only as much of that foundation of all existence, that Dionysiac underground of the world, can be permitted to enter an individual's consciousness as can be overcome, in its turn, by the Apollonian power of transfiguration, so that both of these artistic drives are required to unfold their energies in strict, reciprocal proportion, according to the law of eternal justice. Where the Dionysiac powers rise up with such unbounded vigour as we are seeing at present, Apollo, too, must already have descended amongst us, concealed in a cloud, and his most abundant effects of beauty will surely be seen by a generation which comes after us.

Nietzsche claimed that all knowledge is perspectival. One sees the world from a specific located point of view; therefore, there is no "universal truth" or "objective knowledge" that exists apart from the mind. The idea of a truth that is independent of perspective is an illusion. He was right, of course. Philosophers since Plato had been mistaking the new cognitive ability for something "out there," a realm of universal ideas that existed in the world. Those universals are indeed sharable mental representations just as the language of mathematics is a sharable representational model that acts as a cultural tool for manipulating and transforming the world. But mathematics resides in the mind or in the written symbols that embody its ideas, not in the world. The same is true of abstract ideas.

Writing at the start of the twentieth century, Edmund Husserl sought to bridge the divide between perspective and objective truth, between mental action (conceiving of abstract ideas) and true ideas (ideas whose validity would be universal). He did so by locating truth in perspective. His "phenomenology" grounded truth in the mind's ability to formulate ideas that could transcend perspective while yet being lodged in the perspective of consciousness. Those pure ideas became formal and transcendental when purified of worldly elements. Ideas in the mind were more true when grasped by "intuition." They were more likely to be purer ideas, unlike ideas derived from sensory data.

One of the first aestheticians to draw on phenomenology was Benedetto Croce. He held that the intuitions evident in art are different from logic and science. They constitute a purer kind of knowledge. As a European political conservative, Croce formulated this theory in terms of the ideal of individual liberty, the model of a self that has no master and that is dependent on no one. It is also an elitist conception; the "civilized man" is capable of grasping the intuitions of art but others are not. This doctrine would inform the elitism of the American New Criticism, a politically conservative movement

which also saw art as delivering intuitive truths that were difficult to grasp and that sorted the “great” from the less great.

**Benedetto Croce:** Now, the first point to be firmly fixed in the mind is that intuitive knowledge has no need of a master, nor to lean upon any one; she does not need to borrow the eyes of others, for she has most excellent eyes of her own. Doubtless it is possible to find concepts mingled with intuitions. But in many other intuitions there is no trace of such a mixture, which proves that it is not necessary. The impression of a moonlight scene by a painter; the outline of a country drawn by a cartographer; a musical motive, tender or energetic; the words of a sighing lyric, or those with which we ask, command and lament in ordinary life, may well all be intuitive facts without a shadow of intellective relation. But, think what one may of these instances, and admitting further that one may maintain that the greater part of the intuitions of civilized man are impregnated with concepts, there yet remains to be observed something more important and more conclusive. Those concepts which are found mingled and fused with the intuitions, are no longer concepts, in so far as they are really mingled and fused, for they have lost all independence and autonomy. They have been concepts, but they have now become simple elements of intuition. The philosophical maxims placed in the mouth of a personage of tragedy or of comedy, perform there the function, not of concepts, but of characteristics of such personage; in the same way as the red in a painted figure does not there represent the red colour of the physicists, but is a characteristic element of the portrait. The whole it is that determines the quality of the parts. A work of art may be full of philosophical concepts; it may contain them in greater abundance and they may be there even more profound than in a philosophical dissertation, which in its turn may be rich to overflowing with descriptions and intuitions. But, notwithstanding all these concepts it may contain, the result of the work of art is an intuition; and notwithstanding all those intuitions, the result of the philosophical dissertation is a concept. The *Promessi Sposi* contains copious ethical observations and distinctions, but it does not for that reason lose in its total effect its character of simple story, of intuition. In like manner the anecdotes and satirical effusions which may be found in the works of a philosopher like Schopenhauer, do not remove from those works their character of intellective treatises. The difference between a scientific work and a work of art, that is, between an intellective fact and an intuitive fact lies in the result, in the diverse effect aimed at by their respective authors. This it is that determines and rules over the several parts of each.

As phenomenology became influential in the mid-twentieth century, the emphasis shifted from pure ideas grasped by mental intuition to the conscious awareness of the flow of everyday experience and the interpersonal aspects of the meeting of minds through the act of reading. When Georges Poulet, a Swiss phenomenologist, came to teach in the US, he influenced a number of scholars, including Stanley Fish, who repackaged phenomenology as “reader-response criticism.”

**Georges Poulet:** Such is the initial phenomenon produced whenever I take up a book and begin to read it. At the precise moment that I see surging out of the object I hold open before me, a quantity of significations which my mind grasps, I realize that what I hold in my hands is no longer just an object, or even simply a living thing. I am aware of a rational being, of a consciousness; the consciousness of another, no different from the one I automatically assume in every human being I encounter, except that in this case, the consciousness is open to me, welcomes me, lets me look deep inside itself, and even allows me, with unheard-of license, to think what it thinks and feel what it feels.

Unheard of, I say. Unheard-of, first, is the disappearance of the “object.” Where is the book I held in my hands? It is still there, and at the same time it is there no longer, it is

nowhere. That object wholly object, that thing made of paper, as there are things made of metal or porcelain, that object is not more, or at least it is as if it no longer existed, as long as I read the book. For the book is no longer a material reality. It has become a series of words, of images, of ideas, which in their turn begin to exist. And where is this new existence? Surely not in the paper object. Nor, surely, in external space. There is only one place left for this new existence: my innermost self.

One of the major new schools of literary theory in the early twentieth century was Russian Formalism. While it sought to make the study of literature more scientific, more concerned with literature as literature and with the specifically literary techniques that distinguished literary writing from other kinds of writing, Russian Formalism was in its inception connected to the art radicalism of the period, which felt art could transform human consciousness and change the world. The radical writers of the Dada movement, which formed in 1916 in response to World War I, sought to create a new disruptive kind of art. That a supposedly civilized Europe could lapse into militarism and war shocked this group of leftwing writers. If Reason could lead to such barbarism, then poetry should be deliberately irrational. It should seek to evoke a different kind of thinking, and to do so, it must shatter the rational forms of verse. Dada would be nonsensical and anti-bourgeois. It would reject the nineteenth-century platitudes of Church and Family, what today we would be called “family values.”

**Tristan Tzara:** The love of novelty is the cross of sympathy, demonstrates a naive I-don’t-give-damn-ism, it is a transitory, positive sign without a cause. But this need itself is obsolete. In documenting art on the basis of the supreme simplicity: novelty, we are human and true for the sake of amusement, impulsive, vibrant to crucify boredom. At the crossroads of the lights, alert, attentively awaiting the years, in the forest. I write a manifesto and I want nothing, yet I say certain things, and in principle I am against manifestoes, as I am also against principles (half-pints to measure the moral value of every phrase too too convenient; approximation was invented by the impressionists). I write this manifesto to show that people can perform contrary actions together while taking one fresh gulp of air; I am against action; for continuous contradiction, for affirmation too, I am neither for nor against and I do not explain because I hate common sense....

A work of art is never beautiful by decree, objectively and for all. Hence criticism is useless, it exists only subjectively, for each man separately, without the slightest character of universality. Does anyone think he has found a psychic base common to all mankind? The attempt of Jesus and the Bible covers with their broad benevolent wings: shit, animals, days. How can one expect to put order into the chaos that constitutes that infinite and shapeless variation: man? The principle: “love thy neighbor” is a hypocrisy. “Know thyself” is utopian but more acceptable, for it embraces wickedness.... No pity. After the carnage we still retain the hope of a purified mankind. I speak only of myself since I do not wish to convince, I have no right to drag others into my river, I oblige no one to follow me and everybody practices his art in his own way, if he knows the joy that rises like arrows to the astral layers, or that other joy that goes down into the mines of corpse-flowers and fertile spasms. Stalactites: seek them everywhere, in managers magnified by pain, eyes white as the hares of the angels. And so Dada was born of a need for independence, of a distrust toward unity. Those who are with us preserve their freedom. We recognize no theory....

Every product of disgust capable of becoming a negation of the family is Dada; a protest with the fists of its whole being engaged in destructive action: Dada; knowledge of all the means rejected up until now by the shamefaced sex of comfortable compromise and good manners: Dada; abolition of logic, which is the dance of those impotent to create: Dada; of

every social hierarchy and equation set up for the sake of values by our valets: Dada: every object, all objects, sentiments, obscurities, apparitions and the precise clash of parallel lines are weapons for the fight: Dada; abolition of memory: Dada; abolition of archaeology: Dada; abolition of prophets: Dada; abolition of the future: Dada; absolute and unquestionable faith in every god that is the immediate product of spontaneity: Dada; elegant and unprejudiced leap from a harmony to the other sphere; trajectory of a word tossed like a screeching phonograph record; to respect all individuals in their folly of the moment: whether it be serious, fearful, timid, ardent, vigorous, determined, enthusiastic; to divest one's church of every useless cumbersome accessory; to spit out disagreeable or amorous ideas like a luminous waterfall, or coddle them – with the extreme satisfaction that it doesn't matter in the least – with the same intensity in the thicket of core's soul pure of insects for blood well-born, and gilded with bodies of archangels. Freedom: Dada Dada Dada, a roaring of tense colors, and interlacing of opposites and of all contradictions, grotesques, inconsistencies: LIFE.

Drawing on the same well of ideas that informed Dada, one of the leading Russian literary theorists, Viktor Shklovsky (1893–1984) advanced the idea that poetry roughens up our everyday experience, which tends with time to become overly routine and habituated to the world around us. Poetry defamiliarizes that world and makes it new again.

**Viktor Shklovsky:** If we start to examine the general laws of perception, we see that as perception becomes habitual, it becomes automatic. Thus, for example, all of our habits retreat into the area of the unconsciously automatic; if one remembers the sensations of holding a pen or of speaking in a foreign language for the first time and compares that with his feeling at performing the action for the ten thousandth time, he will agree with us. Such habituation explains the principles by which, in ordinary speech, we leave phrases unfinished and words half expressed....

Habituation devours work, clothes, furniture, one's wife, and the fear of war. "If the whole complex lives of so many people go on unconsciously, then such lives are as if they had never been." And art exists that one may recover the sensation of life; it exists to make one feel things, to make the stone stony. The purpose of art is to impart the sensation of things as they are perceived and not as they are known. The technique of art is to make objects "unfamiliar," to make forms difficult, to increase the difficulty and length of perception because the process of perception is an aesthetic end in itself and must be prolonged. Art is a way of experiencing the artfulness of an object: the object is not important....

Shklovsky, Boris Eichenbaum, and Juri Tinjanov shifted the emphasis in the study of literature from a theory based largely in philosophy to a study based largely in linguistics and the techniques of literary construction. Those included the procedures of narration such as delayed revelation or stepped narrative and the techniques of poetry such as alliteration and euphony.

The early twentieth century was a time of lively reflection on poetry. Ezra Pound argued that poetry should be as spare as possible. In keeping with the Modernist ethos that rejected Victorian ornamentation and sentimentalism, he contended words should be efficient and free of emotion. T. S. Eliot saw poets in terms of place within tradition. Arguing against the ideal of Romantic subjectivism, he urged instead impersonality and an elevation above emotion.

Linguistics came of age in the early twentieth century. The work of Ferdinand de Saussure (1857–1913) was especially influential. He studied language as a system of

signs whose interconnections allowed words to function and to have meaning. Roman Jakobsen, a member, along with Shklovsky, of the Moscow Poetry Circle, was an early proponent of the study of the link between linguistic forms such as metaphor (which characterizes poetry) and metonymy (which characterizes fictional narrative) and such cognitive processes and disorders as aphasia. He introduced French thinkers such as anthropologist Claude Lévi-Strauss to the ideas of Saussure and helped to launch the movement called Structuralism, which sought to study culture using the tools and methods of linguistics. Lévi-Strauss's structural study of myth was especially influential. In it, he compared hundreds of myths from diverse cultures and found that they shared common structural elements. Already, Vladimir Propp had found structural similarities between folktales, all of which seem to follow a similar narrative pattern of departure, conflict, assistance, vindication, and reconciliation. Lévi-Strauss suggested that myths shared a similar structure because they dealt with the same universal human concerns. This concern with stories and with narratives would become a central concern of the Structuralist study of literature. Gerard Genette and Tzvetan Todorov led the way in developing a science of "narratology." The emphasis in Structuralist Linguistics on signs and semiological systems also inspired French theorists such as Roland Barthes to study culture using linguistic tools. Barthes' short "mythologies" examined aspects of popular culture such as advertisements and guide books as sign systems that communicated meaning using sign images.

While European literary theorists were aspiring to make the study of literature more scientific, theorists in America sought to determine what about literature was at odds with science. In science, words have one meaning, but in literature, New Critics such as Cleanth Brooks argued, the effect of the placement of words in the context of the literary work is to give rise to additional connotative meanings that might even have a spiritual quality. While science seeks the truth of specific things by naming them accurately, literature provides access to less easily nameable truths through the use of complex tropes such as irony and paradox that create semantically fruitful tensions between words. The new meanings generated are more like abstract ideas than sensory objects that can be named directly using a scientific vocabulary. The New Critics merged the idealist tradition (which saw art as the expression of a realm of either spirit or Mind) with the new movement towards the study of literary techniques and forms. They argued for the "close reading" or study of individual literary works for the complex ways they merged imagery and meaning in a unity. Cleanth Brooks emphasized the way poetry dislocated the ordinary uses of words to create meaning.

**Cleanth Brooks:** [T]here is irony of a very powerful sort in Wordsworth's "Intimations" ode. For the thrusts and pressures exerted by the various symbols in this poem are not avoided by the poet: they are taken into account and played, one against the other. Indeed, the symbols – from a scientific point of view – are used perversely: it is the child who is the best philosopher; it is from a kind of darkness – from something that is "shadowy" – that the light proceeds; growth into manhood is viewed, not as an extrication from, but as an incarceration within, a prison.

There should be no mystery as to why this must be so. The terms of science are abstract symbols which do not change under the pressure of the context. They are pure (or aspire to be pure) denotation; they are defined in advance. They are not to be warped into new meanings. But where is the dictionary which contains the terms of a poem? It is a truism that the poet is continually forced to remake language. As Eliot has put it, his task is to "dislocate language into meaning."

Literary theory in Europe in the mid-twentieth century also included Marxism. György Lukács theorized in *The Historical Novel* that works of literature even by reactionary royalist writers such as Balzac could, because they were realist, capture the totality of their age. Walter Benjamin developed an innovative method of historical study in his *Origin of German Tragic Drama*. He also suggested that new media such as film bring about new ways of experiencing the world. Some members of the so-called Frankfurt School such as Theodor Adorno and Max Horkheimer argued that popular culture was a realm of delusion that sustained the power of capitalists over workers, while other thinkers such as Herbert Marcuse and Ernst Bloch described utopian aspirations within even conservative or, in a Marxist sense, “ideological” cultural forms.

One positive outcome of the various formalist enterprises was the emergence of a variety of theories regarding different regions of literature. Those included genres like the novel, modes such as realism, and historical periods such as Romanticism.

Russian theorist Mikhail Bakhtin emphasized the social linguistic character of the novel. Novels draw on multiple voices from the ambient social universe. He cites the example of Charles Dickens who mimes different kinds of speech and integrates them to his fiction. Some are mocked or parodied; some are simply cited. By integrating diverse forms of speech, Dickens novels emphasize the heteroglossic or multi-voiced character of the novel in general, the way it draws on and is sustained by the multiple forms of discourse in a society. Each strand of discourse interacts with proximate strands in the novel. Bakhtin’s term for this is dialogization.

**Mikhail Bakhtin:** The novel as a whole is a phenomenon multiform in style and variform in speech and voice. In it the researcher is confronted with several heterogeneous stylistic unities, often located on different linguistic levels and subject to different stylistic controls.

We list below the basic types of compositional-stylistic unities into which the novelistic whole usually breaks down:

1. Direct authorial literary-artistic narration (in all its diverse variants);
2. Stylistization of the various forms of oral everyday narration [skaz];
3. Stylistization of the various forms of semiliterary everyday narration (the letter, the diary, etc.);
4. Various forms of literary but extra-artistic authorial speech (moral, philosophical or scientific statements, oratory, ethnographic descriptions, memoranda and so forth);
5. The stylistically individualized speech of character...

The novel can be defined as a diversity of social speech types (sometimes even a diversity of languages) and a diversity of individual voices, artistically organized. The internal stratification any single national language into social dialects, characteristic group behavior, professional jargons, generic languages, languages of generations and age groups, tendentious languages, languages of the authorities, of various circles and of passing fashions, languages that serve the specific sociopolitical purposes of the day, even of the hour (each day has its own slogan, its own vocabulary, its own emphases) – this internal stratification present in every language at any given moment of its historical existence is the indispensable prerequisite for the novel as a genre. The novel orchestrates all its themes, the totality of the world of objects and ideas depicted and expressed in it, by means of all the social diversity of speech types and by the differing individual voices that flourish under such conditions. Authorial speech, the speeches of narrators, inserted genres, the speech of characters are merely those fundamental compositional unities with whose help heteroglossia can enter the novel; each of them permits a multiplicity of social voices and a wide

variety of their links and relationships between utterances and languages, this movement of the theme through different languages and speech types, its dispersion into the rivulets and droplets of social heteroglossia, its dialogization – this is the basic distinguishing feature of the stylistics of the novel.

Erich Auerbach's ambitious history of realism, *Mimesis*, described literary realism as evolving from purely external descriptions to the rendering of internal psychology and emotion in modern fiction. His famous first chapter examines Homer's style of narration in the *Odyssey* and notes how Homer foregrounds events and maintains a sense of a perpetual present.

**Erich Auerbach:** Readers of the *Odyssey* will remember the well-prepared and touching scene in Book 19, when Odysseus has at last come home, the scene in which the old housekeeper Euryclea, who had been his nurse, recognizes him by a scar on his thigh.... To the word scar (v. 393) there is first attached a relative clause ("which once long ago a boar ..."), which enlarges into a voluminous syntactical parenthesis; into this an independent sentence unexpectedly intrudes (v. 396: "A god himself gave him ..."), which quietly disentangles itself from syntactical subordination, until, with verse 399, an equally free syntactical treatment of the new content begins a new present which continues unchallenged until, with verse 467 ("The old woman now touched it ..."), the scene which had been broken off is resumed. To be sure, in the case of such long episodes as the one we are considering, a purely syntactical connection with the principal theme would hardly have been possible; but a connection with it through perspective would have been all the easier had the content been arranged with that end in view; if, that is, the entire story of the scar had been presented as a recollection which awakens in Odysseus' mind at this particular moment. It would have been perfectly easy to do; the story of the scar had only to be inserted two verses earlier, at the first mention of the word scar, where the motifs "Odysseus" and "recollection" were already at hand. But any such subjectivistic-perspectivist procedure, creating a foreground and background, resulting in the present lying open to the depths of the past, is entirely foreign to the Homeric style; the Homeric style knows only a foreground, only a uniformly illuminated, uniformly objective present.

Perhaps the most ambitious project in literary theory during this period in the mid-twentieth century was the "anatomy" carried out by Canadian theorist Northrop Frye. Frye conceived of the genres of literature as part of a cycle that followed the seasons as well as the cycles of religious life.

The revival of Nietzsche in the 1960s in France inspired thinkers such as Gilles Deleuze and Jacques Derrida to develop theories that departed from the emphasis on scientific order in Structuralism. Saussure had suggested that each element of language is given an identity by its difference from other elements. That insight opened the possibility that there existed another realm of being entirely that could not be known using the usual tools of knowledge, which tended to focus on things or objects rather than on their relations. How could one know "difference" if it was something "between" two things? And how could one say those things had "identity" or a sense of "own-ness" if they depended essentially on a relation to something other than themselves that was itself an "in-between," a differential relation to something other? So much for certain knowledge and a knowable order of being. And so much as well for the moral normative orders humans have built upon the foundational assumption that they could use their minds to easily determine the truth of things and of ideas. Indeed, if those normative orders were built on sand, mightn't they then have more to do with regimes of social

power than with truth, the attempt by ruling economic and political groups to impose their will on others by pretending their will represented a universal order of true ideas?

Marxists denounced this new “Postmodernism” as a symptom of capitalism. Conservatives suggested it was undermining Truth and Civilization (which it was, rather jollily). But so-called “Postmodernism” also gave rise to some fruitful new literary theories, some of which have faded and some of which have proved enduring.

Deleuze pointed out that the meaning one finds in literature (or in philosophy) comes into being against a backdrop of non-meaning or non-sense. What meanings are chosen to be privileged in a culture therefore belong to a regime of knowledge that is founded on exclusions, a cutting off of semantic possibilities. If one pursues those possibilities, the borders that maintain the integrity and identity of such things as books dissolve. Even the distinction between culture and nature falls apart. All of our ideational constructs are forms of matter. These insights would help found the “New Materialism” in literary theory in the early twenty-first century.

Derrida examined the history of philosophy and noticed a persistent tendency to ignore the slipperiness of the ground knowledge was built on, a ground philosophy mistakenly assumed to be stable. Philosophy assumes the identity of meaning in literary and philosophical texts, but everywhere Derrida looked, he found signs of the difference Saussure had noticed in language. One cannot, therefore, move from a text to a meaning or to the life of an author without getting into a complex web of differential relations that added a lot more meaning than one expected.

A school of theory derived from Derrida’s work developed in the US called “deconstruction.” Its leading proponent was Paul de Man, and its leading practitioner was Barbara Johnson. De Man used Derrida’s ideas to argue that all literary texts ended up unreadable because it was impossible to locate a stable meaning that was not plagued by further reference, further relays to something other. Roland Barthes also put Derrida’s ideas to good use by noting that the study of literature should now be less concerned with an author’s life and more with the various meanings his/her text generates. Literature consisted now of complex “texts” rather than of “works.”

A major French thinker of this period in the second half of the twentieth century, Michel Foucault, was both a significant Structuralist and an influential Post-Structuralist. He first studied the “orders of discourse,” the way embedded rules and assumptions in the discourses we use to describe the world shape how we conceive of that world. His work then shifted to the analysis of power and to the way “discipline” is assured through non-governmental means in society. Finally, his attention turned to discursive regulation of the body and of sexuality over time. While he did not develop a theory of literature, Foucault provoked a renewal of the historical study of literature that focused less on political events and more on the way discourses shaped history. The “New Historicism” of Stephen Greenblatt, Catherine Gallagher, and others was concerned with the links across discourses in any one historical period.

Foucault’s analysis of power grew out of the social and political movements of the 1950s and 1960s, and those movements inspired a number of important schools of literary theory. The anti-colonial and anti-imperialist struggles lie behind the rise of Post-Colonial and Transnational Studies; the Women’s Movement for equality led to Feminist literary theory; the Civil Rights Movement inspired the various ethnic area studies; and the Gay Liberation Movement helped bring about Queer and Gender Studies.

Post-Colonial/Transnational Studies began with the study of the dynamics of colonial rule. White metropolitan culture was invariably portrayed as superior to the culture

of the colonial periphery in English literature. Edward Said noticed that a whole field of study called “orientalism” developed to account for the difference between Occident and Orient, a field invariably tainted by crude stereotypes despite its scholarly status. Theorists such as Homi Bhabha, operating in a deconstructive vein, portrayed the relation of colonizer and colonial as one of insidious subversion. Transnational Studies assumes the reality of global culture, one in which traditional models such as center and periphery no longer make sense. Even the traditional anti-colonial idea of a national culture might no longer make sense in a connected digital and mediated global world.

Ethnic theory moves between the study of the specific tropes of ethnic culture to the study of the dynamic interaction between such culture and the majority or dominant culture. While the goal for some is the realization of an ideal of diverse inclusiveness, for others it remains the preservation of the specific forms of traditional ethnic culture. For African-Americans, this has meant reestablishing a sense of connection to severed African origins, while for indigenous Native Americans it has meant producing works of literature that embody the values and ideas of Native culture.

Feminist literary theory began by demarcating a tradition of women’s writing and by studying the way male-dominated literary culture often portrayed women negatively. It then moved to an exploration of the qualities that make women’s writing different from men’s. Theorists like Luce Irigaray and Hélène Cixous asked the question, Is there a separate realm of female experience captured in a style of writing noticeably different from that of men? A further development occurred when Judith Butler examined the “performed” character of gender identity.

What today is called Queer Theory began as Gay and Lesbian Studies. Theorists such as John d’Emilio, Lee Edelman, Bonnie Zimmerman, and others excavated a tradition of closeted writers such as Henry James and Elisabeth Bishop. Edelman portrayed the homonymic character of queer identity – that it looks straight yet was “different.” Eve Sedgwick noted the continuum between straight and gay culture. These critical evaluations of the dominant hetero-normative culture were both upsetting and exhilarating. They destroyed the standards that aligned biological gender with sexual preference while opening up a realm of mix-and-match possibilities that make gender a realm of great creativity. Kind of a drag indeed.

Post-Structuralist theory has proved enduringly helpful in these realms of theory. That theory was a critique of philosophy, but philosophy, it turns out, has a way of informing the everyday assumptions and perceptions of a culture. The same values of authenticity, nature, and reason that made a certain regime of truth seem more authoritative turned up in the realm of gender, assuring that straight men would appear more natural, authentic, and reasonable than the various “others” they feared and stigmatized.

The most recent developments in literary theory include cognitive studies, evolutionary theory, emotion studies, and the new materialism. All seek to dissolve the barrier between mind and body, between the capacity for idealizing abstraction that allowed *H. sapiens* to build a civilization and the actual physical activity that makes such abstract mental representation possible and in which it is anchored. Cognitive literary studies draws attention to the way the mind operates. One influential idea is that all knowledge is embodied, which is to say, it assumes the form of spatial schemas such as in/out, up/down, center/margin, et cetera. We tend to organize our thinking spatially, and often spatial schemas align with standards of evaluation (a “low” occupation is not a “high” calling). Emotion or Affect Studies takes note of the power of emotions in our lives and in literature. *King Lear* has many facets, but one important one, certainly, is the trajectory

of emotions, as Lear moves from fatuous affection to wounded anger in a space of just a few moments in Act One. Hurt, rage, sorrow, regret – the play might be characterized critically entirely in these terms. Evolutionary theory grounds itself in the Darwinian idea that humans have evolved over time through natural selection. All of our traits aided our ability to survive in harsh conditions. Those who benefited from small changes in their make-up (adaptations due to accidental yet beneficent changes wrought in our make-up by genetic mutation) survived at a greater rate than others who were not so lucky in their genetic inheritance. If eyes in front rather than on the side of the head made survival more likely, then only those with such eyes were likely to reproduce, and all subsequent iterations of the species would have that trait. What we are now, therefore, reaches far into the past, and many of our habits and dispositions, such as greed or generosity, can be understood as the fruit of past adaptations that aided survival. Courtship has attracted probably more attention than it deserves in evolutionary criticism, as scholars note how Edith Wharton or Jane Austen describe the rituals that bring about mating and successful reproduction.

The new materialism connects human life to a broad conception of biology and ecology. Where is the border between human life and ambient biological life? How might we conceive of life without such borders and boundaries – as an interdependent continuum that links humans to habitat, or animals to humans, and that sees life as gradients of matter across a variety of iterations, none more privileged or central than the others? Considered from the perspective of a post-humanist materiality, an ocean and a beach are not a line, a boundary, or even an opposition; they are different forms of matter, a contrast of thick or thin molecular states. Heterosexuals like to think of heterosexual reproduction as a social, even a moral norm, but such reproduction is a minority form in biology, which favors more variable forms of sexuality. What we consider to be “perversions” constitute life as usual for many species. This reconceptualization of human life as biology and ecology will no doubt prompt us to rethink the debates in literature between norms and deviations or models of social order and the various threats such models inevitably imagine and project.

# **PART ONE**

## Russian Formalism, New Criticism, Poetics

---

# CHAPTER 1

## Introduction *Formalisms*

*Julie Rivkin and Michael Ryan*

It has become a commonplace of literary study that to study literature is to study language, yet prior to the formalist movements of the early twentieth century – Russian Formalism and American New Criticism – the study of literature was concerned with everything about literature except language, from the historical context of a literary work to the biography of its author. How literary language worked was of less importance than what a literary work was about. Two movements in early twentieth-century thought helped move literary study away from this orientation. The first movement was the attempt on the part of philosophers of science like Edmund Husserl to isolate objects of knowledge in their unmixed purity. The Russian Formalists, a group of young scholars (Viktor Shklovsky, Roman Jakobson, Boris Tomashevsky, Boris Eichenbaum) who wrote in the teens and twenties, were influenced by this approach. For them, literature would be considered not as a window on the world but as something with specifically literary characteristics that make it literature as opposed to philosophy or sociology or biography. Literature is not a window for looking at sociological themes or philosophic ideas or biographical information; rather, it is a mural or wall painting, something with a palpability of its own which arrests the eye and merits study. The manipulation of representational devices may create a semblance of reality and allow one to have the impression of gazing through glass, but it is the devices alone that produce that impression, and they alone are what makes literature literary.

The second movement was the attempt on the part of idealist philosophers like Benedetto Croce to develop a new aesthetics, or philosophy of art, which would rebut the claim of science that all truth is grounded in empirical facts knowable through scientific methods. Art provides access to a different kind of truth than is available to science, a truth that is immune to scientific investigation because it is accessible only through connotative language (allusion, metaphor, symbolism, etc.) and cannot be rendered in the direct, denotative, fact-naming language of the sciences. The American New Critics (Cleanth Brooks, William K. Wimsett, John Crowe Ransom, Allen Tate) were influenced by the new aesthetic philosophies. For them, literature should be studied for the way literary language differs from ordinary practical language and for the unique truths conveyed only through such literary language.

The Russian Formalists were interested both in describing the general characteristics of literary language and in analyzing the specific devices or modes of operation of such language. Perhaps their most famous general claim is that literary language consists of an act of defamiliarization, by which they mean that such literature presents objects or experiences from such an unusual perspective or in such unconventional and self-conscious language that our habitual, ordinary, rote perceptions of those things are disturbed. We are forced to see things that had become automatic and overly familiar in new ways. Shklovsky cites the example of Tolstoy, who presents a meditation on property from the point of view of a horse, or who recounts the story of a flogging in such a blank manner that the then accepted practice seems strange and novel to the otherwise inured reader.

More specifically, the Formalists were interested in analyzing literature into its component parts and in describing its principal devices and modes of operation. This analysis took two main forms in the two major genres of prose narrative and poetry, concentrating in the first on the operations of narrative and in the second on sound in verse. The Formalists noticed that narrative literature consisted of two major components: the plot, by which they meant the story as narrated within the pages of the book (with all the attendant arrangements of chronological sequence, point of view, etc.), and the story, by which they meant the sequence of events in the order and the actual duration in which they ostensibly occurred. Once this simple distinction is made, one can begin to analyze all of the features of story-telling, the many devices such as point of view, delayed disclosure, narrative voice, and the like that go into the creation of the imaginary story through the manipulation of plot or story-telling devices. One can, for example, begin to study a novel like *The Scarlet Letter* for its narrative strategies instead of for the ways in which it depicts Puritanism.

In the analysis of poetry, the Formalist focus was on the qualities of poetic language that distinguish it from ordinary practical language, the distinction between the literary and the non-literary being more pronounced in this genre. Whereas ordinary language must subordinate its rules of operation (grammar) to the practical goal of communicating information, poetic language is distinguished by the foregrounding of such devices or motifs as euphony, rhythm, alliteration, consonance, repetition, and rhyme which obey a very different logic from that required to communicate information. A meteorologist might say that “precipitation in the Iberian peninsula is concentrated in the central plateau,” and in light of that practical use of language, the internal rhyming of “the rain in Spain falls mainly on the plain” will seem impractical and unnecessary, but it is such devices that make poetry a distinct linguistic undertaking, a mode of language use with autonomous rules of operation which, unlike grammar, are not subordinated to a practical function. While practical speech facilitates access to information by making language as transparent as possible, poetic speech contorts and roughens up ordinary language and submits it to what Roman Jakobson called “organized violence,” and it is this roughening up of ordinary language into tortuous “formed speech” that makes poetry poetry rather than a weather report.

While literature for the Formalists is characterized by invariant patterns, recurring devices, and law-like relations, it also changes over time and varies from one historical epoch to another. The Formalists account for such change in two ways. They claim that literary evolution is the result of the constant attempt to disrupt existing literary conventions and to generate new ones. And they argue that literary change is the result of the autonomous evolution of literary devices.

A more traditional concept of the content/form distinction might lead one to conclude that literature changes when the world changes because literature merely gives form to ideas and realities that lie outside the literary realm and constitute its cause or

motivation. But for the Formalists, literary devices owe no debt to such motivations; they evolve autonomously of them and are motivated entirely by literary origins. For literature to be literature, it must constantly defamiliarize the familiar, constantly evolve new procedures for story-telling or poetry-making. And such change is entirely autonomous of the social and historical world from which the materials of literature are taken. Cervantes' satiric novel *Don Quixote*, for example, makes fun of the popular romantic novels about knights and quests which constituted the dominant form of story-telling in his day. It emerged not because of changes in the world or in Cervantes' life but rather as a result of a specifically literary evolution. The new device of the problematic hero was made possible and necessary by the development of the novel form itself.

You will find a major Russian Formalist, Roman Jakobson, placed under Structuralism in this anthology because there is a strong historical as well as methodological link between the two intellectual movements. Many of the original Formalists were linguists, with Jakobson being the most influential. He left Russia in 1920 and traveled to Czechoslovakia, where he was part of the linguistic circles that inspired French Structuralism in the 1940s and 1950s. The Structuralists, whose work was particularly influential in France through the 1960s, share a methodological interest with Formalist linguistics in that they saw culture in general as constituted by the same rules of operation that one finds in language. Although the Russian Formalists were suppressed by the Stalinist government in Russia in the 1920s, news of their work was borne West by East European émigrés such as René Wellek, Julia Kristeva, and Tzvetan Todorov, where it helped shape French Structuralism as well as such literary critical schools as poetics, stylistics, and narratology.

The impulse towards formal analysis was not limited in Russia to the group of thinkers usually clustered under the rubric Russian Formalists. Vladimir Propp was a scholar of folktales who wrote at the same time as the Formalists and who analyzed the component features of folktale narratives. A wide range of tales could be shown to share the same sequence of narrative motifs, from "the hero leaves home" to "the hero receives a magic token" to "the hero is tested in battle." The work of Mikhail Bakhtin, while it is historically at odds with the Formalists in its emphasis on the social and ideological features of literature, shares their concern with describing those formal elements that make a literary genre such as the novel distinct from other literary forms. His work also represents an expansion of the original Formalist undertaking to include not only genres but also extra-literary uses of language such as that of the carnival, which Bakhtin saw influencing the work of certain writers such as François Rabelais.

While the Russian Formalist movement was scientific and rational, the other major formalist school – American New Criticism – was anti-scientific and interested in the non-rational dimension of art. Both critical movements nevertheless shared an interest in what it is about literary language that makes it different from the ordinary use of language, and both considered the proper object of literary study to be literary texts and how they worked rather than authors' lives or the social and historical worlds to which literature refers. Two well-known terms that are part of a New Critical legacy – the intentional fallacy and the affective fallacy – name this act of delimiting the object of literary study and separating it from biography or sociology. According to the intentional fallacy, meaning resides in the verbal design of a literary work, not in statements regarding his or her intention that the author might make. According to the affective fallacy, the subjective effects or emotional reactions a work provokes in readers are irrelevant to the study of the verbal object itself, since its objective structure alone contains the meaning of the work.

While the Russian Formalists were concerned with elucidating the modes of operation of entire genres such as the novel, the New Critics concentrated their energies on individual literary works, especially poems. “Close reading” is the term most often used to describe their method. The purpose of such close reading was not, however, the analysis of literary devices or motifs considered as an end in itself. It was instead the elucidation of the way literature embodies or concretely enacts universal truth, what the New Critics called “concrete universals.”

Poetry, they argued, differs from ordinary practical speech, which uses language denotatively (one word for one thing), in that poetry uses language connotatively or in a way that evokes secondary meanings. Such language use allows poetry to be both concrete and specific as well as universal and general. An urn can be both an ordinary object *and* a metaphor for the eternal durability of art. Poetic language thus reconciles the ordinarily opposed elements of the concrete and the universal, the specific word and general meaning, body and spirit. Such reconciliation is possible in connotative poetic tropes such as paradox, irony, and metaphor, tropes which either join ordinary objects to universal meanings (metaphor, symbol) or reconcile seemingly opposed elements (irony, paradox). Cleanth Brooks, for example, notices in a famous close reading that Keats’s poem “Ode on a Grecian Urn” is full of paradoxes such as “Cold pastoral” and “unheard melodies” which imply both life and death at once, the paradoxical cohabitation of what is vivid and moving with what is frozen and still. This is so, Brooks argues, because the poem is about how art, figured in the urn, is more vivid than life itself, even though it seems lifeless. Although dead, it possesses eternal life.

The practical denotative language of science cannot name such truth because such language is limited to the naming of positive empirical facts that can be grasped by the senses. The realm of universal meaning, however, is beyond sensory experience and cannot be analyzed using scientific methods. It can only be alluded to indirectly in poetic language and cannot be paraphrased in literal, denotative speech. For the American New Critics, therefore, the description of literary devices such as metaphor, irony, and paradox was inseparable from a theory of universal meaning that was a polemical response to modern positivist science. While the Russian Formalists sought a value-free mode of critical description, one that would scientifically specify what it is about literature that is literary, the New Critics informed the study of literature with a concern for traditional religious and aesthetic values of a kind being displaced by science, in this case, the values of Christian theology and idealist aesthetics (that is, an aesthetics rooted in the idea that universal truth is available through art of a kind that is not determined by material social and historical circumstances). Those values have receded in importance with time, and the legacy of the New Criticism that has remained most abiding is the concern with the close reading of texts and with the analysis of the operation of literary language in all its complexity.

Formalism has become a standard approach to literature as well as to other cultural artifacts such as film and television. The specific kinds of form and procedure vary across media. Film formal analysis is concerned with the way images are constructed through set design, art direction, camera work, framing, composition, and the like. Because the production schedule usually is more compressed, television is inclined to be more constructed around narrative, character, and story than image aesthetics, although the pervasive presence of cinematographers and directors trained in film schools in television production means that television narratives are seldom lacking in compositional complexity. Story-telling has become more of an issue in television as well because

of the emergence of long-form narratives such as *True Detective* and *Forbrydelsen* (aka *The Killing*) in which a single story line is pursued through multiple episodes. *True Detective* especially invites attention to story construction because of the use of a double narrative that operates as testimony and flashback to connect the present to the past. The dual narrative structure is appropriate to a story about both personal and professional redemption and self-remaking. It is, as Sean O'Sullivan in his essay below would say, “broken on purpose.” *Forbrydelsen* (the Danish original of the US show *The Killing*) operates more as what television narrative theorist Jeff Rush would call a spiral that loops back on itself as it moves forward, recapitulating some of the same conflicts as it moves progressively closer to its goal of solution and revelation. Each serial honors the conventions of the detective story. A somewhat monomaniacal detective sacrifices personal relations and opposes obstructive institutions as he or she tenaciously pursues a goal only he or she has the vision to see. The device of institutional obstruction is common to each, and often, the narrative tension is more provoked by the conflict with dim-witted superiors than by the interaction with suspects. While the formal dimension of both shows is weighted towards narrative issues such as obstruction, deflection, frustration, and delay, the visual style of each is characterized by highly thematic and often quite melodramatic shot selection and combination conjoined with a sound design that emphatically evokes emotional distress, empathy, and concern. *True Detective*, which dwells on the role of the cultural environment in crime, often relies on long shots that emphasize the size of the environment in comparison with the detectives. In one of the key moments in the first episode of *Forbrydelsen*, the camera stays on the detective, Sarah Lund, as she rotates her head, thinking about what might have happened at the crime scene. Her colleagues have told her there is no use in continuing the search; they should give up and go home, but Lund lingers, thinking, looking around. The sound accompaniment is strongly pronounced, and it evokes the process of thoughtful reflection in its slow cadence and rising and falling notes. When her rotation finally stops, there is a cut to what she sees: people coming down a road with bicycles and fishing poles. No one amongst the many police searching, she realizes, has thought to search in that direction, and it is there they find a canal containing a car and a body. The narrative is set in motion by a piece of visual story-telling that emphasizes her singularity of vision and its contrast (and conflict) with the hurried irresponsibility of her police comrades and superiors.

# CHAPTER 2

## Art as Technique

*Viktor Shklovsky*

One of the founders of the Formalist study group in Petrograd in the early twentieth century, Shklovsky was also one of its most innovative thinkers. In seeking to move literary study out of the realm of religion and into that of science, Shklovsky and his colleagues argued against the Symbolists who conceived of poetry in spiritualist terms. In continuing the effort to exactly delineate the “literary” quality of those devices and techniques that separates them from ordinary prose, Shklovsky argues in this essay (1916) that such devices impede normal perceptions. This essay demonstrates the similarity between the formal scholarly undertaking and the innovations in poetry that were occurring at the same time in Europe, such as Dada. Concerned with writing that would be brutally honest and shockingly new, these writers rejected traditional culture and traditional artistic forms that had for them become both boring and overly conventional. Shklovsky, thinking along similar lines, saw all poetry as producing a shock effect that disrupted habitual ways of seeing and thinking.

If we start to examine the general laws of perception, we see that as perception becomes habitual, it becomes automatic. Thus, for example, all of our habits retreat into the area of the unconsciously automatic; if one remembers the sensations of holding a pen or of speaking in a foreign language for the first time and compares that with his feeling at performing the action for the ten thousandth time, he will agree with us. Such habituation explains the principles by which, in ordinary speech, we leave phrases unfinished and words half expressed. In this process, ideally realized in algebra, things are replaced by symbols. Complete words are not expressed in rapid speech; their initial sounds are barely perceived. Alexander Pogodin offers the example of a boy considering the sentence “The Swiss mountains are beautiful” in the form of a series of letters: *T, S, m, a, b.*<sup>1</sup>

This characteristic of thought not only suggests the method of algebra, but even prompts the choice of symbols (letters, especially initial letters). By this “algebraic” method of thought we apprehend objects only as shapes with imprecise extensions; we do not see them in their entirety but rather recognize them by their main characteristics.

*Original publication details:* Viktor Shklovsky, “Art as Technique” from *Russian Formalist Criticism: Four Essays*, trans. Lee T. Lemon and Marion J. Reis, pp. 11–16. University of Nebraska Press, 1965.  
Reproduced with permission from the University of Nebraska Press.

We see the object as though it were enveloped in a sack. We know what it is by its configuration, but we see only its silhouette. The object, perceived thus in the manner of prose perception, fades and does not leave even a first impression; ultimately even the essence of what it was is forgotten. Such perception explains why we fail to hear the prose word in its entirety (see Leo Jakubinsky's article<sup>2</sup>) and, hence, why (along with other slips of the tongue) we fail to pronounce it. The process of "algebrization," the over-automatization of an object, permits the greatest economy of perceptive effort. Either objects are assigned only one proper feature – a number, for example – or else they function as though by formula and do not even appear in cognition:

I was cleaning and, meandering about, approached the divan and couldn't remember whether or not I had dusted it. Since these movements are habitual and unconscious I could not remember and felt that it was impossible to remember – so that if I had dusted it and forgot – that is, had acted unconsciously, then it was the same as if I had not. If some conscious person had been watching, then the fact could be established. If, however, no one was looking, or looking on unconsciously, if the whole complex lives of many people go on unconsciously, then such lives are as if they had never been.<sup>3</sup>

And so life is reckoned as nothing. Habitualization devours work, clothes, furniture, one's wife, and the fear of war. "If the whole complex lives of many people go on unconsciously, then such lives are as if they had never been." And art exists that one may recover the sensation of life; it exists to make one feel things, to make the stone *stony*. The purpose of art is to impart the sensation of things as they are perceived and not as they are known. The technique of art is to make objects "unfamiliar," to make forms difficult, to increase the difficulty and length of perception because the process of perception is an aesthetic end in itself and must be prolonged. *Art is a way of experiencing the artfulness of an object: the object is not important ...*

After we see an object several times, we begin to recognize it. The object is in front of us and we know about it, but we do not see it<sup>4</sup> – hence we cannot say anything significant about it. Art removes objects from the automatism of perception in several ways. Here I want to illustrate a way used repeatedly by Leo Tolstoy, that writer who, for Merezhkovsky at least, seems to present things as if he himself saw them, saw them in their entirety, and did not alter them.

Tolstoy makes the familiar seem strange by not naming the familiar object. He describes an object as if he were seeing it for the first time, an event as if it were happening for the first time. In describing something he avoids the accepted names of its parts and instead names corresponding parts of other objects. For example, in "Shame" Tolstoy "defamiliarizes" the idea of flogging in this way: "to strip people who have broken the law, to hurl them to the floor, and to rap on their bottoms with switches," and, after a few lines, "to lash about on the naked buttocks." Then he remarks:

Just why precisely this stupid, savage means of causing pain and not any other – why not prick the shoulders or any part of the body with needles, squeeze the hands or the feet in a vise, or anything like that?

I apologize for this harsh example, but it is typical of Tolstoy's way of pricking the conscience. The familiar act of flogging is made unfamiliar both by the description and by the proposal to change its form without changing its nature. Tolstoy uses this technique of "defamiliarization" constantly. The narrator of "Kholstomer," for example, is a horse,

and it is the horse's point of view (rather than a person's) that makes the content of the story seem unfamiliar. Here is how the horse regards the institution of private property:

I understood well what they said about whipping and Christianity. But then I was absolutely in the dark. What's the meaning of "his own," "his colt"? From these phrases I saw that people thought there was some sort of connection between me and the stable. At the time I simply could not understand the connection. Only much later, when they separated me from the other horses, did I begin to understand. But even then I simply could not see what it meant when they called me "man's property." The words "my horse" referred to me, a living horse, and seemed as strange to me as the words "my land," "my air," "my water."

But the words made a strong impression on me. I thought about them constantly, and only after the most diverse experiences with people did I understand, finally, what they meant. They meant this: In life people are guided by words, not by deeds. It's not so much that they love the possibility of doing or not doing something as it is the possibility of speaking with words, agreed on among themselves, about various topics. Such are the words "my" and "mine," which they apply to different things, creatures, objects, and even to land, people, and horses. They agree that only one may say "mine" about this, that or the other thing. And the one who says "mine" about the greatest number of things is, according to the game which they've agreed to among themselves, the one they consider the most happy. I don't know the point of all this, but it's true. For a long time I tried to explain it to myself in terms of some kind of real gain, but I had to reject that explanation because it was wrong.

Many of those, for instance, who called me their own never rode on me – although others did. And so with those who fed me. Then again, the coachman, the veterinarians, and the outsiders in general treated me kindly, yet those who called me their own did not. In due time, having widened the scope of my observations, I satisfied myself that the notion "my," not only has relation to us horses, has no other basis than a narrow human instinct which is called a sense of or right to private property. A man says "this house is mine" and never lives in it; he only worries about its construction and upkeep. A merchant says "my shop," or "my dry goods shop," for instance, and does not even wear clothes made from the better cloth he keeps in his own shop.

There are people who call a tract of land their own, but they never set eyes on it and never take a stroll on it. There are people who call others their own, yet never see them. And the whole relationship between them is that the so-called "owners" treat the others unjustly.

There are people who call women their own, or their "wives," but their women live with other men. And people strive not for the good in life, but for goods they can call their own.

I am now convinced that this is the essential difference between people and ourselves. And therefore, not even considering the other ways in which we are superior, but considering just this one virtue, we can bravely claim to stand higher than men on the ladder of living creatures. The actions of men, at least those with whom I have had dealings, are guided by *words* – ours by deeds.

The horse is killed before the end of the story, but the manner of the narrative, its technique, does not change:

Much later they put Serpukhovsky's body, which had experienced the world, which had eaten and drunk, into the ground. They could profitably send neither his hide, nor his flesh, nor his bones anywhere.

But since his dead body, which had gone about in the world for twenty years, was a great burden to everyone, its burial was only a superfluous embarrassment for the people. For a long time no one had needed him; for a long time he had been a burden on all. But nevertheless, the dead who buried the dead found it necessary to dress this bloated body, which

immediately began to rot, in a good uniform and good boots; to lay it in a good new coffin with new tassels at the four corners, then to place this new coffin in another of lead and ship it to Moscow; there to exhume ancient bones and at just that spot, to hide this putrefying body, swarming with maggots, in its new uniform and clean boots, and to cover it over completely with dirt.

Thus we see that at the end of the story Tolstoy continues to use the technique even though the motivation for it (the reason for its use) is gone.

In *War and Peace* Tolstoy uses the same technique in describing whole battles as if battles were something new. These descriptions are too long to quote; it would be necessary to extract a considerable part of the four-volume novel. But Tolstoy uses the same method in describing the drawing room and the theater:

The middle of the stage consisted of flat boards; by the sides stood painted pictures representing trees, and at the back a linen cloth was stretched down to the floor boards. Maidens in red bodices and white skirts sat on the middle of the stage. One, very fat, in a white silk dress, sat apart on a narrow bench to which a green pasteboard box was glued from behind. They were all singing something. When they had finished, the maiden in white approached the prompter's box. A man in silk with tight-fitting pants on his fat legs approached her with a plume and began to sing and spread his arms in dismay. The man in the tight pants finished his song alone; then the girl sang. After that both remained silent as the music resounded; and the man, obviously waiting to begin singing his part with her again, began to run his fingers over the hand of the girl in the white dress. They finished their song together, and everyone in the theater began to clap and shout. But the men and women on stage, who represented lovers, started to bow, smiling and raising their hands.

In the second act were pictures representing monuments and openings in the linen cloth representing the moonlight, and they raised lamp shades on a frame. As the musicians started to play the bass horn and counter-bass, a large number of people in black mantels poured onto the stage from right and left. The people, with something like daggers in their hands, started to wave their arms. Then still more people came running out and began to drag away the maiden who had been wearing a white dress but who now wore one of sky blue. They did not drag her off immediately, but sang with her for a long time before dragging her away. Three times they struck on something metallic behind the side scenes, and everyone got down on his knees and began to chant a prayer. Several times all of this activity was interrupted by enthusiastic shouts from the spectators...

Anyone who knows Tolstoy can find several hundred such passages in his work. His method of seeing things out of their normal context is also apparent in his last works. Tolstoy described the dogmas and rituals he attacked as if they were unfamiliar, substituting everyday meanings for the customarily religious meanings of the words common in church ritual. Many persons were painfully wounded; they considered it blasphemy to present as strange and monstrous what they accepted as sacred. Their reaction was due chiefly to the technique through which Tolstoy perceived and reported his environment. And after turning to what he had long avoided, Tolstoy found that his perceptions had unsettled his faith.

The technique of defamiliarization is not Tolstoy's alone. I cited Tolstoy because his work is generally known.

Now, having explained the nature of this technique, let us try to determine the approximate limits of its application. I personally feel that defamiliarization is found almost everywhere form is found ... An image is not a permanent referent for those mutable

complexities of life which are revealed through it, its purpose is not to make us perceive meaning, but to create a special perception of the object – *it creates a vision of the object instead of serving as a means for knowing it* ...

Such constructions as “the pestle and the mortar,” or “Old Nick and the infernal regions” (*Decameron*) are also examples of the technique of defamiliarization. And in my article on plot construction I write about defamiliarization in psychological parallelism. Here, then, I repeat that the perception of disharmony in a harmonious context is important in parallelism. The purpose of parallelism, like the general purpose of imagery, is to transfer the usual perception of an object into the sphere of new perception – that is, to make a unique semantic modification.

In studying poetic speech in its phonetic and lexical structure as well as in its characteristic distribution of words and in the characteristic thought structures compounded from the words, we find everywhere the artistic trademark – that is, we find material obviously created to remove the automatism of perception; the author’s purpose is to create the vision which results from that deautomatized perception. A work is created “artistically” so that its perception is impeded and the greatest possible effect is produced through the slowness of the perception. As a result of this lingering, the object is perceived not in its extension in space, but, so to speak, in its continuity. Thus “poetic language” gives satisfaction. According to Aristotle, poetic language must appear strange and wonderful; and, in fact, it is often actually foreign: the Sumerian used by the Assyrians, the Latin of Europe during the Middle Ages, the Arabisms of the Persians, the Old Bulgarian of Russian literature, or the elevated, almost literary language of folk songs. The common archaisms of poetic language, the intricacy of the sweet new style [*dolce stil nuovo*],<sup>5</sup> the obscure style of the language of Arnaut Daniel with the “roughened” [*harte*] forms which *make pronunciation difficult* – these are used in much the same way. Leo Jakubinsky has demonstrated the principle of phonetic “roughening” of poetic language in the particular case of the repetition of identical sounds. The language of poetry is, then, a difficult, roughened, impeded language. In a few special instances the language of poetry approximates the language of prose, but this does not violate the principle of “roughened” form.

Her sister was called Tatyana  
 For the first time we shall  
 Willfully brighten the delicate  
 Pages of a novel with such a name

wrote Pushkin. The usual poetic language for Pushkin’s contemporaries was the elegant style of Derzhavin; but Pushkin’s style, because it seemed trivial then, was unexpectedly difficult for them. We should remember the consternation of Pushkin’s contemporaries over the vulgarity of his expressions. He used the popular language as a special device for prolonging attention, just as his contemporaries generally used Russian words in their usually French speech (see Tolstoy’s examples in *War and Peace*).

Just now a still more characteristic phenomenon is under way. Russian literary language, which was originally foreign to Russia, has so permeated the language of the people that it has blended with their conversation. On the other hand, literature has now begun to show a tendency towards the use of dialects (Remizov, Klyuyev, Essenin, and others,<sup>6</sup> so unequal in talent and so alike in language, are intentionally provincial) and/or barbarisms (which gave rise to the Severyanin group<sup>7</sup>). And currently Maxim Gorky is changing his diction

from the old literary language to the new literary colloquialism of Leskov.<sup>8</sup> Ordinary speech and literary language have thereby changed places (see the work of Vyacheslav Ivanov and many others). And finally, a strong tendency, led by Khlebnikov, to create a new and properly poetic language has emerged. In the light of these developments we can define poetry as *attenuated, tortuous speech*. Poetic speech is *formed speech*. Prose is ordinary speech – economical, easy, proper, the goddess of prose [*dea prosae*] is a goddess of the accurate, facile type, of the “direct” expression of a child. I shall discuss roughened form and retardation as the general *law* of art at greater length in an article on plot construction.<sup>9</sup>

Nevertheless, the position of those who urge the idea of the economy of artistic energy as something which exists in and even distinguishes poetic language seems, at first glance, tenable for the problem rhythm. Spencer’s description of rhythm would seem to be absolutely incontestable:

Just as the body in receiving a series of varying concussions, must keep the muscles ready to meet the most violent of them, as not knowing when such may come: so, the mind in receiving unarranged articulations, must keep its perspectives active enough to recognize the least easily caught sounds. And as, if the concussions recur in definite order, the body may husband its forces by adjusting the resistance needful for each concussion; so, if the syllables be rhythmically arranged, the mind may economize its energies by anticipating the attention required for each syllable.<sup>10</sup>

This apparent observation suffers from the common fallacy, the confusion of the laws of poetic and prosaic language. In *The Philosophy of Style* Spencer failed utterly to distinguish between them. But rhythm may have two functions. The rhythm of prose, or a work song like “Dubinushka,” permits the members of the work crew to do their necessary “groaning together” and also eases the work by making it automatic. And, in fact, it is easier to march with music than without it, and to march during an animated conversation is even easier, for the walking is done unconsciously. Thus the rhythm of prose is an important automatizing element; the rhythm of poetry is not. There is “order” in art, yet not a single column of a Greek temple stands exactly in its proper order; poetic rhythm is similarly disordered rhythm. Attempts to systematize the irregularities have been made, and such attempts are part of the current problem in the theory of rhythm. It is obvious that the systematization will not work, for in reality the problem is not one of complicating the rhythm but of disordering the rhythm – a disordering which cannot be predicted. Should the disordering of rhythm become a convention, it would be ineffective as a procedure for the roughening of language. But I will not discuss rhythm in more detail since I intend to write a book about it.

## Notes

- 1 Alexander Pogodin, *Yazyk, kak tvorchestvo [Language as Art]* (Kharkov, 1913), p. 42. [The original sentence was in French, “Les montagnes de la Suisse sont belles,” with the appropriate initials.]
- 2 Leo Jakubinsky, *Sborniki*, I (1916).
- 3 Leo Tolstoy’s *Diary*, entry dated February 29, 1897. [The date is transcribed incorrectly; it should read March 1, 1897.]
- 4 Viktor Shklovsky, *Voskresheniye slova [The Resurrection of the Word]* (Petersburg, 1914).
- 5 Dante, *Purgatorio*, 24:56. Dante refers to the new lyric style of his contemporaries. [Trans.]
- 6 Alexy Remizov (1877–1957) is best known as a novelist and satirist; Nicholas Klyuyev (1885–1937) and Sergey Essenin (1895–1925) were “peasant poets.” All three were noted for their faithful reproduction of Russian dialects and colloquial language. [Trans.]

- 7 A group noted for its opulent and sensuous verse style. [Trans.]
- 8 Nicholas Leskov (1831–95), novelist and short story writer, helped popularize the *skaz*, or yarn, and hence, because of the part dialect peculiarities play in the *skaz*, also altered Russian literary language. [Trans.]
- 9 Shklovsky is probably referring to his *Razvyortyvaniye syuzheta* [Plot Development] (Petrograd, 1921). [Trans.]

# CHAPTER 3

## The Formalist Critics

*Cleanth Brooks*

Published (1951) in *The Raritan Review*, this polemic in favor of the New Criticism was written by one of the major practitioners and promoters of the new approach to literature – Cleanth Brooks. Brooks had studied in Cambridge with I. A. Richards, who first laid the foundation for the New Criticism in his *Principles of Literary Criticism* (1924). Upon his return to the United States, Brooks began writing a series of books, from *An Approach to Literature* (1936) to *The Well-Wrought Urn: Studies in the Structure of Poetry* (1947), that helped establish “close reading” as the dominant form of literary study in the American academy from the 1940s through the late 1960s.

Here are some articles of faith I could subscribe to:

- That literary criticism is a description and an evaluation of its object.
- That the primary concern of criticism is with the problem of unity – the kind of whole which the literary work forms or fails to form, and the relation of the various parts to each other in building up this whole.
- That the formal relations in a work of literature may include, but certainly exceed, those of logic.
- That in a successful work, form and content cannot be separated.
- That form is meaning.
- That literature is ultimately metaphorical and symbolic.
- That the general and the universal are not seized upon by abstraction, but got at through the concrete and the particular.
- That literature is not a surrogate for religion.
- That, as Allen Tate says, “specific moral problems” are the subject matter of literature, but that the purpose of literature is not to point a moral.
- That the principles of criticism define the area relevant to literary criticism; they do not constitute a method for carrying out the criticism.

*Original publication details:* Cleanth Brooks, “The Formalist Critics” from *The Kenyon Review* OS XIII.1 (Winter 1951). Reproduced with permission from *The Kenyon Review*.

Such statements as these would not, however, even though greatly elaborated, serve any useful purpose here. The interested reader already knows the general nature of the critical position adumbrated – or, if he does not, he can find it set forth in writings of mine or of other critics of like sympathy. Moreover, a condensed restatement of the position here would probably beget as many misunderstandings as have past attempts to set it forth. It seems much more profitable to use the present occasion for dealing with some persistent misunderstandings and objections.

In the first place, to make the poem or the novel the central concern of criticism has appeared to mean cutting it loose from its author and from his life as a man, with his own particular hopes, fears, interests, conflicts, etc. A criticism so limited may seem bloodless and hollow. It will seem so to the typical professor of literature in the graduate school, where the study of literature is still primarily a study of the ideas and personality of the author as revealed in his letters, his diaries, and the recorded conversations of his friends. It will certainly seem so to literary gossip columnists who purvey literary chitchat. It may also seem so to the young poet or novelist, beset with his own problems of composition and with his struggles to find a subject and a style and to get a hearing for himself.

In the second place, to emphasize the work seems to involve severing it from those who actually read it, and this severance may seem drastic and therefore disastrous. After all, literature is written to be read. Wordsworth's poet was a man speaking to men. In each *Sunday Times*, Mr J. Donald Adams points out that the hungry sheep look up and are not fed; and less strenuous moralists than Mr Adams are bound to feel a proper revulsion against "mere aestheticism." Moreover, if we neglect the audience which reads the work, including that for which it was presumably written, the literary historian is prompt to point out that the kind of audience that Pope had did condition the kind of poetry that he wrote. The poem has its roots in history, past or present. Its place in the historical context simply cannot be ignored.

I have stated these objections as sharply as I can because I am sympathetic with the state of mind which is prone to voice them. Man's experience is indeed a seamless garment, no part of which can be separated from the rest. Yet if we urge this fact, of inseparability against the drawing of distinctions, then there is no point in talking about criticism at all. I am assuming that distinctions are necessary and useful and indeed inevitable.

The formalist critic knows as well as anyone that poems and plays and novels are written by men – that they do not somehow happen – and that they are written as expressions of particular personalities and are written from all sorts of motives – for money, from a desire to express oneself, for the sake of a cause, etc. Moreover, the formalist critic knows as well as anyone that literary works are mere potential until they are read – that is, that they are recreated in the minds of actual readers, who vary enormously in their capabilities, their interests, their prejudices, their ideas. But the formalist critic is concerned primarily with the work itself. Speculation on the mental processes of the author takes the critic away from the work into biography and psychology. There is no reason, of course, why he should not turn away into biography and psychology. Such explorations are very much worth making. But they should not be confused with an account of the work. Such studies describe the process of composition, not the structure of the thing composed, and they may be performed quite as validly for the poor work as for the good one. They may be validly performed for any kind of expression – nonliterary as well as literary.

On the other hand, exploration of the various readings which the work has received also takes the critic away from the work into psychology and the history of taste. The various

imports of a given work may well be worth studying. I. A. Richards has put us all in his debt by demonstrating what different experiences may be derived from the same poem by an apparently homogeneous group of readers; and the scholars have pointed out, all along, how different Shakespeare appeared to an eighteenth-century as compared with a nineteenth-century audience; or how sharply divergent are the estimates of John Donne's lyrics from historical period to historical period. But such work, valuable and necessary as it may be, is to be distinguished from a criticism of the work itself. The formalist critic, because he wants to criticize the work itself, makes two assumptions: (1) he assumes that the relevant part of the author's intention is what he got actually into his work; that is, he assumes that the author's intention as realized is the "intention" that counts, not necessarily what he was conscious of trying to do, or what he now remembers he was then trying to do. And (2) the formalist critic assumes an ideal reader: that is, instead of focusing on the varying spectrum of possible readings, he attempts to find a central point of reference from which he can focus upon the structure of the poem or novel.

But there is no ideal reader, someone is prompt to point out, and he will probably add that it is sheer arrogance that allows the critic, with his own blindsides and prejudice, to put himself in the position of that ideal reader. There is no ideal reader, of course, and I suppose that the practicing critic can never be too often reminded of the gap between his reading and the "true" reading of the poem. But for the purpose of focusing upon the poem rather than upon his own reactions, it is a defensible strategy. Finally, of course, it is the strategy that all critics of whatever persuasion are forced to adopt. (The alternatives are desperate: either we say that one person's reading is as good as another's and equate those readings on a basis of absolute equality and thus deny the possibility of any standard reading. Or else we take a lowest common denominator of the various readings that have been made; that is, we frankly move from literary criticism into socio-psychology. To propose taking a consensus of the opinions of "qualified" readers is simply to split the ideal reader into a group of ideal readers.) As consequences of the distinction just referred to, the formalist critic rejects two popular tests for literary value. The first proves the value of the work from the author's "sincerity" (or the intensity of the author's feelings as he composed it). If we heard that Mr Guest testified that he put his heart and soul into his poems, we would not be very much impressed, though I should see no reason to doubt such a statement from Mr Guest. It would simply be critically irrelevant. Ernest Hemingway's statement in a recent issue of *Time* magazine that he counts his last novel his best is of interest for Hemingway's biography, but most readers of *Across the River and Into the Trees* would agree that it proves nothing at all about the value of the novel – that in this case the judgment is simply pathetically inept. We discount also such tests for poetry as that proposed by A. E. Housman – the bristling of his beard at the reading of a good poem. The intensity of his reaction has critical significance only in proportion as we have already learned to trust him as a reader. Even so, what it tells us is something about Housman – nothing decisive about the poem.

It is unfortunate if this playing down of such responses seems to deny humanity to either writer or reader. The critic may enjoy certain works very much and may be indeed intensely moved by them. I am, and I have no embarrassment in admitting the fact; but a detailed description of my emotional state on reading certain works has little to do with indicating to an interested reader what the work is and how the parts of it are related.

Should all criticism, then, be self-effacing and analytic? I hope that the answer is implicit in what I have already written, but I shall go on to spell it out. Of course not. That will depend upon the occasion and the audience. In practice, the critic's job is

rarely a purely critical one. He is much more likely to be involved in dozens of more or less related tasks, some of them trivial, some of them important. He may be trying to get a hearing for a new author, or to get the attention of the freshman sitting in the back row. He may be comparing two authors, or editing a text; writing a brief newspaper review or reading a paper before the Modern Language Association. He may even be simply talking with a friend, talking about literature for the hell of it. Parable, anecdote, epigram, metaphor – these and a hundred other devices may be thoroughly legitimate for his varying purposes. He is certainly not to be asked to suppress his personal enthusiasms or his interest in social history or in politics. Least of all is he being asked to *present* his criticisms as the close reading of a text. Tact, common sense, and uncommon sense if he has it, are all requisite if the practicing critic is to do his various jobs well.

But it will do the critic no harm to have a clear idea of what his specific job as a critic is. I can sympathize with writers who are tired of reading rather drab “critical analyses,” and who recommend brighter, more amateur, and more “human” criticism. As ideals, these are excellent; as recipes for improving criticism, I have my doubts. Appropriate vulgarizations of these ideals are already flourishing, and have long flourished – in the class room presided over by the college lecturer of infectious enthusiasm, in the gossipy Book-of-the-Month Club bulletins, and in the columns of the *Saturday Review of Literature*.

I have assigned the critic a modest, though I think an important, role. With reference to the help which the critic can give to the practicing artist, the role is even more modest. As critic, he can give only negative help. Literature is not written by formula: he can have no formula to offer. Perhaps he can do little more than indicate whether in his opinion the work has succeeded or failed. Healthy criticism and healthy creation do tend to go hand in hand. Everything else being equal, the creative artist is better off for being in touch with a vigorous criticism. But the other considerations are never equal, the case is always special, and in a given case the proper advice could be: quit reading criticism altogether, or read political science or history or philosophy – or join the army, or join the church.

There is certainly no doubt that the kind of specific and positive help that someone like Ezra Pound was able to give to several writers of our time is in one sense the most important kind of criticism that there can be. I think that it is not unrelated to the kind of criticism that I have described: there is the same intense concern with the text which is being built up, the same concern with “technical problems.” But many other things are involved – matters which lie outside the specific ambit of criticism altogether; among them a knowledge of the personality of the particular writer, the ability to stimulate, to make positive suggestions.

A literary work is a document and as a document can be analyzed in terms of the forces that have produced it, or it may be manipulated as a force in its own right. It mirrors the past, it may influence the future. These facts it would be futile to deny, and I know of no critic who does deny them. But the reduction of a work of literature to its causes does not constitute literary criticism; nor does an estimate of its effects. Good literature is more than effective rhetoric applied to true ideas – even if we could agree upon a philosophical yardstick for measuring the truth of ideas and even if we could find some way that transcended nose-counting for determining the effectiveness of the rhetoric.

A recent essay by Lionel Trilling bears very emphatically upon this point. (I refer to him the more readily because Trilling has registered some of his objections to the critical

position that I maintain.) In the essay entitled "The Meaning of a Literary Idea," Trilling discusses the debt to Freud and Spengler of four American writers, O'Neill, Dos Passos, Wolfe, and Faulkner. Very justly, as it seems to me, he chooses Faulkner as the contemporary writer who, along with Ernest Hemingway, best illustrates the power and importance of ideas in literature. Trilling is thoroughly aware that his choice will seem shocking and perhaps perverse, "because," as he writes, "Hemingway and Faulkner have insisted on their indifference to the conscious intellectual tradition of our time and have acquired the reputation of achieving their effects by means that have the least possible connection with any sort of intellectuality or even with intelligence."

Here Trilling shows not only acute discernment but an admirable honesty in electing to deal with the hard cases – with the writers who do not clearly and easily make the case for the importance of ideas. I applaud the discernment and the honesty, but I wonder whether the whole discussion in his essay does not indicate that Trilling is really much closer to the so-called "new critics" than perhaps he is aware. For Trilling, one notices, rejects any simple one-to-one relation between the truth of the idea and the value of the literary work in which it is embodied. Moreover, he does not claim that "recognizable ideas of a force or weight are 'used' in the work," or "new ideas of a certain force and weight are 'produced' by the work." He praises rather the fact that we feel that Hemingway and Faulkner are "intensely at work upon the recalcitrant stuff of life." The last point is made the matter of real importance. Whereas Dos Passos, O'Neill, and Wolfe make us "feel that they feel that they have said the last word," "we seldom have the sense that [Hemingway and Faulkner] ... have misrepresented to themselves the nature and the difficulty of the matter they work on."

Trilling has chosen to state the situation in terms of the writer's activity (Faulkner is intensely at work, etc.). But this judgment is plainly an inference from the quality of Faulkner's novels – Trilling has not simply heard Faulkner say that he has had to struggle with his work. (I take it Mr Hemingway's declaration about the effort he put into the last novel impresses Trilling as little as it impresses the rest of us.)

Suppose, then, that we tried to state Mr Trilling's point, not in terms of the effort of the artist, but in terms of the structure of the work itself. Should we not get something very like the terms used by the formalist critics? A description in terms of "tensions," of symbolic development, of ironies and their resolution? In short, is not the formalist critic trying to describe in terms of the dynamic form of the work itself how the recalcitrancy of the material is acknowledged and dealt with?

Trilling's definition of "ideas" makes it still easier to accommodate my position to his. I have already quoted a passage in which he repudiates the notion that one has to show how recognizable ideas are "used" in the work, or new ideas are "produced" by the work. He goes on to write: "All that we need to do is account for a certain aesthetic effect as being in some important part achieved by a mental process which is not different from the process by which discursive ideas are conceived, and which is to be judged by some of the criteria by which an idea is judged." One would have to look far to find a critic "formal" enough to object to this. What some of us have been at pains to insist upon is that literature does not simply "exemplify" ideas or "produce" ideas – as Trilling acknowledges. But no one claims that the writer is an inspired idiot. He uses his mind and his reader ought to use his, in processes "not different from the process by which discursive ideas are conceived." Literature is not inimical to ideas. It thrives upon ideas but it does not present ideas patly and neatly. It involves them with the "recalcitrant stuff of life." The literary critic's job is to deal with that involvement.

The mention of Faulkner invites a closing comment upon the critic's specific job. As I have described it, it may seem so modest that one could take its performance for granted. But consider the misreadings of Faulkner now current, some of them the work of the most brilliant critics that we have, some of them quite wrong-headed, and demonstrably so. What is true of Faulkner is only less true of many another author, including many writers of the past. Literature has many "uses" – and critics propose new uses, some of them exciting and spectacular. But all the multiform uses to which literature can be put rest finally upon our knowing what a given work "means." That knowledge is basic.

# CHAPTER 4

## Keats' Sylvan Historian: History Without the Footnotes\*

*Cleanth Brooks*

The New Critics favored the close reading of literary texts over the historical study of literature that was popular when they came upon the scene in the mid-twentieth century. The approach called for the critic to attend to image patterns and semantic tensions within the work. Poetry lent itself especially well to this critical endeavor, and English poetry from the sixteenth to the nineteenth century, because it was so stylized and philosophic, was an especially attractive object of study. In this essay, the leading New Critic, Cleanth Brooks, examines Keats's famous "Ode on a Grecian Urn" for the way its images embody ideas about the tension between the brevity of actual life and the eternal life art guarantees. Paradox, Brooks argues, is essential to poetry expression, since a poem embodies a universal idea with concrete form.

There is much in the poetry of Keats which suggests that he would have approved of Archibald MacLeish's dictum, "A poem should not mean / But be." There is even some warrant for thinking that the Grecian urn (real or imagined) which inspired the famous ode was, for Keats, just such a poem, "palpable and mute," a poem in stone. Hence it is the more remarkable that the "Ode" itself differs from Keats's other odes by culminating in a statement – a statement even of some sententiousness in which the urn itself is made to say that beauty is truth, and – more sententious still – that this bit of wisdom sums up the whole of mortal knowledge.

This is "to mean" with a vengeance – to violate the doctrine of the objective correlative, not only by stating truths, but by defining the limits of truth. Small wonder that some critics have felt that the unravished bride of quietness protests too much.

T. S. Eliot, for example, says that "this line ['Beauty is truth,' etc.] strikes me as a serious blemish on a beautiful poem; and the reason must be either that I fail to understand it, or that it is a statement which is untrue." But even for persons who feel that they do understand it, the line may still constitute a blemish. Middleton Murry, who,

after a discussion of Keats's other poems and his letters, feels that he knows what Keats meant by "beauty" and what he meant by "truth," and that Keats used them in senses which allowed them to be properly bracketed together, still, is forced to conclude: "My own opinion concerning the value of these two lines *in the context of the poem itself* is not very different from Mr. T. S. Eliot's." The troubling assertion is apparently an intrusion upon the poem – does not grow out of it – is not dramatically accommodated to it.

This is essentially Garrod's objection, and the fact that Garrod does object indicates that a distaste for the ending of the "Ode" is by no means limited to critics of notoriously "modern" sympathies.

But the question of real importance is not whether Eliot, Murry, and Garrod are right in thinking that "Beauty is truth, truth beauty" injures the poem. The question of real importance concerns beauty and truth in a much more general way: what is the relation of the beauty (the goodness, the perfection) of a poem to the truth or falsity of what it seems to assert? It is a question which has particularly vexed our own generation – to give it I. A. Richards' phrasing, it is the problem of belief.

The "Ode," by its bold equation of beauty and truth, raises this question in its sharpest form – the more so when it becomes apparent that the poem itself is obviously intended to be a parable on the nature of poetry, and of art in general. The "Ode" has apparently been an enigmatic parable, to be sure: one can emphasize *beauty* is truth and throw Keats into the pure-art camp, the usual procedure. But it is only fair to point out that one could stress *truth* is beauty, and argue with the Marxist critics of the 'thirties for a propaganda art. The very ambiguity of the statement, "Beauty is truth, truth beauty" ought to warn us against insisting very much on the statement in isolation, and to drive us back to a consideration of the context in which the statement is set.

It will not be sufficient, however, if it merely drives us back to a study of Keats's reading, his conversation, his letters. We shall not find our answer there even if scholarship does prefer on principle investigations of Browning's ironic question, "What porridge had John Keats?" For even if we knew just what porridge he had, physical and mental, we should still not be able to settle the problem of the "Ode." The reason should be clear: our specific question is not what did Keats the man perhaps want to assert here about the relation of beauty and truth; it is rather: was Keats the poet able to exemplify that relation in this particular poem? Middleton Murry is right: the relation of the final statement in the poem to the total context is all-important.

Indeed, Eliot, in the very passage in which he attacks the "Ode" has indicated the general line which we are to take in its defense. In that passage, Eliot goes on to contrast the closing lines of the "Ode" with a line from *King Lear*, "Ripeness is all." Keats's lines strike him as false; Shakespeare's, on the other hand, as not clearly false, and as possibly quite true. Shakespeare's generalization, in other words, avoids raising the question of truth. But is it really a question of truth and falsity? One is tempted to account for the difference of effect which Eliot feels in this way: "Ripeness is all" is a statement put in the mouth of a dramatic character and a statement which is governed and qualified by the whole context of the play. It does not directly challenge an examination into its truth because its relevance is pointed up and modified by the dramatic context.

Now, suppose that one could show that Keats's lines, *in quite the same way*, constitute a speech, a consciously riddling paradox, put in the mouth of a particular character, and modified by the total context of the poem. If we could demonstrate that the speech was "in character," was dramatically appropriate, was properly prepared for – then would not the lines have all the justification of "Ripeness is all"? In such case, should we not

have waived the question of the scientific or philosophic truth of the lines in favor of the application of a principle curiously like that of dramatic propriety? I suggest that some such principle is the only one legitimately to be invoked in any case. Be this as it may, the "Ode on a Grecian Urn" provides us with as neat an instance as one could wish in order to test the implications of such a maneuver.

It has seemed best to be perfectly frank about procedure: the poem is to be read in order to see whether the last lines of the poem are not, after all, dramatically prepared for. Yet there are some claims to be made upon the reader too, claims which he, for his part, will have to be prepared to honor. He must not be allowed to dismiss the early characterizations of the urn as merely so much vaguely beautiful description. He must not be too much surprised if "mere decoration" turns out to be meaningful symbolism – or if ironies develop where he has been taught to expect only sensuous pictures. Most of all, if the teasing riddle spoken finally by the urn is not to strike him as a bewildering break in tone, he must not be too much disturbed to have the element of paradox latent in the poem emphasized, even in those parts of the poem which have none of the energetic crackle of wit with which he usually associates paradox. This is surely not too much to ask of the reader – namely, to assume that Keats meant what he said and that he chose his words with care. After all, the poem begins on a note of paradox, though a mild one: for we ordinarily do not expect an urn to speak at all; and yet, Keats does more than this: he begins his poem by emphasizing the apparent contradiction.

The silence of the urn is stressed – it is a "bride of quietness"; it is a "foster-child of silence," but the urn is a "historian" too. Historians tell the truth, or are at least expected to tell the truth. What is a "Sylvan historian"? A historian who is like the forest rustic, a woodlander? Or, a historian who writes histories of the forest? Presumably, the urn is sylvan in both senses. True, the latter meaning is uppermost: the urn can "express / A flowery tale more sweetly than our rhyme," and what the urn goes on to express is a "leaf-fring'd legend" of "Tempe or the dales of Arcady." But the urn, like the "leaf-fring'd legend" which it tells, is covered with emblems of the fields and forests: "Overwrought, / With forest branches and the trodden weed." When we consider the way in which the urn utters its history, the fact that it must be sylvan in both senses is seen as inevitable. Perhaps too the fact that it is a rural historian, a rustic, a peasant historian, qualifies in our minds the dignity and the "truth" of the histories which it recites. Its histories, Keats has already conceded, may be characterized as "tales" – not formal history at all.

The sylvan historian certainly supplies no names and dates – "What men or gods are these?" the poet asks. What it does give is action – of men *or* gods, of godlike men or of superhuman (though not daemonic) gods – action, which is not the less intense for all that the urn is cool marble. The words "mad" and "ecstasy" occur, but it is the quiet, rigid urn which gives the dynamic picture. And the paradox goes further: the scene is one of violent love-making, a Bacchanalian scene, but the urn itself is like a "still unravish'd bride," or like a child, a child "of silence and slow time." It is not merely like a child, but like a "foster-child." The exactness of the term can be defended. "Silence and slow time," it is suggested, are not the true parents, but foster-parents. They are too old, one feels, to have borne the child themselves. Moreover, they dote upon the "child" as grandparents do. The urn is fresh and unblemished; it is still young, for all its antiquity, and time which destroys so much has "fostered" it.

With Stanza II we move into the world presented by the urn, into an examination, not of the urn as a whole – as an entity with its own form – but of the details which overlay it.

But as we enter that world, the paradox of silent speech is carried on, this time in terms of the objects portrayed on the vase.

The first lines of the stanza state a rather bold paradox – even the dulling effect of many readings has hardly blunted it. At least we can easily revive its sharpness. Attended to with care, it is a statement which is preposterous, and yet true – true on the same level on which the original metaphor of the speaking urn is true. The unheard music is sweeter than any audible music. The poet has rather cunningly enforced his conceit by using the phrase, “ye soft pipes.” Actually, we might accept the poet’s metaphor without being forced to accept the adjective “soft.” The pipes might, although “unheard,” be shrill, just as the action which is frozen in the figures on the urn can be violent and ecstatic as in Stanza I and slow and dignified as in Stanza IV (the procession to the sacrifice). Yet, by characterizing the pipes as “soft,” the poet has provided a sort of realistic basis for his metaphor: the pipes, it is suggested, are playing very softly; if we listen carefully, we can hear them; their music is just below the threshold of normal sound.

This general paradox runs through the stanza: action goes on though the actors are motionless; the song will not cease; the lover cannot leave his song; the maiden, always to be kissed, never actually kissed, will remain changelessly beautiful. The maiden is, indeed, like the urn itself, a “still unravished bride of quietness” – not even ravished by a kiss; and it is implied, perhaps, that her changeless beauty, like that of the urn, springs from this fact.

The poet is obviously stressing the fresh, unwearied charm of the scene itself which can defy time and is deathless. But, at the same time, the poet is being perfectly fair to the terms of his metaphor. The beauty portrayed is deathless because it is lifeless. And it would be possible to shift the tone easily and ever so slightly by insisting more heavily on some of the phrasings so as to give them a darker implication. Thus, in the case of “thou canst not leave / Thy song,” one could interpret: the musician cannot leave the song even if he would: he is fettered to it, a prisoner. In the same way, one could enlarge on the hint that the lover is not wholly satisfied and content: “never canst thou kiss, / … yet, do not grieve.” These items are mentioned here, not because one wishes to maintain that the poet is bitterly ironical, but because it is important for us to see that even here the paradox is being used fairly, particularly in view of the shift in tone which comes in the next stanza.

This third stanza represents, as various critics have pointed out, a recapitulation of earlier motifs. The boughs which cannot shed their leaves, the unwearied melodist, and the ever-ardent lover reappear. Indeed, I am not sure that this stanza can altogether be defended against the charge that it represents a falling off from the delicate but firm precision of the earlier stanzas. There is a tendency to linger over the scene sentimentally: the repetition of the word “happy” is perhaps symptomatic of what is occurring. Here, if anywhere, in my opinion, is to be found the blemish on the ode – not in the last two lines. Yet, if we are to attempt a defense of the third stanza, we shall come nearest success by emphasizing the paradoxical implications of the repeated items; for whatever development there is in the stanza inheres in the increased stress on the paradoxical element. For example, the boughs cannot “bid the Spring adieu,” a phrase which repeats “nor ever can those trees be bare,” but the new line strengthens the implications of speaking: the falling leaves are a gesture, a word of farewell to the joy of spring. The melodist of Stanza II played sweeter music because unheard, but here, in the third stanza, it is implied that he does not tire of his song for the same reason that the lover does not tire of his love – neither song nor love is consummated. The songs are “for ever new” because they cannot be completed.

The paradox is carried further in the case of the lover whose love is "For ever warm and still to be enjoy'd." We are really dealing with an ambiguity here, for we can take "still to be enjoy'd" as an adjectival phrase on the same level as "warm" – that is, "still virginal and warm." But the tenor of the whole poem suggests that the warmth of the love depends upon the fact that it has not been enjoyed – that is, "warm and still to be enjoy'd" may mean also "warm because still to be enjoy'd."

But though the poet has developed and extended his metaphors furthest here in this third stanza, the ironic counterpoise is developed furthest too. The love which a line earlier was "warm" and "panting" becomes suddenly in the next line, "All breathing human passion far above." But if it is *above* all breathing passion, it is, after all, outside the realm of breathing passion, and therefore, not human passion at all.

(If one argues that we are to take "All breathing human passion" as qualified by "That leaves a heart high-sorrowful and cloy'd" – that is, if one argues that Keats is saying that the love depicted on the urn is above only that human passion which leaves one cloyed and not above human passion in general, he misses the point. For Keats in the "Ode" is stressing the ironic fact that all human passion *does* leave one cloyed; hence the superiority of art.)

The purpose in emphasizing the ironic undercurrent in the foregoing lines is not at all to disparage Keats – to point up implications of his poem of which he was himself unaware. Far from it: the poet knows precisely what he is doing. The point is to be made simply in order to make sure that we are completely aware of what he is doing. Garrod, sensing this ironic undercurrent, seems to interpret it as an element over which Keats was not able to exercise full control. He says: "Truth to his main theme [the fixity given by art to forms which in life are impermanent] has taken Keats farther than he meant to go. The pure and ideal art of this 'cold Pastoral,' this 'silent form,' has a cold silentness which in some degree saddens him. In the last lines of the fourth stanza, especially the last three lines ... every reader is conscious, I should suppose, of an undertone of sadness, of disappointment." The undertone is there, but Keats has not been taken "farther than he meant to go." Keats's attitude, even in the early stanzas, is more complex than Garrod would allow: it is more complex and more ironic, and a recognition of this is important if we are to be able to relate the last stanza to the rest of the "Ode." Keats is perfectly aware that the frozen moment of loveliness is more dynamic than is the fluid world of reality *only* because it is frozen. The love depicted on the urn remains warm and young because it is not human flesh at all but cold, ancient marble.

With Stanza IV, we are still within the world depicted by the urn, but the scene presented in this stanza forms a contrast to the earlier scenes. It emphasizes, not individual aspiration and desire, but communal life. It constitutes another chapter in the history that the "Sylvan historian" has to tell. And again, names and dates have been omitted. We are not told to what god's altar the procession moves, nor the occasion of the sacrifice.

Moreover, the little town from which the celebrants come is unknown; and the poet rather goes out of his way to leave us the widest possible option in locating it. It may be a mountain town, or a river town, or a tiny seaport. Yet, of course, there is a sense in which the nature of the town – the essential character of the town – is actually suggested by the figured urn. But it is not given explicitly. The poet is willing to leave much to our imaginations; and yet the stanza in its organization of imagery and rhythm does describe the town clearly enough; it is small, it is quiet, its people are knit together as an organic whole, and on a "pious morn" such as this, its whole population has turned out to take part in the ritual.

The stanza has been justly admired. Its magic of effect defies reduction to any formula. Yet, without pretending to “account” for the effect in any mechanical fashion, one can point to some of the elements active in securing the effect: there is the suggestiveness of the word “green” in “green altar” – something natural, spontaneous, living; there is the suggestion that the little town is caught in a curve of the seashore, or nestled in a fold of the mountains – at any rate, is something secluded and something naturally related to its terrain; there is the effect of the phrase “peaceful citadel,” a phrase which involves a clash between the ideas of war and peace and resolves it in the sense of stability and independence without imperialistic ambition – the sense of stable repose.

But to return to the larger pattern of the poem: Keats does something in this fourth stanza which is highly interesting in itself and thoroughly relevant to the sense in which the urn is a historian. One of the most moving passages in the poem is that in which the poet speculates on the strange emptiness of the little town which, of course, has not been pictured on the urn at all.

The little town which has been merely implied by the procession portrayed on the urn is endowed with a poignance beyond anything else in the poem. Its streets “for evermore / Will silent be,” its desolation forever shrouded in a mystery. No one in the figured procession will ever be able to go back to the town to break the silence there, not even one to tell the stranger there why the town remains desolate.

If one attends closely to what Keats is doing here, he may easily come to feel that the poet is indulging himself in an ingenious fancy, an indulgence, however, which is gratuitous and finally silly; that is, the poet has created in his own imagination the town implied by the procession of worshipers, has given it a special character of desolation and loneliness, and then has gone on to treat it as if it were a real town to which a stranger might actually come and be puzzled by its emptiness. (I can see no other interpretation of the lines, “and not a soul to tell / Why thou art desolate can e'er return.”) But, actually, of course, no one will ever discover the town except by the very same process by which Keats has discovered it: namely, through the figured urn, and then, of course, he will not need to ask why it is empty. One can well imagine what a typical eighteenth-century critic would have made of this flaw in logic.

It will not be too difficult, however, to show that Keats’s extension of the fancy is not irrelevant to the poem as a whole. The “reality” of the little town has a very close relation to the urn’s character as a historian. If the earlier stanzas have been concerned with such paradoxes as the ability of static carving to convey dynamic action, of the soundless pipes to play music sweeter than that of the heard melody, of the figured lover to have a love more warm and panting than that of breathing flesh and blood, so in the same way the town implied by the urn comes to have a richer and more important history than that of actual cities. Indeed, the imagined town is to the figured procession as the unheard melody is to the carved pipes of the unwearied melodist. And the poet, by pretending to take the town as real – so real that he can imagine the effect of its silent streets upon the stranger who chances to come into it – has suggested in the most powerful way possible its essential reality for him – and for us. It is a case of the doctor’s taking his own medicine: the poet is prepared to stand by the illusion of his own making.

With Stanza V we move back out of the enchanted world portrayed by the urn to consider the urn itself once more as a whole, as an object. The shift in point of view is marked with the first line of the stanza by the apostrophe, “O Attic shape ...” It is the urn itself as a formed thing, as an autonomous world, to which the poet addresses these last words. And the rich, almost breathing world which the poet has conjured up for us

contracts and hardens into the decorated motifs on the urn itself: "with brede / Of marble men and maidens overwrought." The beings who have a life above life – "All breathing human passion far above" – are marble, after all.

This last is a matter which, of course, the poet has never denied. The recognition that the men and maidens are frozen, fixed, arrested, has, as we have already seen, run through the second, third, and fourth stanzas as an ironic undercurrent. The central paradox of the poem, thus, comes to conclusion in the phrase, "Cold Pastoral." The word "pastoral" suggests warmth, spontaneity, the natural and the informal as well as the idyllic, the simple, and the informally charming. What the urn tells is a "flowery tale," a "leaf-fring'd legend," but the "sylvan historian" works in terms of marble. The urn itself is cold, and the life beyond life which it expresses is life which has been formed, arranged. The urn itself is a "silent form," and it speaks, not by means of statement, but by "teasing us out of thought." It is as enigmatic as eternity is, for, like eternity, its history is beyond time, outside time, and for this very reason bewilders our time-ridden minds: it teases us.

The marble men and maidens of the urn will not age as flesh-and-blood men and women will: "When old age shall this generation waste." (The word "generation," by the way, is very rich. It means on one level "that which is generated" – that which springs from human loins – Adam's breed; and yet, so intimately is death wedded to men, the word "generation" itself has become, as here, a measure of time.) The marble men and women lie outside time. The urn which they adorn will remain. The "Sylvan historian" will recite its history to other generations.

What will it say to them? Presumably, what it says to the poet now: that "formed experience," imaginative insight, embodies the basic and fundamental perception of man and nature. The urn is beautiful, and yet its beauty is based – what else is the poem concerned with? – on an imaginative perception of essentials. Such a vision is beautiful but it is also true. The sylvan historian presents us with beautiful histories, but they are true histories, and it is a good historian.

Moreover, the "truth" which the sylvan historian gives is the only kind of truth which we are likely to get on this earth, and, furthermore, it is the only kind that we *have to* have. The names, dates, and special circumstances, the wealth of data – these the sylvan historian quietly ignores. But we shall never get all the facts anyway – there is no end to the accumulation of facts. Moreover, mere accumulations of facts – a point our own generation is only beginning to realize – are meaningless. The sylvan historian does better than that: it takes a few details and so orders them that we have not only beauty but insight into essential truth. Its "history," in short, is a history without footnotes. It has the validity of myth – not myth as a pretty but irrelevant make-belief, an idle fancy, but myth as a valid perception into reality.

So much for the "meaning" of the last lines of the "Ode." It is an interpretation which differs little from past interpretations. It is put forward here with no pretension to novelty. What is important is the fact that it can be derived from the context of the "Ode" itself.

And now, what of the objection that the final lines break the tone of the poem with a display of misplaced sententiousness? One can summarize the answer already implied thus: throughout the poem the poet has stressed the paradox of the speaking urn. First, the urn itself can tell a story, can give a history. Then, the various figures depicted upon the urn play music or speak or sing. If we have been alive to these items, we shall not, perhaps, be too much surprised to have the urn speak once more, not in the sense in

which it tells a story – a metaphor which is rather easy to accept – but, to have it speak on a higher level, to have it make a commentary on its own nature. If the urn has been properly dramatized, if we have followed the development of the metaphors, if we have been alive to the paradoxes which work throughout the poem, perhaps then, we shall be prepared for the enigmatic, final paradox which the “silent form” utters. But in that case, we shall not feel that the generalization, unqualified and to be taken literally, is meant to march out of its context to compete with the scientific and philosophical generalizations which dominate our world.

“Beauty is truth, truth beauty” has precisely the same status, and the same justification as Shakespeare’s “Ripeness is all.” It is a speech “in character” and supported by a dramatic context.

To conclude thus may seem to weight the principle of dramatic propriety with more than it can bear. This would not be fair to the complexity of the problem of truth in art nor fair to Keats’s little parable. Granted; and yet the principle of dramatic propriety may take us further than would first appear. Respect for it may at least insure our dealing with the problem of truth at the level on which it is really relevant to literature. If we can see that the assertions made in a poem are to be taken as part of an organic context, if we can resist the temptation to deal with them in isolation, then we may be willing to go on to deal with the world-view, or “philosophy,” or “truth” of the *poem as a whole* in terms of its dramatic wholeness: that is, we shall not neglect the maturity of attitude, the dramatic tension, the emotional *and* intellectual coherence in favor of some statement of theme abstracted from it by paraphrase. Perhaps, best of all, we might learn to distrust our ability to represent any poem adequately by paraphrase. Such a distrust is healthy. Keats’s sylvan historian, who is not above “teasing” us, exhibits such a distrust, and perhaps the point of what the sylvan historian “says” is to confirm us in our distrust.

### Note

\* This essay had been finished some months before I came upon Kenneth Burke’s brilliant essay on Keats’s “Ode” (“Symbolic Action in a Poem by Keats,” *Accent*, Autumn, 1943). I have decided not to make any alterations, though I have been tempted to adopt some of Burke’s insights, and, in at least one case, his essay has convinced me of a point which I had considered but rejected – the pun on “breed” and “Brede.”

I am happy to find that two critics with methods and purposes so different should agree so thoroughly as we do on the poem. I am pleased, for my part, therefore, to acknowledge the amount of duplication which exists between the two essays, counting it as rather important corroboration of a view of the poem which will probably seem to some critics overingenious. In spite of the common elements, however, I feel that the emphasis of my essay is sufficiently different from Burke’s to justify my going on with its publication.

# CHAPTER 5

## The Intentional Fallacy

*Monroe Beardsley and W.K. Wimsatt*

Composed in 1949, "The Intentional Fallacy" is an important polemical essay in the *corpus* of the New Criticism. The New Critics were determined to isolate literature from other objects of study, especially historical and biographic criticism, which often treated literary texts as boxes of clues that had to be solved through the tracking down of references to the author's life. Shakespeare inserted references to a ship called *The Tyger* in *Othello* because he was involved in Court politics and had an actual vessel used by the queen's minister, Robert Cecil, in mind. Such intended meanings were what literature was about. Not so, argued the New Critics. Literature is much more than that. It is the texture of images the writer creates, a texture that, once launched, has a semantic dimension entirely its own that should be deciphered and described. The writer engages with the history of language when s/he writes, and his or her work is, in a sense, absorbed into that history. It becomes objective, and its meaning ceases to be subjective. Moreover, literature, through its complex linguistic forms, evokes universals that are not reducible to a singular conscious intention. That point is not made in this essay, but it can be found in other works of Wimsatt especially (for example, "The Concrete Universal").

Monroe Beardsley was a Professor of Philosophy at Temple University and Swarthmore University. Beardsley's body of work focused on aesthetics, theory of art, and the examination of criticism in myriad subjects. He is the author of *Aesthetics: Problems in the Philosophy of Criticism* (1958), *The Aesthetic Point of View* (1982), and many others.

W. K. Wimsatt was a Professor of English at Yale University with works mainly on criticism and theory. He is the author of *Literary Criticism: A Short History* (1957) and *Verbal Icon: Studies in the Meaning of Poetry* (1954). His theories are rooted deeply in formalism and were key contributions to the New Criticism movement during the twentieth century.

He owns with toil he wrote the following scenes;  
 But, if they're naught, ne'er spare him for his pains:  
 Damn him the more; have no commiseration  
 For dullness on mature deliberation.

William Congreve, Prologue to  
*The Way of the World*

The claim of the author's "intention" upon the critic's judgment has been challenged in a number of recent discussions, notably in the debate entitled *The Personal Heresy*, between Professors Lewis and Tillyard, and at least implicitly in periodical essays like those in the "Symposiums" of 1940 in the *Southern and Kenyon Reviews*.<sup>1</sup> But it seems doubtful if this claim and most of its romantic corollaries are as yet subject to any widespread questioning. The present writers, in a short article entitled "Intention" for a *Dictionary*<sup>2</sup> of literary criticism, raised the issue but were unable to pursue its implications at any length. We argued that the design or intention of the author is neither available nor desirable as a standard for judging the success of a work of literary art, and it seems to us that this is a principle which goes deep into some differences in the history of critical attitudes. It is a principle which accepted or rejected points to the polar opposites of classical "imitation" and romantic expression. It entails many specific truths about inspiration, authenticity, biography, literary history and scholarship, and about some trends of contemporary poetry, especially its allusiveness. There is hardly a problem of literary criticism in which the critic's approach will not be qualified by his view of "intention."

"Intention," as we shall use the term, corresponds to *what he intended* in a formula which more or less explicitly has had wide acceptance. "In order to judge the poet's performance, we must know *what he intended*." Intention is design or plan in the author's mind. Intention has obvious affinities for the author's attitude toward his work, the way he felt, what made him write.

We begin our discussion with a series of propositions summarized and abstracted to a degree where they seem to us axiomatic, if not truistic.

(1) A poem does not come into existence by accident. The words of a poem, as Professor Stoll has remarked, come out of a head, not out of a hat. Yet to insist on the designing intellect as a *cause* of a poem is not to grant the design or intention as a *standard*.

(2) One must ask how a critic expects to get an answer to the question about intention. How is he to find out what the poet tried to do? If the poet succeeded in doing it, then the poem itself shows what he was trying to do. And if the poet did not succeed, then the poem is not adequate evidence, and the critic must go outside the poem – for evidence of an intention that did not become effective in the poem. "Only one *caveat* must be borne in mind," says an eminent intentionalist<sup>3</sup> in a moment when his theory repudiates itself; "the poet's aim must be judged at the moment of the creative act, that is to say, by the art of the poem itself."

(3) Judging a poem is like judging a pudding or a machine. One demands that it work. It is only because an artifact works that we infer the intention of an artificer. "A poem should not mean but be." A poem can be only through its *meaning* – since its medium is words – yet it is, simply is, in the sense that we have no excuse for inquiring what part is intended or meant.<sup>4</sup> Poetry is a feat of style by which a complex of meaning is handled all at once. Poetry succeeds because all or most of what is said or implied is relevant; what

is irrelevant has been excluded, like lumps from pudding and “bugs” from machinery. In this respect poetry differs from practical messages, which are successful if and only if we correctly infer the intention. They are more abstract than poetry.

(4) The meaning of a poem may certainly be a personal one, in the sense that a poem expresses a personality or state of soul rather than a physical object like an apple. But even a short lyric poem is dramatic, the response of a speaker (no matter how abstractly conceived) to a situation (no matter how universalized). We ought to impute the thoughts and attitudes of the poem immediately to the dramatic *speaker*, and if to the author at all, only by a biographical act of inference.

(5) If there is any sense in which an author, by revision, has better achieved his original intention, it is only the very abstract, tautological, sense that he intended to write a better work and now has done it. (In this sense every author’s intention is the same.) His former specific intention was not his intention. “He’s the man we were in search of, that’s true,” says Hardy’s rustic constable, “and yet he’s not the man we were in search of. For the man we were in search of was not the man we wanted.”<sup>5</sup>

“Is not a critic,” asks Professor Stoll, “... a judge, who does not explore his own consciousness, but determines the author’s meaning or intention, as if the poem were a will, a contract, or the constitution? The poem is not the critic’s own.”<sup>6</sup> He has diagnosed very accurately two forms of irresponsibility, one which he prefers. Our view is yet different. The poem is not the critic’s own and not the author’s (it is detached from the author at birth and goes about the world beyond his power to intend about it or control it). The poem belongs to the public. It is embodied in language, the peculiar possession of the public, and it is about the human being, an object of public knowledge. What is said about the poem is subject to the same scrutiny as any statement in linguistics or in the general science of psychology or morals. Mr. Richards has aptly called the poem a *class* – “a class of experiences which do not differ in any character more than a certain amount ... from a standard experience.” And he adds, “We may take as this standard experience the relevant experience of the poet when contemplating the completed composition.” Professor Wellek in a fine essay on the problem has preferred to call the poem “a system of norms,” “extracted from every individual experience,” and he objects to Mr. Richards’ deference to the poet as reader. We side with Professor Wellek in not wishing to make the poet (outside the poem) an authority.

A critic of our *Dictionary* article, Mr. Ananda K. Coomaraswamy, has argued<sup>7</sup> that there are two kinds of enquiry about a work of art: (1) whether the artist achieved his intentions; (2) whether the work of art “ought ever to have been undertaken at all” and so “whether it is worth preserving.” Number (2), Mr. Coomaraswamy maintains, is not “criticism of any work of art *qua* work of art,” but is rather moral criticism; number (1) is artistic criticism. But we maintain that (2) need not be moral criticism: that there is another way of deciding whether works of art are worth preserving and whether, in a sense, they “ought” to have been undertaken, and this is the way of objective criticism of works of art as such, the way which enables us to distinguish between a skilful murder and a skilful poem. A skilful murder is an example which Mr. Coomaraswamy uses, and in his system the difference between the murder and the poem is simply a “moral” one, not an “artistic” one, since each if carried out according to plan is “artistically” successful. We maintain that (2) is an enquiry of more worth than (1), and since (2), and not (1), is capable of distinguishing poetry from murder, the name “artistic criticism” is properly given to (2).

## II

It is not so much an empirical as an analytic judgment, not a historical statement, but a definition, to say that the intentional fallacy is a romantic one. When a rhetorician, presumably of the first century A.D., writes: "Sublimity is the echo of a great soul," or tells us that "Homer enters into the sublime actions of his heroes" and "shares the full inspiration of the combat," we shall not be surprised to find this rhetorician considered as a distant harbinger of romanticism and greeted in the warmest terms by so romantic a critic as Saintsbury. One may wish to argue whether Longinus should be called romantic,<sup>8</sup> but there can hardly be a doubt that in one important way he is.

Goethe's three questions for "constructive criticism" are "What did the author set out to do? Was his plan reasonable and sensible, and how far did he succeed in carrying it out?" If one leaves out the middle question, one has in effect the system of Croce – the culmination and crowning philosophic expression of romanticism. The beautiful is the successful intuition-expression, and the ugly is the unsuccessful; the intuition or private part of art is the aesthetic fact, and the medium or public part is not the subject of aesthetic at all. Yet aesthetic reproduction takes place only "if all the other conditions remain equal."

Oil-paintings grow dark, frescoes fade, statues lose noses ... the text of a poem is corrupted by bad copyists or bad printing.

The Madonna of Cimabue is still in the Church of Santa Maria Novella; but does she speak to the visitor of to-day as to the Florentines of the thirteenth century?

*Historical interpretation* labours ... to reintegrate in us the psychological conditions which have changed in the course of history. It ... enables us to see a work of art (a physical object) as its *author saw it* in the moment of production.<sup>9</sup>

The first italics are Croce's, the second ours. The upshot of Croce's system is an ambiguous emphasis on history. With such passages as a point of departure a critic may write a close analysis of the meaning or "spirit" of a play of Shakespeare or Corneille – a process that involves close historical study but remains aesthetic criticism – or he may write sociology, biography, or other kinds of non-aesthetic history. The Crocean system seems to have given more of a boost to the latter way of writing.

"What has the poet tried to do," asks Spingarn in his 1910 Columbia Lecture from which we have already quoted, "and how has he fulfilled his intention?" The place to look for "insuperable" ugliness, says Bosanquet, in his third *Lecture* of 1914, is the "region of insincere and affected art." The seepage of the theory into a non-philosophic place may be seen in such a book as Marguerite Wilkinson's inspirational *New Voices*, about the poetry of 1919 to 1931 – where symbols "as old as the ages ... retain their strength and freshness" through "Realization." We close this section with two examples from quarters where one might least expect a taint of the Crocean. Mr. I. A. Richards' fourfold distinction of meaning into "sense," "feeling," "tone," "intention" has been probably the most influential statement of intentionalism in the past fifteen years, though it contains a hint of self-repudiation: "This function [intention]," says Mr. Richards, "is not on all fours with the others." In an essay on "Three Types of Poetry" Mr. Allen Tate writes as follows:

We must understand that the lines  
Life like a dome of many-colored glass  
Stains the white radiance of eternity

are not poetry; they express the *frustrated will* trying to compete with science. The *will* asserts a rhetorical proposition about the whole of life, but the *imagination* has not seized upon the materials of the poem and made them into a whole. Shelley's simile is imposed upon the material from above; it does not grow out of the material.

The last sentence contains a promise of objective analysis which is not fulfilled. The reason why the essay relies so heavily throughout on the terms "will" and "imagination" is that Mr. Tate is accusing the romantic poets of a kind of insincerity (romanticism in reverse) and at the same time is trying to describe something mysterious and perhaps indescribable, an "imaginative whole of life," a "wholeness of vision at a particular moment of experience," something which "yields us the quality of the experience." If a poet had a toothache at the moment of conceiving a poem, that would be part of the experience, but Mr. Tate of course does not mean anything like that. He is thinking about some kind of "whole" which in this essay at least he does not describe, but which doubtless it is the prime need of criticism to describe – in terms that may be publicly tested.

### III

I went to the poets; tragic, dithyrambic, and all sorts. ... I took them some of the most elaborate passages in their own writings, and asked what was the meaning of them. ... Will you believe me? ... there is hardly a person present who would not have talked better about their poetry than they did themselves. Then I knew that not by wisdom do poets write poetry, but by a sort of genius and inspiration.

That reiterated mistrust of the poets which we hear from Socrates may have been part of a rigorously ascetic view in which we hardly wish to participate, yet Plato's Socrates saw a truth about the poetic mind which the world no longer commonly sees – so much criticism, and that the most inspirational and most affectionately remembered, has proceeded from the poets themselves.

Certainly the poets have had something to say that the analyst and professor could not say; their message has been more exciting: that poetry should come as naturally as leaves to a tree, that poetry is the lava of the imagination, or that it is emotion recollected in tranquillity. But it is necessary that we realize the character and authority of such testimony. There is only a fine shade between those romantic expressions and a kind of earnest advice that authors often give. Thus Edward Young, Carlyle, Walter Pater:

I know two golden rules from *ethics*, which are no less golden in *Composition*, than in life. 1. *Know thyself*; 2dly, *Reverence thyself*.

This is the grand secret for finding readers and retaining them: let him who would move and convince others, be first moved and convinced himself. Horace's rule, *Si vis me flere*, is applicable in a wider sense than the literal one. To every poet, to every writer, we might say: Be true, if you would be believed.

Truth! there can be no merit, no craft at all, without that. And further, all beauty is in the long run only *fineness* of truth, or what we call expression, the finer accommodation of speech to that vision within.

And Housman's little handbook to the poetic mind yields the following illustration:

Having drunk a pint of beer at luncheon – beer is a sedative to the brain, and my afternoons are the least intellectual portion of my life – I would go out for a walk of two or three hours. As I went along, thinking of nothing in particular, only looking at things around me and following the progress of the seasons, there would flow into my mind, with sudden and unaccountable emotion, sometimes a line or two of verse, sometimes a whole stanza at once. . . .

This is the logical terminus of the series already quoted. Here is a confession of how poems were written which would do as a definition of poetry just as well as “emotion recollected in tranquility” – and which the young poet might equally well take to heart as a practical rule. Drink a pint of beer, relax, go walking, think on nothing in particular, look at things, surrender yourself to yourself, search for the truth in your own soul, listen to the sound of your own inside voice, discover and express the *vraie vérité*.

It is probably true that all this is excellent advice for poets. The young imagination fired by Wordsworth and Carlyle is probably closer to the verge of producing a poem than the mind of the student who has been sobered by Aristotle or Richards. The art of inspiring poets, or at least of inciting something like poetry in young persons, has probably gone further in our day than ever before. Books of creative writing such as those issued from the Lincoln School are interesting evidence of what a child can do if taught how to manage himself honestly.<sup>10</sup> All this, however, would appear to belong to an art separate from criticism, or to a discipline which one might call the psychology of composition, valid and useful, an individual and private culture, yoga, or system of self-development which the young poet would do well to notice, but different from the public science of evaluating poems.

Coleridge and Arnold were better critics than most poets have been, and if the critical tendency dried up the poetry in Arnold and perhaps in Coleridge, it is not inconsistent with our argument, which is that judgment of poems is different from the art of producing them. Coleridge has given us the classic “anodyne” story, and tells what he can about the genesis of a poem which he calls a “psychological curiosity,” but his definitions of poetry and of the poetic quality “imagination” are to be found elsewhere and in quite other terms.

The day may arrive when the psychology of composition is unified with the science of objective evaluation, but so far they are separate. It would be convenient if the passwords of the intentional school, “sincerity,” “fidelity,” “spontaneity,” “authenticity,” “genuineness,” “originality,” could be equated with terms of analysis such as “integrity,” “relevance,” “unity,” “function”; with “maturity,” “subtlety,” and “adequacy,” and other more precise axiological terms – in short, if “expression” always meant aesthetic communication. But this is not so.

“Aesthetic” art, says Professor Curt Ducasse, an ingenious theorist of expression, is the conscious objectification of feelings, in which an intrinsic part is the critical moment. The artist corrects the objectification when it is not adequate, but this may mean that the earlier attempt was not successful in objectifying the self, or “it may also mean that it was a successful objectification of a self which, when it confronted us clearly, we disowned and repudiated in favor of another.”<sup>11</sup> What is the standard by which we disown or accept the self? Professor Ducasse does not say. Whatever it may be, however, this standard is an element in the definition of art which will not reduce to terms of objectification. The evaluation of the work of art remains public; the work is measured against something outside the author.

## IV

There is criticism of poetry and there is, as we have seen, author psychology, which when applied to the present or future takes the form of inspirational promotion; but author psychology can be historical too, and then we have literary biography, a legitimate and attractive study in itself, one approach, as Mr. Tillyard would argue, to personality, the poem being only a parallel approach. Certainly it need not be with a derogatory purpose that one points out personal studies, as distinct from poetic studies, in the realm of literary scholarship. Yet there is danger of confusing personal and poetic studies; and there is the fault of writing the personal as if it were poetic.

There is a difference between internal and external evidence for the meaning of a poem. And the paradox is only verbal and superficial that what is (1) internal is also public: it is discovered through the semantics and syntax of a poem, through our habitual knowledge of the language, through grammars, dictionaries, and all the literature which is the source of dictionaries, in general through all that makes a language and culture; while what is (2) external is private or idiosyncratic; not a part of the work as a linguistic fact: it consists of revelations (in journals, for example, or letters or reported conversations) about how or why the poet wrote the poem – to what lady, while sitting on what lawn, or at the death of what friend or brother. There is (3) an intermediate kind of evidence about the character of the author or about private or semi-private meanings attached to words or topics by an author or by a coterie of which he is a member. The meaning of words is the history of words, and the biography of an author, his use of a word, and the associations which the word had for *him*, are part of the word's history and meaning.<sup>12</sup> But the three types of evidence, especially (2) and (3), shade into one another so subtly that it is not always easy to draw a line between examples, and hence arises the difficulty for criticism. The use of biographical evidence need not involve intentionalism, because while it may be evidence of what the author intended, it may also be evidence of the meaning of his words and the dramatic character of his utterance. On the other hand, it may not be all this. And a critic who is concerned with evidence of type (1) and moderately with that of type (3) will in the long run produce a different sort of comment from that of the critic who is concerned with type (2) and with (3) where it shades into (2).

The whole glittering parade of Professor Lowes' *Road to Xanadu*, for instance, runs along the border between types (2) and (3) or boldly traverses the romantic region of (2). "Kubla Khan," says Professor Lowes, "is the fabric of a vision, but every image that rose up in its weaving had passed that way before. And it would seem that there is nothing haphazard or fortuitous in their return." This is not quite clear – not even when Professor Lowes explains that there were clusters of associations, like hooked atoms, which were drawn into complex relation with other clusters in the deep well of Coleridge's memory, and which then coalesced and issued forth as poems. If there was nothing "haphazard or fortuitous" in the way the images returned to the surface, that may mean (1) that Coleridge could not produce what he did not have, that he was limited in his creation by what he had read or otherwise experienced, or (2) that having received certain clusters of associations, he was bound to return them in just the way he did, and that the value of the poem may be described in terms of the experiences on which he had to draw. The latter pair of propositions (a sort of Hartleyan associationism which Coleridge himself repudiated in the *Biographia*) may not be assented to. There were certainly other combinations, other poems, worse or better, that might have been written by men who had read Bartram and

Purchas and Bruce and Milton. And this will be true no matter how many times we are able to add to the brilliant complex of Coleridge's reading. In certain flourishes (such as the sentence we have quoted) and in chapter headings like "The Shaping Spirit," "The Magical Synthesis," "Imagination Creatrix," it may be that Professor Lowes pretends to say more about the actual poems than he does. There is a certain deceptive variation in these fancy chapter titles; one expects to pass on to a new stage in the argument, and one finds – more and more sources, more about "the streamy nature of association."<sup>13</sup>

"Wohin der Weg?" quotes Professor Lowes for the motto of his book. "Kein Weg! Ins Unbetretene." Precisely because the way is *unbetreten*, we should say, it leads away from the poem. Bartram's *Travels* contains a good deal of the history of certain words and romantic Floridan conceptions that appear in "Kubla Khan." And a good deal of that history has passed and was then passing into the very stuff of our language. Perhaps a person who has read Bartram appreciates the poem more than one who has not. Or, by looking up the vocabulary of "Kubla Khan" in the *Oxford English Dictionary*, or by reading some of the other books there quoted, a person may know the poem better. But it would seem to pertain little to the poem to know that *Coleridge* had read Bartram. There is a gross body of life, of sensory and mental experience, which lies behind and in some sense causes every poem, but can never be and need not be known in the verbal and hence intellectual composition which is the poem. For all the objects of our manifold experience, especially for the intellectual objects, for every unity, there is an action of the mind which cuts off roots, melts away context – or indeed we should never have objects or ideas or anything to talk about.

It is probable that there is nothing in Professor Lowes' vast book which could detract from anyone's appreciation of either *The Ancient Mariner* or *Kubla Khan*. We next present a case where preoccupation with evidence of type (3) has gone so far as to distort a critic's view of a poem (yet a case not so obvious as those that abound in our critical journals).

In a well-known poem by John Donne appears the following quatrain:

Moving of th' earth brings harmes and feares,  
Men reckon what it did and meant,  
But trepidation of the spheares,  
Though greater farre, is innocent.

A recent critic in an elaborate treatment of Donne's learning has written of this quatrain as follows:

... he touches the emotional pulse of the situation by a skillful allusion to the new and the old astronomy. ... Of the new astronomy, the "moving of the earth" is the most radical principle; of the old, the "trepidation of the spheres" is the motion of the greatest complexity. ... As the poem is a valediction forbidding mourning, the poet must exhort his love to quietness and calm upon his departure; and for this purpose the figure based upon the latter motion (trepidation), long absorbed into the traditional astronomy, fittingly suggests the tension of the moment without arousing the "harmes and feares" implicit in the figure of the moving earth.<sup>14</sup>

The argument is plausible and rests on a well-substantiated thesis that Donne was deeply interested in the new astronomy and its repercussions in the theological realm. In various works Donne shows his familiarity with Kepler's *De Stella Nova*, with Galileo's *Siderius*

*Nuncius*, with William Gilbert's *De Magnete*, and with Clavius's commentary on the *De Sphaera* of Sacrobosco. He refers to the new science in his Sermon at Paul's Cross and in a letter to Sir Henry Goodyer. In *The First Anniversary* he says the "new philosophy calls all in doubt." In the *Elegy on Prince Henry* he says that the "least moving of the center" makes "the world to shake."

It is difficult to answer argument like this, and impossible to answer it with evidence of like nature. There is no reason why Donne might not have written a stanza in which the two kinds of celestial motion stood for two sorts of emotion at parting. And if we become full of astronomical ideas and see Donne only against the background of the new science, we may believe that he did. But the text itself remains to be dealt with, the analyzable vehicle of a complicated metaphor. And one may observe: (1) that the movement of the earth according to the Copernican theory is a celestial motion, smooth and regular, and while it might cause religious or philosophic fears, it could not be associated with the crudity and earthiness of the kind of commotion which the speaker in the poem wishes to discourage; (2) that there is another moving of the earth, an earthquake, which has just these qualities and is to be associated with the tear-floods and sigh-tempests of the second stanza of the poem; (3) that "trepidation" is an appropriate opposite of earthquake, because each is a shaking or vibratory motion; and "trepidation of the spheres" is "greater far" than an earthquake, but not much greater (if two such motions can be compared as to greatness) than the annual motion of the earth; (4) that reckoning what it "did and meant" shows that the event has passed, like an earthquake, not like the incessant celestial movement of the earth. Perhaps a knowledge of Donne's interest in the new science may add another shade of meaning, an overtone to the stanza in question, though to say even this runs against the words. To make the geo-centric and helio-centric antithesis the core of the metaphor is to disregard the English language, to prefer private evidence to public, external to internal.

## V

If the distinction between kinds of evidence has implications for the historical critic, it has them no less for the contemporary poet and his critic. Or, since every rule for a poet is but another side of a judgment by a critic, and since the past is the realm of the scholar and critic, and the future and present that of the poet and the critical leaders of taste, we may say that the problems arising in literary scholarship from the intentional fallacy are matched by others which arise in the world of progressive experiment.

The question of "allusiveness," for example, as acutely posed by the poetry of Eliot, is certainly one where a false judgment is likely to involve the intentional fallacy. The frequency and depth of literary allusion in the poetry of Eliot and others has driven so many in pursuit of full meanings to the *Golden Bough* and the Elizabethan drama that it has become a kind of commonplace to suppose that we do not know what a poet means unless we have traced him in his reading — a supposition redolent with intentional implications. The stand taken by Mr. F. O. Matthiessen is a sound one and partially forestalls the difficulty.

If one reads these lines with an attentive ear and is sensitive to their sudden shifts in movement, the contrast between the actual Thames and the idealized vision of it during an age before it flowed through a megalopolis is sharply conveyed by that movement itself, whether or not one recognizes the refrain to be from Spenser.

Eliot's allusions work when we know them – and to a great extent even when we do not know them, through their suggestive power.

But sometimes we find allusions supported by notes, and it is a very nice question whether the notes function more as guides to send us where we may be educated, or more as indications in themselves about the character of the allusions. "Nearly everything of importance ... that is apposite to an appreciation of 'The Waste Land,'" writes Mr. Matthiessen of Miss Weston's book, "has been incorporated into the structure of the poem itself, or into Eliot's Notes." And with such an admission it may begin to appear that it would not much matter if Eliot invented his sources (as Sir Walter Scott invented chapter epigraphs from "old plays" and "anonymous" authors, or as Coleridge wrote marginal glosses for "The Ancient Mariner"). Allusions to Dante, Webster, Marvell, or Baudelaire, doubtless gain something because these writers existed, but it is doubtful whether the same can be said for an allusion to an obscure Elizabethan:

The sound of horns and motors, which shall bring  
Sweeney to Mrs. Porter in the spring.

"Cf. Day, *Parliament of Bees*:" says Eliot,

When of a sudden, listening, you shall hear,  
A noise of horns and hunting, which shall bring  
Actaeon to Diana in the spring,  
Where all shall see her naked skin. ...

The irony is completed by the quotation itself; had Eliot, as is quite conceivable, composed these lines to furnish his own background, there would be no loss of validity. The conviction may grow as one reads Eliot's next note: "I do not know the origin of the ballad from which these lines are taken: it was reported to me from Sydney, Australia." The important word in this note – on Mrs. Porter and her daughter who washed their feet in soda water – is "ballad." And if one should feel from the lines themselves their "ballad" quality, there would be little need for the note. Ultimately, the inquiry must focus on the integrity of such notes as part of the poem, for where they constitute special information about the meaning of phrases in the poem, they ought to be subject to the same scrutiny as any of the other words in which it is written. Mr. Matthiessen believes the notes were the price Eliot "had to pay in order to avoid what he would have considered muffling the energy of his poem by extended connecting links in the text itself." But it may be questioned whether the notes and the need for them are not equally muffling. The omission from poems of the explanatory stratum on which is built the dramatic or poetic stuff is a dangerous responsibility. Mr. F. W. Bateson has plausibly argued that Tennyson's "The Sailor Boy" would be better if half the stanzas were omitted, and the best versions of ballads like "Sir Patrick Spens" owe their power to the very audacity with which the minstrel has taken for granted the story upon which he comments. What then if a poet finds he cannot take so much for granted in a more recondite context and rather than write informatively, supplies notes? It can be said in favor of this plan that at least the notes do not pretend to be dramatic, as they would if written in verse. On the other hand, the notes may look like unassimilated material lying loose beside the poem, necessary for the meaning of the verbal symbol, but not integrated, so that the symbol stands incomplete.

We mean to suggest by the above analysis that whereas notes tend to seem to justify themselves as external indexes to the author's *intention*, yet they ought to be judged like any other parts of a composition (verbal arrangement special to a particular context), and when so judged their reality as parts of the poem or their imaginative integration with the rest of the poem, may come into question. Mr. Matthiessen, for instance, sees that Eliot's titles for poems and his epigraphs are informative apparatus, like the notes. But while he is worried by some of the notes and thinks that Eliot "appears to be mocking himself for writing the note at the same time that he wants to convey something by it," Mr. Matthiessen believes that the "device" of epigraphs "is not at all open to the objection of not being sufficiently structural." "The *intention*," he says, "is to enable the poet to secure a condensed expression in the poem itself." "In each case the epigraph is *designed* to form an integral part of the effect of the poem." And Eliot himself, in his notes, has justified his poetic practice in terms of intention.

The Hanged Man, a member of the traditional pack, fits my purpose in two ways: because he is associated in my mind with the Hanged God of Frazer, and because I associate him with the hooded figure in the passage of the disciples to Emmaus in Part V. ... The man with Three Staves (an authentic member of the Tarot pack) I associate, quite arbitrarily, with the Fisher King himself.

And perhaps he is to be taken more seriously here, when off guard in a note, than when in his Norton Lectures he comments on the difficulty of saying what a poem means and adds playfully that he thinks of prefixing to a second edition of *Ash Wednesday* some lines from *Don Juan*:

I don't pretend that I quite understand  
My own meaning when I would be *very* fine;  
But the fact is that I have nothing planned  
Unless it were to be a moment merry.

If Eliot and other contemporary poets have any characteristic fault, it may be in *planning* too much.<sup>15</sup>

Allusiveness in poetry is one of several critical issues by which we have illustrated the more abstract issue of intentionalism, but it may be for today the most important illustration. As a poetic practice allusiveness would appear to be in some recent poems an extreme corollary of the romantic intentionalist assumption, and as a critical issue it challenges and brings to light in a special way the basic premise of intentionalism. The following instance from the poetry of Eliot may serve to epitomize the practical implications of what we have been saying. In Eliot's "Love Song of J. Alfred Prufrock," towards the end, occurs the line: "I have heard the mermaids singing, each to each," and this bears a certain resemblance to a line in a Song by John Donne, "Teach me to heare Mermaides singing," so that for the reader acquainted to a certain degree with Donne's poetry, the critical question arises: Is Eliot's line an allusion to Donne's? Is Prufrock thinking about Donne? Is Eliot thinking about Donne? We suggest that there are two radically different ways of looking for an answer to this question. There is (1) the way of poetic analysis and exegesis, which inquires whether it makes any sense if Eliot-Prufrock is thinking about Donne. In an earlier part of the poem, when Prufrock asks, "Would it have been worth while, ... To have squeezed the universe into a ball," his words take half

their sadness and irony from certain energetic and passionate lines of Marvell's "To His Coy Mistress." But the exegetical inquirer may wonder whether mermaids considered as "strange sights" (to hear them is in Donne's poem analogous to getting with child a mandrake root) have much to do with Prufrock's mermaids, which seem to be symbols of romance and dynamism, and which incidentally have literary authentication, if they need it, in a line of a sonnet by Gérard de Nerval. This method of inquiry may lead to the conclusion that the given resemblance between Eliot and Donne is without significance and is better not thought of, or the method may have the disadvantage of providing no certain conclusion. Nevertheless, we submit that this is the true and objective way of criticism, as contrasted to what the very uncertainty of exegesis might tempt a second kind of critic to undertake: (2) the way of biographical or genetic inquiry, in which, taking advantage of the fact that Eliot is still alive, and in the spirit of a man who would settle a bet, the critic writes to Eliot and asks what he meant, or if he had Donne in mind. We shall not here weigh the probabilities – whether Eliot would answer that he meant nothing at all, had nothing at all in mind – a sufficiently good answer to such a question – or in an unguarded moment might furnish a clear and, within its limit, irrefutable answer. Our point is that such an answer to such an inquiry would have nothing to do with the poem "Prufrock"; it would not be a critical inquiry. Critical inquiries, unlike bets, are not settled in this way. Critical inquiries are not settled by consulting the oracle.

# CHAPTER 6

## Broken on Purpose *Poetry, Serial Television, and the Season*

*Sean O'Sullivan*

Sean O'Sullivan is an Associate Professor of English at the Ohio State University. He is the author of *Mike Leigh* (2011), a volume in the Contemporary Film Directors series from the University of Illinois Press. His articles on serial narrative and television include such topics as poetic design and serial television; third seasons; episodic storytelling; modernist structure in *Mad Men*; and the television series of Ingmar Bergman.

Formalist criticism thrives in the field of television studies. Much of the work focuses on narrative structure, ranging from the smallest units of story-telling ("beats") to the larger categories of seasons. Serial television in particular opens up space for formal analysis, drawing on the history of publication by installment, whose popular origins date to Charles Dickens and the nineteenth-century Victorian novel. Sean O'Sullivan's essay argues that the segmented nature of serials connects to the segmented elements of poetry, including meter, line, and stanza. The essay claims that serials operate as a collection of fractures, rather than as single undivided texts, using the first season of *The Sopranos* (1999) as an illustration of the recent phenomenon of the "sonnet-season" – the 13-episode uninterrupted season that has become a recurrent form for many of the most ambitious television serials of the twenty-first century.

This essay has two goals. The first is to argue that serial narrative, and in particular serialized television drama, is a poetic enterprise. All serials, by definition, are broken; like poems, they are broken on purpose. This prosodic art, unlike the art of nonserialized fiction, calls attention to itself as an array of parts; it is the art of fracture, of separation, and it is the art of the energy required to stitch together those pieces, just as the art of poetry requires a persistent process of breaking and reconnecting sounds, lines, and stanzas. We need to understand the most ambitious serials of our current

*Original publication details:* Sean O'Sullivan, "Broken on Purpose: Poetry, Serial Television, and the Season." *Story Worlds: A Journal of Narrative Studies* 2, pp. 59–77. University of Nebraska Press, 2010.

gilded age – including such shows as *The Sopranos*, *Deadwood*, *Six Feet Under*, *The Wire*, *Mad Men*, and *Lost* – as a significant branch in poetry’s genealogical tree. Although prose fiction has been commonly invoked as the clearest precursor to these televisual enterprises, in fact they recall narrative’s earliest traditions; specifically, they echo oral performances – narratives governed by metrical organization, iteration, and variation. Here I address two crucial pairs of terms – segmentivity and numbers, and meter and rhythm – that connect the infrastructure of poetry to the infrastructure of serial television; and I draw particular attention, by way of example, to the role of anaphora and caesura in the construction of serialized television episodes. In using these terms in the present pilot-study, I hope to do more than just demonstrate the pertinence of poetic structures for the study of serial narrative. Beyond this I aim to show what is distinctively different about some of the most compelling art of the present moment – art that has adapted an ancient cultural technology for innovative purposes.

The second goal of the essay is to argue that this process of adaptation has produced a new and significant unit of meaning: the season. When asked to think about long-form televisual storytelling, both authors and critics often have recourse to analogies with the novel; by this logic individual episodes are deemed to be like chapters in a long book (see *The West Wing* 2003; Ayres 2009; McGrath 2000). But the multiplot spectrum of characters, events, and thematic contexts in a single serialized episode far exceeds the ambit of a traditional novel chapter, which typically emphasizes one narrative cluster rather than the juxtaposition of several. A closer ancestor might be the weekly, monthly, or bimonthly installment of the nineteenth-century serialized novel, such as *Great Expectations*, *Bleak House*, and *Middlemarch*, respectively. These installments – called “parts,” or “numbers,” or “books” – more closely approximate the shape and variety of an episode; but those earlier installments worked together to serve one contiguous instrument, namely the novel as a whole – whose final length was anticipated by authorial convention (in Dickens’s twenty-part stories, following the 1836 success of *The Pickwick Papers*), or by prescriptive announcement (in serializing journals such as *All the Year Round*). Television, by contrast, operates from season to season – runs of episodes marked off by significant gaps. With each season separated from the next by several, or many, months, the promise of continuation is almost always in abeyance, vulnerable to cancellation or creative exhaustion. And although hourly television drama has long operated through the medium of seasons, until recently those seasons have been too long, and too irregular in their alternation between new and old episodes, to offer a sustained narrative experience. The last decade, however, has seen the advent of the thirteen-episode uninterrupted sequence, a system that most closely resembles the poetic stanza. I argue that we need to think of those thirteen episodes as lines of verse, and this new model of the season as something like a sonnet – a clear but flexible shape that both hews to established protocols and breaks those protocols when necessary. Consequently, my next section samples from several shows to provide an overview of how metrical structures (including the season) function in television serials, and my final section uses the first of the true “sonnet-seasons” – namely, season 1 of *The Sopranos* – to provide a more detailed case study. There I illustrate the role of such prosodic devices as enjambment, the turn, quatrains, and tercets in the design of this newest serial form.

## Prosodic Structures in Television Serials

### Segmentivity and Numbers

I borrow “segmentivity,” the first of these terms of art, from Brian McHale, who himself borrows it from Rachel Blau DuPlessis. McHale endorses DuPlessis’ proposal that we deem segmentivity to be the defining feature of poetry, just as we deem narrativity to be the defining feature of narrative, and performativity the defining feature of performance.<sup>1</sup> As McHale notes, DuPlessis argues that “[p]oetry involves ‘the creation of meaningful sequence by the negotiation of gap (line break, stanza break, page space)’; conversely, then, segmentivity, ‘the ability to articulate and make meaning by selecting, deploying, and combining segments’ is ‘the underlying characteristic of poetry as a genre’” (McHale 2009: 14). McHale’s brief is to bring renewed attention to the narrative dimension of poetry, and he notes that although segmentivity also operates in nonpoetic narrative – which “is certainly segmented in various ways, at various levels and scales” – segmentivity “is not dominant in narrative, by definition.” By contrast, he argues, segmentation “must always contribute meaningfully (for better or worse) to the structure of poetic narrative” (17, 18). McHale’s analysis sets an important precedent for exploring serial television as a shaped collection of pieces. In particular, his emphasis on “spacing” and “the negotiation of gap” (along with “gappiness” and “gapped lines”) provides elements of a vocabulary for studying the building blocks, and the blocks of omission, that govern serial television narrative.

On a quite literal level, the practice of making serial television often starts with a bunch of bits of stuff. For example, David Chase and Matthew Weiner, creators and showrunners of *The Sopranos* and *Mad Men*, respectively, begin thinking about each episode by subdividing the potential circumstances or scenes into “beats,” then listing them on a dry erase board or cutting them into small slips of paper, laying out those slips, and then moving those slips around (mentally and physically) in thinking about how to orient and present the forthcoming cluster that we call an episode (Chase 2002: ix; Chozick 2009). The beats of each episode – the separate scenes, sometimes less than a minute long, that are strung together in the narrative of an hour – move us from one location or plot strand to another, creating parallels, dialectical contrasts, and interruptions, in the manner of verse but always requiring us to see the pieces *as* pieces, independent contractors participating in a large project. I have argued elsewhere that the three key items of seriality are the old, the new, and the gap (or the “between”) (O’Sullivan 2006: 120–21); these are likewise three key elements of poetry, especially lyric poetry – with its emphasis on new versions of old forms (like the sonnet), and the gaps created by line breaks and stanzas. In many ways it is the articulation of the gap, the between, that animates the familiarity of old and new; the way in which a poem, or serial television, articulates those breaks makes that poem, or that unit of seriality, what it is. This is the discourse of segmentivity – parts, size, form – wrapped in the language of new and old, of the discovered and the familiar, defining itself through the logic of gapping and spacing.

The use of *numbers*, as a defining practice, connects poetry and seriality in the pre-history of television – since “numbers” is both the name given to Dickens’s monthly fictional installments and the synonym for “verse” deployed by, among others, Wordsworth. His negotiation, in the preface to *Lyrical Ballads*, between the mechanics of numbers (“the ease and gracefulness with which the Poet manages his numbers

are themselves confessedly a principal source of the gratification of the Reader") and plain speech lead to his goal of fitting "to metrical arrangement a selection of the real language of men" (Wordsworth 1996: 174, 164). That same tension between numbers and mimesis obtains in television serials, as evidenced again in Chase's formula of the beats. He explains that the template for every episode of *The Sopranos* is a system of "approximately 35 beats," divided among an A and a B story ("thirteen or so" beats each), a C story ("five or six beats"), and the occasional D story ("a few beats") (Chase 2002: ix); that same kind of division of labor, with local variations, applies to *The Sopranos'* cohort of serials. Individual episodes may feature subtle fluctuations, just as lines of verse may scan differently from their putative metrical model; the dictates of arithmetic quarrel, as in poetry, with the local needs of story and character. This quarrel, as I've noted, makes us aware of the broken surface of the text, making us consider the multiple effects of each beat – not just its place in a continuing storyline but its possible tonal, visual, or thematic relationships with the preceding and succeeding beat. The beats of television serve differing narrative purposes simultaneously, as links in a narrative chain (or story) and as distinct agents colliding with beats from other chains, just as words in poetry serve simultaneously as meanings, numbers, and sounds.

Another art system privileging sound, and likewise predicated on the mathematical arrangement of distinct parts, is music – which when wedded to poetry creates songs, also known as "numbers." This is no casual pun, especially in the case of *The Sopranos*, which uses numbers, that is, pre-existing musical selections, as its only nondiegetic accompaniment. In other words, the show rejects the signature of score – a symphonic form that connects, reminds, and familiarizes – in favor of a disconnected array of songs – ranging from rock to hip hop to opera – that add more broken pieces to the episodes. Each song brings its own meter and rhythm to each moment, sometimes suggesting clear rhymes or parallels between story and music, sometimes creating off rhymes or dissonances. The use of quoted, rather than original, music has become more and more prevalent in serialized television over the last decade, further emphasizing the numerical or metrical organization of the serials themselves.<sup>2</sup>

### Meter and Rhythm

David Milch, creator of *Deadwood*, offers us a way of transitioning from numbers to meter and rhythm. Milch has claimed that "the highest form of storytelling ... is mathematics – where literally the signs contain within themselves the most violent and basic form of energy. Einstein understood that if he was able to sign correctly he would experience the secret of energy" (Singer 2005: 204). This bridge between mathematics, or numbers, and the energy of storytelling – the raw energy of psychology and event – recalls Wordsworth's effort to apply meter to the language of real men. More precisely, meter represents half of the mathematical energy of verse, since its prescriptive claim – that in the case of iambic pentameter a line will be composed of five iambs – is in constant conversation with the local demands of rhythm – the actual assembly of iambs, spondees, dactyls, trochees, and anapests that fill out a specific line. This is the fertile tension between plan and execution, or in somewhat grander terms, between Platonic conception and Aristotelian practice. In Hollywood's economic model of industrial art, that tension translates into the master plans that the likes of Chase and Milch may cook up

for a season versus the real exigencies of time and money that shape those plans. Serial television production offers a parallel to the Victorian pressure of weekly and monthly publication, since by the end of the season, the scramble to turn scripts into shots into episodes typically accelerates, as the gap between process and air time shrinks. Television in general operates on a much tighter schedule than feature filmmaking. The usual time frame for filming an episode is ten days, with five or six pages shot per day; by contrast, features aim to shoot one or two pages per day. That constriction exerts a much greater pressure to compress and improvise, especially in terms of how scenes are filmed, resulting in a constant negotiation between the intended meter of a scene and the eventual rhythm.

Milch addresses the clash between meter and rhythm in serial television art, or the tension between global designs and local possibilities, by citing poetic precedent. In the companion book to *Deadwood*, he states: “Melville said that any great poem spins against the way it drives” (Milch 2006: 17). Milch in fact re-appropriates the context of this citation; it comes from Melville’s 1860–61 poem titled – appropriately for our purposes – “The Conflict of Convictions,” wherein the speaker announces, “I know a wind in purpose strong – / It spins *against* the way it drives” (lines 63–64). The italicization of the word “*against*” is original to the poem and underscores the governing push and pull not only of the convictions advertised in the poem’s title but also of poetic construction itself, as segments argue with gaps, syllables argue with sentences, and lines argue with stanzas. McHale, citing the work of John Shoptaw, offers the term “countermeasure,” where “measure at one level or scale is played off against measure at another level or scale,” so that, for example, Emily Dickinson’s poetry “may be predominantly phrase-measured, but her phrases are also counterpointed or countermeasured at the level of line and stanza” (McHale 2009: 17). Whether we choose to call it meter and rhythm, spin and drive, or measure and countermeasure, both poetry and serial television explore this dialectic prominently through the tension between circular and linear patterns. In poetry we might call the drive toward the end of each line a progressive one, as each word moves us forward in space, in narrative accumulation or lyric addition; but the end of the line often heralds a return (a spin), as much as a conclusion. In certain kinds of poems, we call the return (or spin) “rhyme,” an aural device that reminds us of a sound we’ve heard in the preceding line.

Consider, as an illustration of how meter and rhythm operate in serial television, two prosodic techniques: *anaphora* – which we might call both a driving and spinning force, since it creates a progressive structure while reminding us of each preceding iteration – and *caesura*, a harsher strategy that shatters the unity of the line by creating an end in the middle, a syntactical rhythm clashing with the requirements of meter. One manifestation of anaphora in serial television is the opening credits sequence, which serves circularly to remind us of the metrical conventions of the program. But there are in effect two beginnings to each program – the credits sequence (the spin) and the beginning of the show “proper” (the drive). Sometimes this narrative beginning appears before the credits and produces what is known as a “cold open,” as is the case with *Lost* and *The Wire*, and sometimes the credits precede the beginning of the narrative proper, as is the case with *The Sopranos*, *Deadwood*, and *Mad Men*. Not only do these alternative patterns for constructing anaphoric links offer quite different consequences for the beginning of each episode (or line of the poem); they can also operate as either a countermeasure to, or rhyme with, the closing credits. In this respect, the start and finish of *Lost* always work symmetrically. After the cold open, the title of the show appears over a

black screen, accompanied by the signature ominous opening music; at the end of the episode, the final credits appear over a black screen, accompanied by the signature ominous closing music. By contrast, each episode of *The Sopranos*, *Deadwood*, and *Mad Men* concludes with a new piece of music, one we have not heard before and will never hear again. In effect, these last-mentioned shows rhyme at the beginning of each episode, but not at the end. *The Wire* finds a prosodic middle ground, since the same song is played at the beginning of each episode, and the same instrumental piece (different from the opening song) is played at the end; but each season features a new version of that initial song, thereby creating spin and drive simultaneously.

For an example of caesura, the prosodic opposite of the framing devices in serial television, we need to think not of patterns but of exceptions – such as the storytelling rift in the middle of “That’s My Dog,” episode 5 of season 4 of *Six Feet Under*, which violates convention mid-way through by suddenly shedding the multiplot alternations of serial drama and confining itself for the rest of the hour to the uninterrupted carjacking ordeal of David Fisher. The episode caused a furor, ostensibly because the audience objected to seeing a beloved character unrelentingly brutalized; but that emotional shock was amplified by a procedural shock, namely, the sudden rupture of metrical expectation and the violation of rhythmic precedent, an abandonment of narrative protocol that forced viewers to wonder what, and how, they were watching. “That’s My Dog,” significantly, enacted not simply a caesura within its own narrative drive but one within season 4 as a whole, since its consequences transformed the trajectory not only of David Fisher but also of the central group of characters around him (Nussbaum 2004: 52; O’Sullivan 2009: 221–23).

### The Season as Unit of Meaning

The double-consequence of this caesura in *Six Feet Under*, both for the specific episode and for the episodes preceding and succeeding it, provides a segue to my discussion of a relatively new lyric form: the season. Until 1999, the television season had operated purely as a system of production, numbering from as many thirty-four episodes per year for a show like *Bonanza* in the mid-1960s and tapering off gradually to the more recent convention of twenty-two episodes. This loose, baggy superstructure traditionally begins in the autumn and runs through late spring; the twenty-two-episode season unfolds in clusters of new installments – aimed around “sweeps” periods of the calendar, when ratings are tied to advertising prices – alternating with clusters of reruns. This model gives audiences a general sense of commencement and conclusion, with occasional spikes along the way; but each of these markers – commencement, conclusion, spike – is relatively “soft,” in a manner that is reflective of what Raymond Williams influentially referred to as the “flow” of television.

Williams suggested that the sequence of programs aired by any television station, and the collection of genres within that sequence, including series, commercials, promotions, and so forth, constituted a continuous stream; we do not so much shift clearly back and forth between sustained narrative worlds and interrupting advertisements as experience one sustained program of images and sounds (Williams 1974: 91–92). Jane Feuer has amended Williams’s argument, positing television as “a dialectic of segmentation and flow” (Feuer 1983: 15). Most recently, flow has been drastically eroded by the technology of the digital video recorder (DVR), which allows viewers to control what they

watch, and to become, in effect, bricoleur programmers – rather than passive recipients of program sequences constructed by executives. The twenty-two-episode season emphasizes a version of flow, at the expense of segmentation, since it is not so much shaped and bounded (i.e., clearly segmented and gapped) as arrayed in notional bunches. That ontological fuzziness of the traditional season underlies the recurrent critical emphasis on serial television as an open-ended enterprise; consequently, writers such as Jennifer Hayward (1997) and Robyn Warhol (2003), while interested in parallels to earlier serial forms, have concentrated televisualy on soap opera, a continuous genre wherein the unit of the seasons is completely effaced.

In January 1999 HBO aired the first season of a new series, called *The Sopranos*, an event that generated a well-documented cultural tsunami. What has been relatively unremarked upon is the watershed created by the specific form of that season: thirteen episodes, aired in consecutive weeks, with no interrupting reruns. When I say that the pre-1999 television season was purely a system of production, I do not mean to suggest that the first season of *The Sopranos* was not also originally engineered to serve the financial and structural demands of a network. The thirteen episodes resemble the typical first batch of episodes that are ordered for a traditional twenty-two-episode season, with the succeeding nine episodes (or “back end”) ordered only if the ratings for the first batch warrant such an investment. But before *The Sopranos*, those first thirteen episodes had not been envisioned or consumed as a self-contained narrative cluster. The thirteen-episode uninterrupted complete season provided, for the first time in American television history, a distinct narrative form, one that was large enough to occupy significant time and space, but not so large as to turn into vague sprawl. Its close analogy, in length, to the fourteen-line parameter of the sonnet may be an industrial accident, since the proximate benefits of that first, shorter season were cost control and a convenient quarter-year of programming; but as so often in the history of American film and television, a corporate decision has had far-reaching artistic consequences.<sup>3</sup>

Before we address the particulars of this parallel between sonnet and season, let us remember the reasons for the sonnet’s own success – and how quickly both it and the thirteen-episode season caught on. The sonnet is long enough to develop an observation or a thought, flexible enough to be metaphorically prescriptive in the hands of William Shakespeare, and colloquially investigative in the hands of Robert Frost. Its end is far enough away from its beginning to suggest a change or translation, but not so far as to suggest a daunting journey.<sup>4</sup> And just as Philip Sydney’s *Astrophel and Stella* helped kick off the sonnet craze of the 1580s and 1590s, so the first season of *The Sopranos* kicked off the thirteen-episode season (in some versions, the twelve-episode season) of our last decade. Since 1999, many series have followed this form, including such HBO successors as *Six Feet Under*, *The Wire*, *Deadwood*, and *Big Love* but also offerings on rival cable programmers, such as *Mad Men*, *Breaking Bad*, and *Dexter*. Even an over-the-air network show like *Lost*, whose first two seasons enacted the traditional twenty-two- to twenty-four-episode skein – dispersed loosely over thirty-six weeks of the calendar – shifted in its final two seasons to shorter sixteen- to eighteen-episode runs, crucially aired in consecutive weeks, with virtually no interruptions. The season, as a distinct, compressed, and contiguous entity, is no longer the exclusive province of “prestige” cable networks. Even the compact length of the sonnet-season may become part of the over-the-air lexicon, as evidenced in 2009–2010 by the thirteen-episode second season of *Dollhouse* on Fox.<sup>5</sup>

In this context it is important to mention again a key technological innovation that coincided with the advent of *The Sopranos*: namely, the digital versatile disc, or DVD. Like the sonnet-season, this innovation allows the viewer to contain the bulk of epic narrative. Consider what the consumer of television drama had to choose from in 1999, if she wanted to pick her way through the medium's history. She could buy VHS tapes titled "The Very Best of *Hill Street Blues*" or "*Law & Order*: Producer's Collection," or the "Buffy and Angel Chronicles" within the corpus of *Buffy the Vampire Slayer*—cherry-picked assemblages of two or three cassettes that reflected putative thematic links, or apparent indexes of quality. The season as defining unit was essentially invisible as a consumable artifact. Even HBO failed to seize on that artifactual property at first, delaying the release of the first season of *The Sopranos* until December 2000, a few months before the third season aired. As late as 2005 the fourth season of *Six Feet Under* was not available until immediately after the airing of the fifth and final season, thereby keeping at bay the viewer's full purchase on the narrative. Since then the dialogue between season and DVD has become explicit; no show of any stature fails to issue its preceding season on disc before the new season is aired on television. Now all seven seasons of *Buffy the Vampire Slayer* are available in full, and even the thirty-two-episode megalopolis that is the first season of *Bonanza* was finally issued on DVD in 2009. The viewer's ability literally to own seasons, in packaged divisions, has materially changed the narrative dynamics of the text.

*The Wire* exemplifies the consequences of the thirteen-episode uninterrupted season. The series ran from 2002 to 2008 and numbered five seasons, varying in length from thirteen episodes (seasons 1 and 4) to twelve episodes (seasons 2 and 3) to ten episodes (season 5). Each season began with a new performance of the opening credits song, "Way Down in the Hole," as well as a new montage of scenes from the upcoming season; both the musical strategy and the visual strategy were unprecedented for an American television series. That teasing glimpse of what was to come supplied just enough information to convey a sense of how the storyworld would evolve over the course of the season, but not enough to convey specific trajectories of character and plot. This framing device is a direct descendant of Dickens's serial numbers. The green cover of a twenty-part book like *Little Dorrit*, or the monthly version of a weekly like *A Tale of Two Cities*, featured an illustration of the major characters of the novel, organized on the page in graphical relationships that, retrospectively, could be seen to portend as yet undisclosed interconnections and consequences. But the difference, again, is that there is no equivalent to the "season" in Dickens's work. *The Wire*'s decision to change covers each year, as it were, underlined the very different narrative focus of each season; despite the connecting threads of Baltimore, police work, and the drug business, the central narrative landscape constantly changed. Season 1 concentrated on housing projects; season 2 on the shipyards; season 3 on the political arena; season 4 on the schools; season 5 on the newspaper business. Given these radical shifts of attention, it is peculiar that *The Wire* has so frequently been compared to a long novel, since there is nothing comparable to this in any Victorian book, whether serialized or published in volumes.<sup>6</sup> One might tentatively consider a massive project like Balzac's *La Comédie humaine* as an analogue; but just as *Bleak House* is too small to serve as direct precedent, that ninety-five-title edifice is too big. *The Wire* is both more circular than Balzac in its use of structural tropes and more linear than Dickens in its changes of character and context. The prose genealogy, in other words, only goes so far; we need to turn once more to poetry.

## A Case Study of the Sonnet-Season: Season 1 of *The Sopranos*

While the recent televisual wealth offers an array of candidates to illustrate the properties and possibilities of the sonnet-season, it seems appropriate to use the initiator of the form – namely, the first season of *The Sopranos*. It is a season particularly sensitive to the choices and effects of the thirteen-episode uninterrupted sequence, inaugurating the corona of sonnets that we call *The Sopranos*. My proposed homology between this form of televisual season and the sonnet – which we might frame as between twelve and fourteen – does tease us into speculation about connections between serial television and other inherited methods of segmenting experience and time, such as the division of years into months or of shorter periods into fortnights. But the parallel here is not limited to a similar number of lines. I want to spotlight three compositional strategies of the season, strategies that correspond to, but also re-invent, the motions and countermeasures of the sonnet: an initial experimental quatrain (episodes 1–4); two evenly spaced jarring interruptions, in episodes 5 and 10, each of which may be likened to a turn; and a closing tercet. That said, I am not claiming that this specific organization of segments is repeated precisely in subsequent seasons – whether of *The Sopranos* or any other series. The sonnet-season does not fall as rigorously into patterns as the three-quatrains-and-a-couplet form of the English sonnet, or the octave-and-sestet form of the Italian sonnet; rather, Frost's formal experiments provide the closest model. While some of the prosodic maneuvers I describe may recur, the laboratory of the thirteen-episode uninterrupted season in the last decade has played with the possibilities of segmentation, numbers, meter, and rhythm, rather than follow codified orders. In other words, the spin and drive between rigor and freedom, between a fealty to clear rules and an impulse to break them, have become a governing dynamic of television narrative.

The initial stanzaic strategy of the first season of *The Sopranos*, the experimental quatrain, is a four-episode cluster unified by the story of Jackie Aprile, the head of a New Jersey crime family in which Tony Soprano and his Uncle Junior serve as high-ranking lieutenants. Over the course of those episodes, Jackie sickens and dies; the fourth episode concludes at this funeral. This quatrain corresponds to what is more commonly referred to as an arc, a sustained plot strand that moves the broader narrative along, with consequences both for plot and for character.<sup>7</sup> Concurrent with this story cluster is what I will call a verse-structure, as each of these four episodes tries a distinctly different way of beginning.

The first episode, also known as the pilot, starts out in the waiting room of Jennifer Melfi, a psychiatrist whom Tony is about to meet as he seeks treatment for his panic attacks. David Chase has said that if no network had picked up the pilot, he could have added half an hour and released it as a self-contained low-budget feature (*Sopranos* 2001). Consequently the episode is less focused on creating a serial template than in telling its own story; for example, the first half of the pilot relies on Tony's voiceover as a way of organizing and clarifying information – a technique never repeated in the show's subsequent eighty-five episodes. A different narrative experiment inauguates the start of the second episode, "46 Long," which begins, unlike any other episode in *The Sopranos'* six seasons, with a "cold open," a pre-credit scene of little serial consequence – showing, in this case, the mobsters counting money and watching a Mafia expert talk on television. The third episode, "Denial, Anger, Acceptance," begins with an enjambment. Here a lingering storyline from the final act of the second episode – the theft of a truck "belonging" to one part of the mob family by people affiliated with another part – continues

immediately, almost as if there had been no interruption, or gap, between episodes. (Such enjambment is extremely rare as a narrative strategy for the rest of the series.) By contrast with these “false” starts, the fourth episode, “Meadowlands,” begins with a device that will become a hallmark of the season, and the series as a whole: a dream sequence of Tony’s. As an initial gambit, it will be repeated at a parallel moment in a scheme of four-episode clusters, in the eighth episode of the season. But the second time around the dream sequence involves Tony’s nephew, Christopher – creating a kind of rhyme between the oneiric anxieties of these two characters. So, like a poem that begins its first four lines with four distinct sounds, images, or perspectives, the first quatrain of the season emphasizes the divergent over the iterative, the linear over the circular.

The second prosodic, season-dependent strategy under consideration – the interruption – manifests itself in sudden changes of style and direction at two parallel moments of the season: the fifth episode, “College,” and the tenth episode, “A Hit Is a Hit.” “College” is among the most celebrated of all *Sopranos* episodes, and Chase has spoken often of its importance to him, as an instance of his impulse toward anti-serial counter-measure, even as he was making a serial: “‘College’ comes closest to achieving my personal goal of making episodes that could be stand-alone films. It is self-contained” (Chase 2002: viii). The story of Tony and his daughter Meadow’s college tour through Maine, where he encounters and garrotes a witness-protection “rat,” is not serially anticipated by any of the preceding four episodes, and its serial consequences are minimal for the rest of the season. Less celebrated, but equally unintegrated, is “A Hit Is a Hit.” This episode begins (again, out of nowhere) with the killing of a Hispanic rival unfamiliar to the show’s audience and the discovery of a large pile of money, a share of which allows Christopher to try out a side career as producer for a mediocre rock band. The shared structural role of these two episodes would be interesting enough – an anti-serial hour walling off a four-episode proserial cluster preceding it – but the connections go much further. Each episode is about art and culture. “College,” which begins on a small college campus and lingers, near its conclusion, on an inscribed quotation from *The Scarlet Letter*, repeatedly touches explicitly on issues of verisimilitude, sculpture, cinema, and literary inheritance. “A Hit Is a Hit” is a narrative essay about the world of popular music, particularly the tension between early 1960s black acts (run and exploited by white managers) and late 1990s gangsta rap – with related attention to such cultural currency as bidets and imported Italian glass, as well as the contingency of stock values. How is art related to commerce? What are things worth? What is the value of formula, as exemplified, in one instance, by Beatles songs? How do talent and luck magically coalesce into that mysterious entity known as “a hit”? Just as so many poems are about poetic voice and the material nature of language, the first season of *The Sopranos* interrupts itself, twice, at regular intervals, to ask questions about the tension between design and accident, high and low art, the permanent and the evanescent – in other words, the basic cultural work of an ambitious television serial at the end of the twentieth century.

Finally, the closing tercet of the season – “Nobody Knows Anything,” “Isabella,” and “I Dream of Jeannie Cusamano” – returns us from the self-conscious reverie of “A Hit Is a Hit” to the insatiable drive of serials, as Uncle Junior’s plans to kill Tony, and the consequences thereof, take over. This tercet, like the initial quatrain, is united by a storytelling arc, in this case the gradual suspicion that Pussy Bonpensiero, Tony’s best friend, has turned FBI informant. The narrative join to “A Hit Is a Hit,” where Pussy seemed jovial and unanxious, is remarkably awkward; suddenly, an episode later, he acts furtively and walks with the weight of the world on his shoulders. The season, like those

schizophrenic works we call poems, refuses to hide the separation of its parts, fighting the requirement to conclude by emphasizing the cluster, or the segment, over the flow of the whole. The twelfth episode is especially jagged, since it interweaves a long-anticipated serial event – the attempted hit on Tony – with an episode-specific story wherein Tony believes that he has met a beautiful Italian housesitter next door named Isabella – a person who turns out to be completely imaginary. The audience is not explicitly clued in to this delusion until Tony is; this confusion of the subjective and the objective represents an elaboration of the dream trope seen earlier in the season, but now in a way that prompts the viewer to identify with Tony, rather than observing him from an external, rational standpoint. This shift to the fanciful late in a season, often in penultimate or antepenultimate episodes – whether in the famously “irrelevant” pursuit of a Russian in the third season’s “Pine Barrens,” which takes place predominantly in snowy woods for reasons that matter little to the serial context, or the astonishing twenty-minute dream sequence in the fifth season’s “The Test Dream,” a “Circe”-like reprocessing of a vast amount of narrative material – will become a *Sopranos* structural habit, slowing the serial momentum down just when it should be accelerating. These warring impulses offer a synthesis of two warring possibilities for sonnet closure: the summarizing, clarifying Shakespearean couplet that often tries to make sense of questions asked, or the darkening final movement of a Frost sonnet, translating an initial everyday observation into something restless and unresolvable.

What I have tried to offer here is a beginning but also a return – a beginning for inquiry into the new serials, and a return that grounds this inquiry in the prosodic structures of the most ancient forms of verbal art. Recent work has discussed the “complexity,” or cognitive challenge, that these serials produce, with good reason (Mittell 2006; Johnson 2005). But those studies have deployed the rhetoric of the new, rather than the discourse of the old – what is unprecedented within the realm of television or popular culture, rather than what is adapted from poetic practice. Serial television’s lexicon of segmentation, numbers, meter and rhythm, and the genre of the sonnet-season represent the return of verse narrative to its origins as popular art.

## Notes

- 1 The segmented, narrated, and performed art of serial television, it should be noted, enacts all three elements.
- 2 The shock final ending of *The Sopranos* – its infamous cut to black – owes as much to the absence of music as to the absence of image. The final credits, silent for the first and only time, reminded the viewers of their dependence on meter and numbers; as with John Cage’s “4’33”, the absence of measure made measure the very subject of the missing sound.
- 3 The other fundamental variation from network practice was the absence of commercials – a countermeasure that undid the traditional multiple-act structure, studded with pre-commercial climaxes. So the uninterrupted episode and the uninterrupted season were as responsible for undoing ossified segmentation as they were for inventing new ways of breaking narrative form.
- 4 HBO did have internal business models for the thirteen-episode season prior to the debut of *The Sopranos*: three of the six seasons of *The Larry Sanders Show* (1992–98) numbered between eleven and thirteen episodes, and the first season of *Sex and the City*, in 1998, was thirteen episodes long. But these situation comedies, whatever their success and cultural impact, did not aim for the kind of serial season-long interconnection practiced by *The Sopranos* and its successors. While certain ongoing storylines involving principal characters did loosely knit episode to episode, they were also designed to be watchable out of sequence, in the tradition of television comedy. *Sex and the City*’s

interest in season-long, and series-long, serial throughlines did accelerate later on in its run – after *The Sopranos* had helped change the entire experience of serial television.

- 5 It is worth noting that, in Great Britain, each season of a show is called a “series,” and its episodes are presented in consecutive weeks, without interruption. This semantic difference, and this publication model, indicate that the distinctiveness, or separation, of the season/series unit within the entire history of a program has operated longer in the British context than in the American one. But the relative brevity of the traditional British series/season produces significantly different effects from the format initiated in the United States by *The Sopranos*. British dramas with serial components tend to run for six to eight episodes per series, creating a much more abbreviated narrative dynamic, with much less scope for the kind of metrical and rhythmic variety detailed in my examination of the first season of *The Sopranos* in the final section of this essay.
- 6 For direct comparisons between Dickens and *The Wire*, see Weisberg (2006) and Miller (2007). David Simon, the show’s creator, termed his creation a “visual novel” (Mittell 2009: 429).
- 7 Michael Newman discusses arcs and beats within the confines of what he terms “mass art television” (2006: 17), in contrast with the more experimental series that I have been examining.

# CHAPTER 7

## Tools for Reading Poetry

*Herman Rapaport*

Herman Rapaport is a Reynolds Professor of English at Wake Forest University with work focusing on contemporary critical theory and the arts. Books include *The Literary Theory Toolkit* (2011), *Later Derrida* (1994), and *The Theory Mess* (2001). He is currently researching Jacques Derrida's lecture courses of the 1980s in preparation for a book on them.

### Tropes

Traditionally, literary tropes have been considered ornamental devices that supplement or supplant ordinary meanings in ways that both deviate away from and add to what is being said.<sup>1</sup> In Milton's *Paradise Lost* there is a famous epic simile in Book 1 that compares the fallen angels to autumnal leaves that have fallen into the brooks around Vallombrosa, a locale south of Florence, Italy. The simile might well remind one of embroidery, which is to say, of an ornamental stitching of comparisons into the text. The simile occurs when Satan calls up his legions who "lay intrans't ..."'

Thick as Autumnal Leaves that strow the Brooks  
In *Vallombrosa*, where th' *Etrurian* shades  
High overarch't imbow'r; or scatter'd sedge  
Afloat, when with fierce Winds *Orion* arm'd  
Hath vext the Red-Sea Coast, whose waves o'rethrew  
*Busirus* [Pharaoh] and his *Memphian* Chivalry,  
While with perfidious hatred they pursu'd  
The Sojourners of *Goshen*, who beheld  
From the safe shore thir floating Carcasses  
And broken Chariot Wheels; so thick bestrown  
Abject and lost lay these, covering the Flood,  
Under amazement of their hideous change.<sup>2</sup>

(ll. 302–13)

*Original publication details:* Herman Rapaport, "Tools for Reading Poetry" from *The Literary Theory Toolkit: A Compendium of Concepts and Methods*, pp. 98–133. Blackwell Publishing, 2011. © 2011 Herman Rapaport. Reproduced with permission from John Wiley & Sons and H. Rapaport.

Clearly, Milton wanted to compress much information into this diversion away from Satan's action, a prolepsis to a peaceful pastoral moment near a Catholic monastery in Tuscany. Psychologically, the purpose of this sort of epic simile is to forget the traumatic present by substituting something rather remote, natural, and pleasant in its place, in this case brooks bestrewn with leaves in autumn. As it happens, the simile is echoing similes of fallen leaves in Homer, Virgil, and Dante, which gives it a sort of ritual significance or, at the very least, the depth of literary precedent. And the simile generates a parallel simile within it that speaks to the destruction in Exodus of the Egyptians on chariots pursuing the Jews in the Red Sea. The basic associative chain is: Devils = Dead Leaves = Broken Chariot Wheels. What is remarkable is how Milton at the end of the passage manages "so thick bestrewn" to have a double reference, to the wheels and the leaves, and in addition a third reference back to the ostensible object of our attention, "these" (the Devils strewn in Hell). Notice too that Milton wanted to inlay a bit of Greek myth in the midst of all this with reference to Orion, who, in one of the myths about him, walks on water, which makes one realize that he is a prefiguration of Christ and of God's might and mercy.

This epic simile is quite an embellishment. It takes us far afield and puts together rather heterogeneous elements, a scene of falling leaves near a monastery, mention of Orion, the aftermath of Pharaoh's defeat, and the devils abject and lost on the fiery lake at the foot of Satan. Of central importance in considering this and other figures, generally, is the fact that they tend to both compress and compare, and to lead away from and then lead back again to something.

Figures embellish and ornament a text, much as Milton's simile does, but they also amplify and can multiply registers of reference. It's hard not to notice that Milton's simile is pithy: it's very compact and dense and is made up of large and small fragments that do and don't quite go together. Leaves and chariot wheels aren't something we'd usually equate. But Milton makes this work by way of subordinating the power of association to the rhythmic patterning of the words. In other words, the lines build up rhythmic momentum and carry us along in a way that extends over the different elements of the content. Milton does this quite a bit in other parts of the poem, too. Bits that don't really cohere more or less fit because the rhythm of the language overwhelms the discrepancies. Plus Milton is good at the figure known as *syllepsis*. He can let a phrase ambivalently refer to two objects but choose only one of them to advance. This occurs with "so thick bestrown / abject" which refers to both the broken army of Pharaoh and the devils before Satan, carrying onward from the latter reference.

At this point, it is helpful to offer a definition of a literary figure. It was formulated by a French scholar, Pierre Fontanier, in 1830. "Figures of discourse are the traits, forms, or turns that are more or less remarkable and that have a more or less happy effect by means of which discourse, in the expression of ideas, thoughts, or feelings, distances itself more or less from that which had been a simple and common expression." Earlier, the *Académie Française* had followed an older tradition that goes back to antiquity in which a division was made between grammar (ordering isolated ideas) and rhetoric (propositional thinking, expressions used in discourse). On the grammatical axis, "an arrangement of words [gives] force or grace to discourse," and along the rhetorical axis "a turn of thoughts [creates] a beauty, an ornament in discourse."<sup>3</sup>

All of this supports what we have seen in the epic simile of the leaves of Vallombrosa. In fact, what one has there is *grammar* (the ordering of the narrated units: the brooks clogged with leaves, the Jews being pursued by Basirus (Pharaoh), the saving spirit of

Orion (Christ), the broken chariot wheels, the languishing abject devils on a burning lake in Hell) and *rhetoric*, the parenthetical expression of these units as sequential propositions (thick as ... where th'... or scattered ... when with ...). Both grammar and rhetoric are animated by sentiment or what Fontanier called “passion” (in our case, the rhythmic force). Of central importance is that all this is supposed to distance itself from simple and common expression. That it teaches, delights, digresses, beautifies, ornaments, embellishes, complicates, plays logical tricks, references far flung texts, says the impossible, obscures, tantalizes, seduces, compresses, ambiguates, and whatever else figures do is all to the good, especially when, as the *Académie* argues, the result is felicitous (*heureuse*).

As to particular types of figures that turn up in discourse, Fontanier covers pretty much everything imaginable in his *Figures du discours*. Here are just some of the examples he covers: abruptness, adjunction, allegorization, alliteration, anacolouthon, catachresis, conjunction, counterfision (contrefision), correction, dubitation, enthymemism, epitropism, imprecation, license, litotes, metalepsis, metaphor, optation, paradox, paranomasia, preterition, repetition, syllepsis, synecdoche, topography.

Of interest should be that Fontanier’s understanding of these discursive devices requires a division into three types: figures that correspond (i.e. metonymy), figures that resemble (i.e. metaphor), and figures that connect (i.e. synecdoche). In the epic simile of the leaves of Vallombrosa, we have resemblance (the devils resemble leaves and broken chariot wheels with respect to their fallenness, brokenness, and death) and correspondence insofar as the devils and Pharaoh’s forces are both forces of evil and therefore actually connected by something they both have in common. In fact, Milton was probably thinking that Pharaoh’s troops *are* devils who will be doing mischief later in human history, and that Pharaoh will be none other than Satan disguised as the Egyptian leader. In addition we have Fontanier’s idea of connection in the simile, given that all the parts belong to a *topos* Milton calls Hell. Everything is connected to Hell because it is all a part of it, Hell not being confined to a time and place. This is a crucial point, because it overturns the impression that Hell has a confined locus and temporality: that it is a place like other places. In terms of Fontanier’s notion of connection, we have an extension of a type or genre of thing into things that are “of” that genre and even generally representative of it. Here, again, the broken army of Pharaoh comes most immediately to mind.

Something that Fontanier doesn’t stress is the fact that figures in literature often have to do with transformation, the change of one thing into another, the swapping of appearances, one thing being displaced by another, and so forth. Milton was greatly influenced by Ovid, who was the great poet of metamorphosis. Throughout *Paradise Lost* the devils keep getting metamorphosed into one thing or another. In fact, the whole epic could be said to be about metamorphosis: changes in state. In that sense, the simile of the devils being seen as autumnal leaves isn’t quite as decorative as one might imagine, though it is and remains an embellished ornament, in any case, a digression in which the changes of identity or of state can be pushed quite a bit further than they could otherwise. Recall the Académie’s point: figures enable the poet to discourse in a way that is not commonplace (i.e. “normal”). In fact, that means figures enable the poet to indulge in transformational flights of extraordinary fancy and skill.

One point to underscore is that it’s not always too useful to think of figures as separate entities whose definition we memorize so that we can identify them when they pop up in poems, plays, and novels. Rather figureation is quite protean and overlapping. In Milton’s epic simile we saw the extended comparison that was introduced with the word “as.”

This, obviously, is the epic *simile* itself; we saw ambiguity in the selection of that monastic site south of Florence which may be a nasty swipe at Catholicism or a tribute to Dante, Virgil, and Homer; we saw *metaphor* – one thing resembling another (devils = leaves = broken wheels); we saw *metonymy* – correspondence in which one entity is actually a part of another entity; and we saw *synecdoche* – the whole simile being a part of Hell that is representative of its various dimensions. We could have found *irony* in the comparison of the leaves, which are natural, peaceful, and predestined to die and the devils who are unnatural, troubled, and had the choice not to fall. And we could have noticed that Orion is a *personification* of the wind that walks and disturbs the waters. Or we could have noticed the use of *euphemism* and *epithet*: the Sojourners of Goshen.

Incidentally, reading by way of Fontanier, we would have to notice that Goshen, too, is a kind of Hell, that the Sojourners are doing exactly what the devils will not be able to do, and that they are doing exactly the inverse of what Adam and Eve will do at the end of the epic. That is, the Sojourners are leaving their Hell in Egypt for a promised land (a sort of Eden). Inversely, the devils will never get out of their Hell, and the parents of Mankind, in another sort of inversion, will be leaving Eden for a much less paradisial “World before them.” This inverse crossing is known as *chiasmus*. And in a way the Sojourners of Goshen do manage to figure or sign an invisible cross in terms of their crossing the paths of both the devils and the fallen Adam and Eve. And that would relate to *symbolism*.

In case one wonders why Milton’s epic, *Paradise Regained*, has lacked the popularity of the longer epic, it is because that later poem lacks the ornamentation and fanciful detail that Milton lavished on the story of the parents of Mankind. Probably, Milton envisaged the earlier poem as pre-Christian and therefore more in line with ancient epic devices, whereas *Paradise Regained* he imagined within a Calvinist aesthetic: pure, austere, minimal, pious, stripped of classical ornamentation and flights of fancy. Whether the *Académie Française* read Milton at all, I do not know, but I’m sure if they had, the determination would have been made that *Paradise Lost* has a felicity lacking in the more dour *Paradise Regained*.

## Elision

That poetry is often telegraphic and compressed can be a source of annoyance to readers who find it frustrating to be caught up in a verbal game of “keep away” in which the poet manages to tease us with half-spoken messages. Notice the following riddle poem (# 1489) by Emily Dickinson.

A Route of Evanescence  
 With a revolving Wheel –  
 A Resonance of Emerald –  
 A Rush of Cochineal –  
 And every Blossom on the Bush

Adjusts its tumbled Head –  
 The mail from Tunis, probably,  
 An easy Morning's Ride –

When Dickinson sent this poem to Helen Hunt Jackson in 1879, she wrote the following as a preface. “To the Oriole you suggested I add a Humming Bird and hope they are not untrue –”.<sup>4</sup>

In collections of Dickinson’s poetry the poem is untitled, which suggests that editors are under the impression we’re supposed to be able to figure such poems out by ourselves, which may be somewhat unreasonable, given that Dickinson herself didn’t think people might be able to fill in the blanks. This speaks to a culture of poetry reading, not necessarily shared by Dickinson, in which the art of reading poetry is precisely that of supplying content that has been elided (withdrawn, kept back, skipped over). In “A Route of Evanescence” the subject of the poem is never mentioned, only some rather attenuated qualitative correspondences are given that have both metaphorical and metonymical significance. The route of evanescence itself is a metaphor for the darting around of the hummingbird; Dickinson seems to be asking whether hummingbirds make a route like other birds. The revolving wheel is a metaphor too, but it is also a metonymy. The wings in flight appear to be analogous to a revolving wheel (metaphor), but they are also a very distinctive feature of the bird itself (part for whole: metonymy). The emerald and red (Cochineal) are impressions of color that the poet sees as the bird feeds. There is then a shift to mention of the flowers upon which the bird is feeding, and one has to suppose we’re to guess what sort of bush this might be, or at least visualize *something* akin to what Dickinson had in mind. The bush is personified, that much is clear. Finally, there is a comparison with mail carriers and reference to where the hummingbird has migrated from: North Africa. Given the bird’s speed, it’s “an easy Morning’s Ride,” but this is intentional hyperbole (exaggeration). It’s meant humorously.

What many readers may not be aware of is that Dickinson wrote different versions of the same poems and, at times, couldn’t decide on particular words. Line two of “A Route of Evanescence” had variants in the manuscripts with respect to the word “revolving” (“With a revolving Wheel”). Variants included “delusive wheel,” “dissolving wheel,” “dissembling” (“With a dissembling”), and “renewing” (“With a renewing”). In those last two instances no mention of wheel appears. It’s elided. Here we can see that Dickinson had various other possibilities in mind with respect to content that she suppressed by using the much more concrete and literal “revolving.” But that too is an elision: a sort of suppression of suggestions the poet had in mind and might have liked to work out had the poem allowed it. This speaks to fit. What can’t be fitted into a line? And what if that material is important to the conceptualization of the poem?

Here are a few lines from “Maroon” by Chelsey Minnis, a poem that shows the blanks, as it were, by means of punctuation.

.....my bloodthirsty.....wet.....  
 .....  
 .....bab.....  
 ....is.....an auburn.....and.....bloody.....beauty.....<sup>5</sup>

Minnis writes what is clearly a typical narrative sentence broken up with ellipses. But one has to wonder, is our skipping over the dots not a mistake? Isn’t the narrative closure here *deceptive*? We would naturally assume “baby” to be the subject of the sentence,

given its syntactic structure. But perhaps a sentence or two is missing here and what we take to be a continuation is a mistaken presumption. The dots in Minnis' collection *Zirconia*, of which "Maroon" is a part, are not entirely unrelated to the dashes that Dickinson loved to use in her poems and letters: signs of absence.

In contrast notice how space functions in Jackson Mac Low's "People Swamp" of 4–5 July, 1990.

People swamp flavor.  
Iridescence knot ring dove end needle sieve.  
Keeper encystment palliation aftervarnish creepiness instrument.<sup>6</sup>

The obvious question here is whether these statements have anything to do with one another or not, let alone whether these are well formed propositions out of which a narrative could or should be constructed. "Swamp" could be a noun or a verb. In the first case one would be left with a nominative phrase or perhaps just three nouns. In the second case we would have a sentence with subject, verb, object. It sort of makes sense that way, but only sort of. In the second line the words "knot" and "end" also have this doubleness of being either nouns or verbs. But now there appears to be little gain in seeing them that way. However one considers the words grammatically, the sentence doesn't quite manage to be a well formed statement. The same is true for line three. Is this poem just meaningless? Would it help if we knew what it's leaving out? But how would we know if something is being elided here? By what test could we determine this?

In *North of Intention*, Steve McCaffery, himself a poet, quotes Leon S. Roudiez on the paragram: "A text is paragrammatic in the sense that its organization of words (and their denotations), grammar, and syntax is challenged by the infinite possibilities provided by letters or phonemes combining to form networks of signification not accessible through conventional reading habits." McCaffery adds: "Paragrammatic wordplay thus manufactures a crisis within semantic economy, for whilst engendering meanings, the paragram also turns unitary meaning against itself."<sup>7</sup> The para-gramme in at least one of its manifestations posits a para-grammar, a pseudo-linguistic construct that elides conventional practices of making meaning – for example, the use of standard grammatical constructions. Rather, the paragramme constellates verbal entities or parts thereof in ways that redistribute linguistic combinations in ways that make up *alternative signifying economies* that are, for the most part, *antisemantic*. If Mac Low elides something, it is the function of standard grammatical constructions, something that turns against semantics: the function of words as transparently meaningful entities and the function of lines as complete thoughts. Here there is no narrative that exists in the wings waiting for someone to decipher it by means of a verbal game of hints and winks. But does this only obtain with poets like Mac Low? Couldn't we read Edmund Spenser and John Donne paragrammatically as well? As it turns out, yes. But this would require something other than a literary historical approach that assumes all poetry is a translation of an a priori story into elliptical form, an encryption of ordinary language into poetic language.

## Resemblance

As Fontanier noticed, poetry is largely the construction of resemblances, which accounts for the importance of figuration in poetry, but also relations of sound and sense. This section considers resemblance in terms of *juxtaposition* (adjacency), *analogy* (metaphysical conceit), *allegoresis* (allegory), *emulation* (sympathy), and *imitation* (mimesis). For a more in depth account of some of this, see Michel Foucault's chapter "The Prose of the World" from *The Order of Things*.<sup>8</sup> Foucault's thesis is that in the later seventeenth century we can begin to see an "epistemic break" (or conceptual rupture) with Renaissance practices of signification that were analogy based, so that, for example, one shifts rather abruptly from a world in which everything is seen in hierarchical correspondence to a world in which one simply enumerates data statistically and then distributes it according to graphs whose purpose is to empirically measure and quantify the data. Whereas the Renaissance had a strong interest in qualitative relations among entities, which had moral and metaphysical significance, the Age of Reason had an overriding interest in quantitative relations among entities, which had statistical and empirical significance. The question that Foucault didn't resolve is whether the arts can ever make that leap. Paul de Man's influential paper, "The Rhetoric of Temporality," suggests not.<sup>9</sup> However, this is also just plainly apparent from reading many twentieth century poets: T.S. Eliot, Wallace Stevens, Sylvia Plath, and John Ashbery, among them.

### Juxtaposition

Juxtaposition refers to how we make linguistic associations when poets simply put words, phrases, or sentences adjacent to one another. When Shakespeare juxtaposes swear and forswear – as in sonnet 152 – the result is a verbal matrix that serves as a sort of verbal engine for the poem as a whole. By juxtaposing these words, Shakespeare encourages the contamination of one by the other, which produces an overload of meanings.

As poetry became more compressed by modernist poets who had repudiated the rhetorical style of Victorian poetry, emphasis fell upon the juxtaposition of fragmentary motifs and images. Ezra Pound's famous "In a Station of the Metro" is exemplary: it juxtaposes the image of faces in a crowd to petals on a wet, black bough. The mention of the petals on the bough is merely juxtaposed. Pound is not saying the petals *are* a metaphor for the faces. There's no actual connection, just the association that we happen to make.

Robert Creeley's "FIVE Eight Plus" (from the collection *Windows* (1987)) is composed of short juxtaposed bits that don't make the sort of obvious association we saw in Pound. The following is just a short excerpt taken from the middle of the poem.

WINDOW  
Up from reflective  
table top's glass  
the other side of it.

AROUND  
The pinwheel's pink  
plastic spinning  
blade's reversing.

EGO  
I can  
hear I can  
see

DAYTIME  
It's got to be  
lighter<sup>10</sup>

No doubt, we can try to link the texts in small capital letters as if they were keys to some narrative progression, but this will be less successful than looking at the poem as a modular series of juxtapositions in which the sections relate out of sequence. One could relate WINDOW with DAYTIME, for example. In such a case, the reader is actually selecting what goes with what by putting the sections together in whatever way makes sense to him or her. This is reminiscent of aleatory music of the post 1945 period in which composers were writing bits of music that musicians could play in whatever order they wished. Although no two performances of the piece would be the same, in all likelihood, the work still had its own recognizable sound texture. Suddenly, order wasn't the determining factor of what a piece sounded like. Creeley's poem participates in this kind of aesthetic.

### Analogy

*Analogy* is easily seen in the poetry of John Donne. In “The Relique,” Donne compares himself and his mistress to holy relics that have been dug up at some future time after their deaths.

Then, he that digges us up, will bring  
Us, to the Bishop, and the King,  
To make us Reliques; then  
Thou shalt be a Mary Magdalen, and I  
A something else thereby;

In this case the analogy is transformative in that it makes the beloved into Mary Magdalen and Donne into Christ (the one to whom “something else” is referring). Donne can make that association, because the lovers have not consummated their love sexually, only Platonically. For “Difference of sex no more we knew, / Than our guardian angels do.” In Donne, emulation is not sufficient, for he generally seeks a translation of one thing into another that is transformative. This occurs again, famously, in “The Flea” wherein Donne’s mistress is about to kill a flea in bed that has bitten both of them and therefore could be said to contain “three lives,” its own, Donne’s, and the mistress’s. “This flea is you and I, and this / Our marriage bed, and marriage temple is.” Here again the analogy has logical consequences that the poet extrapolates in order to amplify if not to exaggerate the transformative effect of the initial correspondence. Lastly, in Donne these correspondences are redemptive. The transformation into Mary Magdalen and Christ, as well as the transformation into the marriage temple would attest to this. But notice, too, the redemptiveness of analogy in “Air and Angels.”

Twice or thrice had I loved thee,  
 Before I knew thy face or name,  
 So in a voice, so in a shapeless flame  
 Angels affect us oft, and worshipped be.

What could be viewed as a sordid relation between anonymous lovers is redeemed by means of comparing the mistress to an angel. Again, the exaggerations and implausibility of these comparisons raise the suspicion that these analogies must be ironical or satirical and that therefore their redemptive effects are dubious, however tempting it might be to accept them at face value.

### Allegory

The extension of analogy into an isomorphic set of correspondences that substitute for the literal sense is known as allegoresis, something that Donne is broaching in the poems above. Indeed, if one extended the analogies of the relic, the flea, and angels to any great extent, the poems would turn into full scale allegories. Typical of allegory is the thirteenth-century poem on the art of love entitled the *Romance of the Rose* (Jean de Meun and Guillaume de Lorris), in which a lady, allegorically personified by a rose, is being courted by a lover. A young man initially follows a stream to a large walled in garden, and upon the walls he contemplates personifications of various abstractions: hate, felony, avarice, covetousness, envy, sadness, and poverty, among them. That these figures decorate the outside of what is, in fact, a garden of delight, speak to those personal attributes that one should consider antithetical to pleasure and that therefore should be banished. These are the attributes that no lover ought to possess. Edmund Spenser's *Faerie Queene*, similarly, uses personifications in order to represent psychological human attributes, though in many cases the relationship between the person and the attribute are not in a simple one to one correspondence. Red Crosse Knight is a complex character that is not simply reducible to a religious redeemer figure, though he is certainly that, as well. Una, who represents the true church, is again not simply a walking abstraction. She is developed to the point that she is not just a convenient allegorical device whose function is to make an abstraction more comprehensible in human terms. Whereas Spenser's allegorical depictions are readily comprehensible within both the Christian and Romance traditions, William Blake's *Jerusalem* is a complex allegory that rewrites and revises the Judaic-Christian tradition in ways that reflect Blake's idiosyncratic personal revelations. In such a case, the allegorical transparency of various personifications is diminished and readers are required to figure out precisely what Blake must have had in mind, since the meanings aren't to be found in the cultural tradition.

Allegoresis occurs in more modern poetry as well. In T.S. Eliot's *The Waste Land*, the medieval topos of the waste land functions as an analogue to the condition of Europe in the 1920s. At moments within the poem, Eliot is referencing *Perceval* by Chrétien de Troyes (twelfth century), therefore using its story as the allegorical analogue for the twentieth-century spiritual condition of Europeans. But also notice the recent poem *Lip Service* (2001) by the Language Poet Bruce Andrews, which is keyed to the cantos of Paradiso in Dante's *Divine Comedy*. Dante writes the following near the end of canto 33:

As is the geometer who wholly applies himself to measure the circle, and finds not, in pondering, the principle of which he is in need, such was I at that new sight. I wished to see how the image conformed to the circle and how it has its place therein;

And Bruce Andrews nearing the end of *Lip Service* writes:

geometry at total, raptures diaphanous closeout diagram  
 generalizes fingers arraigned as chocolate,  
     adorable base alias reality image refusal emboldens  
     fetus using your body without your consent –  
     its sweet front lathed with  
     this is something else;<sup>11</sup>

Whether or how Andrews' text is allegory or even just allegoresis is probably a matter for some debate; however, the fact that Andrews used Dante's poem as a structural and thematic source (as he has pointed out and as we can see from the references in both poems to geometry) leaves open the question of whether we shouldn't at least try to make the connection and pose the possibility that allegory is active, though not in ways we're used to seeing in most poetry. Indeed, that there is an allegorical aspect to Andrews' poem is perhaps self-evident, but whether it abides by any of the usual rules of allegorical procedure is open for discussion. It's possible that what we have in Andrews' poem is simply a number of tangential resemblances that posit the effect of allegory without its actually taking place.

### Emulation

We have already discussed sympathetic analogies. This is what Michel Foucault was thinking of in terms of *emulation*, or what we can see in the sympathetic correspondences in Milton's *Paradise Lost*. Note that Eve is in emulative correspondence with Satan. In other words, of all the creatures in Eden, she alone could be sympathetic to Satan's condition when he was a revolting angel in heaven, given that just as Satan felt secondary to the Son, Eve feels secondary to Adam, something that the moment she senses it, irritates her. Now, this does *not* mean that Eve is analogous to Satan, which is Milton's subtle point in the parts of *Paradise Lost* leading up to the fall in Book 9. For if she were, she would have been created evil, which clearly wouldn't make sense in the Pauline tradition within which Milton is working.

Sympathetic emulation occurs, quite noticeably, throughout much of William Wordsworth's poetry. In "The Ruined Cottage" (1780), an old man whom Wordsworth, speaking of the poem, once identified as a peddler, has been witness to the economic ruin of a family on account of economic changes within England. The old man tells the poet,

Sympathies there are  
 More tranquil, yet perhaps of kindred birth,  
 That steal upon the meditative mind  
 And grow with thought. Beside yon spring I stood  
 and eyed its waters till we seemed to feel  
 One sadness, they and I.

(ll. 79–85)

Sympathy in this case concerns the man's capacity to feel what the family feels by way of experiencing the waters of the spring that to him are in tune or sympathy with his thoughts. "They and I" is somewhat ambivalent, referring at once to the family but also to the waters (nature) and the man. Wordsworth himself said that had he not been educated he could imagine himself very much to be someone like the old man who relates the story of the ruined cottage.

In "Lines Composed a Few Miles above Tintern Abbey," emulation is very pronounced in terms of the poet's relation to his sister Dorothy, whose journals are so central to an understanding of this poem's intensity, given that it is through her (and her writings) that the poet is shown once more how to experience rapture in the presence of nature, an experience the poet can not have without Dorothy's example as a being-in-nature who experiences its sublimity in the smallest details of vegetative life. In Dorothy Wordsworth's *Grasmere Journals* we can read: "I never saw daffodils so beautiful they grew among the mossy stones about & about them, some rested their heads upon these stones as on a pillow for weariness & the rest tossed & reeled & danced & seemed as if they verily laughed with the wind that blew upon them over the lake, they looked so gay ever glancing ever changing."<sup>12</sup> In such cases, consciousness is animated by nature's emulation of what we might mistakenly assume to be exclusively human.

A final example of emulation is the close of Robert Lowell's "Skunk Hour" (1959) when the poet notices a mother skunk and her kittens late at night rummaging through the garbage out in back of his house. What should be a low point for him in terms of the depression he feels and the situation he is in reveals a ray of hope in terms of something that stops quite short of analogy whereby the poet would be compared to being a skunk pure and simple. Rather, in stopping short of metaphor, Lowell emphasizes how the determined behavior of the skunk *emulates* something in the poet's character that will save him: that he will not be scared off.

### Imitation

Consider Ezra Pound's poem about the Paris Metro mentioned above. In that poem the petals on a wet black bough do and don't actually imitate (resemble) the crowd that one sees entering and exiting the metro. What about "Shall I compare thee to a summer's day?" Shakespeare's proposition in Sonnet 18 is that of a conceit that equates a period in a man's lifecycle to a season, which can be done since the macrocosm of a human life is believed commonly in Shakespeare's day to be equivalent to the microcosm of a year with its four seasons. But is the resemblance contrived? What about the opening stanza to "Lake Bud" by Ishmael Reed? Its subject is the great jazz pianist Bud Powell.

Lake Merritt is Bud Powell's piano  
 The sun tingles its waters  
 Snuff-jawed pelicans descend  
 tumbling over each other like  
 Bud's hand playing Tea For Two  
 or Two For Tea<sup>13</sup>

Here the lake resembles the piano just as the pelicans resemble the hands: Tea for Two=Two for Tea. Of course, we have to perceive the imitative resemblance, which requires knowledge of what Powell's piano playing sounds like.

Imitation can also be structural, and here we should be reminded of Milton's mirror poems "L'Allegro" and "Il Penseroso" that are imitative in terms of structure as well as content. "L'Allegro" (the happy life) is the inverse of "Il Penseroso" (the melancholic life) in terms of content, but both are structurally symmetrical to a high degree. Structural imitation occurs, as well, in Dante and in Spenser. In recent examples of poetry, see work by Leslie Scalapino, whose first collection, *Concerning How Exaggerated Music Is*, demonstrates a high degree of structural imitation in the form of recursivity. This is a technique she has refined over some four decades to stunning effect.<sup>14</sup>

## Reading

Michel Foucault, *The Order of Things* (1971)

## Objective Correlative

T.S. Eliot, who was a critic as well as a poet, coined the term objective correlative, by which he meant an object, situation, or event (in the singular or plural) that functions as an adequate correlative to the poet's emotions. A very good example is Matthew Arnold's poem "Dover Beach" (1851) in which the beach at Dover is a concretely experienced place that has emotional correlatives. As a setting, Dover Beach has a metonymical relation to the much bigger place that is England, if not, Europe. Dover Beach is the stage, as it were, for setting up an experiential analogue to what it feels like to be a European living in a time of vulgar empirical demystification and social leveling. The poem famously ends with a premonition of ignorant armies clashing in the night. What makes the poem so successful is that the correlative of the beach to the feelings of the poet and his concerns is not just apt, but revelatory, given our historical hindsight. Indeed, many poets since have repeated this sort of Victorian poem, among them, T.S. Eliot, whose *The Waste Land*, however more fragmented in terms of setting, still employs the objective correlative of the waste land metaphor to approximate the spiritual condition and feeling of the poet. For a poem to be successful, according to Eliot, the objectification of the emotions has to be convincing; that is, it has to convey the inner state of the poet's feelings and, one might suppose, his or her psychology.

Apparently, Eliot imagined the correlative must be sincere, plausible, realistic, and serious in intent. But is William Wordsworth's objective correlative of the cloud plausible, realistic, and serious in "I Wandered Lonely as a Cloud"? What about Emily Dickinson's "I felt a funeral in my brain"? Is John Ashbery's objective correlative sincere, let alone, plausible, realistic, and serious in "Caesura" ("Job sat in a corner of the dump eating asparagus ..." from *Shadow Train*)? Indeed, Ashbery is quite a lesson in how far a poet can get in terms of mocking the objective correlative, but, Eliot might have countered, that is the objective correlative (the situation) for postmodern subjects.

The funny thing is, despite all the objections one could raise about what precisely makes up a successful objective correlative, we all know a bad objective correlative when we see or hear one. For example, consider the Country-Western lyric, "I flushed you from the toilet of my heart." That's not viable, is it? And yet, someone could argue that if the vulgarity of the correlative is so extremely insensitive that it ironically undermines the

sentiments regarding hurt feelings, we've in fact found a quite good correlative with respect to how people actually respond to betrayal: as hurt *and* angry; sensitive *and* insensitive.

What Eliot calls the objective correlative is, from another perspective, *the controlling metaphor that captures the social subject's actual relation at a point in historical time to the world*. Of course, the identity of this social subject will be defined in terms of gender, class, ethnicity (possibly), race (possibly), and nationality (almost certainly). Yet, if this social subject lacks a certain generality or averageness, the objectivity of the correlative, as one that a wide diversity of readers could identify with, collapses in on itself. Sylvia Plath, for example, is a social subject who was white, female, well educated, and a poet who was part of the American "poetry scene" of the 1950s and 1960s. Many thousands of readers can and do identify with her. Even those of us who aren't female can cross the bridge whereby her relatives make sense as an experience we can imagine holding in common, for without that, the poetry would be merely sectarian.

As to the reference above to an "actual relation" to the world, it is important to point out that what Georg Lukács referred to as the requirement for realism in literature applies to poetry as well as to fiction – at least, in Eliot's context. The objective correlative needs to be a controlling metaphor that discloses the social subject's *actual* relation to history; otherwise, nothing that is said will have anything but subjective significance. When W.B. Yeats spoke in his poetry of the center not holding anymore, he perceived something quite major about what had changed with respect to people's actual historical circumstance. Eliot's waste land metaphor is a similar case in point. Eliot's poem isn't saying that the poet feels as if he's living in a waste land; it is making the point that empirically Europeans had entered an age in which culture had turned into a waste land, because the culture was being turned into nothing more than the standard of living. In other words, culture is what people buy at the department store. There is nothing else, anymore. If this wasn't absolutely true in the 1920s, the Frankfurt School (Max Horkheimer, Theodor Adorno, et al.) was predicting it would come to pass in the period following the Second World War, which has largely happened, in fact.

Have artists found good objective correlatives as good as the waste land metaphor in the second half of the twentieth century? As noted, Ashbery makes fun of this type of thinking, and he is not alone. There appears to be a widespread impression today that the world is so complex and logically impenetrable that it would be foolish to imagine an artist could sort it out by finding just the right correlative, the way Arnold did back in the 1850s, or, for that matter, the way Pablo Picasso did in the painting *Guernica* in 1939. But is this skepticism merely an excuse for not having managed to sort something out or not? Lukács thought that the worth of a literary writer was to be measured in terms of the extent to which he or she could understand society and history as a coherent totality and the special conditions that therefore pertained to the social subject as a historical personage. Whereas many contemporary writers may have abandoned this expectation, it turns out that the general public has not.

## Language Poetry

*Language Poetry* is an avant garde movement of the second half of the twentieth century that has had roots in the high modernist writing of Gertrude Stein, William Carlos Williams, Paul Zukofsky, and George Oppen, though a major influence was certainly Jackson Mac Low whose own work was indebted to the sort of procedural compositional practices initiated by the composer John Cage in the 1940s and 1950s. Cage's work crossed boundaries between music, writing, painting, and what later came to be known as performance art. Many of his pieces are essentially directions of a rather general sort that a performer is being asked to realize with the aid of a page of instructions.

Mac Low often included rather detailed and lengthy rules of composition, to which he generally adhered. "A Note on the PFR-3 poems" of 1938–1985 speaks of the use of a computer program to generate the poetry. An excerpt follows in which Mac Low addresses work he did at Information International, Inc., in Los Angeles in 1969 (!) "with the aid of their PFR-3, a programmable film reader connected to a DEC-PDP-9 computer":

Their [computer] program allowed me to enter as "data" a list of "messages": originally up to 100 single lines, each comprising at most 48 characters and/or spaces. Later longer messages, though fewer at most, and ones having two or more lines, were possible. From any list the program randomly selected and permuted series of "message members" (characters, words, or strings of linked words, e.g., sentences, separated in the message by spaces) and displayed them on a monitor. When a lever on the control board was pushed, every tenth line appearing on the screen was printed out ...<sup>15</sup>

The poem itself has statements that read out as follows:

FURIOUSLY IDEAS COLORLESS SLEEPING GREEN  
 DEMANDING  
 FREEING BREASTS ROUNDED DEEPBOSOMED  
 CRUNCHING ABSENTMINDED PLASTIC  
 TASTY GRANDMOTHERS  
 ARE  
 HONEYMAKING ARE EUCALYPTUS DRAWING BEES<sup>16</sup>

Readers unfamiliar with this sort of poetry immediately complain that "it makes no sense." But in fact the lines are filled with suggestive words and odd juxtapositions that give rise to fantasies that pull together the disconnected bits by jumping over their syntacticality. "HONEYMAKING ... ARE EUCALYPTUS ... DRAWING BEES" is really just very elliptical. And "FREEING BREASTS ROUNDED DEEPBOSOMED" isn't at all hard to figure out. If "PLASTIC" is supposed to go together with "TASTY GRANDMOTHERS," it's a rather comical phrase. Mac Low himself argued that one had to adopt something akin to the Zen Buddhist conception of "no mind" when reading this kind of poetry. That is, one perceives each linguistic event as elements in themselves that arise and pass away without being gathered up into overarching meanings (sayings, propositions, arguments, stories).

When Language Poetry emerged, it constellated a number of significant talents: Ron Silliman, Charles Bernstein, Barrett Watten, Bruce Andrews, Clark Coolidge, Michael Davidson, Bob Perelman, Michael Palmer, Ray DiPalma, Steve Benson, Robert Grenier,

Lyn Hejinian, Leslie Scalapino, Susan Howe, Carla Harryman, Rae Armantraut, and Hannah Wiener, just to name the more prominent figures. In the seminal early anthology edited by Silliman, *In the American Tree*, Mac Low questioned whether Language Poetry is any more language centered than any other literature, contrary to what some were proposing. He admitted that many of the writers depart from normal syntax, that “the subject matter shifts rapidly,” and that indeterminacy and a de-emphasis upon the ego is noticeable. “Few of these works tell a connected story or support an explicit thesis,” and there is “lack of narration or exposition.” Moreover, Mac Low wondered, “Can these works be seen as imitations in *any* sense of the term?” He answers,

Seemingly no. Often one word, phrase, or sentence seems to follow another with little regard for the recognized imports of these signs and strings. Their concatenation seems governed not by their referents, or by relations among them, but by features and relations intrinsic to them as language objects. Indeed, some practitioners … call such works “non-referential,” and one of them has mounted a brilliant seemingly Marxist, attack on reference as a kind of fetishism contributing to alienation. … [But] what could be more of a fetish or more alienated than slices of language stripped of reference? [...] Attention seems centered on linguistic details and the relations among *them*, rather than on what they might “point to.”<sup>17</sup>

Mac Low specified, quite rightly, that referentiality was very much a part of Language Poetry, but that it was structured in such a way that instead of communicating itself as exposition, argument, or narration, the perceiver is required to construct larger wholes semiconsciously. “The mind moves beyond the language elements themselves, impelled by a complex mélange of denotations and connotations and of remembered language experiences and life experiences.” In that sense Mac Low said such poetry was actually “perceiver-centered” as opposed to “language centered.”<sup>18</sup>

Charles Bernstein and Steve MacCaffery have both been quite forceful on the point that Language Poetry should be thought of as superseding what they call Voice Poetry or, alternatively, Official Verse Culture, by which they mean the kind of poetry taught in Masters of Fine Arts Programs in the United States. Essentially, the model for this poetry is Plath’s “Ariel,” which is certainly a great poem. But the problem is that Plath perfected this sort of poetry and that already in the 1970s it was time to move on. An academy with poetry writing programs filled with students all trying to emote in poems that follow in the wake of Sylvia Plath or Robert Lowell doesn’t quite make sense some 50 years after these figures passed away. Language Poetry, by contrast, is not anachronistic aesthetically and attempts to innovate with language in quite radical ways that take it deep into realms of linguistic abstraction that aren’t imaginable within Official Verse Culture. But Language Poetry isn’t what lyric poets would consider expressive – at least not in the personal or psychological sense, if only because such poetry doesn’t believe in the authority of the self as a psychological being whose purpose or function is to express feelings. In other words, there is the concern that for the Language Poets there can be no objective correlative other than the various discourses in collision out there in the world. But is this sort of dialogism a sufficient condition for the writing of poetry?

A younger generation of poets who have brought lyric and language poetry together in interesting ways appear to have decided this issue for themselves insofar as they hold the possibility for an objective correlative open. A very strong example of this approach can be seen in Laura Mullen’s prose poem “Torch Song (Prose Is a Prose Is a Prose)” which brings diverse discursive formations together around one of those outrageously “senseless” crimes all too typical in America.

Re:Vision: As if made for a made-for-TV-movie the already tired scene played over and over: "She was so upset," etc. (Question: How upset do you need to be to burn 137,000 acres?) The print is grainy. Did you see her, "in your mind's eye," with matches, crying so her hand shook too much to strike a light at first? Or do you picture her standing there, resolute, raising a lighter aloft like a concert-goer during the encore? "The only thing that is different from the one time to another is what is seen and what is seen depends upon how everybody is doing everything," Gertrude Stein repeats ("Composition is Explanation"). The Russian filmmaker Andrei Tarkovsky dies in exile, his countrymen having refused his vision, even now some people say of his movies that there's not enough story there. In *The Mirror* a drenched woman appears in the charred room of a gone house, a dream or memory, haunting the narrator. *Homage*: as if the word had a home in it. All the elements the filmmaker loved and lovingly reassembled are here: the woman, the forest, the tears ... a letter on fire.<sup>19</sup>

Mullen's poem is largely about "The Hayman Fire" that occurred in Colorado in the summer of 2002. The biggest fire that Colorado had ever seen, it was started by Terry Barton, a federal forestry officer who said that she was trying to burn a letter by her estranged husband. Barton was indicted on four counts of arson. Barton's anger is the objective correlative that Mullen herself is setting alight in her poem, as the last sentence in the quotation demonstrates. The conflagration was a horrible tragedy for the state of Colorado, but it is also the objective correlative of the woman's hurt and all the rage that women feel collectively in such situations. The act of burning some 137,000 acres is also one in which gross negligence, stupidity, and emotional overload meet as a response to the life world that, however mad, makes a certain sense as the only adequate response to it, given how anonymous, unfair, and uncaring that world is and how outraged and frustrated individuals feel as subjects who aren't responded to and don't see any other alternative than an apocalyptic response (suicide after murdering the whole family, campus rampages and massacres, the setting of massive forest fires). Mullen's poetry is very much mediated by various discourses (media, academic, descriptive, lyrical) but keeps its distance from the kind of personalism and soul searching typical of Sylvia Plath, Denise Levertov, John Berryman, and their many imitators. Quite noticeably, Mullen doesn't try to psychoanalyze or attempt to make sense of the absurdity of the forest ranger's act. She respects the absurdity of the act and the events that led up to it even while offering decontextualized statements on other matters that do and don't intersect with the life of Terry Barton, something that has the effect of challenging our ideas of what is and isn't normal. "That's the way fire does, it don't have no rules to it. – Anonymous Firefighter, Summer 2002."

## The New Sentence

The new *sentence* was advanced by the Language Poetry Movement and refers to decontextualized prose whose syntax is used as if it were prosody. Unlike the sentence you are reading right now, the new sentence has no specific referential focus. Ron Silliman provides a useful example.

He lived here, under the elm trees  
 versus  
 He lived here, under the assumptions.

Silliman points out that in the new sentence the sentence doesn't resolve the syntax. Silliman's list of descriptors for the new sentence reads as follows:

- (i) The paragraph organizes the sentences.
- (ii) The paragraph is a unity of quantity, not logic or argument.
- (iii) Sentence length is a unit of measure.
- (iv) Sentence structure is altered for torque, or increased polysemy/ambiguity.
- (v) Syllogistic movement is (a) limited; (b) controlled.
- (vi) Primary syllogistic movement is between the preceding and following sentences.
- (vii) Secondary syllogistic movement is toward the paragraph as a whole, or the total work.
- (viii) The limiting of syllogistic movement keeps the reader's attention at or very close to the level of language, that is, most often at the sentence level or below.<sup>20</sup>

Apparently, in poetry that employs new sentences, the paragraph is an arbitrary container of a number of sentences that are to be seen as just so many units in the aggregate. Therefore, the paragraph is just a unit of measure and has no function as a structure within which sentences are subordinated logically. By altering a sentence structure by torque, Silliman means that it is changed by the rearrangement/substitution of elements that break with grammatical expectations and rules. Carla Harryman's sentence, "The back of the hand resting on the pillow was not wasted" is a new sentence because the noun "hand" cannot logically take "wasted" as a verbal descriptor, whereas "washed" or "wished for" would have been all right. By syllogistic movement, Silliman means logic in terms of its pertaining to the unit of the sentence itself. The primary logic doesn't overrun the sentence in order to unify a group of sentences, which focuses attention upon words (the morpheme) or small groups of them. There can be a secondary logic that works at the paragraph level or level of the whole, however. Silliman's example of a group of new sentences comes from Harryman's "For She":

The back of the hand resting on the pillow was not wasted. We couldn't hear each other speak. The puddle in the bathroom, the sassy one. There were many years between us. I started the stranger into facing up to Maxine, who had come out of the forest wet from bad nights. I came from an odd bed, a vermillion riot attracted to loud dogs.

In this example, the pronouns and deictic markers (there, on, of) help establish a sense of normalcy against which the so-called torquing (or deformations) take place. A more traditional term for this kind of writing is *parataxis*, unsubordinated prose. To this, the new sentence is adding the grammatical and idiomatic deformation of typical language use.<sup>21</sup>

## Sound Poetry/Concrete Poetry

Both concrete and sound poetry have their inceptions as self-conscious artistic practices in Dada and allied movements within the European avant garde of the early twentieth century. If in the case of concrete poetry the visual dimension of the poem strives to achieve material autonomy, the same can be said for sound in sound poetry. Whereas most of the poetry one is likely to study can be considered a balance between sound patterning, verbal design, and denotation, in both concrete and sound poetry there is a tendency to alter the balance in a way that denotation loses its centrality as “the sense” beneath which everything else is to be subordinated. “Thus Adam to himself lamented loud” (*Paradise Lost*, 10.845) is visually shaped in such a way that “loud” receives end placement. We can also see the two l’s in “lamented loud,” which visually reinforces the stresses that the beginnings of these words will receive. But all of this works in the service of the denotation, as does the sound, which puts stress on “loud,” as if to make that word imitate its sense. Sonically, “loud” is loud. Here, of course, we’re examining a very commonplace example of what New Critics called “sound and sense,” the expectation that the sound will imitate the sense. In sound poetry, the sonic aspect of the poetry becomes so autonomous that it discards denotation altogether, while retaining the capacity to connote in its absence.

For most readers, Lewis Carroll’s “Jabberwocky” would be the poem that exemplifies the borderline between where sound and sense go their own ways. We can imagine what a Bandersnatch is, but there’s really no telling if we’d be right. Of course, Carroll allows us to “imagine” by means of borrowing from what we know, as if we were trying to find cognates among two different languages. “Frumious” sounds hectoring, probably because we can sense the word “furious” in it. “Jabberwock” is quite recognizable as a compound word with “wock” being a cognate for “walk.” But what about “talk”? “Jabber” itself is ambiguous because it refers to both jabbering (as in, jabbering and walking) and jabbing, which in the context of the poem appears the more likely meaning. The brilliance of this poem is how it keeps us betwixt and between language options, hence refusing us a definitive translation.

Beware the Jabberwock, my son!  
 The jaws that bite, the claws that catch!  
 Beware the Jubjub bird, and shun  
 The frumious Bandersnatch!

Steve McCaffery tells us that the sound poem came in various genres back in the days of Zurich-style Dada in 1916. Chief among them was the “simultaneous poem” and the “poem without words.”<sup>22</sup> The simultaneous poem was invented by Henri Barzun and Fernand Divoire and in it one could expect a sonic collage made up of “sound, text, discrepant noises, whistles, cries, and drums.” This contrasts with Hugo Ball, a major figure in Dada, who restricted himself to poems without words. Ball explained:

I have invented a new genre of poems, “Verse ohne Worte” [poems without words] or *Lautgedichte* [sound poems], in which the balance of the vowels is weighted and distributed solely according to the values of the beginning sequence.

Ball also wrote that

In these phonetic poems we totally renounce the language that journalism has abused and corrupted. We must return to the innermost alchemy of the word, we must even give up the word too, to keep for poetry its last and holiest refuge. We must give up writing second-hand: that is, accepting words (to say nothing of sentences) that are not newly invented for our own use.<sup>23</sup>

Such poetry was intended to defamiliarize and undermine ordinary language use and to reintroduce sense as something we intuit from hearing sounds whose ostensive meanings aren't given. The sound poem, therefore, is very much like a foreign language whose sense we grasp through its sounds, even though we would be at a loss if someone actually required us to denote what was being communicated. Of course, onomatopoeia plays an important role in sound poetry to the extent that sounds are physical presences (in the form of vibrations) which prompt various associations: linguistic, psychological, etc.

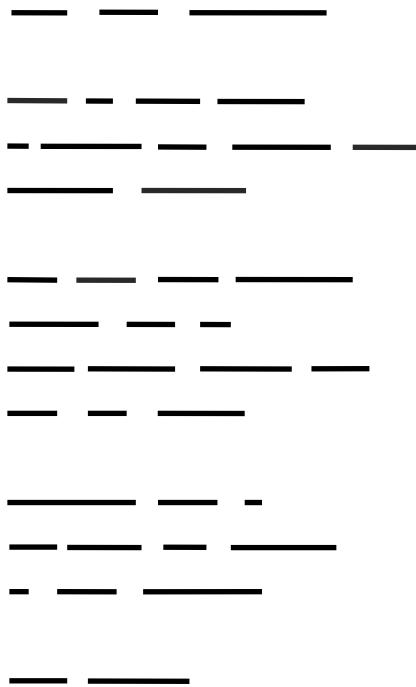

Well known, too, is work by poets such as the Russian futurist Velimir Khlebnikov who is famously associated with the term *zaum*, a neologism in Russian that denotes transnationality. Russian futurism, much like Dadaism and Surrealism in Western Europe, had one thing in common, namely, the expectation that certain non-rational uses of language could trigger imaginative experiences that would break with conformist (that is, ideologically determined) ways of perceiving the world. *Zaum* enabled the individual to know that everyday consciousness must necessarily be a sort of false consciousness that represses creativity and the capacity to think differently than one's neighbor. Klebnikov understood sound as material, hence arguing for sound poetry as a materialist approach to art that went beyond the bourgeois understanding of the sign in terms of a property relation in which the sign is in possession of its referent. In the context of Ferdinand de Saussure, one is reminded of that subtle interrelation between sound and thought before a moment when they are separated, the one brushing against the other at a moment when they are still fused. "Zangezi" (1923) was a theatrical piece by Klebnikov staged by Vladimir Tatlin and included various invented poetic languages related to birds and gods. And here, of course, one sees how natural it was for sound poetry to be translated into performance art.

Unquestionably the most celebrated sound poem per se is Kurt Schwitters' *Ursonate* (1922–1932), of which there is a re-engineered recording available on compact disk. "Ursonate" (Primeval Sonata) is actually not as primeval as one might think. One can sense musical sonata allegro form in the piece; in fact, it's even written in four movements, some of which are paced like movements in a classical sonata. Moreover, the piece is as much sung as it is spoken. It makes use of pitch as well as rhythmical repetitions, which establish cadence and momentum. If "Ursonate" suggests some sort of primeval European language, it is, in fact, modeled upon Germanic languages that would include German, Dutch, Swedish, Danish, and Norwegian. German and Swedish seem particularly pronounced, given Schwitters' rather frequent use of the umlaut: *rinnzkrrrmüüüü*. Also pay attention to the rolled r and the use of the pf which is a characteristic of German pronunciation.

Rum!  
 Rrummpff? (G)  
 Rum!  
 Rrummpff t?  
 Rr rr rum!

Although one might suppose the poem to be nonsense verse, there are familiar words that pop up every now and then. “Rum,” in German, could mean the liquor we know as rum, or could be associated with “herum,” the adverb for “around.” In this sense, “Ursonate” often communicates like some earlier form of a language we already know and think we can therefore decipher. The use of pitch, speed, repetition, reprise, cadence, and phonemic clusters generally associated with German, give “Ursonate” a highly crafted and purposeful sense that its sounds both advance and occlude in ways that are tantalizing for the hearer who can’t be sure whether he or she is listening to music or to language. Because “Ursonate” is a work of powerful expression in the absence of denotation, it has interested recent performance artists, who see it as foundational for work in which sound and sense are to be reconceptualized in aesthetic terms.

If sound poetry departs from usual expectations wherein sound and sense are brought into relation, concrete poetry departs from usual expectations wherein sight and sense are related. The following is a concrete poem modeled by myself on a work made by Francis Picabia, a visual artist of enormous originality who belonged to the European avant garde.

**Figure 1** Concrete Poem.

The point of such an exercise in Dadaism is to show how much poetic information or stimulus we get in a purely visual form even before we begin reading a word of poetry. Even without seeing a single word, but merely lines in their stead, regular readers of poetry will probably sense a signifying effect, because of the many poems that they have read whose powerful meanings are conveyed in precisely such visual forms. In other words, this sort of poem reveals just how behaviorally conditioned we are in terms of pattern stimulation. Notice that here too verbal denotation has been discarded. The design, however, does explicitly refer to the typographical shape of typical poetry.

And the lines also have connotative significance. The longer ones connote nouns, the shorter ones articles, conjunctions, and the like.

In fact, concrete poetry precedes the twentieth century. In a poem like George Herbert's "Easter Wings," the stanzas are put in the shape of angel's wings. The 1633 edition of the poem situates each wing (each comprises one of the two stanzas of the poem) so that we're required to read from top to bottom, or to turn the book sideways. We can see that the outer edges of the wings are longer, much as we would imagine angels' wings to be, and it is clear, as well, that the visual element of the poem relates to mention of the lark. The first and last lines are the strongest, rhetorically, and Herbert is playing with amplification (the outer edges of the wings) and diminution (the place where the wings attach). He is also invoking the opposition of flying and falling. In fact, the second stanza (not reproduced) will indicate that the second pair of wings are probably those of the poet who wants to attach his wings to that of the angel. Since each pair of wings gets its own facing page in the 1633 edition, the book's binding would represent this suturing of the poet to the angel.

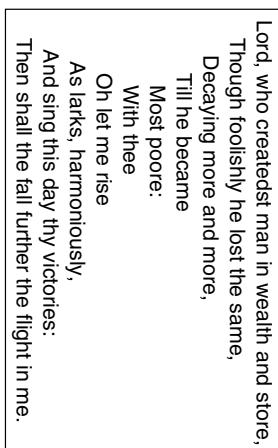

Figure 2 George Herbert, from "Easter Wings" (1633).

Also well known for their visual appeal are Guillaume Apollinaire's calligrammes from the early part of the twentieth century. These are pictures drawn in outlines that are made up of words. Perhaps the most successful of these is "Heart Crown and Mirror." The mirror is a large oval outline composed of words that make up a circular sentence in which the end leads right back into its supposed beginning. As one reads this sentence the relation of its parts changes as one goes round the oval. Inside the space that is supposed to be the mirror surface we can read the name Guillaume Apollinaire. In this and other calligrammes, the figure appears to have the function of destroying linearity, because the figure's purpose is more allied to figuration (representing an object or objects) than to organizing the words into well formed propositions. And yet, the place of the words in terms of the figural pattern isn't arbitrary either, and tends to have optical significance in relation to where other words are placed.

Significant instances of concrete poetry are to be found in Charles Olson's *The Maximus Poems* and various books of poetry by Susan Howe, Hannah Wiener, and Douglas Messerli. Indeed, the moment poets such as Stéphane Mallarmé began experimenting with typefaces, font sizes, and spacing of words on the page, concrete poetry

had been broached as an important dimension of new developments in the art of writing poetry. Certainly, what separates modern poetry (and its legacies) from earlier poetries of the past has been the considerable amount of attention paid to typographical layout and page design. Also of importance is the way in which page design has led to an interest in making artists' books in which the difference between poetry and visual art is difficult to separate out. Tom Phillips' *A Humument* (the entire book is accessible on the Internet) is a famous example in which each page of a novel has been drawn and colored over exposing only certain of the original words that when blocked out in this way read like poetry. Leslie Scalapino's *The Tango* is an important poetic collaboration with artist Marina Adams in which the final product is an artist's book in which what happens on the page visually is as important as what happens verbally.<sup>24</sup>

## Prosody

In poetry there is a close relation between line, syntax, diction, and rhythm. Notice how Milton, for example, uses an iambic pattern to restabilize a passage in Book 1 of *Paradise Lost* in which Satan is being described as holding a shield; it's a parody of the shield of Achilles in Homer's *The Iliad* on which there is a complex design. The Tuscan artist Milton references is Galileo.

the broad circumference  
 Hung on his shoulders like the Moon, whose Orb  
     /    /    /    /    /    /    /    /  
 through Optic Glass the Tuscan Artist views  
 At ev'ning from the top of Fesole

The regular iambic feet begin already at the end of the second line above with "whose Orb." Notice that this is enjambed with the following line, that is, run together as if there were no break. Also notice how Milton stitches the diction together by repeating vowels. The "O's" are quite dominant, but the "U's" have their effect as well. What makes passages like this so interesting is how Milton both regulates and deregulates relations between rhythm, syntax, and line, such that one is moving between the effects of prose and poetry. "The broad circumference hung on his shoulders" is really a prose line. "Whose Orb through Optic Glass the Tuscan Artist views" is obviously iambic poetry (the repetition of two beats, the first short, the second long). Rhythmically, the iambic feet work to *slow down* the pace of the passage as well as to stabilize the rhythm so that there will be the possibility of counterpoint between regular/irregular. The enjambment, moreover, skews the balance in such a way that Satan's wearing the moon as a shield is imitated in terms of its lopsidedness. One suspects the passage is mimicking Satan's attempt to walk with this enormously heavy shield, a walking that is off balance but also in balance at certain moments. It is in passages like this that one can see enormously subtle relations between sound and sense (which in this case is quite visual).

Everyone has been taught the “feet”: iambic (short-long), trochaic (long short), dactylic (long short short,) and anapestic (short-long long). But what is usually not taught in the lower schools, or even in university, is how the meter comes into conflict with main line stresses. When we read, we tend to stress the words whose meanings are important to the sense of the line, but these stresses may well conflict with the stresses hammered out by the meter, so that there is a counterpoint between how we read the line for sense and what the meter of the line itself is doing. Examples abound, but consider Ashbery’s line from “Farm Implements and Rutabagas in a Landscape,”

/ / / / / / /  
Be of no help to you. Good-bye...

The iambic pattern appears above the line and the main-line stresses are shown in terms of the underlined words. Now it has to be said that how one distributes these main-line stresses varies in terms of how we ourselves read. You may stress something differently than I would, which is what makes this sort of analysis a bit idiosyncratic. That aside, we can see that in the line above the main-line stresses actually predominate, though the iambic rhythm runs along like a sort of musical beat in the background.

For a slightly more complex example, notice Christina Rossetti’s “I plucked pink blossoms from mine apple tree” which is iambic throughout. Notice, however, that the alliteration of “plucked pink” and the elongation of “my” into “mine” works against the iambic meter. In fact, the trade off between the “p’s” and the “b” of “blossoms” (the phonemes are in binary opposition, but still labial) carries through an emphasis on the mouth, as if Rossetti was thinking of some relationship between herself and Eve with respect to tasting apples. The poem is entitled “An Apple-Gathering.” Throughout, Rossetti pairs words in imitation of the speaker’s relation to her beloved: “Lilian and Lilas smiled in trudging by”; “Ah, Willie, Willie, was my love less worth”; “Laughing and listening in this very lane.” Added to this is the fact that readers will impose main-line stresses, as well, that will serve to help imitate the speaker’s discourse in terms of an ordinary type of speaking. In other words, the main-line stresses work to naturalize or normalize the artificiality of the poem’s rhythm and its alliterative pairings and reaffirmations. “I plucked pink blossoms from mine apple tree.” No doubt, some would emphasize “blossoms” too since grammatically it’s the direct object. Yet, however we mark this line, the point is that main-line stresses are going to override the rhythm and even the alliteration, but that this isn’t in any way absolute, as the rhythm and alliteration are in counterpoint and exerting their own influence upon the overall aural texture of the lines.

To see a rather more complex example in the case of a contemporary work, here is a stanza by the British poet John Wilkinson.

I was. But she grinds in her condyl  
 all that’s known by heart  
cloaks the tongue your counter-  
poise would furl back. She refers  
foreign calls to her program<sup>25</sup>

This, at least, is how I read these lines in terms of the main-line stresses that have been underlined. Notice that “But she grinds in her condyl” (condyl is a medical term for a bone protrusion; perhaps a bone is out of joint here) is composed of two anapests and

that these fall in line with the main-line stresses. That second line is more iambic (“that’s known, by heart” is two iambs). But in reading it, the line seems to have but one major stress – at the end. The enjambment with the next line breaks the rhythm up quite perceptibly. “Heart/cloaks” is spondaic (two stresses together). But notice, isn’t that enjambment really a caesura (a break)? Alternatively, couldn’t it be either? There’s some imitation of stress between “heart/cloaks” and “furl back.” And “refers” imitates somewhat the ambiguity of the line break between “heart” and “cloaks.” We could read it as an enjambment and probably should, but I’m not convinced there isn’t the possibility of a caesura here. Given how the stanza reads in terms of its meaning, we needn’t be convinced necessarily that “refers” has to carry over to “foreign calls.” And yet the main-line stresses would suggest otherwise.

What we have in this stanza is a complex tapestry of inwoven metrical bits that mirror one another: iambs, anapests, spondees. We also have line breaks that manage to ambiguise the enjambment/caesura distinction, as well as metrical line stresses that mark out the places where meaning would appear to be most significant. Perhaps the reader has noticed that in this poem we’re not so far from the world of Ron Silliman’s concept of the *new sentence* in which a complete thought never achieves the kind of referential resolution (semantic or logical) that enables us to correlate the meanings onto something altogether recognizable within the life world. And yet the stanza is held together by the commonplace dominance of a subject (in this case, “she”) that works to normalize grammatical expectations and to organize how words ought to relate, given ordinary language practices. However, this isn’t always strong enough to hold a mimetic sound and sense relation together, given that in spots the details conflict with the givens of the life world that we know. And yet, “She refers/foreign calls to her program” is a well formed sentence, and *not a new sentence*. This speaks to the sense one may get in such poetry that the words slip into and out of mimetic correspondence so that one is in a kind of borderland region between proper and new sentences. Maybe a better way to put this would be to say that we’re in a liminal zone between mimesis proper and interlingual imitation. Ultimately, this takes us back into the work of Gertrude Stein in which a delicate balance exists between overt referentiality and the sort of inter-lingual wordplay that threatens to annihilate reference, not imitate it. Stein:

Checking an emigration, checking it by smiling and certainly by the same satisfactory stretch of hands that have more use for it than nothing, and mildly not mildly a correction, not mildly even a circumstance and a sweetness and a serenity.<sup>26</sup>

# CHAPTER 8

## Theory in Practice “Look, Her Lips”: Softness of Voice, Construction of Character in King Lear

*Michael Holahan*

Michael Holahan teaches English at Southern Methodist University. He studies the literature of the English Renaissance and its affiliations with the classical past. While his principal concern now is the drama of Shakespeare, he also extends his interests to include the development of the novel from Austen to Henry James and L. P. Hartley.

### I

*Slack and sleeping senses must be addressed with thunder and heavenly fire-works. But the voice of beauty speaks gently: it creeps only into the most awakened souls.<sup>1</sup>*

Twentieth-century theorists have been severe with the notion of literary character. It does not speak strongly to post-Victorian souls – to this century’s skepticism toward moral and mimetic constructions. The New Criticism set character aside for finer patterns of imagery and wit or paradoxical structures of ironical tone. Myth criticism subsumed it in the more powerful archetype. Deconstruction, new historicism, and the related specialties of poststructural critique have viewed an obviously figurative construct with alert suspicion. It has seemed a rallying point for essentialist notions of the self, reinforcing a superficial moralism and commonsense psychology while all along remaining just rhetoric: *ethos* and *pathos* meeting in *prosopographia*. Nevertheless, the artifice of character is hardly a postmodern discovery. The notion is central to most rhetorical traditions, although not entailing in every case the reduction of character to rhetoric.<sup>2</sup> In drama the issue is moot: there, within a constructed environment, the rhetoric of character is allowed to take on guises of truth because spectators can

*Original publication details:* Michael Holahan, “‘Look, Her Lips’: Softness of Voice, Construction of Character in King Lear.” *Shakespeare Quarterly* 48.4 (Winter 1997), pp. 406–431. Reproduced with permission from Johns Hopkins University Press.

willingly – and consciously – suspend degrees of disbelief. It needs to be added that suspending disbelief is not the same thing as becoming credulous.

Although no more than a literary device, composed of rhetorical elements, character has shown such persistence in literary and critical practice that it may well outlast theories that diagnose its death. The idea that literary character might remain one of the textual pleasures we seek out may be tested in the relentless assault on character we find in *King Lear*, which goes beyond character but uses the device itself to do so. Indeed, the play constitutes itself by dramatizing meanings and values that arise from various nodal locations set *between* literary devices of character. The play's disguising, for example, seems to flaunt such *knotted intervals* by calling attention to character put on, then off.<sup>3</sup> "Poor Turlygod! poor Tom! / That's something yet: Edgar I nothing am" (2.3.20–21).<sup>4</sup> Another example, and one central to my purpose of reconfiguring character here, involves the voicing-over of one character upon another: a juxtaposition and joining of two distinct figures – one with "something yet" in speech, the other with "no breath at all" (5.3.306). The interval comes down to this shifting, barely perceptible space between speech and silence, between one voice and an invoked voice no longer there. *Topoi* of speech, voice, and breath disclose an uncertain space between characters and suggest some moral arguments of acknowledgment that arise within it. These arguments extend from acknowledgment by a dramatic character to the particular kinds of acknowledgment offered in literary response.

This essay presents an interpretation of the value of one character, Cordelia, and the final relation of that value to Lear's last speeches over her body. My concern lies with a relation between characters at or near points of death and the issue of aesthetic closure. I find Cordelia's value located in her soft voice and "ripe lip" (4.3.20), and I wish to link these descriptions to Lear's final summons to our close attention: "Look on her, look, her lips" (5.3.309). This essay raises issues of stability of character, considering changes in the dying Edmund as preliminary to changes that occur for Lear. In my argument Lear changes by *looking* for and *imitating* Cordelia's soft voice; his character change is not solely a development of internal depth but is also an acquired responsiveness to another character. Character evolves not as a formation around a void but as a progressive delineation of spaces between or beyond distinct figures onstage. Instability in this case is no hindrance to character as meaning; it is a groundwork for varied effects of meaning. My goal is to emphasize this interpretation but also to keep in view a theoretical proposition concerning subjectivity. This holds that to term character "constructed" strips it of signifying value and reveals an emptiness of meaning in matters of subjectivity. Since character is nothing but marks on a page, such arguments run, it must be silent, seen but not heard. This claim is not so much a theorized objection to character as it is an evasion by reduction of the issue of meanings (and knowledge) generated by literary constructions.<sup>5</sup>

Against this reductive claim I try to find within Lear's speech to the dead Cordelia a discourse that is dramatic in its concern with character, ethical in its judgment of value, and constructed in its establishment of a perspective not original to Lear. My purpose is not to offer a theoretical defense of literary character; it is, rather, to test the possibility that a traditional literary device has been set in an unusual construction and, in so doing, to articulate patterns of achieved bonds more than those of developed interiority. My concern is to detach subjectivity from an exclusive identification with inwardness and to attach it to forms of ethical perception that resist categorical explanation. I aim at a description of character, ethical value, and shaped perspective that is "thick" in the sense that it plait these different languages into an "anthropology" of Lear's change.<sup>6</sup> His character is complete, defined by death and the play's close, in moments of final

change and construction that embrace other characters. This is the antithesis to disguising, for Lear becomes most himself as he becomes more like his daughter – or, more precisely, like her only in the briefest of dramatic moments and in the delicate sharing of a single trait as he takes on her voice. This taking-on is contingent, tangential, yet so marked that it may well elude theory's finest rigors. That is, precisions of a theoretical skepticism may not be the best way to recognize brief and delicate points of closure in *King Lear*.<sup>7</sup> Moral inquiry, with its concern for the particular nature of exchanges between persons, is better able, I believe, to represent those qualities that summon, shape, and puzzle our attention.

Such an occasion of brevity and delicacy gains dramatic resonance within a large architecture that continually repositions eyes and voices in significant meetings of image, theme, and situation. The father finds himself by means of his child, for this least daughter's voice has already taught him how to recreate certain bonds amid a ruin of doubt. The achievement in Act 5 depends upon an exchange in Act 4, where this poor sinner, once a king, claims nothing for himself except the name of his child. Yet his terrible weakness finds recompense in Cordelia's immediate response as she enacts without hesitation the difference between laughter and gentle acknowledgment.

LEAR	... Methinks I should know you and know this man Yet I am doubtful: for I am mainly ignorant What place this is, and all the skill I have Remembers not these garments; nor I know not Where I did lodge last night. Do not laugh at me For, as I am a man, I think this lady To be my child Cordelia.
CORDELIA	And so I am, I am. (4.7.64–70)

An effective brevity, Erasmus considered, is “so full of meaning that much more is understood than is heard.”<sup>8</sup> The brevity of this lady/child makes up an affirmation that is richly understood, and her two qualities – simplicity and affirmation – constitute the “I,” also constructed, who identifies in gentle reverberation the family relationship and the proper name. Confirming herself, she confirms this abused “man” as father and king, a confirmation of identities and roles that will be brutally tested until simple assertions of existence can no longer be uttered. Yet Lear will recall Cordelia’s voice and proclaim its general excellence, joining two crucial inflections – distinction and type – in the value of character: “Her voice was ever soft, / Gentle and low, an *excellent* thing in *woman*” (5.3.272–73, emphasis added). The close of *King Lear* projects drama’s rich interrogations about being and presence. What does it mean to hold and consider such excellence? to recollect her saying “I am, I am” or “No cause, no cause” (4.7.75), only to listen and watch her die, unable to speak? The shock to Dr. Johnson is well known and was not endured again until he subjected the play and himself to editorial discipline.

## II

*Finis coronat opus.*<sup>9</sup>

The play has other patterns of character development to examine beyond those of disguising, personal confirmation, or spherical predominance. Edmund uses (without

perhaps believing) a notion of historical conditioning or shaping. “[M]en / Are as the time is,” he notes to his captain after the British victory: “to be tender-minded / Does not become a sword” (5.3.31–33).<sup>10</sup> He then sets his executioner a task that leads to rope and his own death from the old king’s sword. This is one of the many turns to the sword that mark the violence of this play. We never hear, and perhaps do not expect to, whether the captain had his own moment of tendermindedness as Cordelia’s death conjoined with his. Since all characters are not equally important, by extension, what is offstage and out-of-text need not exist for speculation. It is different for Edmund. He is attractive (as Harold Bloom assures us), desired by both evil sisters, and distinctive; the time conspires to grant him, before death at his brother’s hand, a final and surprising shift to kind intention.<sup>11</sup> Moved by Edgar’s “brief tale” of their father’s end (5.3.181–99), he thinks of enacting a good. He reveals his “writ … on the life of Lear and on Cordelia,” offers his sword as a “token of reprieve,” and urges all to “send in time” (ll. 243–51). Time does expire for the queen. But what of her executioner, turned by voice, tale, and timing into a would-be savior: is his conversion legitimate or out-of-character? Is the problem one of ethics or aesthetics? What is the “time” of this character which leads him to this last effort at ineffective charity?

Does Shakespeare as well as Nature stand up for Edmund? Should we? Does it make a difference to condemn him for a writ on these two lives if he then goes on to mean well, despite his own nature? Cannot the end crown the work, the bastard speaking for, not against, Cordelia? Edmund’s attractiveness, for me, is theoretical in that he illuminates problems of stability and alteration in matters of character and ethical judgment. After 3.7 who could have thought that this young man had so much good in him? His Act 5 conversion is astonishing not only in itself but also as a prelude to more remarkable changes in Lear. They do share extremes of attitude toward Cordelia, even if last judgments on the two should not rest there. Nonetheless, an ultimate Edmund, unexpectedly tender, introduces a “new King Lear,” who brings his silent daughter to the stage and once again asks for her speech.<sup>12</sup> As the play concludes, *King Lear* raises basic issues of character, acknowledgment, and exchange. In my sense of the play, change of character is directly related to processes in which characters gain or lose acknowledgment as their voices contend within dramatic time.<sup>13</sup>

We like to view human character as stable, as fixed somehow in nature. Yet we know that it is not. It grows, or is constructed and reconstructed, to follow the signs of our time. In either case, a character must alter if ethical judgment is to do more than report on disjunct moments from the past when this or that agent performed well (or ill). That is, notions that a character can change yet retain a distinct identity are crucial to ideas of responsible freedom and their representation in literature. As Paul Ricoeur has remarked, one can distinguish between identity as sameness and as selfhood (a site for significant change) and in this distinction find occasions to weigh elements that do and do not change.<sup>14</sup> In this sense, character is not at all an unequivocal formation but the name for certain continuing negotiations between stability and alteration. In turn, an ethical judgment must be supple over time as well as tolerant of the sudden changes that can come to one as attractive as Edmund. Literary interpretation is not alien to such latitudes of judgment, for this practice encourages varied readings rather than a unitary law. Here, ironically, an attractive traitor is reduced to a character function and his dying affords an aesthetic perspective on the royal characters whom he tries to murder, then fails to save. Edmund’s good serves the literary plot before any argument of ethics; he is neither center nor circumference of this work. He can usurp many things but not *King Lear*. It has its own way with a “ficelle” so winningly brutal. He is borne offstage toward his man,

to die – “a trifle” (5.3.295) – as his victims return to the center with a specifically dramatic power. This aesthetic shaping of dismissal and return does carry some relish of ethical value. Poetic justice remains a kind of justice, at least for Edmund. Conversion to a good only earns him Albany’s final contempt and alerts us to more striking transformations for Lear. The endings of the two men are quite different yet not unrelated, for each comes to a voicing of ethical perception as a sign of altered character. Such signs should not be mistaken; they may very well bring us to a deep sense of the continuity of characters within the play. This can be said in another way: that judgments made about one character are not made in isolation from judgments about other characters. To note the irrelevance of Edmund, even in his last muster of an ethical voice, is to register the final power of Lear and Cordelia. Appeals to aesthetic qualities cannot, of course, forestall other judgments, even as acts and performances said to be ethical can still be evaluated aesthetically. One language of judgment cannot preempt the other. Nonetheless, *King Lear* asks for both and torments our professional efforts at a strict discrimination of issues. We may deny “Edmund” any benefit from his conversion even as we appreciate its aesthetic virtues. Acting always as an end unto himself, he ends up as a device of the play.<sup>15</sup>

Literary critics as different as Harley Granville-Barker and Stephen Greenblatt have noted an odd circling in *King Lear*.<sup>16</sup> Its action opens and closes with Cordelia’s silence, and it is the ethical value of those silences that I want to consider now, especially and obviously in their effects on Lear. The two silences are radically different, yet we know that difference to be the point of the dramatic action, language, and scene as these coalesce intensively at the end in general patterns of speech and sight.<sup>17</sup> The old man bends over his daughter’s body, desperate to prove any signs of an invisible speech or breath. Now his concern is less *what* she says than *that* she says, and he dies in the act of acknowledging something intended but unspecified – except for location – about Cordelia. Beholders are asked to see what may not exist, for this is and is not Cordelia. Her character now appears only in an actor’s body’s mimicry of a past life – a striking union of death and theatrical illusion. Yet the rhetorical effect is one of intense concentration on “her” – by the king and, with him, by the watching armies. Lear ends in a passion of seeing and commanding sight, with his own mortal period and point of exclamation: “Do you see this? Look on her, look, her lips, / Look there, look there! [Dies.]” (5.3.309–10).<sup>18</sup> As before, he desires her speech and gains nothing. Shakespeare reconstructs his design so that this last question and command extend from the stage groupings to us as readers or spectators. We are asked to see and told to look. To do so, we must read Cordelia’s lips, her father’s anguish, and our own capacity for compassion. Ethical judgment is contextual; it must include the object of value, the affect of those interested, and the skills of the judge. Lear can be held to these standards, for he comes to a profound revision of the value of his daughter and her gender as he asks her not to go. In Act 1 he bribed Cordelia to speak her love; then, when she would not (or could not), he ordered her to go. Here, as the circle closes, he utters a plea of love that asks only for softest speech – speech he must then recreate himself. We could say that Lear mistakes silence in a new way. Or perhaps we are struck by his belief that speech remains possible. In either case, the process is one of naming, address, and characterization with an intensity that few works match. The old king’s voice has changed.<sup>19</sup> An imperative “stay” begs. The original command – “Speak” (1.1.85) – is here a gentle question, although he himself is certainly not gentle in stopping Edmund’s man. Nonetheless, he has learned to plead with silence – the figure he now holds, addresses, and describes. His language becomes briefly a caress, softness itself.

Cordelia, Cordelia! stay a little. Ha!  
What is't thou say'st? Her voice was ever soft,  
Gentle and low, an excellent thing in woman.  
I kill'd the slave that was a-hanging thee.

(5.3.271–74)

Edmund was wrong about the time. Here a sword has indeed become tenderminded, for Lear has not always spoken so well of this woman, let alone all women.<sup>20</sup> The rack of the world has cracked his darker purpose as well as the misogyny in his own hangman impulses: “the great rage, / You see, is kill’d in him,” the doctor told Cordelia as she bent over her father (4.7.78–79). That rage was an exiled, exposed man’s frenzied madness. It followed and enlarged the earlier rages of an angry father and monarch. The arc of those emotions brought Lear to his own silence, an exhaustion between sleep and death. A medical diagnosis, however, was hardly enough to represent this condition or its outcome.

The play’s circle travels from and toward Cordelia by way of the king. Plot movement suggests an inner circle of characters bound together. We cannot understand the silence of the daughter without understanding the state or speech of the father. Lear’s health now rests with his daughter’s return and manner of identification. She must sweeten his imagination of “the sulphurous pit” (4.6.130), extending the motif of royal medicine by inverting archetypes of lost children and searching parents.<sup>21</sup> Her character seeks out his – to say in Act 4 what could not be commanded in Act 1, and with a gentleness that can repair the “high-engender’d battles” of his storm and night (3.2.23). It may strike some viewers that Cordelia mingles qualities of passivity and power to such a fine degree that the first quality must enhance (not diminish) the second. Cordelia’s gentleness can be understood etymologically as a joining of social or family status and of personal qualities – a royal birth as well as a private sense of loving duty. The difference between Act 1 and Act 4 concerns a divergence, within this patriarchal system, between royal commands and paternal appeals to a complex gentleness.

An ethics without an objective standard must be trivial. In *King Lear* that standard – one concerning the worth of speech – is embodied in Cordelia, especially in her lips and voice. They both form the shape and sound of value in this kingdom and suggest its vulnerability. Ironically, the injury to value begins in the command to speak. Lear is not wrong to want to hear Cordelia’s love; he is wrong to command its expression as a condition of inheritance. Commodifying love is not a way to recognize this daughter’s worth. “She is herself,” France chides Burgundy – and Lear – “a dowry” (1.1.241). Since this wealth lies in a silent character, the real challenge is a difficult discrimination between softness and emptiness. Kent puts the matter negatively to the king, but he only begins a terrible process in which Lear learns to distinguish “low sounds” from the “hollowness” of least loving: “Thy youngest daughter does not love thee least; / Nor are those empty-hearted whose low sounds / Reverb no hollowness” (ll. 152–54). Kent’s “plainness” (l. 148) has no effect but to send Lear’s hand to his sword, while “low sounds” are indeed concealed by “hollowness.” A statement of Cordelia’s value is assigned to France, a monarch-suitor who provides a formal set of loving paradoxes (ll. 250–61).<sup>22</sup> We in turn may decide that, if Cordelia is a center of value, her “low sounds” have yet to be constructed in an adequate rhetoric. The speech on duty which rings so coldly in Act 1 (ll. 95–104) requires later events to bring out its full tonalities.<sup>23</sup> Her exile heralds a terrible void in Britain, one that is figured by chaotic sites and acts of terror – a wild heath, a blinding storm, plucked eyes. The challenge for ethical inquiry is to complete a

circle, to redraw that map of hollowness, to call a soft voice home. An acoustics of true reverberation is tested severely by the longest absence from the stage of a major Shakespearean character.

The construction finally occurs in 4.3, a scene omitted from the Folio and often dropped in performance, perhaps because its technique is indirect yet highly mannered in the fashion of the reporting scenes in the late romances.<sup>24</sup> The scene may also seem irrelevant if one is unconcerned with Cordelia speaking or spoken about, with indeed the play's reverberations of her presence and absence. But 4.3 does reverberate the scene in which Kent, while stocked, takes out Cordelia's letter and prays for a "warm sun" to read by (2.2.162). In 4.3 Kent, turned auditor, listens to an unnamed gentleman describe Cordelia's reading of letters about Lear.

GENTLEMAN ... it seem'd she was a queen  
 Over her passion; who, most rebel-like  
 Sought to be king o'er her.  
 KENT O! then it mov'd her.  
 GENTLEMAN Not to a rage; patience and sorrow strove  
 Who should express her goodliest. You have seen  
 Sunshine and rain at once; her smile and tears  
 Were like, a better way; those happy smilts  
 That play'd on her ripe lip seem'd not to know  
 What guests were in her eyes; which parted thence  
 As pearls from diamonds dropp'd. In brief  
 Sorrow would be a rarity most belov'd  
 If all could so become it.  
 KENT Made she no verbal question?  
 GENTLEMAN Faith, once or twice she heav'd the name of "father"  
 Pantingly forth, as if it press'd her heart....

(ll. 14–27)

Both scenes contain rebellions – Kent's enraged attempt to punish Oswald, Cordelia's better self-control. The gentleman's language traces elaborate conceits of thematic bearing and a ceremonial description that offers itself as a part of its own gentleness. It is lettered artifice: a flourish of metaphors, an effort to state Cordelia's full worth as ruler and woman while underscoring her absence.<sup>25</sup> Here understanding is achieved by courtliness, not suffering, and by a language that asserts a virtue in surplus as *King Lear*'s plainest speaker listens. Although rhetoric, this is the antithesis of hollow speakers at court or of unaccommodated man, whimpering his folly before the elements. It is a revelation in figured meaning of what "play'd on her ripe lip" (1. 21).

The anonymous gentleman restates the Stoic ideal of self-government in a language of courtly richness. France's metaphor of the self as dower is extended to issues of rule. This new rhetoric shows rebellion subdued by queenly patience, nature's "sunshine and rain" bettered in the true daughter's ripe lips and pearl tears. Her qualities still speak to this gentleman's eye of recollection as he tries to convey to Kent the wonder of her presence. Here the power of her subjectivity is so well controlled that, in governing itself, it can lay claim to govern others, this unnamed gentleman or a would-be king of passion. The masculine title of "king" suggests that the implicit model may be Lear's earlier usurping rage. A gentle microcosm suddenly takes shape in Cordelia's rich sorrow, as if Act 3's storm should be replayed now in precious miniature.

In addition to self-government, the gentleman describes an act of heavy lifting that Cordelia could not perform in Act 1: “Unhappy that I am, I cannot heave / My heart into my mouth” (1.1.91–92). (In Act 5 that verbal action will pass to Lear in the literal burden of a dead daughter.) Here, before Cordelia returns to the stage, her authority in two bodies – as queen and as subjective person – is confirmed.<sup>26</sup> Her majesty is not that of Lear’s raging nor that of her husband’s cool faith. She can project her heart in the name of her father. In the next scene she will begin a process of healing, advised by the doctor to “close the eye of anguish” (4.4.15). A court ceremony of bestowing jewels will be translated into a deeply emotional spending of attention and care. From Cordelia’s heart and eyes (as imaged by the gentleman), a royal progress travels by tears and lips to Lear’s own sight (as witnessed by the audience). A ripeness of language and spectacle is all in both plots of the play; acts of jeweled pathos – the queen’s touch in language – will reach an untender brother in Edgar’s words about their father’s “bleeding rings, / Their precious stones new lost” (5.2.11; 5.3.189–90). This iconic language gradually rules even Regan’s “sweet lord,” who absented himself from ring-pulling and delegated murders so attractively.

Cordelia’s “ripe lip” closes the eye of anguish to enable better seeing. She is “rare” not only because of her absence but also because of her own verbal translation of the gentleman’s jewel metaphors into healing medicines. Act 4 moves from Cordelia described to Cordelia present (yet without her father) and finally to her moment of awakening him onstage.

DOCTOR Please you, draw near. Louder the music there!  
 CORDELIA O my dear father! Restoration hang  
     Thy medicine on my lips, and let this kiss  
     Repair those violent harms that my two sisters  
     Have in thy reverence made!

(4.7.25–29)

The simples of music and embrace lift him “out o’ th’ grave” and soothe the “molten lead” of his tears (ll. 45, 48). Act 1’s expulsion is under repair: having learned for himself to “say nothing” (3.2.38), the old man is reborn, recast. The natural relation of father and child is reconstructed as a relation of art. The void fills with gentle sounds. A counterpoint of music and the queen’s voice calls Lear from “the heaviness of sleep” to a restored vision of her as soul (4.7.21, 46). “[W]here did you die?” he asks her (1. 49), believing her to be the one transformed rather than the agent of his transformation. His phrase in Act 1 for a future with Cordelia could not have meant this scene, yet the scene does ironically reveal “her kind nursery” (1.1.124). Salving the hollow sisters’ “fangs” (3.7.57), the child brings the father to himself in a scene of waking and second birth as she heals a prodigal parent with an artful medicine of lips.<sup>27</sup> The intimations of a romance recovery are strong but not strong enough to overcome the swords, writ, poisons, noose, and quick savagery of Act 5.

The gentleman’s account was static, ornamental; Cordelia’s address is dynamic, performative. “Restoration” is allegory, desire, and event. The paired speeches are complementary, not antithetical; both hang on her lips as she returns to her nation and to language. “Love, and be silent” was the first resolve (1.1.62); now her lips can be act and speech act, the kiss and the gentle speech of kissing. Fragile and gracious, she is the real physician-antagonist to nature’s fearful storms. Such complementarity fits other

relationships. If royal authority is patriarchal, it still requires this daughter's healing; the "reverence" she anoints is that of the unkind father and the injured monarch at once. It is both reconciliation and recoronation: "How does my royal Lord? How fares your Majesty?" (4.7.44). The construction of Cordelia's value passes to her own speech and to the verb "repair" issuing in speech and kiss from her *ripe* lip; *ripe* in the senses of rich, red, full, yet ready for the reaping.<sup>28</sup> The play sets the construction of value in the lady, dramatizing a worth to her objective presence in stages of absence, reported return, and actual appearance. It then reveals the force of her value and presence in the repair of Lear, which will survive further losses, including that of the lady herself. She returns to go about her royal father's business and reapplies Luke 2:49 by subsuming in her "simples" the work of ideology in family, state, and belief (4.4.14, 23–24). Her character is at once value and value's instrument.<sup>29</sup>

A new power in that healing shows in the aftermath of defeat as feudal chivalry is put to one side. We are left to wonder whether Shakespeare's feudalism works as a sign of bourgeois progress or as a dramatic frame for tragedy. We may even conclude that historical approaches, whether that of a history of ideas or that of a new cultural materialism, overvalue not the fact but the role of feudalism in the play.<sup>30</sup> There may be some sense in following the lead of the characters. Lear does not regard this lost battle as he once did the loss of his knights, and we attribute the difference not just to the reductions experienced on the heath but also to the mingled strengths and tenderness given by Cordelia's love: her emotions fill the spaces opened and exhausted on the heath. He has been – and will be again – "child-changed" (4.7.17). There may be traces of escapism in the lyrical speech beginning "Come, let's away to prison" (5.3.8). Its assertive energies and purpose, however, stand in contrast to the weak, uncertain questionings in 4.7. Not so much distracted as prudent, it is the oblique, coded speech necessary before triumphant power.<sup>31</sup> One of "Gods' spies" (1. 17), distinct from Oswald, Tom, and Kent, Lear can speak to divine methods with an assurance that is resonant and vernacular, finding strange virtues in this necessity. Most kings enjoy a power over prisons; this one enjoys his power within and against the cage.<sup>32</sup>

Upon such sacrifices, *my* Cordelia,  
 The Gods *themselves* throw incense. Have *I* caught *thee*?  
*He* that parts *us* shall bring a brand from heaven,  
 And fire *us* hence like foxes. Wipe *thine* eyes;  
 The good years shall devour *them*, flesh and fell,  
 Ere *they* shall make *us* weep: *we'll* see 'em starv'd first.  
*Come.*

(5.3.20–26, emphasis added)

One can set Lear's two earlier speeches banishing and recognizing Cordelia against this farewell to power that invites new bonds of intimacy constructed in speech. Even programmatic skeptics toward large claims for language might allow that one could speak for two here. A new authority in the king emerges in this speech to Cordelia. Something is "caught" in his discourse, despite defeat and prison. What it means to win and lose is now in process of reconfiguring.

The failure of public speech and understanding in Act 1 is past. These two begin to share an imagination of sacrifice that ranges from heaven to fox burrows and across the good years that devour. The point is tone, not prediction; an uncanny poise of force and

gentleness in which, although she says nothing – a strange prolepsis – we may hear the lady's silent acceptance shaped in the address to her. Along with 4.3's Gentleman, Lear also talks for two. The king's speech is a harbinger – not the end but closer to the end than the plot is yet. Character effects – a rhythmical shifting of singular pronouns to plural – impart a sense of Lear's stand against the cosmos. Invoked sacrifices lead to mysterious images of *our* triumph in *providentia edax*: “the good years shall devour them.” We are left uncertain, as we are later in the scene, of the exact referents of pronouns and thus of the vocalized space that is set for us. Lear's language no longer divides the kingdom for others; it establishes a special space for his and his daughter's understanding. Feudalism establishes bonds of service that carry authority due to an ordering of classes and property by means of kinship hierarchies and personal dependence. *King Lear* explores sacrificial transformations that disclose through subjectivities of speech a new and objective authority. Lear's power rests in his speech, not in “champains rich'd” (1.1.64). His tones claim a vernacular emphasis quite new to him, although the accent took hold gradually in Acts 3 and 4. On seeing Gloucester in 4.6, he offered advice that seemed to amalgamate the experiences of both men: “What! art mad? A man may see how this world goes with no eyes. Look with thine ears” (ll. 151–52). Lear takes his own advice in Act 5. His eyes and voice disclose together, beyond the pain of loss, the rough shapes of sacred violence.<sup>33</sup> Yet this play does not allow private reconstructions to go unchallenged. However we may understand any testing agency ourselves, one appears in this play with terrifying economy and precision. This couple has been caught and shall be parted. An attractive character has had his own timely thoughts about the devouring to be done. As Lear and Cordelia exit under guard, Edmund signals to his captain and, by echoing “the old and miserable King” (5.3.47), extends the metrical line that Lear began: “Come hither, captain; hark. / Take thou this note” (ll. 27–28). The time is ripe for a brief lecture on tendermindedness and men who are swords – but it is delivered to a mercenary who is willing to hang a young woman in front of her father. Charity will later extend itself quite differently to Edmund. Here the postwar executions begin with an unattractive, banal exchange on postfeudal service – an administrator's act of passing on a letter and a chore.

### III

*And the truth is, one can't write directly about the soul. Looked at, it vanishes....<sup>34</sup>*

*King Lear* does not advance a single or unitary notion of literary character. It allows us to see characters made and unmade. A king is maddened but restored, only to face defeat, imprisonment, release, and stages of dying. The unmaking can be done verbally or violently, as a function of cultural practice or of physical assault. Cordelia's place in Britain goes as quickly, as savagely, as Gloucester's eyes. Throughout the play, we need to recall that Lear is the first to presage her death. In disowning her, his imagination inauguates horror.

Here I disclaim all my paternal care,  
Propinquity and property of blood,  
And as a stranger to my heart and me  
Hold thee from this for ever. The barbarous Scythian,  
Or he that makes his generation messes

To gorge his appetite, shall to my bosom  
 Be as well neighbour'd, pitied, and reliev'd,  
 As thou my sometime daughter.

(1.1.113–20)

We can read the Marlovian simile one way before syntax adjusts sense to make Cordelia, not Lear, the savage cannibal. We may further note the peculiar form of high speaking that is involved in this citation of a helpless daughter for her supposed savagery. It is not simply that an error is made here. Lear's speech reveals him as fully capable of evil – the evil of Tamburlaine, lord of “these barbarous Scythians,” who made his own child nothing, and who is present here as an allusive, usurping voice that reverberates, against historical time, within the British king's words.<sup>35</sup>

Lear will be held to account for this disfathering voice that invokes, if only by simile, the monsters to come. He must know the force of “disclaim” in the feudal vocabulary of renouncing lordship, although he cannot know the parallel between what he does to Cordelia and what he is doing to himself. The irony in his speech is that the behavior attributed to Cordelia seems, in the gender and violence of his chosen figure, all the more his own. In one or another reading of “generation,” Lear seems determined to interrupt and unmake his creation.<sup>36</sup> The simile of the “barbarous Scythian” seems at first to align him with the man who “makes his generation messes.” A surprise lies in turning from the three verbs of kindness to the brutal equation of Cordelia with that barbarity – the rhetorically dramatized consequence of being disclaimed by the king. The primitive fury stated here with deliberate and measured pace, Latinate diction, and calculated simile is – and ought to be – frightening. The voice is that of the savage father, wrathful beyond cause, demolishing all of the shelters of law and civilized existence as he learnedly denies his own child and, of course, himself. The agent of horror can be legitimate authority or not, a dragon or a dog in office. It makes little change: bodies, like kingdoms, were made to be torn apart, and other bodies are there to do what the captain terms, with brutal casualness, “man's work” (5.3.40).<sup>37</sup>

There is a large difference, to be sure, between bodies and characters. This is clear with Gloucester, who does not begin to see until after his eyes have been put out. Lear, in turn, is thrust into the “eyeless rage” of the storm (3.1.8), but his eye of anguish can discover a new vision of Cordelia. Yet there should be no quick assumption that new visions are necessarily desirable. Lear must move relentlessly from seeing the child restored as a royal lady to viewing the strangled woman “dead as earth” – Cordelia's character reduced to no more than the body of his sometime daughter (4.7.70; 5.3.261). At the end, he is beyond all issues of feudalism – not because society does not matter but because, as society's head, he has already broken the bonds of blood, neighborliness, and pity. Feudalism ceases to operate as an image for social structure at his own behest. All come crying hither, and no one in *King Lear* can alter this condition of birth beyond tears that part, like guests or jewels, from eyes of anguish.

Lear can anticipate madness. He can imagine a long imprisonment, provided Cordelia is there. Her actual death is another matter. His imperious temperament still expresses itself in absolute judgment: “I know when one is dead, and when one lives; / She's dead as earth” (5.3.260–61). But temper is now swayed by an intense love – one reconstructed from fury, madness, and exhaustion. Lear searches for Cordelia's life with things as slight as a looking glass, a feather, or his own dull eyes, hoping for “a chance which does redeem all sorrows / That ever I have felt” (ll. 66–67). We must be struck by such contrasts

of frailty and subjective intensity, as Lear does find a woman whose value has been repaired and restored at a cost not less than everything. She is now everything but alive, and his judgment wrestles with this disproportion of all and nothing, juggling in his words a hierarchy of queen and missing fool.<sup>38</sup>

And my poor fool is hang'd! No, no, no life!  
 Why should a dog, a horse, a rat, have life,  
 And thou no breath at all? Thou'l come no more,  
 Never, never, never, never!

(5.3.305–8)

What value could come to something poor, absent, dead? How can so little earth on a map be worth so much? – no less than all the sorrows of an antic majesty, redeemed perhaps but not yet ended. His speech contracts from “no life” to “no breath at all” and then to “no more.” It is destitution’s language; all ceremonies of distinction vanish with Cordelia’s last absence, and what remains is ordinary or worse – dog, horse, rat. This is an agony of dying, one of such force that the negations, augmented in the Folio, are simultaneously denials and acceptances of “no life” and “Thou'l come no more.” The half-brothers’ struggle – a feudal contest of trial by sword and combat – is completely outdone, and within seconds the questions asked of Cordelia will apply as well to this speaker. Set in climactic position, the deaths of these two characters are given a greater significance than the conflicts of national armies or the ritual contests of the brother-knights. Historical events and institutions, all arbitrations by sword, are subordinated to privileged characters and character relationships – everything that the new historicism argues is off-center in such literature. Should constructed characters of royalty so center and command the field of history? The daughter speaks with “no breath” to her anguished father; Kent declares that he “must not say no” to a silent call heard only in his ear of loyal service (l. 322). Can meaning’s “something yet” ever come from so near nothing? Can history simply declare itself a privileged form of new or old interpretation and tell us what *he* might have heard? Now as then, Cordelia speaks only to awakened ears as the soundless voice of gentle ways, the softest mystery in all things. Her silence is not the feminine submissiveness that Catherine Belsey hears, for the quality of her voice has passed to Lear as an authoritative sign of her rule in his ethical growth. To trace the limits on individual character in this play, we must study the interplay of its characters and not just the paradigms of social structure.<sup>39</sup>

Ethical judgment in *King Lear* arises from and returns to literary character. Each is matrix to the other. It is not a matter of a moral allegory or a Greek etymology but a view of dramatic action. Drama allows us to watch a process in which the construction of character cannot be separated from the judgments made by the characters about one another. Plot is not the only binding; we see that *ethos* is ethics. Lear’s first address to Cordelia concerns his “joy” in her, but that is a love understood according to elements of hierarchy, competitions of kingdoms or sisters, and the property wealth of nations. He stages spectacles – first for the British court, then for neighbor rulers – as his desires *interess* the presumed greed of all.<sup>40</sup> He can mention love, but Cordelia must speak for opulence, for rich lands in Britain and in France or Burgundy. As king and father, Lear defines her character as a subject-daughter: she must, in nature, want what his speech dictates. His pride swells as he gauges the worth of his “last” and “least” to fertile nations elsewhere. The command to speak introduces what should astonish all: that when this

British king divides, more is created. It is no simple weighing of dukes and their moieties. His least is indeed most, as the powers of France and Burgundy await the verbal aptitude of a youngest daughter. Her speech is supposed to delight Lear, then re-map Europe. We watch a royal father who gives away his kingdom but tries to control the gift, who gives away his last daughter but makes that gift contingent on his command over her. The treatment of Cordelia replicates the treatment of the kingdom, as the use of heraldic crops and geographical titles to identify her two suitors makes clear.

... Now, our joy,  
 Although our last, and least; to whose young love  
 The vines of France and milk of Burgundy  
 Strive to be interessa'd; what can you say to draw  
 A third more opulent than your sisters? Speak.  
 (1.1.82–86)

The nothing of Cordelia's silence reveals the failure in Lear's speech, which has demanded that her voice fulfill ideological purposes. Imperial calculations like these are absent from Lear's last speeches, although kingdoms remain at stake and the speaker can show his old temper. Cordelia no longer stands before and against him; she is nearer yet more distant. From her, still his center, he asks little: nothing formal, a short stay, a soft voice before the return to killing thoughts. The sequences of impotence and power in his address are rapid, intense.

I might have sav'd her; now she's gone for ever!  
 Cordelia, Cordelia! stay a little. Ha!  
 What is't thou say'st? Her voice was ever soft,  
 Gentle and low, an excellent thing in woman.  
 I kill'd the slave that was a-hanging thee.  
 (5.3.270–74)

As if beyond hearing him, "Cordelia" seems to move away. The effect rests in a turn from "thou say'st" to "Her voice" in line 272, as the dead body holds mimetic place onstage. Spaces open from his gestures of language, as intimacy suddenly generates – where no one is – a tiny dialogue of *I* and *thou* across a linguistic distance to death. Does one invoke Buber or Bakhtin here: the dialogue as a structure of intense, intimate relationships or as a structure of radical differences conjoined?<sup>41</sup> The gentle speaker and the murdered hangman join in the king's sentences: one death easily given, the other impossible to tell. Yet both figures have crossed to an undiscovered country whose nearest border is mapped by this final juncture of bent age and a least body. It is obvious to say that the play replaces Act 1's literal map with one that must be intuited, less obvious to urge that the second map is one of language, one that can chart the spaces between the ferocity of the finite verb in line 274 and the desperate tendermindedness of the last personal pronoun of renewed address to the hanged woman.

This point concerns Lear no less than Cordelia, his own lips as well as hers, and the way he speaks about her "now she's gone for ever." The fate of the hangman reminds us – and Lear – of the persistent, violent energies of the warrior-king. Edmund's sense of the times is not distant from this "good": "I have seen the day, with my good biting falchion / I would have made them skip" (ll. 276–77). All the more remarkable, then, is the juxtaposition of another ethical character within the dramatic character's speech.

This character is also Lear, but it has been constructed in the course of the play, as if being follows on speech. It has emerged after a natural schooling – in wild weather and in the abyss of madness. Howlings of storm and man still to a deep quiet. In this new character and experience, Lear can speak yet listen for the softest of gentle and low voices. Cordelia's asides in Act 1 would be marked now. Her softness is not the king's tonic register, but he has learned to speak within it and to hear it.<sup>42</sup> He seeks Cordelia's voice in his question, glosses her silence as her custom, and deflects the fact of her hanging into his execution of Edmund's "sword." In Lear's own voice we find the changes worked by this child who can speak no more, as Lear performs her voice before "her" body. A strange dialogue across existential spaces and times joins two different characters, preserving a difference in speech yet folding the two voices into the one body of the king.

This is not, though brief, an event without context. In 4.7, when Cordelia bent over Lear's exhausted face, she could see there, despite her absence and a reported reliance on letters, the storm and heath of Act 3.

... Was this a face  
 To be oppos'd against the warring winds?  
 To stand against the deep dread-bolted thunder?  
 In the most terrible and nimble stroke  
 Of quick, cross lightning? to watch – poor *perdu!* –  
 With this thin helm?

(4.7.31–36)

Oddly, her gentle voice reproduced his voicing of the winds: the characters reunite in shared speech. A stylistic joining of epithets, battle imagery, and a foreign term allows us to register the presence as well as the absence of the lady at the play's center. It must be a British princess and now a French queen who joins these two languages to lament her unconscious father – lost, then seen in marks on a page, now found in sleeping ruin: "poor *perdu*." From his face she seems to read and hear the terrible sights and sounds of cosmic battle. Her gentleness and absence form no obstacle to understanding his great loss, which is summoned from the past in a near-Marlovian echo of a more distant struggle and a very different face.<sup>43</sup> In 5.3 positions reverse as Lear scans his daughter's face. Others tried to interpret Cordelia for him in Act 1; he assumes that role here as his right, whether as father or as king. His reiteration of "ever" transmutes his loss ("gone for ever") into her enduring excellence ("ever soft"). The first silence is no longer "nothing"; what the angry father then disclaimed he now gives back in gentleness, her voice plaited within his own. Near death himself, yet still on watch within his thin helm, he completes a circle begun in Act 4, preserving in his speech the ever-soft voice of the absent-present dead, the character who is and is not there either at the play's center or at its end.<sup>44</sup>

The ethical value of Lear's speech is located in three emergent traits of dramatic character. The first is flexibility. An otherwise inflexible man assumes another voice radically different from his own. In the process, he alters his violently expressed opinions about his least daughter and her sex. He racks himself into tolerance, stretching his character by taking hers on. The second is acknowledgment. At the moment of death, Cordelia's presence is recognized as a value of utmost worth. Her body must be returned to the stage by the old man himself. After howling, he must bend over, cajole her into speech, and acknowledge the fact of her death and the equal fact of his passionate need for her

life. The third is reciprocity. It presupposes the first two but goes beyond them while twining them together. In imitating and characterizing the voice of Cordelia, Lear returns that voice to her in desperate gift and compliment. Her ripe lip repaired and restored him to social exchange. His deictic rhetoric concentrates final attention on her: “Do you see this? Look on her, look, her lips, / Look there, look there!” (5.3.310–11). “[T]his” is “there” in all ripe presence and reverberation, much more than can be said; and the corollary of such ripeness, now “autumn’s dust” (4.6.199), is a last reaping on a site anciently named a seeing place.<sup>45</sup> The mysteries of entwined lives meet in this accounting of eyes and voices, opening the terrible spaces in a dialogue of one. He looks, speaks, to her lips, there, “there.”

Shakespeare phrases Lear’s words so that no one shall see as much as the king commands. We are told to look, and we are left. We can, however, see what he says and read there the values in a committed attentiveness that bonds ethics and character in the play’s eponymous construction. The ethical point of real importance is not whether Lear is deluded as he dies.<sup>46</sup> It is rather the register and quality of his voice as he attends his daughter before he dies, his voice sinking toward hers as toward a shelter. No theory or law, however powerful, gives access to this site. There is no hovel or vault that stage or film can show us. It is the verbal space between characters that separates as it bonds them on a terrain of meanings. It is the unnerving sense in Shakespearean drama of an intense subjectivity showing its back above the language that it lives in. A gesture of direction is made, “Look there,” and we reach it – there is no other way – by means of the ripe lip, simples, and soft voice of interpretation.<sup>47</sup> Death may end the lady but not other locations for her voice. The value of Cordelia is now a function in Lear’s speech, a last “trick of that voice” (Gloucester’s phrase at 4.6.109), as if dramatic language could show, well beyond both bodies and characters, a transpersonal soul or (in terms less metaphysical) an ethical bond to a remembered voice. It is, as the gentleman said of the absent Cordelia, a becoming sorrow, “a rarity most belov’d.” Subjectivity is sensed most sharply not inside one character but in the intervals disclosed by the verbal response of one character to another’s silence. H. P. Grice coined the term *implicature* to refer to the influence of context on formations of unstated meaning. In *King Lear*, implicature locates subjectivity powerfully within the spaces between speech and dead silence.<sup>48</sup> Context allows us to hear Cordelia in King Lear, and that response from us completes the protagonist-king’s command.

Characters mean marks and subjects of difference. Shakespeare constructs and positions them to reveal the palpable gaps in between – joining; interesting; investing as though with rights, values, being – those same literary constructions that remain different yet so remarkably combined in dramatic speech, death, and closure. It is not that any one character per se defines meaning but that characters, stable or changing, have agencies to perform in constructing those complex meanings that plays supply. They are agencies that audiences do and theories should aim to read.<sup>49</sup> The notion of an essential self may well be delusory. It may also be a red herring. There is no cognate relation between the philosophical concept and the literary construction, and the former’s powers of delusion only increase if invoking them can direct attention away from Shakespeare’s inventions of character and the extraordinary relations between their sustaining words. We repeatedly watch characters start out as *données* yet end as achievements, and such achievements only heighten the interplay of pattern and distinction in structures of language, character, and drama. When King Lear describes Cordelia as a voice – soft, gentle, low – he also redescribes himself, binds a constant of her character to his own,

and enacts some small measure of the freedom to complete change at *King Lear's* ending. In the midst of "general woe" (5.3.319), a cracking and tearing of all given bonds, he performs something remarkable yet next to nothing, a shift of phrase and tone in four lines: "Few words, but, to effect, more than all yet" (3.1.52). The achievement may be slight in various schemes of judgment, including some within the play, but interpretations of it can still reward the effort.<sup>50</sup> "Look with thine ears" was Lear's mad counsel to the blind earl (4.6.152), and the end of the play shows the king observing his own advice. What would it mean if we did not or could not listen? That the voice was not there? Or too soft for sleepers to hear? Even Nietzsche—the notable thunderer of my epigraph—knew to listen for soft sounds and a gentle voice.

## IV

*I don't really speak about what I see, but to it.*<sup>51</sup>

Such is the power of artistic conventions, as E. H. Gombrich has shown us, that we are always completing patterns, designs, and forms in our minds.<sup>52</sup> Characters only begin in marks on the page; they reach their ends in us, occasioning a more extensive text than appears on the page. Even if skeptical, we may still find it difficult to regard such signs without presuming an interior self continuous with the character we behold. Perhaps this is the point of the device. As we advance our own process of inner understanding, it may seem quite natural to imagine a similar process at work, especially onstage, in a vivid, powerful figure like Lear as he beholds Cordelia. And who is to say that such imagining is unreal or irrelevant? Why not call it a personal experience pressing toward conditions of knowledge, a speculative sympathy, an exercise in ethical imagination?<sup>53</sup> Moral inquiry requires such attitudes of generosity, a speculative willingness to entertain the value of someone other who is only partially perceived. Much the same may be claimed for the literary interpretation of texts. An essay by Maynard Mack that I admire accounts for Lear's death as just such a complex of actions interior to one character. It creates meaning by making Lear's own vision, consciousness, heart, and hope trace a final plot of inner subjectivity. Seeing his daughter dead, the character is said to confront what he knows and has known of this world and so to strain the limits of his being. As his *cogito* disintegrates, he still

tries to hold ... this painful vision unflinchingly before his consciousness, but the strain ... is too great: consciousness itself starts to give way: "Pray you, undo this button: thank you, Sir." And with it the vision gives way too: he cannot sustain it; he dies, reviving in his heart the hope that Cordelia lives: "Look on her, look, her lips, Look there, look there!"<sup>54</sup>

This is a forceful account of Lear's death, its qualities drawn from the confident use of texts and inward perspectives on dramatic action. Yet in it, the royal directive seems to point only toward Cordelia's lips. Its plot stands revealed as a subjective action in Lear's heart and hope, an inner space where, despite disintegration, both revive, as if only there they can unite, as if inwardness and subjectivity must be one space – the sole place to join the importance of speech to that of unity and termination.

My effort has been to look in a different direction: to study the fields of space around and between characters rather than within one character, and to consider acts of looking

and speaking as dramatic contractions of such spaces. A distinction from Wittgenstein has served as my prompt.<sup>55</sup> I have concentrated on the energy and intensity of *looking to*, and the pattern that I complete involves Lear's lips rather than his heart and a mimetic sentence that prolongs "a little" Cordelia's vocal life. It is a voiceover of recognized otherness rather than one of interior expression, revealing a knowledge of one character embodied in the other's vocal action. Because Lear knows this, and can say this, we now know a great deal more about his powers. What he achieves in his language – a combining of distinct voices – is not simply an interiorization of the other gained by inferences about that character's subjectivity. His language is public, ethical, dramatic – meant for all audiences to hear, to understand as judgment, and to feel as the completion of a terrible circle. "Speak" was the imperative to Cordelia in Act 1. No one could then realize that his command would be obeyed only when she speaks at last in and through his voice, complicating finally the roles of speaker and listener as "she" mends his speech a little (1.1.93). Cordelia *speaks there* so gently and softly as to be heard and not heard, her lips' motions seen and not seen. The end is thus a strange form of pleasure asking us to see exact yet wrenching constructions of *ethos* and *pathos* in distinct yet contingent characters who make little sense, have no life, apart from one another.<sup>56</sup>

Precisely because it is a matter of characters, not one character, I cannot look through Lear's racked body to his breaking heart, although that word has figured in the play's language from the first scene. Stage directions signal a different turn and bond: "*Enter Lear with Cordelia in his arms.*"<sup>57</sup> We are to witness an unexpected strength, endurance, and discipline as we measure finally Lear's burdened acts of carrying, looking, and speaking. A broken heart may mark the end, as Kent prays, but it is only one sign of the ethical action that is at last painfully complete. I agree with the last speaker – Albany (Q) or Edgar (F): this king has indeed seen much and borne most.<sup>58</sup> He has looked on Cordelia's lips, and what he sees there, in the face of final silence, entails the play. He has borne to the stage not only this least weight of body but also a soft, gentle voice in his own child-changed character of speech. Lear speaks as father but also as king, surrounded by audiences but centered as before by variously gauged distances between his character and that of Cordelia. The spectacle is both domestic and political. Cordelia returned to a father and king: "How does my royal Lord? How fares your Majesty?" Lear and his play circle back again to divisions of kin and kingdom. Having much to answer for, he brings in the work's grim harvest as two distinct changes in death and closure remain. They set him with his daughter in the namesake play and finish a father's business in an achieved softness of voice: not "nothing" but "something yet," a tonality struck by him that is not his alone, a voice literally now between their lips. Before the silences of death and dramatic closure, such shifting constructions of character let us hear fine lines of affiliation drawing a fullness and an emptiness in represented being. The study of character in *King Lear* need not restrict or simplify meanings; it need not return us covertly to Victorian codes of ethics and empire. It can enable the play's richest meanings because the figures of character are thoroughly constructed and set within intimate companies and embraces of voice, though within, finally, no more than voice itself.<sup>59</sup>

It is an ending that a later play repairs, although in a language of antithetical reverberation. Impossibility here is art's easy making in *The Winter's Tale*. There one king, urged on by another ("See, my lord, / Would you not deem it breath'd?"), can admire in a "dear stone" a queen's true image: "The very life seems warm upon her lip" (5.3.63–64, 24, 66). Leontes, his lost daughter now found, can be moved to astonished questioning – "What fine chisel / Could ever yet cut breath?" (ll. 78–79) – and then to

genuine wonder. He affirms the lady who has preserved his dead wife's character and statue so that image and figure, seeming and life, can be one. It is a resonant, happy metamorphosis of emotion, stone, and art; everything, in short, that cannot be achieved in *King Lear*.<sup>60</sup>

What you can make her do,  
I am content to look on: what to speak,  
I am content to hear; for 'tis as easy  
To make her speak as move.

(ll. 91–94)

Contingencies, even of breath and speech, move oppositely in romance and tragedy. Ethical meaning in *King Lear* has little to do with assembled pieties or retreats into a fragmenting, solitary self. It has everything to do with the nearly ineffable value of life in a character who has none, and under this intense pressure the character who speaks of that life gives up his own, after commanding us to do as he has done. “Do you see this? Look on her, look, her lips, / Look there, look there!” The force of this perception, which I have linked to moral inquiry, is such that we run the risk of becoming what we see, of speaking for ourselves the voice that we long to hear. There is, nevertheless, a greater risk: that of refusing sight and of regarding silence as if it means nothing at all. “Nothing will come of nothing,” Lear retorted earlier to Cordelia’s silence (1.1.90). By play’s end, he thinks differently, and that difference is a function of his character and hers over the time of the plot. There is “something yet” in the nothing of her death, and it is caught in, and represented by, Lear’s recollection of her voice.

My last point – that there is a function to characters – cuts against the grain of current speculation about literature. That speculation finds the idea of character too blunt an instrument for analytic work as well as too burdened with suspect categories of philosophical thought. In each case the objection involves attitudes toward literary construction. The first objection concerning bluntness may well seem true if certain instances of literary analysis are put on display. But since character is a constitutive part of the literary work itself and not merely a term of hermeneutic art, it cannot be the case that we *ought* to read a play and ignore its characters, no matter what else we or others choose to notice. It is precisely the construction that needs a finer study. The second objection concerning suspect categories is well taken, but only if the idea of character has been confused with ideological concepts of an impermeable, self-sufficient, or sovereign individualism. Lear may be every inch a king; it does not follow that he knows or rules himself. There is a clear remedy: study the construction, erase the confusion, trace the knots that bind characters. Toward that end, this essay has sought to understand characters within a play as one would words within language. That is, the meanings generated by characters are established by an interplay of difference and resemblance across protocols of custom and use, and the meanings so generated and established own their significance not within themselves but against ground-works of structure. The structure studied here is the voice of Lear as he comes to articulate the value of his daughter’s life in dramatic speech that shapes absence and presence at start and finish. Literary works are indeed structured like a language, and it is because of such structuring that characters, like words, enable a play of meaning – not in any absolute sense but in the varied and contingent senses of meaning that make up the difficult conditions of truth within time.<sup>61</sup> Within those conditions, the “voice of beauty,” which is not the voice of any single

character, offers distinctive inflections and asks an acknowledgment of the crucial work of characterization, voice, and speech in *King Lear*.

## Notes

Two seminars at annual meetings of the Shakespeare Association of America gave this essay its start: one on character led by Robert Knapp (1994), and one on *King Lear* led by R. A. Foakes (1996). I would also like to thank Walter Reed, who read an early version with care; my colleagues at Southern Methodist University; and an anonymous reviewer for this journal, who saw large as well as small problems acutely.

- 1 Friedrich Nietzsche, *Thus Spoke Zarathustra: A Book for All and None*, trans. Walter Kaufmann (New York: The Modern Library, 1995), 93.
- 2 Christy Desmet situates character in the context of theory; see *Reading Shakespeare's Characters: Rhetoric, Ethics, and Identity* (Amherst: U of Massachusetts P, 1992), 3–58. See also J. Leeds Barroll, *Artificial Persons: The Formation of Character in the Tragedies of Shakespeare* (Columbia: U of South Carolina P, 1974); and Lawrence Manley, *Convention 1500–1750* (Cambridge, MA: Harvard UP, 1980), 106–33. Richard Lanham defines the rhetorical terms in *A Handlist of Rhetorical Terms*, 2d ed. (Berkeley: U of California P, 1991), 111 and 123.
- 3 Maynard Mack treats an opposite arrangement: “umbrella speeches, [under which] … more than one consciousness may shelter” (“The Jacobean Shakespeare” in *Jacobean Theatre*, Stratford-upon-Avon Studies 1 [London: Edward Arnold, 1960], 26). Mack states his purpose modestly as a revision of Bradley, but his notion of speech as a shelter for multiple consciousnesses suggests a new view of language rather than a revision of ideas about character. One should note that New Criticism and postmodern theory do share some views: e.g., on the limits of character criticism. My italicized phrase notices the somewhat different qualities of density (*knotted*) and emptiness (*intervals*) that concern me.
- 4 Quotations of *Lear* follow the Arden Shakespeare *King Lear*, ed. Kenneth Muir (London: Methuen, 1952). Muir’s is a composite text, based on the Folio with additions from the Quarto. I am grateful to the publishers of the Arden Shakespeare Third Series, who allowed me to see bound proofs of Reginald Foakes’s forthcoming edition, *King Lear* (Walton-on-Thames, UK: Thomas Nelson and Sons, 1997). Bringing to bear a thorough knowledge of the textual issues, Foakes has chosen to present a conflated text’s “possible versions” (128). Quotations of all other Shakespeare plays follow the *Riverside Shakespeare*, ed. G. Blakemore Evans (Boston: Houghton Mifflin, 1974).
- 5 The classic case against *nothing-but* arguments is William James, *The Varieties of Religious Experience* (Cambridge, MA: Harvard UP, 1985), 11–50; the reduction he counters: that religion is nothing but sexuality displaced. To say that character is nothing but marks on a page reduces an idea to its material display. William H. Gass offers the grammatical reduction: “Polonius, that foolish old garrulous proper noun” (“The Concept of Character in Fiction” in *Fiction and the Figures of Life* [New York: Knopf, 1970], 34–54, esp. 37). On the beholder’s share that lets a noun age and talk foolishly, see E. H. Gombrich, *Art and Illusion: A Study in the Psychology of Pictorial Representation*, rev. ed. (New York: Pantheon, 1965), 181–241. Bernard Harrison comments on *Lear* while discussing postmodern theory and kinds of truth in literature; see *Inconvenient Fictions: Literature and the Limits of Theory* (New Haven, CT: Yale UP, 1991), 54–61.
- 6 Character is usually viewed as a literary device that represents effects of consciousness – senses of coherent interiority and depth. Harold Bloom declares Shakespearean inwardness canonical; see *The Western Canon: The Books and School of the Ages* (New York: Harcourt Brace, 1994), 70–75. I do not deny such representation or its importance in *Lear*. I consider an awareness that seems to move among characters and not within one alone. “Thick description,” a term coined by Gilbert Ryle, is associated with Clifford Geertz’s “Thick Description: Toward an Interpretive Theory of Culture” (in Geertz, *The Interpretation of Cultures: Selected Essays* [New York: Basic Books, 1973], 3–30) and indicates accounts that are circumstantially specific and interpretive. By “an ‘anthropology’ of Lear’s change,” I mean that change in Lear’s character is best understood as a function of his bonds to

others, especially Cordelia. I use the term more narrowly than Louis Adrian Montrose does in “The Purpose of Playing: Reflections on a Shakespearean Anthropology” (*Helios* n.s. 7 [1980]: 53–74) to refer to a dramatic refinement of kinship relations. His concern is with larger implications of ritual and symbol in theater and society.

- 7 Paul de Man, for example, makes fragmentation a theoretical principle in his essay on Shelley’s *Triumph of Life*; see “Shelley Disfigured” in *Deconstruction and Criticism*, Geoffrey Hartman et al., eds. (New York: Seabury, 1979), 39–73. De Man’s closing abstractions assert a program of radical skepticism (68–69); in contrast, Shelley’s richly figured *terza-rima* stanzas lead to a break-off question. The distinction lies between unfolding a theoretical argument of skepticism and a poetic rhetoric of interrogation.
- 8 Desiderius Erasmus, *On Copia of Words and Ideas*, trans. Donald B. King (Milwaukee, WI: Marquette UP, 1963), 104. Kent likewise notes the value of brevity: “Few words, but, to effect, more than all yet” (3.1.52).
- 9 Cf. “The end crowns all” (*Troilus and Cressida*, 4.5.224).
- 10 According to Jonathan Dollimore’s materialist reading of *Lear*, the play confirms the dictum that men are determined by the time; see *Radical Tragedy*, 2d ed. (Durham, NC: Duke UP, 1993), 196. He does not put the theory in any qualifying context: e.g., Edmund’s own deviation from that time. At 1.2.124–40, Edmund mocks his father’s sense of heaven’s agency, as he would, no doubt, any similar dependence on history as an agent.
- 11 Harold Bloom suggests that Edmund is attractive because he is at ease in the world and able to articulate it as his own; see *Ruin the Sacred Truths* (Cambridge, MA: Harvard UP, 1989), 77–79. Shakespearean character, Bloom argues, has come to model human nature; developing Chaucer, Shakespeare stages “the representation of change by showing people pondering their own speeches and being altered through that consideration” (54).
- 12 Barbara Everett, “The New King Lear,” *Critical Quarterly* 2 (1960): 325–39. Her title takes in two meanings: a change in the king’s character and a shift in interpretations of that change. She spots tendencies to Christianize Lear’s suffering, opposing to them her vitalist sense of “forms of intense life” (338).
- 13 S. L. Goldberg emphasizes “acknowledgement” and the limits to meaning in *An Essay on King Lear* (Cambridge: Cambridge UP, 1974), 30–34, 174, and 190. I admire this account but find a greater possibility for meaning in Lear’s sense of Cordelia’s voice than Goldberg’s essay allows. See also Emmanuel Levinas, *Outside the Subject*, trans. Michael B. Smith (Stanford, CA: Stanford UP, 1993), 121–25 and 34. Levinas adopts tropes of “the face” and “face-to-face” encounters to express issues of subjectivity and intersubjectivity.
- 14 See Paul Ricoeur, “Self as *Ipse*” in *Freedom and Interpretation: The Oxford Amnesty Lectures, 1992*, Barbara Johnson, ed. (New York: Basic Books, 1993), 103–19.
- 15 It is formally neat as well as ethically appalling that Edmund is responsible for the deaths of all three daughters. Stephen Booth finds the proper end of the play in the deaths of Edmund, Goneril, and Regan (the end in poetic justice?) and declares the deaths of Cordelia and Lear to be “culminating events of [Shakespeare’s] story” that take place “after his *play* is over” (*King Lear, Macbeth, Indefinition, and Tragedy* [New Haven, CT: Yale UP, 1983], 11). I am uncertain about the value of distinguishing between *play* and *story*.
- 16 See Harley Granville-Barker, *Prefaces to Shakespeare I* (London: Sidgwick and Jackson, 1927), 133–231; and Stephen Greenblatt, *Learning to Curse: Essays in early modern culture* (New York: Routledge, 1990), 98. For a severe circularity that omits Act 4’s reunion, see Jonathan Goldberg, “Shakespearean Inscriptions: The Voicing of Power” in *Shakespeare and the Question of Theory*, Patricia Parker and Geoffrey Hartman, eds. (New York: Methuen, 1985), 116–37.
- 17 Paul J. Alpers offers an interesting critique of the New Criticism; see “*King Lear* and the Theory of the ‘Sight Pattern’” in *In Defense of Reading*, Reuben A. Brower and Richard Poirier, eds. (New York: Dutton, 1963), 133–52. Alpers argues that treating metaphors as primary data (in place of characters and actions) yields unwarranted equations; images of sight (a function of metaphor) are made to represent insight (a function of character). Patterns of imagery intensify instead character bonds, “man’s actual dealings with other men” (138). Postmodernists, however, might question

- any designation of character as primary with respect to other uses of literary language. The issue is whether literary study can accept categories other than those of language, whether hierarchies of categories are possible or useful.
- 18 These lines appear in F only (without exclamation point). They concentrate Lear's attention on Cordelia and move forward the moment of his death. Kent's reference to "the rack ["wracke"] of this tough world" (1. 313) follows as choral commentary. In Q the death and choral commentary coincide, turning attention from Lear and Cordelia to Lear and Kent. Q thus lacks the intensity of structure in F. The treatment of death as a visual or theatrical experience is established by the managed suicide in 4.6.
  - 19 Beginning with Alpers's distinction between language and character, Stanley Cavell argues that *King Lear* avoids recognitions and thus love. A subargument treats character change; another considers what it means to acknowledge a person. Cavell treats character experience atomistically; he discusses Lear's recognition of Cordelia but not, as a part of that experience, Cordelia's response to her father. Cavell's general view of the play excludes responsiveness and exchange; see "The Avoidance of Love" in *Must we mean what we say?* (Cambridge: Cambridge UP, 1976), 267–353.
  - 20 F gives *woman*; Q, *women*. It is worthwhile to consider both words in competition for textual space and the differences they suggest about general character. Editorial selection on display yields a richer end than does strict separation – here a generic, not a plural, term, marking Cordelia's constitutive power. Such work with a conflated text and its apparatus can show the text to be more than marks on a page yet not mystify its origins.
  - 21 Maud Bodkin's well-known treatment of archetypes emphasizes a pattern of heroic suffering in the father, an emphasis that obscures Cordelia's role in returning to vary the pattern of paternal suffering; see *Archetypal Patterns in Poetry: Psychological Studies of Imagination* (Oxford: Oxford UP, 1934), 15–17 and 272–76.
  - 22 For Elder Olson, France's sketch of Cordelia as a value in herself anticipates Lear's final intuition; see *Tragedy and the Theory of Drama* (Detroit, MI: Wayne State UP, 1961), 207–9. The conflict between Lear and Cordelia, he argues, lies between a feudal lord's asking for one kind of love and a family member's understanding of love not as formal pledge but as unspoken trust. Cordelia dies so that Lear can learn familial love; he dies in sign of the lesson learned. At 1.1.160, Rowe added the stage direction that has Lear reach for his sword.
  - 23 Cordelia's death enacts Kent's point and turns her sisters' early lies to her late truths. Goneril asserted "A love that makes breath poor and speech unable"; Regan claimed that Goneril names her deeds: "In my true heart / I find she names my very deed of love; / Only she comes too short" (1.1.60, 70–72). The older sisters' speeches are validated by the youngest's silence. Cf. Harry Berger Jr., "King Lear: The Lear Family Romance" in *Making Trifles of Terrors: Redistributing Complicities in Shakespeare* (Stanford, CA: Stanford UP, 1997), 25–49, esp. 46–49.
  - 24 Such reporting scenes include *Pericles*, 1.4; *Cymbeline*, 1.1, 2.4, and 5.3; and *The Winter's Tale*, 1.1 and 5.2. Sidney's *Arcadia* is a source for this passage in *Lear* (see Muir, ed., 161n).
  - 25 Sheldon Zitner dislikes the high style's "emptiness" and "pasteboard prettiness" ("King Lear and Its Language" in *Some Facets of King Lear: essays in prismatic criticism*, Rosalie L. Colie and F. T. Flahiff, eds. [Toronto: Toronto UP, 1974], 6). These qualities – under other names perhaps? – are relevant to dramatic function in a sequence from description to appearance to act. Patricia Fumerton, for example, links uses of adornment to "the rise of the self" (*Cultural Aesthetics: Renaissance Literature and the Practice of Social Ornament* [Chicago: U of Chicago P, 1991], 28). Marianne Novy traces an imagery of tears to develop themes of pity, mutuality, and forgiveness and comments acutely on Lear's description of Cordelia's voice in relation to issues of femininity and patriarchy; see *Love's Argument: Gender Relations in Shakespeare* (Chapel Hill: U of North Carolina P, 1984), 158–63.
  - 26 Ernst H. Kantorowicz shows not only the constructedness of character but a full awareness and use of the issue in medieval discourse. He traces distinctions between the monarch's political and natural persons or bodies, beginning his influential study of medieval political theology with *Richard II*; see *The King's Two Bodies: A Study in Medieval Political Theology* (Princeton, NJ: Princeton UP, 1957). In *The Poetics of Primitive Accumulation: English Renaissance Culture and the Genealogy of Capital* (Ithaca, NY: Cornell UP, 1991), Richard Halpern approaches the issue

through a neomarxist economics, studying “the divorce between the signs and the material realities of royal power” (220). Constructedness, one concludes, is not an unconditioned idea; to own significance, it needs a specified historical context. To point out that an entity is constructed cannot by itself fix (or unfix) meaning, since construction is precisely the manner of creating meaning.

- 27 There is a marked orality to family relations in *King Lear*. One can give, deny, withhold, or destroy love by acts of voice, mouth, or lips. On fantasies of passivity and sadism in the oral phase of development, see Norman N. Holland, *The Dynamics of Literary Response* (New York: Oxford UP, 1968), 34–38. F makes Cordelia the medical figure, replacing the Doctor with a Gentleman; see Foakes’s Arden edition, 349n.
- 28 The etymology of *ripe* includes Old English *rip* (harvest) and *ripan* (to reap, harvest). Cordelia describes Lear “crown’d” with weeds and sends a search party to “the high-grown field” (4.4.3, 7). For *repair* and *rich*, see Gloucester to Tom/Edgar (4.1.76–77). Spenser’s account of King Leyr (reprinted in Muir, ed., 237–38) traces patterns of restoration, ripeness, and death; it ends, after the king’s death, with Cordelia’s overthrow and suicide by hanging. Redemptive readings of the Lear story antedate not only Bradley and New Criticism but also Shakespeare’s tragedy.
- 29 Muir, ed., cites Luke 2:49 (166n). Cordelia’s shift of reference to an earthly father is one part of her mediating work. Harold C. Goddard studies Cordelia’s work of repair in *The Meaning of Shakespeare* (Chicago: U of Chicago P, 1951), 522–57, esp. 541–49. For a compressed account of materialist ideology in *Lear*, see Terry Eagleton, *William Shakespeare* (Oxford: Basil Blackwell, 1986), 76–83.
- 30 Studies of the play have treated feudalism variously. For a valuable contrast between the history of ideas and the new historicism, see Rosalie L. Colie, “Reason and Need: *King Lear* and the ‘Crisis’ of the Aristocracy” in Colie and Flahiff, eds., 185–219; and Halpern, 215–69. We may debate whether Shakespeare’s feudalism works primarily as a historical topic or as an artistic device to image historical settings of character. Is chivalry put aside a sign of bourgeois progress, a dramatic frame for tragedy, or some admixture? On the problems of using Foucault and Stone in commentary on Shakespeare, see David Cressy, “Foucault, Stone, Shakespeare and Social History,” *ELR* 21 (1991): 121–33.
- 31 Annabel Patterson shifts the study of censorship from a censor’s work to the author’s mediation of living with censorship; see *Censorship and Interpretation: The Conditions of Writing and Reading in Early Modern England* (Madison, WI: U of Wisconsin P, 1984). The point extends to characterization. Censorship becomes an issue in the play if one takes Lear’s speech as imagining a new life within conditions of imprisonment.
- 32 Marlowe provides a model for powerful helplessness. Bajazeth gains rhetorical power within Tamburlaine’s cage, where he is held with his wife for the spectacle of two onstage imperial suicides; see *Tamburlaine I* in *Christopher Marlowe, The Complete Plays*, ed. J. B. Steane (Harmondsworth, UK: Penguin, 1969), 4.4 and 5.2. *Lear* redirects atrocity in Act 5 toward the savaged emotional bonds between father and daughter, suggesting that the real prison and torture are a world without Cordelia: “he hates him,” Kent states, “That would upon the rack of this tough world / Stretch him out longer” (5.3.313–15).
- 33 René Girard’s work on the relationship of violence to the sacred bears importantly on *King Lear*; see *Violence and the Sacred*, trans. Patrick Gregory (Baltimore: Johns Hopkins UP, 1979). A complex rite of sacrifice, the play reveals bewildering, abrupt acts of substitution and violent displacement. Lear’s language shows him at last to be ripe for a true ceremony of surrendering the kingdom in death. On the use of the pronouns *thou* and *you* in *Lear*, see Randolph Quirk, “Shakespeare and the English Language” in *A New Companion to Shakespeare Studies*, Kenneth Muir and S. Schoenbaum, eds. (Cambridge: Cambridge UP, 1971), 67–82, esp. 70–72; and Alessandro Serpieri, “Reading the signs: towards a semiotics of Shakespearean drama,” trans. Keir Elam, in *Alternative Shakespeares*, John Drakakis, ed. (London: Methuen, 1985), 119–43.
- 34 Virginia Woolf, *A Writer’s Diary: Being Extracts from the Diary of Virginia Woolf*, ed. Leonard Woolf (London: The Hogarth Press, 1953), 85.
- 35 Marlowe heightens the cruelty of his barbarous Scythian in *Tamburlaine II*. The captured Olympia utters this phrase while killing her son to preserve him from worse tortures (3.4.19); Tamburlaine

- kills his first son for failing the father's heroic standards (4.1.105–39). On earlier dramatic forms in Shakespeare, see Howard Felperin, *Shakespearean Representation: Mimesis and Modernity in Elizabethan Tragedy* (Princeton, NJ: Princeton UP, 1977), 12–43.
- 36 Muir, ed., gives examples of usages in which *generation* can mean *parents* rather than *offspring* (11n). Lear may intend a shock at the emergence of the former meaning.
- 37 If one considers the work of Goneril and Regan, an irony attends the phrase "man's work." Elaine Scarry's discussion of the body in pain offers valuable reading beside *King Lear*; see *The Body in Pain: The Making and Unmaking of the World* (Oxford: Oxford UP, 1985). See also Caroline Spurgeon, *Shakespeare's Imagery* (Boston: Beacon Press, 1958), 338–39. On the range of Lear's voice in the physical space of the theater, see Daniel Seltzer, "King Lear in the Theater" in *On King Lear*, Lawrence Danson, ed. (Princeton, NJ: Princeton UP, 1981), 163–85, esp. 178–85.
- 38 Muir summarizes various speculations about Lear's use of "fool" for Cordelia; e.g., Armin, playing the Fool, may have doubled as Cordelia (see Muir, ed., 217n). Sidney objected to kings and fools on the same stage; see Sir Philip Sidney, *An Apology for Poetry*, ed. Geoffrey Shepherd (London: T. Nelson, 1965), 135. Lear's king is called a fool by a fool; later, with a new tone and meaning, the king directs the term to his daughter.
- 39 A principal aim of new-historicist critique is to "decenter" the subject, to remove it from an unfounded place of privilege in the interest of redressing power. New historicism's understanding of a work is thus frequently shaped by ideologies of power and victimization. Alvin Kernan offers a "Whitehall" reading of divine-right theory in *King Lear*, a sly marriage of the often-anathematized Tillyard to new historicism; see *Shakespeare, the King's Playwright: Theater in the Stuart Court, 1603–1613* (New Haven, CT: Yale UP, 1995). On the softness of Cordelia's voice as a sign of feminine submissiveness, see Catherine Belsey, *The Subject of Tragedy: Identity and Difference in Renaissance Drama* (London: Methuen, 1985), 178. The issue of literary centering (e.g., on constructed characters) returns us to what Aristotle might mean by his observation that literature is more philosophical or universal (not simply abstract but putative, counterfactual, speculative) than history; see *Poetics*, trans. W. Hamilton Fyfe (Cambridge, MA: Harvard UP, 1927), 34–39.
- 40 The Latin term *interesse* acquired technical meanings in property law: to invest someone with a right to or share in something; to admit to a privilege. The word occurs in F (1623) but not in Q (1608).
- 41 See Martin Buber, *I and Thou*, trans. Ronald Gregor Smith (New York: Scribner's, 1958), 1–11; and Mikhail Bakhtin, *The Dialogic Imagination*, ed. Michael Holquist, trans. Caryl Emerson and Michael Holquist (Austin: U of Texas P, 1981), 259–422.
- 42 Clifford Geertz points to the ethical dilemma of the anthropologist when recording yet thereby appropriating another's voice; see *After the Fact: Two Countries, Four Decades, One Anthropologist* (Cambridge, MA: Harvard UP, 1995), 128–30. Literature generally, and drama in particular, offer significant violations of this code. Lear's appropriation of Cordelia's voice, however, seems to carry the significance of ethical perception rather than asserted power.
- 43 Cordelia echoes Lear's language on the heath. The letters referred to in 4.3 lead one to expect her knowledge of wind, thunder, and lightning, but she adopts as well his epithets (3.2.1–9) and compound epithets (3.1.11, Q only). We are shown the storm as a continuing function in Lear's mind that Cordelia can read, speak, and calm. *Perdu* entered English in the French phrase *sentinelle perdue* – an exposed or forward and hazardous sentinel post (or the sentinel himself). Such a post was the position of a scout or spy; hence the link of "poor *perdu*" to "God's spies" (5.3.17). Cordelia's use holds the military sense as well as the sense of exposure to the elements. For Marlowe's Faustus and Helen's face, see *Doctor Faustus* in Steane, ed., 5.1.97–103. René Weis notes the allusion and F's abbreviation of this speech in *King Lear: A Parallel Text Edition* (London and New York: Longman, 1993), 269n.
- 44 Marjorie Garber discusses the equation of silence with death and Freud's use of Shakespeare; see "Freud's choice: 'The Theme of the Three Caskets'" in *Shakespeare's Ghost Writers: Literature as uncanny causality* (New York: Methuen, 1987), 74–86. Freud understood Lear's entrance carrying Cordelia as his act of carrying death to himself; I understand it as Lear's qualification of death by love. Cordelia is thus carried in an opposite direction to dying Edmund, an emblem with ethical and theatrical significance.

- 45 *Theater*, from Greek *théatron*, a place for seeing, a theater; from *theáomai*, to view, gaze at, behold. On deictic rhetoric – language that articulates “the situation and … the space in which it is pronounced” – see Serpieri, 122.
- 46 Muir asserts a complicated emotional process for Lear in which joy over seeming life in Cordelia causes his death, a belief that we can see as delusion (lili). Joseph Summers, in a line of argument near mine, revises this Bradleyan point, arguing that what Lear sees and what has life is what Cordelia has taught him about love; see “Look there, look there! The Ending of *King Lear*” in *English Renaissance Studies*, John Carey, ed. (Oxford: Oxford UP, 1980), 74–93. Summers traces convincingly the emotional rhythms of this discovery (92). Muir’s view is seconded by Maynard Mack in King Lear in *Our Time* (Berkeley: U of California P, 1965), 114; Barroll, 250; and recently by R. A. Foakes in *Hamlet versus Lear: Cultural Politics and Shakespeare’s Art* (Cambridge: Cambridge UP, 1993), 218–19. For criticism of this view, Ian J. Kirby, “The Passing of King Lear,” *Shakespeare Survey* 41 (1989): 145–57.
- 47 Getting the world right – and not merely interpreting it – is a traditional way of defining knowledge and philosophy. Considering the limitations of philosophy for ethical thought, Bernard Williams suggests analogies for similar limitations of other forms of theory in relation to interpretation; see *Ethics and the Limits of Philosophy* (Cambridge, MA: Harvard UP, 1985). The point is not to deny theory – it is a strong form of interpretation – only to question claims of governance over all methods of interpretation, as if theory somehow stood outside or above interpretation.
- 48 In arguing against Bradley’s notion of a deceived joy, Kirby suggests that what Lear sees is not an illusion of renewed life but a departing-yet-summoning spirit (156–57). Susan Snyder studies the play in terms of Kübler-Ross’s stages of dying; see “*King Lear* and the Psychology of Dying,” *Shakespeare Quarterly* 33 (1982): 449–60. She concludes that Lear and Cordelia die together and not as individuals; that the time lapse “allows Lear to do the impossible, to experience his own death and cry out against the terrible wrongness of it” (459). Roger Fowler introduces Grice’s term, summarizes his argument, and provides a bibliography; see *Linguistic Criticism*, 2d ed. (Oxford: Oxford UP, 1996), 135–36 and 159.
- 49 Jonathan Goldberg urges “the radical instability of character as a locus of meaning in the Shakespearean text” (“Textual Properties,” *SQ* 37 [1986]: 213–17, esp. 215). This claim may be true if one attempts to align particular meanings with particular characters. If one views a variety of characters as engaged in a process of constructing thick or clustered meanings, the case may seem less desperate, as Goldberg’s discussion of Malvolio suggests.
- 50 In view of such slightness, an objection might be put that I describe less than a change of character – merely a new element added to an existing character. Such an objection might encourage a review of basic terms – *character, person, body, voice, change, event* – and what we might expect of them in literary discussions of constructedness. I have found Bernard Williams especially helpful on physical qualities of a voice as mediations between body and character; see *Problems of the Self: Philosophical Papers 1956–1972* (Cambridge: Cambridge UP, 1973), 11–12. Roland Barthes remarks on pleasures in “the grain of the voice” and “the articulation of the body, of the tongue”; his remarks suggest character’s presence in the physical or material voice (*The Pleasure of the Text*, trans. Richard Miller [London: Jonathan Cape, 1975], 66–67).
- 51 Ludwig Wittgenstein, *The Blue and Brown Books* (New York: Harper and Brothers, 1958), 175.
- 52 See Gombrich, 181–287. Earlier he discusses the role of “schemata” in a process of stipulation, correction, and making in the visual arts (84–90), an exposition that can apply to other disciplines. Here literary character is a function of rhetorical and literary schemata, an author’s practice with them, and the contributing emotions, intelligence, and memory of different audiences. In this view, character could never be reduced simply to printed marks on a page.
- 53 In a recent issue of *PMLA* on “the status of evidence,” Heather Dubrow observes the value of “experiential evidence” and “personal accounts” (“Introduction: The Status of Evidence,” *PMLA* 111 [1996]: 7–20).
- 54 Mack, King Lear in *Our Time*, 114. Mack’s argument is larger than I have managed to suggest; he notes levels of meaning contributed by senses of “intimate humanity” and by various practices of literary history (78–80).

- 55 Elaborating on this distinction, Wittgenstein points out that a direction to see ought not to be confused with what is seen (176).
- 56 A. D. Nuttall puts the issue in a title – *Why Does Tragedy Give Pleasure?* (Oxford: Clarendon Press, 1996) – and ends his discussion with *Lear* and the strange pleasure of tracing sequences to a terrible end (104).
- 57 The stage direction is the same in Q and F (references to attendant figures differ). Muir's Arden edition gives “*Re-enter LEAR, with CORDELIA dead in his arms*” (5.3.256 SD). Because Lear appears earlier in the scene, Dyce altered “*Enter*” to “*Re-enter*”; Rowe inserted “*dead*” to end uncertainty over Cordelia's condition.
- 58 Albany speaks in the plural (“The oldest have …”) and presumably refers to both Lear and Gloucester; Edgar speaks in the singular (“The oldest has …”) and refers to Lear alone. The problem of the close is to adjust the Lear experience to the ongoing fortunes of the state. F develops Lear's death by inserting 5.3.309–10, giving a firmness to the role of Edgar in closure. Thus, rather than the detached Albany, Edgar, who has been to the heath, speaks last in F to represent Lear's influence on the living.
- 59 Hélène Cixous's meditation on character as singular and repressive of genuine literary energies is both stimulating and provocative; “The Character of ‘Character,’” trans. Keith Cohen, *New Literary History* 5 (1974): 383–402. Although her essay can be described as *against character*, it requires the concept to drive its polemic.
- 60 In his Arden edition of *The Winter's Tale* (London: Methuen, 1965), J.H.P. Pafford notes the Pygmalion story from Book X of Ovid's *Metamorphoses* (xxxiv). Lynn Enterline argues the success of the female voice in a rhetoric of animation in *The Winter's Tale*; see “‘You speak a language that I understand not’: The Rhetoric of Animation in *The Winter's Tale*,” *SQ* 48 (1997): 17–44. *King Lear* seems to me to present other problems: the female voice succeeds but at the cost that is tragedy.
- 61 For the analogy between characters and words, see Martin Price, *Forms of Life: Character and Moral Imagination in the Novel* (New Haven, CT: Yale UP, 1983), 55. I have benefited from this wide-ranging discussion of character in the novel.

# CHAPTER 9

## Theory in Practice

### *Romantic Rhetorics (from Elizabeth Bishop: The Restraints of Language)*

*C. K. Doreski*

Elizabeth Bishop's poetry was written during the era when the New Critics were prominent in the American academy and were setting the agenda for how students were supposed to understand and read poetry. Poems were best when they achieved a unity of form and content, welding universal idea to concrete image. The best poems were embodiments and revelations of great truths. Often those truths had a spiritual quality, as was the case with William Wordsworth, who felt nature consisted of embodied spirit. Look at a flower and you see God. Bishop's temperament was more skeptical and materialist. She delighted in describing the world, but she was reluctant to embrace the idea that the world embodied spirit. Indeed, in several poems such as "Crusoe in England" and "Over 2,000 Illustrations and a Complete Concordance," she mocks the notion that the world is anything more than world – simple material physical reality with no spirit in it. Moments of revelation when spirit supposedly intrudes in life are called "epiphanies," and C. K. Doreski describes how Bishop, following Wordsworth, evokes the possibility of an epiphanic revelation of spirit only to disappoint that expectation.

Epiphany and the power of naming (which in the modern era begins by naming the writer-as-authority) are two characteristically romantic-modern rhetorical embodiments of knowledge. Bishop, who largely learned these devices from Wordsworth, manipulates their conventions for some of her richest effects, and also for some of her most intriguing complexities. As I have previously argued, resistance to language that attempts to delve into the psyche or the world of the spirit characterizes her poetry. The process of resistance itself, however, constitutes a powerful rhetorical structure that shapes much of her best work. The epiphanic mode, which this chapter will discuss first, requires the poet to transgress the text and explicitly share its self-realization, its transcendence of

*Original publication details:* C.K. Doreski, "Romantic Rhetorics" from *Elizabeth Bishop: The Restraints of Language*, pp. 34–64. Oxford University Press, 1993. Reproduced with permission from Oxford University Press.

language into immanence. Trust in the epiphany did not come readily to Elizabeth Bishop. As her poem “Santarém” warns, there is always the chance that the auditor might misunderstand the significance of the triggering subject and query “What’s that ugly thing?”, inadvertently mocking the ideational. What some critics consider Bishop’s extreme reticence and excessive decorum may be linked to her notions of decency and communion, and to her ultimate distrust of epiphany.

The challenge for Bishop was to use epiphanic staging (the means of preparing the reader) without violating her aesthetic of reticence (a literary more than psychological tic). Though often labeled epiphanies by her critics, Bishop’s gestures toward the Wordsworthian landscape of divine immanence do not usually function as such. In her encounters with the notion of a spiritual dimension suggested or revealed by landscape, the characteristic motion of her poems is a recoil from the beyond, retreating back into the poem itself.

This suggests the true depth of reticence in Bishop’s poetic. Epiphany would and should open up the poem to uncontrollable exterior forces, relinquishing the law of metaphor and imposing a dimension beyond the ordinary reach of language. Bishop, who viewed poetry as a limited, and fortuitously limiting, exchange, refused to acknowledge any pressure to contain, expand, define, or even escape life through art. From the shark-filled “spangled sea” of “The Unbeliever” to the sheltered interior of “The Monument,” from the road-checked interior of “Cape Breton” to the “armored cars of dreams” in “Sleeping Standing Up,” Bishop clearly defines the terms of commerce in part by delineating the interiority and the exteriority of, respectively, her presence and the poem’s surface strategies. Bishop’s decorum surely included a sense of propriety or decency. Rather than a personality quirk, deficient ego, or exaggerated morality, however, her reticence informs her original language and diction, and is the basis of her refusal of many conventional poetic motifs that would, if allowed to, render her poems almost ordinary.

Throughout her work Bishop explores various rhetorical postures that respond to Wordsworth’s epiphanic stance. At times she presents us with a natural vantage point, nature without human intervention. In “The Sandpiper” [QT], a creature scurries about in the midst of chaos; though “focused” and “preoccupied” he is not yet engulfed by the natural forces swirling about him. Unconscious of the threatening vastness, which humans might identify as epiphanic, he has developed a unique shoreline philosophy:

The roaring alongside he takes for granted,  
and that every so often the world is bound to shake.  
[CP, 131]

At once a student of Blake (“in a state of controlled panic”) and Keats (“The world is a mist. And then the world is / minute and vast and clear”), the shorebird sees his random fate as one with the minute particulars of the “millions of grains” of sand. In his element, the sandpiper knows none of the frustrating dislocations of humans in the landscape and therefore sees no need to transcend them. The traveler-spectator Bishop, on the other hand, needs to correct and interpret, as well as frame the scene:

He runs, he runs straight through it, watching his toes.  
— Watching, rather, the spaces of sand between them,  
where (no detail too small) the Atlantic drains  
rapidly backwards and downwards.

Jealous of the bird's complete concentration on the particular, the poet introduces a human measure of scale. After all, the bird is obsessed with the sand, not his toes. Unlike the fleeing creatures of "The Armadillo" [QT], the sandpiper runs in a world devoid of human presence and its attendant scale. The poem shares a view from above – or beyond – this obsessed bird's seascape.

Though usually occupying a contemplative or a migratory presence in the landscape, Bishop occasionally assumes the advocacy-role of witness of human destruction of nature, the world of damaged shores. Exiled by her refusal of ordinary empathy, the poet grieves from a distance, regretting her undeniable kinship with destroyers. "The Armadillo" and "Brazil, January 1, 1502" confront the violent presence of humans in the natural world. Both deal with the role of Christianity in a fallen world in which humankind is a deadly presence. Bishop sees humans as oppositional, the only creatures capable of losing innocence. She traces sin to religion's door, accusing Christianity of sanctioning, or worse, ignoring true sin.

The paired Brazil poems shuttle back and forth through time, refusing epiphany through shifts in tone and regressions into history. In "Brazil, January 1, 1502" [QT], even as Bishop forsakes the literal for the pictorial frame, she identifies her intrusive presence in Brazil with that of the sixteenth-century conquistadors who, like herself, "left home." Perhaps like the wanderer of "Questions of Travel," these explorers "[t]hink of the long trip home." These men, unlike the poet, came to conquer, not to contemplate, and see their faith as the guiding spirit of their savagery. Leaving Mass, their celebration of interiority, the soldiers are heard

... humming perhaps  
*L'Homme armé* or some such tune,  
 they ripped away into the hanging fabric,  
 each out to catch an Indian for himself –

[CP, 92]

Yet Bishop refuses to acknowledge their conquest, preferring instead to depict the ever-receding unknown of the tropical "hanging fabric." The hellish pollution of the second stanza clearly emanates from these "hard as nails" Christians. This perception becomes the opportunity to capitalize upon Keats's mistake:

Or like stout<sup>1</sup> Cortez when with eagle eyes  
 He star'd at the Pacific – and all his men  
 Look'd at each other with wild surmise –  
 Silent, upon a peak in Darien.  
 "On First Looking into Chapman's Homer"

Cortez (unlike Balboa, the true discoverer of the Pacific) leads the assaulting Christians of Bishop's poem. Christianity here is part of that life "of wealth and luxury" that has brought death and destruction upon the meek. The voices of the vulnerable, miniature women mingle with the cries of the natural creatures of the interior world; they seek a protection in that world beyond humanity.

Escape into that world is not always possible, however, and epiphany may offer only the illusion of escape into another dimension. Within a few pages, Bishop returns to the unyielding persistence of human violence. Again Christianity, or the fragments of religious celebration, hovers in the background, sanctioning the disarray and cruelties of

the piece. Unlike the protective fabric of the earlier poem, the firelit landscape of “The Armadillo” offers no sanctuary for the beleaguered creatures. The poem offers a glimpse of a secularized religious celebration, long since stripped of intent and meaning; the “frail, illegal fire balloons” ascend toward a waiting saint. In ascendancy, the fire floats assume lives of their own:

the paper chambers flush and fill with light  
that comes and goes, like hearts.

[CP, 103]

Unstable and undirected, these heaven-bound balloons, gestures of “love,” bear the potential of either love or war:

Once up against the sky it’s hard  
to tell them from the stars –  
planets, that is – the tinted ones:  
Venus going down, or Mars ...

Oscillating between the heavenly extremes, the “tributes” represent a kind of chaos, not order; terror, not relief and penance. Bishop suggests that their very uncertainty – “With a wind, / they flare and falter, wobble and toss” – aggravates earthly insecurities. Inappropriate celebrations, which are both blasphemous and ignorant, violate the sacredness of ritual and disrupt the relationship between culture and nature. Such violation is likely to provoke fate and turn “dangerous”:

but if it’s still they steer between  
the kite sticks of the Southern Cross,  
receding, dwindling, solemnly  
and steadily forsaking us,  
or, in the downdraft from a peak,  
suddenly turning dangerous.

The final line plummets toward the grim consequence of a moment of particularized sensation – an actual event, not merely a condition. Yet Bishop turns this tale of fragile faith and false tribute not on the plight of humanity but of innocent creatures. As messily careless in descent as ascent, the fire balloon “splatter[s] like an egg of fire,” immolating airborne and ground-dwelling inhabitants alike. The scene commands full attention as the fire “egg” ironically brings death to the owl’s nest:

The flame ran down. We saw the pair  
of owls who nest there flying up  
and up, their whirling black-and-white  
stained bright pink underneath, until  
they shrieked up out of sight.

The appearance of the visibly immature (“short-eared”) baby rabbit captures the instantaneous transition of the setting:

So soft! – a handful of intangible ash  
with fixed ignited eyes.

Even as the poem reaches for the airy substance of the hare it disintegrates into the elements, returning the speaker's gaze with the steadfast certainty of death. An epiphany would reach for comfort and assurance, for insight and explanations through a glimpse of a dimension in which suffering doesn't occur. The lyric hero, however, responds only to ignorance and fear. In the italicized exclamation of the closure, the poet challenges even the aesthetic posture of poetry; she cries out as one forever earthbound:

*Too pretty, dreamlike mimicry!  
O falling fire and piercing cry  
and panic, and a weak mailed fist  
clenched ignorant against the sky!*

The harsh deformations reject all falsification and softening of reality. Invocation and resignation collapse together in an impotent outcry as rage displaces epiphany. Unable to transcend the horror of this awesome occurrence, yet unwilling to return into the experience of the poem, Bishop gestures angrily but agnostically toward the beyond, challenging the type and substance of the incomprehensible. Bishop, like Wordsworth, sees humanity's dilemma as one of estrangement from natural vision; but unlike her predecessor, she has neither the ability nor the will to penetrate the other-world and confirm herself in epiphany, further distancing herself from such harsh realities. She can neither accuse nor ignore her own kind; she can only grieve.

In her distrust of epiphany Bishop, however, occasionally finds herself competing with and antagonistic toward the natural or phenomenal world, and that dramatic situation requires an epiphany. "The Fish" [NS], Bishop's most frequently anthologized poem, relies upon a Wordsworthian spiritual exercise to justify a rowboat transformation from plunderer to benefactor. The collapse of distinctions between land and sea, the air and earth of the speaker, obscures the borders between life and art. Bishop perceives the fish in land-language of "feathers" and "peonies" and "tinfoil" and "isinglass." Even as she works those changes, however, the fish works reciprocal wonders of its own. Passive resistance deprives the fishing poet of her triumph: "He didn't fight. / He hadn't fought at all." She soon understands that her knowledge of the fish is inaccurate.

Evidence of past encounters – "two heavier lines, / and a fine black thread / still crimped from the strain and snap / when it broke and he got away" – tells of a different fish. Earlier seen as "battered and venerable / and homely" (the line-break softening the accuracy of description), the fish now assumes the mock-role of tribal elder and hero:

Like medals with their ribbons  
frayed and wavering,  
a five-haired beard of wisdom  
trailing from his aching jaw.

[CP, 43]

Deprived of the fight, the poet must contemplate her position as the harbinger of death. The "little rented boat" marks a closed world wherein the speaker represents the moral force of her species. Taken by the incongruity and insignificance of the colloquy,

the reader is swept from the sensuous into the psychological, then moved beyond earthly particulars to a spiritual whole:

I stared and stared  
and victory filled up  
the little rented boat,  
from the pool of bilge  
where oil had spread a rainbow  
around the rusted engine  
to the bailer rusted orange,  
the sun-cracked thwarts,  
the oarlocks on their strings,  
the gunnels – until everything  
was rainbow, rainbow, rainbow!  
And I let the fish go.

As in the Christian parable, the oil upon the waters brings peace. It also engenders communication with the otherworldly. Through a rare Wordsworthian “spot of time,” a genuine epiphany, the poet admits, somewhat reluctantly, a momentary conventional wisdom. This leap from perception to wisdom signals the arbitrariness so characteristic of the epiphany.

Though “The Fish” is certainly central to her canon, Bishop’s boredom and dissatisfaction with the poem suggests a fear that the poem settles into sentiment instead of expanding into true wisdom. The matter-of-fact weightiness of the fish, a real survivor, lured the poet beyond the limits of her usual work, and tempted her out of her characteristic reticence. Fully aware and thoroughly suspicious of the technique and purpose of epiphany, Bishop usually contents herself with a suggestive advance toward and a sly retreat from the world of imaginative fulfillment beyond the page. Most of her journeys circumvent the critical moment of epiphany. Even as the poem reaches a crescendo, the poet reverses the flow, forcing it back into the journey, back within the intended limits of the poem itself. As “At the Fishhouses” demonstrates, Bishop is capable of presenting a Wordsworthian landscape only to carve the mass into her own figure. The glistening eternal present yields to the recurring past participles and tide of subjunctives that transform an otherworldly scene into a shared earthly experience – bounded by knowledge that is “historical, flowing, and flown.”

The most useful examples of Bishop’s near-epiphanic mode are found in her journey poems. Her destined or indifferent traveler sets forth with an unvoiced program, an inescapable linearity, but remains uncertain of the destination. The poems never lack a sense of discovery, though the end looms invariably in sight. “Cape Breton,” “The Riverman,” and “The Moose” suggest that Bishop was always aware of figures in the landscape; the problem was to present them without invoking a facile sentimentality that would accrue through gratuitous access to epiphany.

An opportunity to read the landscape for significance without plunging into epiphany comes in “Cape Breton” [CS], which challenges the preconceptions and sensitivities of the reader as it prepares, shapes, and withdraws a glimpse of the otherworldly. Bishop expects her readers to recall the lessons of its neighboring poem,<sup>2</sup> “At the Fishhouses,” and apply that knowledge to this place and situation. “Out on the high ‘bird islands,’ Ciboux and Hertford,” readers enter a world removed from and yet sinisterly impregnated by human habitation. The relatively comical “razorback auks and the silly-looking

puffins” stand as ceremonial guards along the cliff’s edge “with their backs to the mainland.” Humanity’s presence, however, is everywhere: in the “pastured sheep,” in the frightening airplanes that threaten them, in the “rapid but unurgent [pulse] of a motor-boat.” More than humanity’s “unnatural presence” threatens the islands, which are surrounded and upheld by the heartless immensity of the Melvillean<sup>3</sup> sea; as the ocean seems its calmest, it turns most hazardous. Effortlessly, Bishop draws attention from the placid uncertainties of the landscape to the more threatening uncertainties of the sea:

The silken water is weaving and weaving,  
disappearing under the mist equally in all directions,  
lifted and penetrated now and then  
by one shag’s dripping serpent-neck. . . .

[CP, 67]

The times and tides of Bishop’s sea form and enact their own fate. Bishop does not rely solely upon the sea to produce such mysterious effects. The fog blocks the various natural penetrations and rents in the earth’s surface – “the valleys and gorges of the mainland” – further suggesting the difficulty of isolation peculiar to the islands. The poet introduces the spiritual, unearthly world to draw us toward but not into the formative, causative world beyond the poem. The essence of this otherworldly island world lies buried

among those folds and folds of firs: spruce and hackmatack –  
dull, dead, deep peacock-colors,  
each riser distinguished from the next  
by an irregular nervous saw-tooth edge,  
alike, but certain as a stereoscopic view.

Bishop points to origins with the processional solemnity of “dull, dead, deep,” but quickly returns to the constraints of the quotidian. Moore’s “A Grave”<sup>4</sup> – where “The firs stand in a procession, each with an emerald turkey-foot at the top” – and Stevens’s “Domination of Black”<sup>5</sup> echo throughout this stanza. The “striding” color of “heavy hemlocks” and the cry of the peacocks in the Stevens poem suggest a sudden onset of perception and fear. Bishop’s descriptive language parallels Stevens’s imaginative world of tropes in acknowledging the interface between reality and the unknown, this world and the next. Stevens’s fear of the peacock’s cry stems from his discomfort with his ignorance, while Bishop allays a comparable anxiety by sharing the uncertainties engendered by the irregularities that characterize the scene. At the midpoint of “Cape Breton” Bishop seems willing to risk (in Keatsian fashion) the terrible revelations that occur when one “look[s] too far into” a landscape.

The third stanza opens with a reckless, if comical, abandon that indicates a radical change of tone or a penetration of the poem’s surface tension. Here lurks the first hint of the presence of humankind since the ghostly pulsations of the motorboat at the opening. Human works check the flow toward interiority. The island idles on this Sunday as its earthmovers stand driverless, but the mere presence of those objects tempers the movement toward epiphany. Not only has work ceased but so has religious activity:

The little white churches have been dropped into the matted hills like lost quartz  
arrowheads.

The churches themselves are relics of another age and spiritual condition. The road is not a thoroughfare but rather the borderline between the experiential landscape and the interior, “where we cannot see.” Within,

where deep lakes are reputed to be,  
and disused trails and mountains of rock  
and miles of burnt forests standing in gray scratches  
like the admirable scriptures made on stones by stones –

lies the earth’s own record. Bishop suggests, however, that by its very uninhabitable nature, the landscape defies translation. She suggests that the real story has passed; human life has occurred after the fact:

and these regions now have little to say for themselves  
except in thousands of light song-sparrow songs floating upward  
freely, dispassionately, through the mist, and meshing  
in brown-wet, fine, torn fish-nets.

Bishop does not share Keats’s view of the nightingale as “immortal Bird,” but she is well aware of the poetic convention of bird-song as a tentative link between exterior and interior worlds. In “Cape Breton,” though, the sparrow songs and the torn netting pull the poem in a direction Bishop does not wish to follow. The fishnet metaphor, derived from Penelope’s weaving and the handiwork of the Fates, engages the inarticulate, magical creative imagination. The introductory movement of “At the Fishhouses” acknowledges this ominous weight, and uses it to further explore the relationship between netter and net, and by extension, poet and poem. In “Cape Breton,” however, the metaphorical insistence of the nets seems beyond the intended scope of the poem. They and the dangling notes of the song-sparrows drift into and become one with the world beyond her poetry. This marks a turning point, requiring either transcendence or a naturalistic embrace of these natural hieroglyphics to honor, as Bishop always does, the legibility of the text. Drawing attention from the celestial distractions, however, Bishop shifts the focus to the road below, which in following an erratic but earthly course asserts the power of human culture, especially its most mundane occasions, to place natural transcendence under erasure.

As a figure of narration, rather than of lyric ecstasy or brooding meditation, this “wild” road serves as a measure of limits and capacities. The confines of the bus, “packed with people, even to its step,” frame the pilgrimage, “It passes … It stops,” and the availability of domestic knowledge:

… a man carrying a baby gets off,  
climbs over a stile, and goes down through a small steep meadow,  
which establishes its poverty in a snowfall of daisies,  
to his invisible house beside the water.

The family life of the baby-carrying gentleman remains in the imagination; his house, literally out of sight, is unrealized. The poet curiously regards the other guardians of the interior space; just two more passengers, “but today only two preachers extra, one carrying his frock coat on a hanger,” no different really in capacity from, say, the weekday

“groceries, spare automobile parts, and pump parts.” Like the tiny churches littering the hillside, these men of faith seem anachronistic.

“Cape Breton,” like “The Monument,” repeatedly shifts its stance<sup>6</sup> at the onset of epiphanic moments. Bishop is ostensibly shifting her viewpoint, but for what purpose? What does she hope to accomplish by moving from an island profile to a mist-shrouded glimpse of the settled mainland, and then to the departures and arrivals of a bus trip? In the final stanza, apparently on the brink of epiphany, an odd reversal occurs. Linked to the final lines of “At the Fishhouses,” the first line of the closure of “Cape Breton” – “The birds keep on singing, a calf bawls, the bus starts” – does not surprise. This assertive continuity is pure Bishop. Yes, the reader assents, this is true. Here, however, differing from more characteristic Bishop closures, an epiphanic suggestion of the otherworldly enters. The cloaking chill has its roots in *prehistory*, beyond “earthly trust.” How different the effect of the last stanza would be if Bishop had chosen to retain the final word, to deliberately limit her poem’s world:

The thin mist follows  
the white mutations of its dream;  
an ancient chill is rippling the dark brooks.  
The birds keep on singing, a calf bawls, the bus starts.

This remains for Bishop a rather open closure; the poem halts at a moment in which nature and culture seem in verbal congruence. The “ancient chill,” reminiscent of the “chill white blast of sunshine” in “A Cold Spring,” invokes the world of the unknown that engenders the brooks, calves, birds, and even buses of the phenomenal world.

When Bishop sorted and recast her memories of a bus trip from Nova Scotia to Boston, she made a poem of confrontation and exchange with nature that verges on epiphany, but retreats at the last moment into the natural domesticity of the creature world. “Back to Boston”<sup>7</sup> (the working title for “The Moose” [G]) bears the lineaments of an actual bus trip, but turns into a response to romanticism and what she saw as its conflict with life. Situating the narrator in the trope of westward travel, she builds toward and then deviates from an expected epiphany; rather than fully develop her trope, she prefers to pause and reflect upon the “little of our earthly trust,” confounding nature and culture in an embodiment, a creature that is neither threateningly wild nor sentimentally tame.

The measured sestets replicate the moral increments of the human condition. Unlike the repeated sameness of “At the Fishhouses” (“I have seen it over and over, the same sea, the same, / slightly, indifferently swinging above the stones”) or the monotony of the landscape of “Crusoe in England” (“The sun set in the same sea, the same odd sun rose from the sea”), the habits of the natural world of “The Moose” are vaguely reassuring, predictable, repeatable. The Möbius strip – winding and returning – six-stanza, single-sentence introduction creates a recognizable, though not necessarily specific, landscape. The scene defies placement on a map, but its characteristics are predictable. The world depicted in this journey-poem sustains the speaker with glimpses of domesticity to counter the dark and the unease of travel. Inhabited by consumers of “fish and bread and tea,” the landscape offers security in spite of the flux of travel and of the poem itself.

The herrings, the sun, and even the church depend on the will of the sea, which invests the land with life and uncertainty. The vulnerable landscape penetrates the very vehicle of discovery in the poem, the bus:

through late afternoon  
a bus journeys west,  
the windshield flashing pink,  
pink glancing off of metal,  
brushing the dented flank  
of blue, beat-up enamel

[CP, 169]

The mortal substance of the bus reminds us of those “Under the Window” vehicles that so eloquently raised the issues of health and disease (the Mercedes-Benz truck with “Throbbing rosebuds” and the old truck with “a syphilitic nose”). Even as the bus displays a vaguely human anatomy, it reveals a relatively human temperament as it goes

down hollows, up rises,  
and waits, patient, while  
a lone traveller gives  
kisses and embraces  
to seven relatives  
and a collie supervises.

The solitary traveler bids farewell to her kind, while the dog, a guardian of stationary domesticity, presides over the departure into the unknown. Linking the fixed and the mobile worlds in this genre scene gives the landscape an air of unity and harmony. By drawing the introduction together with a series of *wheres* and *pasts*, in the present tense, Bishop emphasizes the predictable, accountable, acceptable aspects of the scene.

As certainly as the traveler relinquishes family and home, the poem relinquishes the comfortable but momentary stasis of the genre scene, along with the scene itself. The true journey begins; the poem abandons the tropes of place-specific domesticity (elms, farm, dog) that embody family, home, and landscape. The mist, a painterly element, drifts in to shroud, enfold, and disclose the dislocating countenance of the natural surroundings. As the familiar world fades in the mist, the poem shifts its attention to a world of diminished scale and microscopic form:

The bus starts. The light  
grows richer; the fog,  
shifting, salty, thin,  
comes closing in.

Its cold, round crystals  
form and slide and settle  
in the white hens' feathers,  
in gray glazed cabbages,  
on the cabbage roses  
and lupins like apostles ...

The atmosphere, though hardly threatening, rapidly grows murky. The “sweet peas cling” to their strings and the “bumblebees creep / inside the foxgloves” for certainty and shelter. As the fog obscures it adheres, transforming phenomena and affecting behavior. Whatever predictability this world possessed in daylight has receded in obscurity. Potentially magical as this landscape had become, it in no way resembles the celestial world of “Seascape” or the iridescent world of “At the Fishhouses.” Bishop is determined to avoid tropes of sublimity (though toying with Wordsworth’s Snowdon mist) and make this bus-trip only as rich as everyday life.

The gradual descent into evening (announced by “evening commences”) occasions a renewed commitment to routine, which offsets the slide into the romantic otherworld of the fog. Frequent stops, signaling arrivals and departures, suggest the continued proximity of the familiar world. The routine of a household as “a woman shakes the tablecloth / after supper” adequately deters the Homeric sense of travel-as-epic. Evening domesticity, despite the passage of the vehicle, enacts its schedule, regular as the tides. Gradually, however, this artificial world yields to the unfocused (because sensory-deprived) world of disconnected sensations, a world unorchestrated by familiar motifs of order and routine:

The Tantramar marshes  
and the smell of salt hay.  
An iron bridge trembles  
and a loose plank rattles  
but doesn’t give way.

Destabilized by unexpectedly full sensory application, the poem drifts through a narrative of peripheral glances, partial appreciations. Even as the postprandial woman fades in that flickering instant, the bus slips into a cloaked land and sea world where the salt marsh sensationally reveals its true and frightening origins. Human structures quake in the uncertainty of this setting; they react in “fear” as they “tremble” and “rattle.” Though they stand firmly, if dubiously, those structures (and the traveler) feel collapse may be imminent. Once again the poem prepares the reader to meet the otherworldly. Though reduced to noting particulars – synecdoches of books and bark – the traveler attempts to impose some structure on a formless environment, and in doing so risks epiphany:

On the left, a red light  
swims through the dark:  
a ship’s port lantern.  
Two rubber boots show,  
illuminated, solemn.  
A dog gives one bark.

This fixed, solemn scene is more than sufficient to trigger an epiphany and render the bus journey a romantic narrative into sublimity and otherworldliness; but the moment passes, ungrasped. The entrance of a particularized, characterized, destined human being interrupts the moment of epiphanic possibility. Her personal characteristics, as she enters “brisk, freckled, elderly” to encounter her fellow travelers, underscore her ordinary, reassuring earthiness, as if to assert in her bearing the sufficiency of this phenomenal world. With her words to the bus driver, “All the way to Boston,” the pilgrimage gains definition and a final destination. Having finally mapped the excursion and avoided premature closure, the poem returns to the preparatory atmosphere that clarifies even as it clouds.

Misty night landscapes and travel constitute a familiar romantic motif. Primed with specific literary sensations, the poem generates a powerful but familiar conjunction between the “moonlight and mist.” The landscape – “hairy, scratchy, splintery” – however, like the “brisk, freckled, elderly” traveler, resists the ascent into a symbolic mode. Eased by the consonantal texture of the material world, the speaker forsakes romance and allegory and reclines toward sleep. This moment of partial oblivion invokes the antecedent world of memory:

Snores. Some long sighs.  
A dreamy divagation  
begins in the night,  
a gentle, auditory,  
slow hallucination. . .

Sprung from but simultaneously divorced from the surrounding matrix of landscape and domesticity, the poem now drifts into the language of ancestry and archetype. Though relying on unsorted and scattered particulars, Bishop relates her speaker to humanity as a whole, and more firmly anchors her in the historical world of culture, by means of an overheard, extended flow of anecdote and genealogy, narrated by anonymous yet firmly characterized interlocutors:

In the creakings and noises,  
an old conversation  
– not concerning us,  
but recognizable, somewhere,  
back in the bus:  
Grandparents' voices  
  
uninterruptedly  
talking, in Eternity:  
names being mentioned,  
things cleared up finally;  
what he said, what she said,  
who got pensioned;  
deaths, deaths and sicknesses;  
the year he remarried;  
the year (something) happened.  
She died in childbirth.  
That was the son lost  
when the schooner foundered.

Devoid of immediate personal significance, these recollections of strangers revolve upon the common organic insults of “deaths, deaths and sicknesses.” These consequential events, though requiring narration, stand isolated against the flow of history. Death itself, an abstraction commemorated in black-bordered obituaries is random and commonplace, yet humanly fascinating. Death occupies the poet’s attention in the way that births and marriages do, as dignifying aspects of the quotidian. Mention of the archaic tragedy – “the schooner foundered” – elevates the discussion even beyond the elevated quotidian to touch upon a mythic dimension and a classic sense of the tragic. Catastrophic events, however, derive their significance from their fatal outcome. The universality of

this closure makes it more bearable, more conversational, less newsworthy. Bishop notes the lack of impact of old news in her survey of “The Bight” [CS]:

Some of the little white boats are still piled up  
against each other, or lie on their sides, stove in,  
and not yet salvaged, if they ever will be, from the last bad storm,  
like torn-open, unanswered letters.  
The bight is littered with old correspondences.

[CP, 60]

Finally the tide of specificity affects only the living; a dreamy retrospect leaves us meditating dates that resonate – “the year (something) happened” – long after the significance of the event has withered. Shutting pronominal exchanges invite the auditor into this world of common history, prompting recall of those universal characters who went “to the bad.” The tentacular frame of reference outlines a common family tree. Individuality, the raw particulars, dissolve in a repetitious history of insults, injury, and events. The drone of recurrence secures and assures the listener while imposing a sense of commonality through disaster.

The traveler in “The Moose,” withdrawing from recognition and resignation – “Life’s like that. / We know *it* (also death).” – cuddles down into a child’s secure understanding and relaxed confidence. Life passes in tranquillity, grandparents droning

in the old featherbed,  
peacefully, on and on,  
dim lamplight in the hall,  
down in the kitchen, the dog  
tucked in her shawl.

Now, it’s all right now  
even to fall asleep  
just as on all those nights.

Though at first this dream-world excursion seems to reach beyond the phenomenal world, Bishop withdraws, reorders, and projects the dream into the quotidian world of her poem. In spite of the childlike acceptance of everything predictable and routine, the language of the memory-passages is that of adult recall. An earlier version shows that Bishop had originally intended a childlike passage similar to the innocence of “Five Flights Up”<sup>8</sup> [G]:

Now, it is safe now  
to go asleep  
Day will take care of things.

[Typescript Draft]

The little dog next door barks in his sleep  
inquiringly, just once.  
Perhaps in his sleep, too, the bird inquires  
once or twice, quavering.  
Questions – if that is what they are –  
answered directly, simply,  
by day itself.

[CP, 181]

As Robert Hass<sup>9</sup> suggests, these midnight inquiries reassure by firmly situating the poem in the conscious world – “being and being seen.”

The encounter with the moose coincides with and benignly disrupts a false and earthbound self-assurance. Rather than reaching for the epiphanic sublime, Bishop summons one reasonably modest (though impressive in its own right) particular of the natural world. In the context of expected epiphany, this creature seems reassuring, only modestly awe-inspiring. Like the Poundian periplim,<sup>10</sup> the encounter is indeed a sighting, a looking on the horizon, but it is certainly not comparable to the grandeur and spiritual pretension of a Wordsworthian natural revelation, nor does it offer the psychological certainty of Joyce’s urban epiphanies. The moose initiates the exchange and actually experiences the bus:

It approaches; it sniffs at  
the bus’s hot hood.

Lacking gender, the creature appears at first both otherworldly and threatening; it seems a force unto itself. The curious animal beckons the dreamy travelers to consciousness. Unlike the retreating farmhouses and churches of the traveler’s landscape, the presence stands solid, comfortable, and inspirational:

Towering, antlerless,  
high as a church,  
homely as a house  
(or, safe as houses).

“Towering,” vaguely threatening, but “antlerless,” somewhat tamed, the moose straddles the worlds of nature and culture, embodying a domestic sense of wholeness. Dwarfed by the unassuming grandeur of the natural world, the passengers resort to childish utterances of the commonplace and obvious, further emphasizing the creature’s domestic appearance and demeanor:

“Sure are big creatures.”  
“It’s awful plain.”  
“Look! It’s a she!”

Unembellished nature on a scale both intimate and impressive startles the passengers, but their commonplace expressions help ward off the sublime. A mute and mild moose, with its relative bulk, silence, curiosity, and sex, affects but does not intimidate them.

The moose does not in the least resemble the battered, defeated fish (“I looked into his eyes ... / They shifted a little, but not to return my stare”) or Crusoe’s goats with their blank, malicious eyes. Instead, like the seal of “At the Fishhouses,” the moose participates in a direct encounter and exchange. The moose “sniffs” and “looks the bus over,” as if in recognition of this fellow creature, vehicle and passengers complimented by its interest in their otherness. The casual yet intimate relationship between moose and travelers demonstrates how “earthly trust” includes all surface-dwellers; as the animal senses the people, so the Boston-bound passengers experience the moose:

For a moment longer,  
  
by craning backward,  
the moose can be seen

on the moonlit macadam;  
then there's a dim  
smell of moose, an acrid  
smell of gasoline.

The essential fact grows dim and is finally displaced by the smell of gasoline, which complements the moose's own scent. Though posed for transcendence, the poem at the moment of confrontation retreats into domesticity and the commonplace, the marvelous transforming environment serving to sensitize and alert the travelers to the precious life they share without violating the poem's essential self-containment by evoking the sublime.

Though suspicious of the romantic *hejira* and the epiphany, Bishop employs their strategies while avoiding the moment of commitment to the ineffable of the infinite. The otherness of nature is but half a perception; nature sees human presence as unnatural and curious. Rather than strive to penetrate or transcend the phenomenal world, Bishop attempts to define domesticity in relation to otherness,<sup>11</sup> to learn by deferring the language of the interior to more clearly experience the language of the palpable world of surface and texture. Finally she asks, "What does nature make of us?" – underscoring the unbridgeable difference between the self and the exterior world.

Bishop attempts to pose an accurate relationship with the environment. Human limitations – destinations, schedules, births, deaths – mirror environmental complexities. Like Darwin, she delights in the natural world because it is natural; she sees the moose not as an emissary from the beyond but as a moose – and marvels at its "mooseness." Generating a language of the environment without attempting to confound it with the self empowers the quotidian, with its hint of epiphanic possibility, which for Bishop is the proper material of poetry.

The act of naming, the other rhetorical device referred to at the beginning of this chapter, in romantic poetics begins with and requires the invocation of the social construct of authorship. Autobiography, a characteristic romantic-modern mode, enforces the notion of the voice of witness as one of authenticity and authority. This claim to authority, however, which was explored in Wordsworth's *Prelude* and claimed by modern poets like Robert Lowell, troubled Bishop. Her lifelong debate with herself concerning the tensions between life and authorship, autobiography and poetry surface repeatedly in her correspondence with Lowell. What she claimed of Marianne Moore<sup>12</sup> (in her memoir, "Efforts of Affection"), she would claim of herself: "to be a poet was not the be-all, end-all of existence." In December 1957, when both poets were in the midst of their life studies, Bishop wrote to Lowell:

And here I must confess<sup>13</sup> ... that I am green with envy of your kind of assurance. I feel that I could write in as much detail about my Uncle Artie, say – but what would be the significance? Nothing at all ...

Whereas all you have to do is put down the names! And the fact that it seems significant, illustrative, American, etc., gives you, I think the confidence you display about tackling any idea or theme, seriously, in both writing and conversation.

The seriousness of this lament is offset by Bishop's "green with envy" sly aside. Though she sees a collateral relationship between "significance" and "confidence," this does not confirm a sense of insecurity on her part. Rather, I suggest, she recognizes the need for

a different kind of authorial posture for herself. If name-dropping and historical context will not work for her, what will?

Bishop requires a fresh approach to the question of authorial presence and its consequences for a poetry conscious of the problems of naming and unnaming. She intuits and anticipates the crisis of authorship<sup>14</sup> and the literary text discussed by Michel Foucault in “What Is an Author?” Foucault suggests that modern literary critics continue to believe that:

the author provides<sup>15</sup> the basis for explaining not only the presence of certain events in a work, but their transformations, distortions, and diverse modifications (through his biography, the determination of his individual perspective, the analysis of his social position, and the revelation of his basic design).

Like Foucault, Bishop challenges the romantic assumption of authorial presence. Further, she asks her readers to socialize the poem, to recognize its full range of significance, in the absence of conventional authorial sanction. The confidence of these poems derives from abandonment: the act of naming becomes one of unnaming. Biography, social position (Bishop appears to be saying), as pre-existent constructs with authority outside of the text, have no place in these poems.

“In the Waiting Room” and “Crusoe in England” – the opening poems of *Geography III* – read intertextually reveal just how deeply and ironically Bishop engaged in the relationship between the self and author, history and memory, orality and literacy, naming and unnaming – indeed, in the binary oppositions of her aesthetic. It is this rhetoric of unnaming that generates the complexity (not the debility) of self-reference and the provisional meaning not only in her last works but throughout her career. Here the poems beckon and then thwart the reader intent on finding significance embedded in a life. The reader obsessed with the mock reality of life will never encounter the real in Bishop’s world.

“In the Waiting Room” and “Crusoe in England” enact competing genealogies of social and personal identity. Insofar as these poems may be read as poems of poetic calling, they bear the testimony of a poet resolute in her determination to designate a fictional self without recourse to the power of naming conferred by the social construct of authorship, and to force authority, instead, from unnaming. This rejection of the self as social construct and privileged naming may seem even more romantic than the solipsism of authorship because it attempts to reinvigorate the originative power of naming. Bishop, however, neither claims access to origins nor refuses the social meaning imposed by language and culture. Instead she attempts to displace the romantic concept of authorial autonomy, because it is a received and therefore logocentric social construct, and install through unnaming and renaming a more broadly mediated sense of things and experience, a socially rather than egoistically based phenomenology.

“In the Waiting Room” may be seen as a prelapsarian poem of anticipation of that social state that precedes the acceptance of received namings; “Crusoe in England” may be read as a postlapsarian meditation on the originating power of naming and renaming. In reinventing the social world that connects the two, she seems willing to reconsider all forms of “name” appropriation: place, family, sex, generation, things. Discovering a world where (as Stevens found<sup>16</sup>) “Mrs. Anderson’s Swedish baby / Might well have been German or Spanish,” she then rejects all such forms of naming as well as (what Foucault calls<sup>17</sup>) “author construction.” Each poem reenacts

“birth, procreation, and death” as a debate between naming and unnaming, the loss imposed by a social (i.e., authorial) identity.

In 1961, Bishop wrote “The Country Mouse,” a posthumously published memoir dedicated to her childhood return to Worcester, Massachusetts, after a lengthy stay with her maternal grandparents in Nova Scotia. Were it not for its startlingly revealing conclusion, the memoir, in spite of its abundance of details, would suffer from (by Bishop’s own standards) insignificance. In the final paragraphs, however, which constitute the nucleus of “In the Waiting Room,” Bishop begins to trouble over the obvious: the social obligation of being human. Having been jolted into awareness of her adoptive family’s class status (*hers* was a family with servants), she recalls with equal sensitivity the *strangeness* of being a human being. As she waits for her aunt in the dentist’s waiting room:

I felt ... *myself*. In a few days it would be my seventh birthday. I felt *I, I, I*, and looked at the three strangers in panic. I was *one* of them too, inside my scabby body and wheezing lungs. “You’re in for it now,” something said. How had I got tricked into such a false position? I would be like that woman opposite who smiled at me so falsely every once in a while. [CPr, 33]

The history of identity is bound to the memory of its occasion. The response is visceral, *not* intellectual:

“You are you,” something said. “How strange you are, inside looking out. You are not Beppo, or the chestnut tree, or Emma, you are *you* and you are going to be *you* forever.” It was like coasting downhill, this thought, only much worse, and it quickly smashed into a tree. *Why* was I a human being?

The fact of this prerational recognition scene resides in the primacy of childhood identity. The duplicity the child hears and sees in the adult world can only be named by those understudy pronouns: *I* and *you*. While dogs, trees, and even servants have names, this as yet unnamed child wrestles with but a taxonomic classification: human.

“In the Waiting Room” marks Bishop’s return to these issues of naming and unnaming, reading and writing, sounding and hearing. Though descriptive, the poem depends less on physical detail and more upon a dialogue between the unnamed (socially unrestricted) self – “I” – and the named (socially restricted) – “an *I*.” The child initially finds security in proper names: “Worcester, Massachusetts” and “Aunt Consuelo.” The certainty fades with the appearance of the intrusive, indefinite pronoun: “*It* was winter. *It* got dark / early” [my emphasis]. Bishop will rely upon the ambiguity of “it” and its corresponding reluctance or inability to name throughout the poem.

Left alone, the child “I” sees and reads the named *National Geographic*. Its “studied photographs” reveal an unpredictable, eruptive (prelapsarian) landscape. Literacy fails, except as an escape route, where metaphor is concerned. Investigating scenes from this magazine, she catalogues that which she can name: volcano erupting, Osa and Martin Johnson. Properly attired people bear names: “Osa and Martin Johnson”; dead people lose their names: “– ‘Long Pig,’ the caption said.” Orality and literacy compete for the child’s attention, each seductive in its way. But she mishears what “the caption sa[ys]”: “A dead man slung on a pole / – ‘Long Pig.’” Mimicking the instability of spoken language and substituting a euphemism for a proper name, the conversational caption confuses the earnest student, who fails to understand that the dead man is here regarded as a food source.

The verbal unknown occasions further confusion as the child's eye traces the physical, sexual uncertainties of uncovered women. So foreign are the native unnamed women "with necks / wound round and round with wire" that the child "reads" right through them: "I read *it* straight right straight through. / I was too shy to stop" [emphasis added]. Unable to name, the child resorts to the tense comfort of the unnamed: "it." She retreats from the shifting planes of unnamed, unnamable uncertainty to the fixity of that which bears a name: "the cover: / the yellow margins, the date." Such is the force of Dickinson's notch in the maelstrom.

Unable to read her way into the larger constellation of human beings, the child nevertheless recognizes the sounded family identity when she hears it. Like the auditor in "The Country Mouse," this child hears from the inside out. History and memory fuse, creating a new identity for her:

What took me  
completely by surprise  
was that it was *me*:  
my voice, in my mouth.  
Without thinking at all  
I was my foolish aunt,  
I – we – were falling, falling,  
our eyes glued to the cover  
of the *National Geographic*,  
February, 1918.

[CP, 160]

The intensity of this "it" draws upon the accumulated chain of reference: "winter," "dark early," "Babies with pointed heads," "horrifying breasts," and Aunt Consuelo's "oh! of pain." Acceding to the social demands, the effect of her aunt's voice, the child involuntarily discovers her own collective voice: *I* becomes *we*. Dates, like names or Aunt Consuelo's voice, momentarily pierce the surface of the "cold, blue-black space" – the sea of habit threatening the child's consciousness. She has lost perceived autonomy even as she has gained a social identity.

Cautiously authorial, the child reads this new self as a mode of being. For the moment the discovery is personal, familial. This is not an attempt to place a "Bishop" in context; rather, it is an opportunity to feel a "self" move forward and backward into genealogy, into time:

But I felt: you are an *I*,  
you are an *Elizabeth*,  
you are one of *them*.

Unlike the familial significance attributed to Lowell by Bishop, the effectiveness of Bishop's self-reading derives from the strategic use of the second person. As if to demonstrate her presence in the text, she removes her self from it long enough to proclaim a social identity, to name her self. This somewhat grudging sensation, verified spontaneously by the child's reaction to her aunt's cry, suggests the child's plight as it would seem from the outside. It recalls the Stevensian<sup>18</sup> self: "Detect[ing] the sound of a voice that doubles its own." However "unlikely" or "strange" these binding "similarities" seem to the child they are the social facts of her life. Though they seem to her unauthorized,

breasts, boots, the *National Geographic*, and the family voice nonetheless constitute homogenizing social realities. By adhering to the laws of pronominal reference, Bishop intensifies the almost Ibsenlike (recall the Button-molder of *Peer Gynt*) threat to an artist's emerging identity.

While "In the Waiting Room" has been routinely read as a poem of juvenile terror, isolation, and marginality, none of those readings account for the remarkable counter-force of the solitary "Me–Myself–I," the artist's isolated yet assertive self. Even if the unnamed self (as seen from the inside out) threatens to fail or consume, it remains the volatile poetry voice for Bishop. She may require (what Beckett calls) a "temporal specification"<sup>19</sup> – "fifth / of February, 1918" – to allow her "to measure the days that separate [her] from that menace" (that which threatens identity). The "falling off" enacted in this poem is the fall into social identity, restrictive or inaccurate naming. The alternative seems to be the "big black wave" of annihilation or namelessness. To be "back in it" is to survive with a social surface – name, age, gender, place – at odds with the continually unnamed self. "The War was on" presages a career intensely committed to slipping the yoke of social identity and changing the rules of the name game.

The child of "In the Waiting Room" advances with uncertainty from the passivity of reader to the tentative aggressiveness of writer – to the authority of authorship. The socializing power of language itself lures the unnamed *I* into the realm of a given and feminine name – and perilously into the beyond of collective, pronominal identity: "one of them." This rush of potential identities refuses to pause at the brink of authorial privilege – *Elizabeth + Bishop* – and instead accelerates into the swirl of *them*. Refusing even gender specificity (recalling that in her memoir, Bishop ends with the more general "Why was I a human being?"), retaining no element of uniqueness, this identity is as good as none.

If the waiting room child must advance toward naming and its requisite social obligation, then "Crusoe at Home" (Bishop's working title for "Crusoe in England"<sup>20</sup>) has the life-won opportunity to revert to his unnamed *I*. Even as "In the Waiting Room" advances the cause of poetic naming, "Crusoe" champions the necessity of retreat. The child relinquishes ignorance for the sake of her name; Crusoe abandons the text and the very power of naming as if discovering the devitalizing force of individuation. Like other world-weary "I am" poems (John Clare's "I Am," Yeats's "The Circus Animals' Desertion," Wallace Stevens's "First Warmth" or "Notes Toward a Supreme Fiction"), "Crusoe" makes its most compelling appeal for readership by its utter rejection of its social role.

The landscape seems familiar; yet this volcanic wasteland is "dead as ash heaps." The colonial appropriators, or namers, are no longer in the characters of Osa and Martin Johnson; they have coalesced into the discovering and naming country itself: England. Decidedly postlapsarian, Crusoe both remembers and re-enacts that ahistorical, asocial moment of genuine love in exile.

Exasperated by the feminine, childhood aspects of the name game, Bishop turns from the dilemma of the given and family name to explore the old age of the retired adventurer. Crusoe, like Lowell, comes with his attendant significance – his fictive and historical authority. In spite of that burden, however, he shrugs off his social (i.e., linguistic) inheritance as irrelevant and inaccurate. Seemingly revisiting in memory the landscape of the *National Geographic* of "In the Waiting Room," Crusoe dismisses everything the child struggled to acquire. Orality and literacy fail to capture the essence of his life,

which remains “un-rediscovered, un-renamable.” The authorial gesture of the poem depends upon the exasperation that “None of the books has ever got it right.” Like Ishmael, Crusoe knows that “true” places remain unnamed.

From Crusoe’s perspective, to acknowledge the shock of “waiting room” recognition is to acquiesce to the failure of language to identify. The core of the poem, preceded by the weary “Well,” charts the encumbrance of language in a solitary world. Relative scale (“I’d think that if they were the size / I thought volcanoes should be, then I had / become a giant”), proper names, aesthetics, categories of all kinds ring false in this underpopulated landscape of “one kind of everything.” Here the distinctions between ignorance and understanding, error and truth seem impossible to ascertain. Who would appreciate the act of delimiting that naming reflects? The landscape seems fated to the same oblivion as language as Bishop echoes “The Map” (where “The names of the sea-shore towns run out to sea”) in the volcanic landscape (where “The folds of lava, running out to sea, / would hiss”).

Like the speaker in John Clare’s “I Am,” Crusoe, too, is a “self-consumer of [his] woes.” Even in isolation this must be given a name and a circumstance: “‘Pity should begin at home.’ So the more / pity I felt, the more I felt at home.” Crusoe resorts to this colloquy with himself to externalize and verify the overwhelmingly interior sensation of pity. The physical remove becomes palpable as he conjectures: “What’s wrong *about* self-pity, anyway?” [my emphasis] Crusoe confesses his humanity through by naming his emotion. For as D. H. Lawrence asserts in his own “Self-Pity”<sup>21</sup>: “I never saw a wild thing / sorry for itself.” Locating his emotion in language denies Crusoe the spontaneity or wildness of the animal world.

Incapable of “looking up” that which he does not possess, Crusoe abides by the asocial strictures of solitude. An air of unreality pervades the intense reality of this itemized landscape. Like the waiting-room child, Crusoe “reads” the landscape and attempts to place through names its inhabitants. His solitary word games seek to defeat “the questioning shrieks, the equivocal replies / over a ground of hissing rain”: “*Mont d’Espoir* or *Mount Despair* / (I’d time enough to play with names),” but serve only to sound off: Names are rendered meaningless. Knowledge and language as social acts become nightmarish anachronisms:

. .... I'd have  
nightmares of other islands  
stretching away from mine ...  
.....  
.....knowing that I had to live  
on each and every one, eventually,  
for ages, registering their flora,  
their fauna, their geography.

[CP, 165]

Such occupational investments in local identity terrify the stranded character. As the waiting-room child discovered, even local geography requires an audience to render the significance fixed.

The eight-stanza terror of the societyless residence is peremptorily displaced by Crusoe’s recollection of Friday. While language seems to have outlived its usefulness, Crusoe nonetheless fixes his “other” with a socially significant temporal marker: he names “Friday.” Even as Crusoe details the effect of this new society, the impoverishment

of language is complete. Declaring parenthetically that “Accounts of [Friday’s arrival] have everything all wrong,” he fails to meet the demands of language. Friday is “nice” and “pretty”; they were “friends.” Stripped of a linguistic interface, Crusoe appears to have met the private, unmediated demands of a relationship shared with but one. Language cannot intervene.

The authorial impulse to give memory a name by converting it into history is a commemorative one. With Friday’s deathdate comes the intrusive, factual marker – fixing in time the moment recalled, begging to be named. Crusoe’s/Bishop’s public and private artifacts seem destined for the Temple of the Muses: “The local museum’s asked me to / leave everything to them.” The human experiences of love and desperation coalesce about the devitalized remains: “the flute, the knife, the shrivelled shoes.” Like Yeats’s “Old iron, old bones, old rags,” the island artifacts sit unre-discoverable and unrenamable. In questioning the value of this hopelessly romantic, Emersonian art of naming, Crusoe challenges the public appropriation of named things even as he re-collects the private bonding of language to love:

How can anyone want such things?  
– And Friday, my dear Friday, died of measles  
seventeen years ago come March.

Unable to thwart the named order of things – names, dates, countries, diseases – Crusoe can only recall a time when the world was unnameable but “nice.” Readers of Stevens will recognize both place and question: “These external regions, what do we fill them with / Except reflections, the escapades of death.”<sup>22</sup>

A reading of *Geography III* that considers the issues raised in discussing these two poems would presuppose a willingness to accept this paradox: that as autobiography abandons Bishop’s poems, they begin to live. In American poetry only Dickinson has been as successful in frustrating critics who need to use the life as a means of explaining. Bishop’s appreciation of Lowell’s “kind of assurance” drove her to assert her confidence from the “interior,” where, with due respect for the social and cultural energy that makes art possible, the poet is alone with the task of distinguishing her work from her self. Her life’s sad facts do not explain why “we feel / (we all feel) this sweet / sensation of joy” when reading her poems and correspondence. Critics too eager to privilege autobiography over other forms of fiction to satisfy current critical trends risk reducing these multidimensional poems to self-elegy. This lack of critical imagination unduly restricts access to a body of work demanding recognition of its, not the poet’s, authority.

The “old correspondences” littering *Geography III* can easily incite misreading, searching for poems definable by cultural or political communities Bishop herself rejected. Seeking the self Bishop deliberately withholds requires resisting a “knowledge … historical, flowing, and flown.” This resistance denies the power of her assertive unnaming, forgetting that to be at war with something (in this case, restrictive identities) is in fact to confront it.

Extending this reading method to the entirety of *The Complete Poems, 1927–1979* reveals Bishop’s career-long desire to subvert the “author-function,” a desire largely fulfilled in the dialectic between autobiographical strategies and those of self-effacement. “Cape Breton” describes the resulting natural scene, which refuses the pathetic fallacy and turns a blank face to the viewer: “Whatever the landscape has of meaning appears to have been abandoned … these regions now have little to say for themselves.” The

private life inspiriting Bishop's poems cannot sustain them; they must live on their own, but they do so by first appropriating that private life and then placing it under erasure. The reader, faced with the transparent splendor of these poems, might wonder with the speaker of "Anaphora": "Where is the music coming from, the energy? / The day was meant for what ineffable creature / we must have missed?" As Foucault warns, "The author is the principle of thrift<sup>23</sup> in the proliferation of meaning." Thriftier than most writers, and anxious that neither name nor gender restrict the authority of her poems, she withdraws, through unnamning, the authorial privilege by purposing, then exposing the feigned naïveté of autobiography. The resultant fiction in its complex reflexivity is too self-possessed for the reader or critic to unmask, and paradoxically refuses either to confound life and art or to clearly distinguish them.

## Notes

1 John Keats, *Poetical Works*, ed. H. W. Garrod (Oxford: Oxford University Press, 1956), p. 38.

2 See typescript drafts of "Cape Breton" [Vassar]. Bishop notes in a piece titled "Bird Islands" that:

Ciboux and Hertford, about six miles off the coast of Nova Scotia. During the war planes practiced dropping bombs on a rock between the two. The sheep pastured on them would get frightened and often stampede in a panic and fall over the cliffs into the sea.

3 See Herman Melville, *Moby-Dick* (New York: W. W. Norton, 1967), Chap. 47: "The Mat-Maker."

4 Marianne Moore, *Observations* (New York: Dial Press, 1924), p. 60.

5 Stevens, *Collected Poems*, p. 8.

6 See James McIntosh, *Thoreau as Romantic Naturalist* (Ithaca: Cornell University Press, 1974) for a detailed discussion of Thoreau's "shifting stances" in the natural world with its implications for transcendentalism in general.

8 See File 27/403 [Vassar].

9 See Hass, "One Body: Some Notes on Form" in *Claims for Poetry*, ed. Donald Hall (Ann Arbor: University of Michigan Press, 1982), p. 152:

Being and being seen. R. D. Laing says somewhere that small children don't get up at night to see if you're there, they get up to see if *they're* there. ... Maybe our first experience of our own formation.

10 See Ezra Pound, *The Cantos* (New York: New Directions, 1972), p. 324.

11 For a useful discussion of domesticity as topic in Bishop, see Helen Vendler, "Domestication, Domesticity and the Otherwordly" in *Modern Critical Views: Elizabeth Bishop*, ed. Harold Bloom (New York: Chelsea House, 1985), pp. 83–96. Once the only essay to make a compelling case for Bishop's place in the canon, it now seems overcommitted to its theme. For example, in introducing "In the Waiting Room":

No domesticity is entirely safe. As in the midst of life we are in death, so, in Bishop's poetry, in the midst of the familiar, and most especially there, we feel the familiar as the unknowable. This *guerilla attack of the alien*, springing from the very bulwarks of the familiar, is the subject of "In the Waiting Room" (87). [emphasis mine]

A "dentist's waiting room" does not seem to me to be "the very bulwarks of the familiar." In fact, if we are to accept Vendler's extreme depiction, it is just where one would expect the "guerilla attack of the alien."

# PART TWO

Structuralism, Linguistics,  
Narratology

---

# CHAPTER 1

## Introduction

### *The Implied Order: Structuralism*

*Julie Rivkin and Michael Ryan*

Structuralism begins with the work of Ferdinand de Saussure, an early twentieth-century Swiss linguist who argued that language should be studied as if it were frozen in time and cut transversely like a leaf. What results is a vision of the entire language system as it exists in implied or unconscious fashion in any spoken utterance. Utterances are merely the manifestation of the rules of the system that lend order to the heterogeneity of language. This notion of an implied order is central to the Structuralist undertaking, as it spreads out from linguistics to anthropology and philosophy and to literary criticism through the course of the twentieth century.

Structuralism derives both historically and logically from Formalism. Roman Jakobson, one of the original Formalists, was also, by virtue of emigration, one of the first major influences on French Structuralism, which flourished from the 1950s through the 1960s. The scientific impulse evident in Formalism also finds its fulfillment in the Structuralist emphasis on the task of adducing the internal system or order of linguistic, cultural, and literary phenomena.

From Jakobson, early Structuralists such as anthropologist Claude Lévi-Strauss learned of Saussure's ideas about language. Lévi-Strauss began to see that culture, like language, is a system characterized by an internal order of interconnected parts that obey certain rules of operation. A structure is both like a skeleton and like a genetic code in that it is the principle of stability and coherence in any cultural system, while also being the principle of action that allows the culture to exist in time as a living thing. After meeting Jakobson in New York during their mutual exile during World War II, Lévi-Strauss began to think about culture as a form of communication like language. What was communicated between cultural participants were tokens, like words, that enacted and reproduced the basic assumptions and rules of the culture. In his analysis of kinship systems, *Elementary Structures of Kinship* (1949), Lévi-Strauss argued that primitive cultures maintain peace between social groups by using women as tokens in marriage. Such inter-familial and inter-tribal marriages function as a form of communication and create personal or family relations that work to diminish the possibility of conflict. Lévi-Strauss went on to conduct famous studies of myths that noticed, in the same manner as Russian critic Vladimir Propp's path-breaking work on folktales, that such myths, despite their heterogeneity and multiplicity, told the same kernel narratives. Those narratives

tended to work to resolve contradictions in the culture, such as that between a conception of humans as plant-growing and peaceful and humans as hunters and warriors. The many versions of the Oedipus myth, for example, all tell a story about the conflict between the idea that humans emerge from the earth ("Oedipus" means lame in the foot) and the idea that they are born from other humans (hence the sanctity of the incest taboo). The tale's function is to provide a mediation to the contradiction between nature (sexuality) and culture (rule against incest) by forbidding natural sex between family members.

The second major contribution that Saussure made to Structuralism was his conception of the linguistic sign. Words, he noted, are signs, and linguistics rightly belongs to another discipline called semiology, which would study the way signs, including words, operate. Words are signs in that they consist of two faces or sides – the signifier, which is the phonic component, and the signified, which is the ideational component. A word is both a sound and an idea or image of its referent. Alongside and often in conjunction with the Structural anthropology of Lévi-Strauss, there developed in France in the 1950s, especially in the work of Roland Barthes, a concern with the study of the semio-logical dimension of literature and culture. A work of literature, Barthes noted, is, after all, nothing but an assemblage of signs that function in certain ways to create meaning. In studying culture, Barthes noticed that films, commodities, events, and images are lent meaning by their association with certain signs. Barthes went on in the 1960s to become one of the major practitioners of semiological analysis in literature. His most important books are *Writing Degree Zero* (1953), *Mythologies* (1957), *On Racine* (1963), *Critical Essays* (1964), *Elements of Semiology* (1965), and *S/Z* (1970).

A direct link between French Structuralism and Russian Formalism was established in 1965 with the publication of Tzvetan Todorov's collected translations of the Formalists' *Theory of Literature*. Todorov's work is associated most often with the study of narrative, and he helped formulate the Structuralist conception of narrative as the common element of organization among diverse examples. In his study of Henry James's tales, for example ("The Structural Analysis of Narrative" in *Poetics of Prose*, 1971), he contends that they all revolve around a missing center, a point of desire that is sought but that never appears. The study of narrative (or narratology, as it is also called) is one of the most abiding strands of Structuralist thinking.

By the mid-1960s, Structuralism was the dominant school of thought in French intellectual life, and its influence is evident in the work of historian Michel Foucault, psychoanalyst Jacques Lacan, literary critic Julia Kristeva, and philosopher Louis Althusser. Foucault's work at that time included *The Order of Things: An Archeology of the Human Sciences* (*Les Mots et les choses*, 1966), *The Archeology of Knowledge* (1969), and *The Order of Discourse* (1970). Foucault is important for drawing attention to the role of language in the conceptual frameworks or "epistemes" that are used in different epochs for understanding the world. Words provide us with maps for assigning order to nature and to society. Foucault notices that what counts as knowledge changes with time, and with each change, the place of language in knowledge is also modified. In one era, the world is considered to be a site of analogies between levels, but in a later epoch, the world is broken down into discrete parts that are then organized into taxonomies.

Foucault is important as well for developing the idea of discourse and of discourse formation. A discursive formation is a coherent group of assumptions and language practices that applies to one region of knowledge, or expresses the beliefs of a social group, or articulates rules and ideals regarding kinds of behavior. Modern science is a

discursive formation in that it is characterized both by a list of discoveries and a body of knowledge, but also by recognized and widely accepted linguistic forms for describing the methods and findings of science. When we get to feminism, you will encounter feminists who speak of the “discourse of patriarchy,” the set of ways of thinking and of practicing language that lend coherence to male rule in society. They also describe the discourse of advice books that educated women prior to the modern era in how to behave “properly” as women, that is, in how to be “chaste, silent, and obedient.”

Foucault’s work draws attention to the fact that many assumptions in a culture are maintained by language practices that comprise a common tool both for knowing the world and for constructing it. By construction here, we mean the translation of physical realities into discursive realities. The “dominant discourse” of the US, for example, is one that lends great privilege to the “freedom” of the individual. The physical reality of modern life is hemmed in and constrained in many complex ways, from laws that allow police to search automobiles without cause to an economic system that requires enormous amounts of time spent at the workplace under someone else’s control. Nevertheless, this physical and institutional reality is rendered discursively in the American lexicon as “freedom.” Just as all women were far from being chaste, silent, and obedient, despite what the dominant discourse of the advice or courtesy books mandated, so also most Americans have limited access to the kind of pure freedom the dominant term seems to imply. What Foucault noted was that the world we live in is shaped as much by language as by knowledge or perception. Indeed, according to him, knowledge and perception always occur through the mediation of language. We would not be able to know anything if we were not able to order the world linguistically in certain ways.

In his later work, Foucault explores the way sexuality is characterized over history in different discourses of the body (*History of Sexuality*, 1976). And he examines the change in regimes of social discipline from medieval times to modern times (*Discipline and Punish*, 1975).

# CHAPTER 2

## The Linguistic Foundation

*Jonathan Culler*

Jonathan Culler's *Structuralist Poetics* (1975) was one of the first complete introductions in English to the French Structuralist movement in literary criticism. In this selection, he proposes an analogy between the structuralist description of how language operates and the rules and conventions that make up human culture.

The notion that linguistics might be useful in studying other cultural phenomena is based on two fundamental insights: first, that social and cultural phenomena are not simply material objects or events but objects or events with meaning, and hence signs; and second, that they do not have essences but are defined by a network of relations, both internal and external. Stress may fall on one or the other of these propositions – it would be in these terms, for example, that one might try to distinguish semiology and structuralism – but in fact the two are inseparable, for in studying signs one must investigate the system of relations that enables meaning to be produced and, reciprocally, one can only determine what are the pertinent relations among items by considering them as signs.

Structuralism is thus based, in the first instance, on the realization that if human actions or productions have a meaning there must be an underlying system of distinctions and conventions which makes this meaning possible. Confronted with a marriage ceremony or a game of football, for example, an observer from a culture where these did not exist could present an objective description of the actions which took place, but he would be unable to grasp their meaning and so would not be treating them as social or cultural phenomena. The actions are meaningful only with respect to a set of institutional conventions. Wherever there are two posts one can kick a ball between them but one can score a goal only within a certain institutionalized framework. As Lévi-Strauss says in his "Introduction à l'œuvre de Marcel Mauss," "particular actions of individuals

*Original publication details:* Jonathan Culler, "The Linguistic Foundation" from *Structuralist Poetics: Structuralism, Linguistics and the Study of Literature*, pp. 4–5, 6–7, 8–9. Cornell University Press and Routledge, 1975. Copyright © 1975 by Jonathan Culler. Reproduced with permission from Cornell University Press and Taylor & Francis.

are never symbolic in themselves; they are the elements out of which is constructed a symbolic system, which must be collective" (p. xvi). The cultural meaning of any particular act or object is determined by a whole system of constitutive rules: rules which do not regulate behavior so much as create the possibility of particular forms of behavior. The rules of English enable sequences of sound to have meaning; they make it possible to utter grammatical or ungrammatical sentences. And analogously, various social rules make it possible to marry, to score a goal, to write a poem, to be impolite. It is in this sense that a culture is composed of a set of symbolic systems. ....

To claim that cultural systems may with profit be treated as "languages" is to suggest that one will understand them better if one discusses them in terms provided by linguistics and analyzes them according to procedures used by linguists. In fact, the range of concepts and methods which structuralists have found useful is fairly restricted and only some half-dozen linguists could qualify as seminal influences. The first, of course, is Ferdinand de Saussure, who waded into the heterogeneous mass of linguistic phenomena and, recognizing that progress would be possible only if one isolated a suitable object for study, distinguished between speech acts (*la parole*) and the system of a language (*la langue*). The latter is the proper object of linguistics. Following Saussure's example and concentrating on the system which underlies speech sounds, members of the Prague linguistic circle – particularly Jakobson and Trubetzkoy – effected what Lévi-Strauss called the "phonological revolution" and provided what was to later structuralists the clearest model of linguistic method. Distinguishing between the study of actual speech sounds (phonetics) and the investigation of those aspects of sound that are functional in a particular language (phonology), Trubetzkoy argued that "phonology should investigate which phonic differences are linked, in the language under consideration, with differences of meaning, how these differentiating elements or marks are related to one another, and according to what rules they combine to form words and phrases" (*Principes de phonologie*, pp. 11–12). Phonology was important for structuralists because it showed the systematic nature of the most familiar phenomena, distinguished between the system and its realization and concentrated not on the substantive characteristics of individual phenomena but on abstract differential features which could be defined in relational terms....

The basic distinction on which modern linguistics rests, and which is equally crucial to the structuralist enterprise in other fields, is Saussure's isolation of *langue* from *parole*. The former is a system, an institution, a set of interpersonal rules and norms, while the latter comprises the actual manifestations of the system in speech and writing. It is, of course, easy to confuse the system with its manifestations, to think of English as the set of English utterances. But to learn English is not to memorize a set of utterances; it is to master a system of rules and norms which make it possible to produce and understand utterances. To know English is to have assimilated the system of the language. And the linguist's task is not to study utterances for their own sake; they are of interest to him only in so far as they provide evidence about the nature of the underlying system, the English language.

Within linguistics itself there are disagreements about what precisely belongs to *langue* and what to *parole*: whether, for example, an account of the linguistic system should specify the acoustic and articulatory features that distinguish one phoneme from another (/p/ is "voiceless" and /b/ "voiced"), or whether such features as "voiced" and "voiceless" should be thought of as the manifestations in *parole* of what, in *la langue* itself, is a purely formal and abstract distinction. Such debates need not concern the

structuralist, except in so far as they indicate that structure can be defined at various levels of abstraction.<sup>1</sup> What does concern him is a pair of distinctions which the differentiation of *langue* from *parole* is designed to cover between rule and behavior and between the functional and the nonfunctional.

The distinction between rule and behavior is crucial to any study concerned with the production or communication of meaning. In investigating physical events one may formulate laws which are nothing other than direct summaries of behavior, but in the case of social and cultural phenomena the rule is always at some distance from actual behavior and that gap is a space of potential meaning. The instituting of the simplest rule, such as "members of this club will not step on cracks in the pavement," may in some cases determine behavior but indubitably determines meaning: the placing of one's feet on the pavement, which formerly had no meaning, now signifies either compliance with or deviation from the rule and hence an attitude towards the club and its authority. In social and cultural systems behavior may deviate frequently and considerably from the norm without impugning the existence of the norm. Many promises are in fact broken, but there still exists a rule in the system of moral concepts that promises should be kept; though of course if one never kept any promises doubts might arise as to whether one understood the institution of promising and had assimilated its rules.

### Note

1 Cf. N. C. Spence, "A Hardy Perennial: The Problem of *la langue* and *la parole*," *Archivum linguisticum* 9 (1957), pp. 1-27.

# CHAPTER 3

## *Course in General Linguistics*

### *Ferdinand de Saussure*

Saussure's *Course in General Linguistics* (1916), which was constructed by his students from his lecture notes, is one of the most influential books of the twentieth century. It transformed intellectual endeavor in a number of fields, from anthropology and sociology to philosophy and cultural studies.

Saussure treats language in the same way a scientist might treat an organism. He describes its essential features rather than studying how it works in everyday life. Words do name things, but that is not what makes language distinct. Rather, it is an entity made up of parts that relate to one another in unique ways that allow language to function.

Saussure wished to describe language more abstractly as a system (or *langue*) rather than as an actual practice of speech communication (what he called *parole*). Essential to that more systematic understanding of language is the sign. All words are signs, but they are not signs for things. Rather, to function as words, they must consist of two parts or planes. The signifier is the sound we make when we speak a word. The signified is the image or idea with which that sound is associated in our minds. Further, Saussure argued that signifiers exist in chains of difference and association. We know "cat" means a furry animal and "hat" a piece of clothing because of a sound difference. Whether "cat" means animal or piece of clothing is entirely arbitrary. What matters is that it have a unique sound identity made by its difference from other sounds. In an assertion that would be crucial for later "Post-Structuralist" thinkers, he argued that in language there are only differences (or relations between terms) and no identities.

*Original publication details:* Ferdinand de Saussure, from *Course in General Linguistics*, pp. 65–127. McGraw Hill, 1966. Reproduced with permission from Philosophical Library, Inc.

## PART ONE

### General Principles

#### *Chapter I: NATURE OF THE LINGUISTIC SIGN*

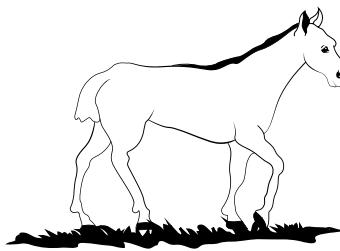

##### 1. Sign, Signified, Signifier

Some people regard language, when reduced to its elements, as a naming-process only – a list of words, each corresponding to the thing that it names. For example:

This conception is open to criticism at several points. It assumes that ready-made ideas exist before words; it does not tell us whether a name is vocal or psychological in nature (*arbor*, for instance, can be considered from either view-point); finally, it lets us assume that the linking of a name and a thing is a very simple operation – an assumption that is anything but true. But this rather naive approach can bring us near the truth by showing us that the linguistic unit is a double entity, one formed by the associating of two terms.

*ARBOR*

*EQUOS*

etc.

etc.

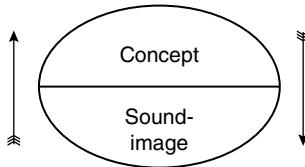

We have seen in considering the speaking-circuit that both terms involved in the linguistic sign are psychological and are united in the brain by an associative bond. This point must be emphasized.

The linguistic sign unites, not a thing and a name, but a concept and a sound-image.<sup>1</sup> The latter is not the material sound, a purely physical thing, but the psychological imprint of the sound, the impression that it makes on our senses. The sound-image is sensory, and if I happen to call it “material,” it is only in that sense, and by way of opposing it to the other term of the association, the concept, which is generally more abstract.

The psychological character of our sound-images becomes apparent when we observe our own speech. Without moving our lips or tongue, we can talk to ourselves or recite mentally a selection of verse. Because we regard the words of our language as sound-images, we must avoid speaking of the “phonemes” that make up the words. This term,

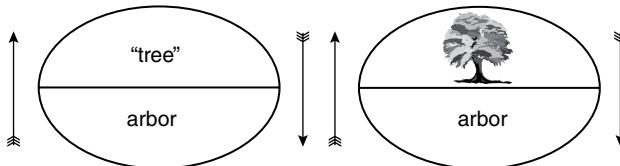

which suggests vocal activity, is applicable to the spoken word only, to the realization of the inner image in discourse. We can avoid that misunderstanding by speaking of the *sounds* and *syllables* of a word provided we remember that the names refer to the sound-image.

The linguistic sign is then a two-sided psychological entity that can be represented by the drawing:

The two elements are intimately united, and each recalls the other. Whether we try to find the meaning of the Latin word *arbor* or the word that Latin uses to designate the concept “tree,” it is clear that only the associations sanctioned by that language appear to us to conform to reality, and we disregard whatever others might be imagined.

Our definition of the linguistic sign poses an important question of terminology. I call the combination of a concept and a sound-image a *sign*, but in current usage the term generally designates only a sound-image, a word, for example (*arbor*, etc.). One tends to forget that *arbor* is called a sign only because it carries the concept “tree,” with the result that the idea of the sensory part implies the idea of the whole.

Ambiguity would disappear if the three notions involved here were designated by three names, each suggesting and opposing the others. I propose to retain the word *sign* [*signe*] to designate the whole and to replace *concept* and *sound-image* respectively by *signified* [*signifié*] and *signifier* [*signifiant*]; the last two terms have the advantage of indicating the opposition that separates them from each other and from the whole of which they are parts. As regards *sign*, if I am satisfied with it, this is simply because I do not know of any word to replace it, the ordinary language suggesting no other.

The linguistic sign, as defined, has two primordial characteristics. In enunciating them I am also positing the basic principles of any study of this type.

## 2. Principle I: The Arbitrary Nature of the Sign

The bond between the signifier and the signified is arbitrary. Since I mean by sign the whole that results from the associating of the signifier with the signified, I can simply say: *the linguistic sign is arbitrary*.

The idea of “sister” is not linked by any inner relationship to the succession of sounds *s-ö-r* which serves as its signifier in French; that it could be represented equally by just any other sequence is proved by differences among languages and by the very existence of different languages: the signified “ox” has as its signifier *b-ö-f* on one side of the border and *o-k-s* (*Ochs*) on the other.

No one disputes the principle of the arbitrary nature of the sign, but it is often easier to discover a truth than to assign to it its proper place. Principle I dominates all the linguistics of language; its consequences are numberless. It is true that not all of them are equally obvious at first glance; only after many detours does one discover them, and with them the primordial importance of the principle.

One remark in passing: when semiology becomes organized as a science, the question will arise whether or not it properly includes modes of expression based on completely natural signs, such as pantomime. Supposing that the new science welcomes them, its main concern will still be the whole group of systems grounded on the arbitrariness of the sign. In fact, every means of expression used in society is based, in principle, on collective behavior or – what amounts to the same thing – on convention. Polite formulas, for instance, though often imbued with a certain natural expressiveness (as in the case of a Chinese who greets his emperor by bowing down to the ground nine times), are nonetheless fixed by rule; it is this rule and not the intrinsic value of the gestures that obliges one to use them. Signs that are wholly arbitrary realize better than the others the ideal of the semiological process; that is why language, the most complex and universal of all systems of expression, is also the most characteristic; in this sense linguistics can become the master-pattern for all branches of semiology although language is only one particular semiological system.

The word *symbol* has been used to designate the linguistic sign, or more specifically, what is here called the signifier. Principle I in particular weighs against the use of this term. One characteristic of the symbol is that it is never wholly arbitrary; it is not empty, for there is the rudiment of a natural bond between the signifier and the signified. The symbol of justice, a pair of scales, could not be replaced by just any other symbol, such as a chariot.

The word *arbitrary* also calls for comment. The term should not imply that the choice of the signifier is left entirely to the speaker (we shall see below that the individual does not have the power to change a sign in any way once it has become established in the linguistic community); I mean that it is unmotivated, i.e. arbitrary in that it actually has no natural connection with the signified.

In concluding let us consider two objections that might be raised to the establishment of Principle I:

(1) *Onomatopoeia* might be used to prove that the choice of the signifier is not always arbitrary. But onomatopoeic formations are never organic elements of a linguistic system. Besides, their number is much smaller than is generally supposed. Words like French *fouet* ‘whip’ or *glas* ‘knell’ may strike certain ears with suggestive sonority, but to see that they have not always had this property we need only examine their Latin forms (*fouet* is derived from *fagus* ‘beech-tree,’ *glas* from *classicum* ‘sound of a trumpet’). The quality of their present sounds, or rather the quality that is attributed to them, is a fortuitous result of phonetic evolution.

As for authentic onomatopoeic words (e.g. *glug-glug*, *tick-tock*, etc.), not only are they limited in number, but also they are chosen somewhat arbitrarily, for they are only

approximate and more or less conventional imitations of certain sounds (cf. English *bom-bom* and French *ouaoua*). In addition, once these words have been introduced into the language, they are to a certain extent subjected to the same evolution – phonetic, morphological, etc. – that other words undergo (cf. *pigeon*, ultimately from Vulgar Latin *pīpiō*, derived in turn from an onomatopoeic formation): obvious proof that they lose something of their original character in order to assume that of the linguistic sign in general, which is unmotivated.

(2) *Interjections*, closely related to onomatopoeia, can be attacked on the same grounds and come no closer to refuting our thesis. One is tempted to see in them spontaneous expressions of reality dictated, so to speak, by natural forces. But for most interjections we can show that there is no fixed bond between their signified and their signifier. We need only compare two languages on this point to see how much such expressions differ from one language to the next (e.g. the English equivalent of French *aïe!* is *ouch!*). We know, moreover, that many interjections were once words with specific meanings (cf. French *diabol!* ‘darn!’ *mordieu!* ‘golly!’ from *mort Dieu* ‘God’s death,’ etc.).<sup>2</sup>

Onomatopoeic formations and interjections are of secondary importance, and their symbolic origin is in part open to dispute.

### 3. Principle II: The Linear Nature of the Signifier

The signifier, being auditory, is unfolded solely in time from which it gets the following characteristics: (a) it represents a span, and (b) the span is measurable in a single dimension; it is a line.

While Principle II is obvious, apparently linguists have always neglected to state it, doubtless because they found it too simple; nevertheless, it is fundamental, and its consequences are incalculable. Its importance equals that of Principle I; the whole mechanism of language depends upon it. In contrast to visual signifiers (nautical signals, etc.) which can offer simultaneous groupings in several dimensions, auditory signifiers have at their command only the dimension of time. Their elements are presented in succession; they form a chain. This feature becomes readily apparent when they are represented in writing and the spatial line of graphic marks is substituted for succession in time.

Sometimes the linear nature of the signifier is not obvious. When I accent a syllable, for instance, it seems that I am concentrating more than one significant element on the same point. But this is an illusion; the syllable and its accent constitute only one phonational act. There is no duality within the act but only different oppositions to what precedes and what follows.

## ***Chapter II: IMMUTABILITY AND MUTABILITY OF THE SIGN***

### 1. Immutability

The signifier, though to all appearances freely chosen with respect to the idea that it represents, is fixed, not free, with respect to the linguistic community that uses it. The masses have no voice in the matter, and the signifier chosen by language could

be replaced by no other. This fact, which seems to embody a contradiction, might be called colloquially “the stacked deck.” We say to language: “Choose!” but we add: “It must be this sign and no other.” No individual, even if he willed it, could modify in any way at all the choice that has been made; and what is more, the community itself cannot control so much as a single word; it is bound to the existing language.

No longer can language be identified with a contract pure and simple, and it is precisely from this viewpoint that the linguistic sign is a particularly interesting object of study; for language furnishes the best proof that a law accepted by a community is a thing that is tolerated and not a rule to which all freely consent.

Let us first see why we cannot control the linguistic sign and then draw together the important consequences that issue from the phenomenon.

No matter what period we choose or how far back we go, language always appears as a heritage of the preceding period. We might conceive of an act by which, at a given moment, names were assigned to things and a contract was formed between concepts and sound-images; but such an act has never been recorded. The notion that things might have happened like that was prompted by our acute awareness of the arbitrary nature of the sign.

No society, in fact, knows or has ever known language other than as a product inherited from preceding generations, and one to be accepted as such. That is why the question of the origin of speech is not so important as it is generally assumed to be. The question is not even worth asking; the only real object of linguistics is the normal, regular life of an existing idiom. A particular language-state is always the product of historical forces, and these forces explain why the sign is unchangeable, i.e. why it resists any arbitrary substitution.

Nothing is explained by saying that language is something inherited and leaving it at that. Can not existing and inherited laws be modified from one moment to the next?

To meet that objection, we must put language into its social setting and frame the question just as we would for any other social institution. How are other social institutions transmitted? This more general question includes the question of immutability. We must first determine the greater or lesser amounts of freedom that the other institutions enjoy; in each instance it will be seen that a different proportion exists between fixed tradition and the free action of society. The next step is to discover why in a given category, the forces of the first type carry more weight or less weight than those of the second. Finally, coming back to language, we must ask why the historical factor of transmission dominates it entirely and prohibits any sudden widespread change.

There are many possible answers to the question. For example, one might point to the fact that succeeding generations are not superimposed on one another like the drawers of a piece of furniture, but fuse and interpenetrate, each generation embracing individuals of all ages – with the result that modifications of language are not tied to the succession of generations. One might also recall the sum of the efforts required for learning the mother language and conclude that a general change would be impossible. Again, it might be added that reflection does not enter into the active use of an idiom – speakers are largely unconscious of the laws of language; and if they are unaware of them, how could they modify them? Even if they were aware of these laws, we may be sure that their awareness would seldom lead to criticism, for people are generally satisfied with the language they have received.

The foregoing considerations are important but not topical. The following are more basic and direct, and all the others depend on them.

1. *The arbitrary nature of the sign.* Above, we had to accept the theoretical possibility of change; further reflection suggests that the arbitrary nature of the sign is really what protects language from any attempt to modify it. Even if people were more conscious of language than they are, they would still not know how to discuss it. The reason is simply that any subject in order to be discussed must have a reasonable basis. It is possible, for instance, to discuss whether the monogamous form of marriage is more reasonable than the polygamous form and to advance arguments to support either side. One could also argue about a system of symbols, for the symbol has a rational relationship with the thing signified; but language is a system of arbitrary signs and lacks the necessary basis, the solid ground for discussion. There is no reason for preferring *sœur* to *sister*, *Ochs* to *boeuf*, etc.
2. *The multiplicity of signs necessary to form any language.* Another important deterrent to linguistic change is the great number of signs that must go into the making of any language. A system of writing comprising twenty to forty letters can in case of need be replaced by another system. The same would be true of language if it contained a limited number of elements; but linguistic signs are numberless.
3. *The over-complexity of the system.* A language constitutes a system. In this one respect (as we shall see later) language is not completely arbitrary but is ruled to some extent by logic; it is here also, however, that the inability of the masses to transform it becomes apparent. The system is a complex mechanism that can be grasped only through reflection; the very ones who use it daily are ignorant of it. We can conceive of a change only through the intervention of specialists, grammarians, logicians, etc.; but experience shows us that all such meddlings have failed.
4. *Collective inertia toward innovation.* Language – and this consideration surpasses all the others – is at every moment everybody's concern; spread throughout society and manipulated by it, language is something used daily by all. Here we are unable to set up any comparison between it and other institutions. The prescriptions of codes, religious rites, nautical signals, etc., involve only a certain number of individuals simultaneously and then only during a limited period of time; in language, on the contrary, everyone participates at all times, and that is why it is constantly being influenced by all. This capital fact suffices to show the impossibility of revolution. Of all social institutions, language is least amenable to initiative. It blends with the life of society, and the latter, inert by nature, is a prime conservative force.

But to say that language is a product of social forces does not suffice to show clearly that it is unfree; remembering that it is always the heritage of the preceding period, we must add that these social forces are linked with time. Language is checked not only by the weight of the collectivity but also by time. These two are inseparable. At every moment solidarity with the past checks freedom of choice. We say *man* and *dog*. This does not prevent the existence in the total phenomenon of a bond between the two antithetical forces – arbitrary convention by virtue of which choice is free and time which

causes choice to be fixed. Because the sign is arbitrary, it follows no law other than that of tradition, and because it is based on tradition, it is arbitrary.

## 2. Mutability

Time, which insures the continuity of language, wields another influence apparently contradictory to the first: the more or less rapid change of linguistic signs. In a certain sense, therefore, we can speak of both the immutability and the mutability of the sign.<sup>3</sup>

In the last analysis, the two facts are interdependent: the sign is exposed to alteration because it perpetuates itself. What predominates in all change is the persistence of the old substance; disregard for the past is only relative. That is why the principle of change is based on the principle of continuity.

Change in time takes many forms, on any one of which an important chapter in linguistics might be written. Without entering into detail, let us see what things need to be delineated.

First, let there be no mistake about the meaning that we attach to the word change. One might think that it deals especially with phonetic changes undergone by the signifier, or perhaps changes in meaning which affect the signified concept. That view would be inadequate. Regardless of what the forces of change are, whether in isolation or in combination, they always result in a shift in the relationship between the signified and the signifier.

Here are some examples. Latin *necāre* ‘kill’ became *noyer* ‘drown’ in French. Both the sound-image and the concept changed; but it is useless to separate the two parts of the phenomenon; it is sufficient to state with respect to the whole that the bond between the idea and the sign was loosened, and that there was a shift in their relationship. If instead of comparing Classical Latin *necāre* with French *noyer*, we contrast the former term with *necare* of Vulgar Latin of the fourth or fifth century meaning ‘drown’ the case is a little different; but here again, although there is no appreciable change in the signifier, there is a shift in the relationship between the idea and the sign.<sup>4</sup>

Old German *drittel* ‘one-third’ became *Drittel* in Modern German. Here, although the concept remained the same, the relationship was changed in two ways: the signifier was changed not only in its material aspect but also in its grammatical form; the idea of *Teil* ‘part’ is no longer implied; *Drittel* is a simple word. In one way or another there is always a shift in the relationship.

In Anglo-Saxon the preliterate form *fot* ‘foot’ remained while its plural \**fōti* became *fēt* (Modern English *feet*). Regardless of the other changes that are implied, one thing is certain: there was a shift in their relationship; other correspondences between the phonetic substance and the idea emerged.

Language is radically powerless to defend itself against the forces which from one moment to the next are shifting the relationship between the signified and the signifier. This is one of the consequences of the arbitrary nature of the sign.

Unlike language, other human institutions – customs, laws, etc. – are all based in varying degrees on the natural relations of things; all have of necessity adapted the means employed to the ends pursued. Even fashion in dress is not entirely arbitrary; we can deviate only slightly from the conditions dictated by the human body. Language is limited by nothing in the choice of means, for apparently nothing would prevent the associating of any idea whatsoever with just any sequence of sounds.

To emphasize the fact that language is a genuine institution, Whitney quite justly insisted upon the arbitrary nature of signs; and by so doing, he placed linguistics on its true axis. But he did not follow through and see that the arbitrariness of language radically separates it from all other institutions. This is apparent from the way in which language evolves. Nothing could be more complex. As it is a product of both the social force and time, no one can change anything in it, and on the other hand, the arbitrariness of its signs theoretically entails the freedom of establishing just any relationship between phonetic substance and ideas. The result is that each of the two elements united in the sign maintains its own life to a degree unknown elsewhere, and that language changes, or rather evolves, under the influence of all the forces which can affect either sounds or meanings. The evolution is inevitable; there is no example of a single language that resists it. After a certain period of time, some obvious shifts can always be recorded.

Mutability is so inescapable that it even holds true for artificial languages. Whoever creates a language controls it only so long as it is not in circulation; from the moment when it fulfills its mission and becomes the property of everyone, control is lost. Take Esperanto as an example; if it succeeds, will it escape the inexorable law? Once launched, it is quite likely that Esperanto will enter upon a fully semiological life; it will be transmitted according to laws which have nothing in common with those of its logical creation, and there will be no turning backwards. A man proposing a fixed language that posterity would have to accept for what it is would be like a hen hatching a duck's egg: the language created by him would be borne along, willy-nilly, by the current that engulfs all languages.

Signs are governed by a principle of general semiology: continuity in time is coupled to change in time; this is confirmed by orthographic systems, the speech of deaf-mutes, etc.

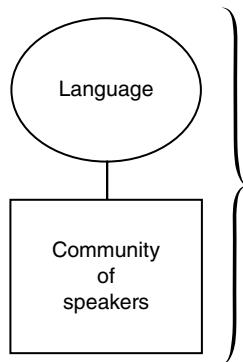

But what supports the necessity for change? I might be reproached for not having been as explicit on this point as on the principle of immutability. This is because I failed to distinguish between the different forces of change. We must consider their great variety in order to understand the extent to which they are necessary.

The causes of continuity are *a priori* within the scope of the observer, but the causes of change in time are not. It is better not to attempt giving an exact account at this point, but to restrict discussion to the shifting of relationships in general. Time changes all things; there is no reason why language should escape this universal law.

Let us review the main points of our discussion and relate them to the principles set up in the Introduction.

1. Avoiding sterile word definitions, within the total phenomenon represented by speech we first singled out two parts: language and speaking. Language is speech less speaking. It is the whole set of linguistic habits which allow an individual to understand and to be understood.
2. But this definition still leaves language outside its social context; it makes language something artificial since it includes only the individual part of reality; for the realization of language, a community of speakers [*masse parlante*] is necessary. Contrary to all appearances, language never exists apart from the social fact, for it is a semiological phenomenon. Its social nature is one of its inner characteristics.

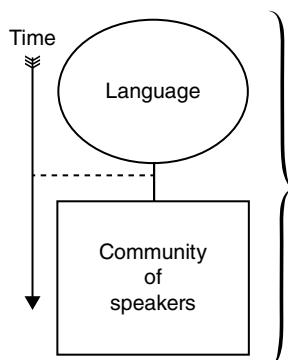

Its complete definition confronts us with two inseparable entities, as shown in this drawing:

But under the conditions described language is not living – it has only potential life; we have considered only the social, not the historical, fact.

3. The linguistic sign is arbitrary; language, as defined, would therefore seem to be a system which, because it depends solely on a rational principle, is free and can be organized at will. Its social nature, considered independently, does not definitely rule out this viewpoint. Doubtless it is not on a purely logical basis that group psychology operates; one must consider everything that deflects reason in actual contacts between individuals. But the thing which keeps language from being a simple convention that can be modified at the whim of interested parties is not its social nature; it is rather the action of time combined with the social force. If time is left out, the linguistic facts are incomplete and no conclusion is possible.

If we considered language in time, without the community of speakers – imagine an isolated individual living for several centuries – we probably would notice no change; time would not influence language. Conversely, if we considered the community of speakers without considering time, we would not see the effect of the social forces that influence language. To represent the actual facts, we must then add to our first drawing a sign to indicate passage of time:

Language is no longer free, for time will allow the social forces at work on it to carry out their effects. This brings us back to the principle of continuity, which cancels freedom. But continuity necessarily implies change, varying degrees of shifts in the relationship between the signified and the signifier.

### **Chapter III: STATIC AND EVOLUTIONARY LINGUISTICS**

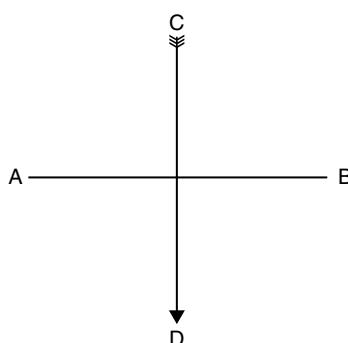

#### **1. Inner Duality of All Sciences Concerned with Values**

Very few linguists suspect that the intervention of the factor of time creates difficulties peculiar to linguistics and opens to their science two completely divergent paths.

Most other sciences are unaffected by this radical duality; time produces no special effects in them. Astronomy has found that the stars undergo considerable changes but has not been obliged on this account to split itself into two disciplines. Geology is concerned with successions at almost every instant, but its study of strata does not thereby become a radically distinct discipline. Law has its descriptive science and its historical science; no one opposes one to the other. The political history of states is unfolded solely in time, but a historian depicting a particular period does not work apart from history. Conversely, the science of political institutions is essentially descriptive, but if the need arises it can easily deal with a historical question without disturbing its unity.

On the contrary, that duality is already forcing itself upon the economic sciences. Here, in contrast to the other sciences, political economy and economic history constitute two clearly separated disciplines within a single science; the works that have recently appeared on these subjects point up the distinction. Proceeding as they have, economists are – without being well aware of it – obeying an inner necessity. A similar necessity obliges us to divide linguistics into two parts, each with its own principle. Here as in political economy we are confronted with the notion of *value*; both sciences are concerned with *a system for equating things of different orders* – labor and wages in one and a signified and signifier in the other.

Certainly all sciences would profit by indicating more precisely the co-ordinates along which their subject matter is aligned. Everywhere distinctions should be made, according to the following illustration, between (1) *the axis of simultaneities* (AB), which stands for the relations of coexisting things and from which the intervention of time is excluded; and (2) *the axis of successions* (CD), on which only one thing can be considered at a time but upon which are located all the things on the first axis together with their changes.

For a science concerned with values the distinction is a practical necessity and sometimes an absolute one. In these fields scholars cannot organize their research rigorously without considering both co-ordinates and making a distinction between the system of values per se and the same values as they relate to time.

This distinction has to be heeded by the linguist above all others, for language is a system of pure values which are determined by nothing except the momentary arrangement of its terms. A value – so long as it is somehow rooted in things and in their natural relations, as happens with economics (the value of a plot of ground, for instance, is related to its productivity) – can to some extent be traced in time if we remember that it depends at each moment upon a system of coexisting values. Its link with things gives it, perforce, a natural basis, and the judgments that we base on such values are therefore never completely arbitrary; their variability is limited. But we have just seen that natural data have no place in linguistics.

Again, the more complex and rigorously organized a system of values is, the more it is necessary, because of its very complexity, to study it according to both co-ordinates. No other system embodies this feature to the same extent as language. Nowhere else do we find such precise values at stake and such a great number and diversity of terms, all so rigidly interdependent. The multiplicity of signs, which we have already used to explain the continuity of language, makes it absolutely impossible to study simultaneously relations in time and relations within the system.

The reasons for distinguishing two sciences of language are clear. How should the sciences be designated? Available terms do not all bring out the distinction with equal sharpness. “Linguistic history” and “historical linguistics” are too vague. Since political history includes the description of different periods as well as the narration of events, the student might think that he is studying a language according to the axis of time when he describes its successive states, but this would require a separate study of the phenomena that make language pass from one state to another. *Evolution* and *evolutionary linguistics* are more precise, and I shall use these expressions often; in contrast, we can speak of the science of *language-states* [*états de langue*] or *static linguistics*.

But to indicate more clearly the opposition and crossing of two orders of phenomena that relate to the same object, I prefer to speak of *synchronic* and *diachronic* linguistics. Everything that relates to the static side of our science is synchronic; everything that has to do with evolution is diachronic. Similarly, *synchrony* and *diachrony* designate respectively a language-state and an evolutionary phase.

## 2. Inner Duality and the History of Linguistics

The first thing that strikes us when we study the facts of language is that their succession in time does not exist insofar as the speaker is concerned. He is confronted with a state. That is why the linguist who wishes to understand a state must discard all knowledge of everything that produced it and ignore diachrony. He can enter the mind of speakers only by completely suppressing the past. The intervention of history can only falsify his judgment. It would be absurd to attempt to sketch a panorama of the Alps by viewing them simultaneously from several peaks of the Jura; a panorama must be made from a single vantage point. The same applies to language; the linguist can neither describe it nor draw up standards of usage except by concentrating on one state. When he follows the evolution of the language, he resembles the moving observer who goes from one peak of the Jura to another in order to record the shifts in perspective.

Ever since modern linguistics came into existence, it has been completely absorbed in diachrony. Comparative Indo-European philology uses the materials at hand to reconstruct hypothetically an older type of language; comparison is but a means of reconstructing the past. The method is the same in the narrower study of subgroups (Romance languages, Germanic languages, etc.); states intervene only irregularly and piecemeal. Such is the tendency introduced by Bopp. His conception of language is therefore hybrid and hesitating.

Against this, what was the procedure of those who studied language before the beginning of modern linguistics, i.e. the “grammarians” inspired by traditional methods? It is curious to note that here their viewpoint was absolutely above reproach. Their works clearly show that they tried to describe language-states. Their program was strictly synchronic. The *Port Royal Grammar*, for example, attempts to describe the state of French under Louis XIV and to determine its values. For this, the language of the Middle Ages is not needed; the horizontal axis is followed faithfully, without digression. The method was then correct, but this does not mean that its application was perfect. Traditional grammar neglects whole parts of language, such as word formation; it is normative and assumes the role of prescribing rules, not of recording facts; it lacks overall perspective; often it is unable even to separate the written from the spoken word, etc.

Classical grammar has been criticized as unscientific; still, its basis is less open to criticism and its data are better defined than is true of the linguistics started by Bopp. The latter, occupying ill-defined ground, has no clear-cut objective. It straddles two areas because it is unable to make a sharp distinction between states and successions.

Linguistics, having accorded too large a place to history, will turn back to the static viewpoint of traditional grammar but in a new spirit and with other procedures, and the historical method will have contributed to this rejuvenation; the historical method will in turn give a better understanding of language-states. The old grammar saw only the synchronic fact; linguistics has revealed a new class of phenomena; but that is not enough; one must sense the opposition between the two classes of facts to draw out all its consequences.

### 3. Inner Duality Illustrated by Examples

The opposition between the two viewpoints, the synchronic and the diachronic, is absolute and allows no compromise. A few facts will show what the difference is and why it is irreducible.

Latin *crispus* ‘crisp’ provided French with the root *crép-*—from which were formed the verbs *crépir* ‘rough-cast’ and *décrepir* ‘remove mortar.’ Against this, at a certain moment the word *décrepitus*, of unknown origin, was borrowed from Latin and became *décrépit* ‘decrepit.’ Certainly today the community of speakers sets up a relation between *un mur décrépi* ‘a wall from which mortar is falling’ and *un homme décrépit* ‘a decrepit man,’ although historically the two words have nothing in common; people often speak of the *façade décrépite* of a house. And this is static, for it concerns the relation between two coexisting forms of language. For its realization, the concurrence of certain evolutionary events was necessary. The pronunciation of *crisp-* had to become *crép-*, and at a particular moment a new word had to be borrowed from Latin. It is obvious that the diachronic facts are not related to the static facts which they produced. They belong to a different class.

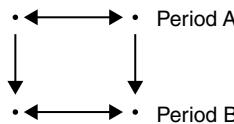

Here is a more telling example. In Old High German the plural of *gast* ‘guest’ was first *gasti*, that of *hant* ‘hand’ was *hanti*, etc. Later the final *-i* produced an umlaut, i.e. it resulted in the changing of the *a* of the preceding syllable to *e*: *gasti* → *gesti*; *hanti* → *henti*. Then the final *-i* lost its timbre: *gesti* → *geste*, etc. The result is that today German has *Gast*: *Gäste*, *Hand*: *Hände*, and a whole group of words marked by the same difference between the singular and the plural. A very similar fact occurred in Anglo-Saxon: the earlier forms were *fōt*: \**fōti*, *tōb*: \**tōbi*, *gōs*: \**gōsi*, etc. Through an initial phonetic change, umlaut, \**fōti* became \**fēti*; through a second, the fall of final *-i*, *fēti* became *fēt*; after that, *fōt* had as its plural *fēt*; *tōb*, *tēb*; *gōs*, *gēs*, etc. (Modern English *foot*: *feet*, *tooth*: *teeth*, *goose*: *geese*.)

Previously, when speakers used *gast*: *gasti*, *fōt*: *fōti*, the simple addition of an *i* marked the plural; *Gast*: *Gäste* and *fōt*: *fēt* show a new mechanism for indicating the plural. The mechanism is not the same in both instances; in Old English there is only opposition between vowels; in German there is in addition the presence or absence of final *-e*; but here this difference is unimportant.

The relation between a singular and its plural, whatever the forms may be, can be expressed at each moment by a horizontal axis:

Whatever facts have brought about passage from one form to another should be placed along a vertical axis, giving the overall picture:

Our illustration suggests several pertinent remarks:

1. In no way do diachronic facts aim to signal a value by means of another sign; that *gasti* became *gesti*, *geste* (*Gäste*) has nothing to do with the plural of substantives; in *tragit* → *trägt*, the same umlaut occurs in verbal inflection, and so forth. A diachronic fact is an independent event; the particular synchronic consequences that may stem from it are wholly unrelated to it.
2. Diachronic facts are not even directed toward changing the system. Speakers did not wish to pass from one system of relations to another; modification does not affect the arrangement but rather its elements.

Here we again find the principle enunciated previously: never is the system modified directly. In itself it is unchangeable; only certain elements are altered without regard for the solidarity that binds them to the whole. It is as if one of the planets that revolve around the sun changed its dimensions and weight: this isolated event would entail general consequences and would throw the whole system out of equilibrium. The opposition of two terms is needed to express plurality: either *fōt*: *fōti* or *fōt*: *fēt*; both procedures are possible, but speakers passed from one to the other,

so to speak, without having a hand in it. Neither was the whole replaced nor did one system engender another; one element in the first system was changed, and this change was enough to give rise to another system.

3. The foregoing observation points up the ever *fortuitous* nature of a state. In contrast to the false notion that we readily fashion for ourselves about it, language is not a mechanism created and arranged with a view to the concepts to be expressed. We see on the contrary that the state which resulted from the change was not destined to signal the meaning with which it was impregnated. In a fortuitous state (*fōt: fēt*), speakers took advantage of an existing difference and made it signal the distinction between singular and plural; *fōt: fēt* is no better for this purpose than *fōt: \*fōti*. In each state the mind infiltrated a given substance and breathed life into it. This new perspective, inspired by historical linguistics, is unknown to traditional grammar, which could never acquire it by its own methods. Most philosophers of language are equally ignorant of it, and yet nothing is more important from the philosophical viewpoint.
4. Are facts of the diachronic series of the same class, at least, as facts of the synchronic series? By no means, for we have seen that changes are wholly unintentional while the synchronic fact is always significant. It always calls forth two simultaneous terms. Not *Gäste* alone but the opposition *Gast: Gäste* expresses the plural. The diachronic fact is just the opposite: only one term is involved, and for the new one to appear (*Gäste*), the old one (*gasti*) must first give way to it.

To try to unite such dissimilar facts in the same discipline would certainly be a fanciful undertaking. The diachronic perspective deals with phenomena that are unrelated to systems although they do condition them.

Here are some other examples to strengthen and complement the conclusions drawn from the first ones.

In French, the accent always falls on the last syllable unless this syllable contains a mute *e* (ə). This is a synchronic fact, a relation between the whole set of French words and accent. What is its source? A previous state. Latin had a different and more complicated system of accentuation: the accent was on the penultimate syllable when the latter was long; when short, the accent fell back on the antepenult (cf. *amīcus*, *ánima*). The Latin law suggests relations that are in no way analogous to the French law. Doubtless the accent is the same in the sense that it remained in the same position; in French words it always falls on the syllable that had it in Latin: *amīcum* → *aimi*, *ánimum* → *âme*. But the two formulas are different for the two moments because the forms of the words changed. We know that everything after the accent either disappeared or was reduced to mute *e*. As a result of the alteration of the word, the position of the accent with respect to the whole was no longer the same; subsequently speakers, conscious of the new relation, instinctively put the accent on the last syllable, even in borrowed words introduced in their written forms (*facile*, *consul*, *ticket*, *burgrave*, etc.). Speakers obviously did not try to change systems, to apply a new formula, since in words like *amīcum* → *amí* the accent always remained on the same syllable; but a diachronic fact was interposed: speakers changed the position of the accent without having a hand in it. A law of accentuation, like everything that pertains to the linguistic system, is an arrangement of terms, a fortuitous and involuntary result of evolution.

Here is an even more striking example. In Old Slavic, *slovo* ‘word’ has in the instrumental singular *slovem'b*, in the nominative plural *slova*, in the genitive plural *slov'b*, etc.; in the declension each case has its own ending. But today the weak vowels *b* and *'b*, Slavic representatives of Proto-Indo-European *i* and *ü*, have disappeared. Czech, for example, has *slovo*, *slovem*, *slova*, *slov*; likewise *žena* ‘woman’: accusative singular *ženu*, nominative plural *ženy*, genitive plural *žen*. Here the genitive (*slov*, *žen*) has zero inflection. We see then that a material sign is not necessary for the expression of an idea; language is satisfied with the opposition between something and nothing. Czech speakers recognize *žen* as a genitive plural simply because it is neither *žena* nor *ženu* nor any of the other forms. It seems strange at first glance that such a particular notion as that of the genitive plural should have taken the zero sign, but this very fact proves that everything comes about through sheer accident. Language is a mechanism that continues to function in spite of the deteriorations to which it is subjected.

All this confirms the principles previously stated. To summarize:

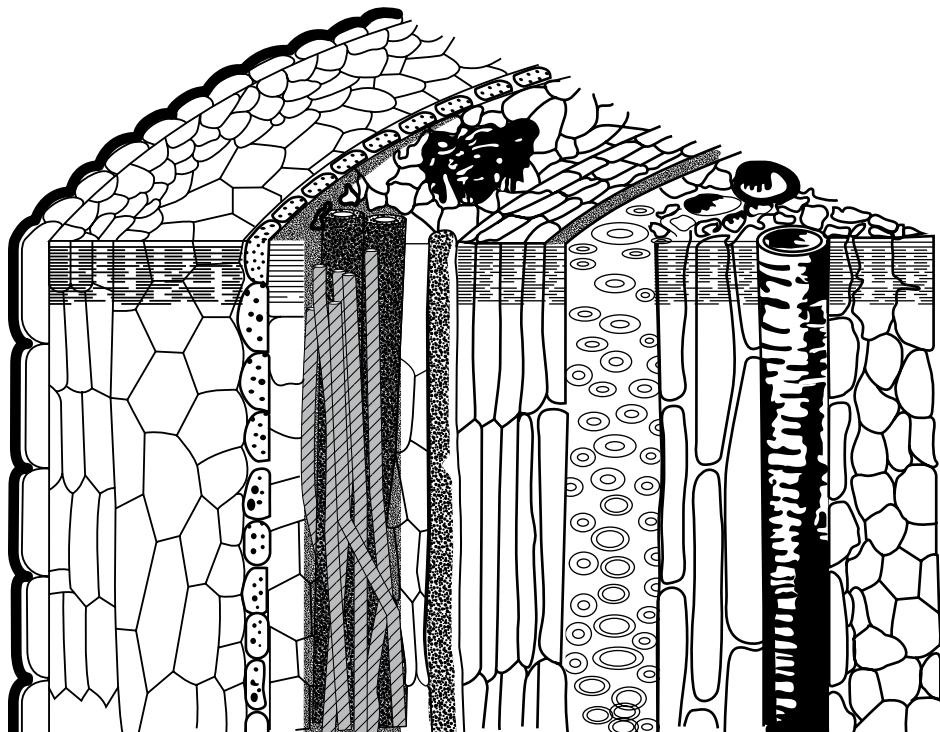

Language is a system whose parts can and must all be considered in their synchronic solidarity.

Since changes never affect the system as a whole but rather one or another of its elements, they can be studied only outside the system. Each alteration doubtless has its countereffect on the system, but the initial fact affected only one point; there is no inner bond between the initial fact and the effect that it may subsequently produce on the whole system. The basic difference between successive terms and coexisting terms, between partial facts and facts that affect the system, precludes making both classes of fact the subject matter of a single science.

#### 4. The Difference between the Two Classes Illustrated by Comparisons

To show both the autonomy and the interdependence of synchrony we can compare the first to the projection of an object on a plane surface. Any projection depends directly on the nature of the object projected, yet differs from it – the object itself is a thing apart. Otherwise there would not be a whole science of projections; considering the bodies themselves would suffice. In linguistics there is the same relationship between the historical facts and a language-state, which is like a projection of the facts at a particular moment. We do not learn about synchronic states by studying bodies, i.e. diachronic events, any more than we learn about geometric projections by studying, even carefully, the different types of bodies.

Similarly if the stem of a plant is cut transversely, a rather complicated design is formed by the cut surface; the design is simply one perspective of the longitudinal fibers, and we would be able to see them on making a second cut perpendicular to the first. Here again one perspective depends on the other; the longitudinal cut shows the fibers that constitute the plant, and the transversal cut shows their arrangement on a particular plane; but the second is distinct from the first because it brings out certain relations between the fibers – relations that we could never grasp by viewing the longitudinal plane.

But of all comparisons that might be imagined, the most fruitful is the one that might be drawn between the functioning of language and a game of chess. In both instances we are confronted with a system of values and their observable modifications. A game of chess is like an artificial realization of what language offers in a natural form.

Let us examine the matter more carefully.

First, a state of the set of chessmen corresponds closely to a state of language. The respective value of the pieces depends on their position on the chessboard just as each linguistic term derives its value from its opposition to all the other terms.

In the second place, the system is always momentary; it varies from one position to the next. It is also true that values depend above all else on an unchangeable convention, the set of rules that exists before a game begins and persists after each move. Rules that are agreed upon once and for all exist in language too; they are the constant principles of semiology.

Finally, to pass from one state of equilibrium to the next, or – according to our terminology – from one synchrony to the next, only one chesspiece has to be moved; there is no general rummage. Here we have the counterpart of the diachronic phenomenon with all its peculiarities. In fact:

- (a) In each play only one chesspiece is moved; in the same way in language, changes affect only isolated elements.
- (b) In spite of that, the move has a repercussion on the whole system; it is impossible for the player to foresee exactly the extent of the effect. Resulting changes of value will be, according to the circumstances, either nil, very serious, or of average

importance. A certain move can revolutionize the whole game and even affect pieces that are not immediately involved. We have just seen that exactly the same holds for language.

- (c) In chess, each move is absolutely distinct from the preceding and the subsequent equilibrium. The change effected belongs to neither state: only states matter.

In a game of chess any particular position has the unique characteristic of being freed from all antecedent positions; the route used in arriving there makes absolutely no difference; one who has followed the entire match has no advantage over the curious party who comes up at a critical moment to inspect the state of the game; to describe this arrangement, it is perfectly useless to recall what had just happened ten seconds previously. All this is equally applicable to language and sharpens the radical distinction between diachrony and synchrony. Speaking operates only on a language-state, and the changes that intervene between states have no place in either state.

At only one point is the comparison weak: the chessplayer *intends* to bring about a shift and thereby to exert an action on the system, whereas language premeditates nothing. The pieces of language are shifted – or rather modified – spontaneously and fortuitously. The umlaut of *Hände* for *hanti* and *Gäste* for *gasti* produced a new system for forming the plural but also gave rise to verbal forms like *trägt* from *tragit*, etc. In order to make the game of chess seem at every point like the functioning of language, we would have to imagine an unconscious or unintelligent player. This sole difference, however, makes the comparison even more instructive by showing the absolute necessity of making a distinction between the two classes of phenomena in linguistics. For if diachronic facts cannot be reduced to the synchronic system which they condition when the change is intentional, all the more will they resist when they set a blind force against the organization of a system of signs.

## 5. The Two Linguistics Contrasted According to Their Methods and Principles

Everywhere the opposition between diachrony and synchrony stands out.

For instance – and to begin with the most apparent fact – they are not of equal importance. Here it is evident that the synchronic viewpoint predominates, for it is the true and only reality to the community of speakers. The same is true of the linguist: if he takes the diachronic perspective, he no longer observes language but rather a series of events that modify it. People often affirm that nothing is more important than understanding the genesis of a particular state; this is true in a certain sense: the forces that have shaped the state illuminate its true nature, and knowing them protects us against certain illusions; but this only goes to prove clearly that diachronic linguistics is not an end in itself. What is said of journalism applies to diachrony: it leads everywhere if one departs from it.

The methods of diachrony and synchrony also differ, and in two ways.

- (a) Synchrony has only one perspective, the speakers', and its whole method consists of gathering evidence from speakers; to know to just what extent a thing is a reality, it is necessary and sufficient to determine to what extent it exists in the minds of speakers. Diachronic linguistics, on the contrary, must distinguish two

perspectives. One of these, the *prospective*, follows the course of time; the other, the *retrospective*, goes back in time; the result is a duplication in methodology with which we shall deal in Part Five.

- (b) A second difference results from delimiting the fields embraced by each of the two disciplines. Synchronic study has as its object, not everything that is simultaneous, but only the totality of facts corresponding to each language; separation will go as far as dialects and subdialects when necessary. The term *synchronic* is really not precise enough; it should be replaced by another – rather long to be sure – *idiiosyncratic*. Against this, diachronic linguistics not only does not need but even rejects such specialization; the terms that it studies do not necessarily belong to the same language (compare Proto-Indo-European *\*esti*, Greek *esti*, German *ist*, and French *est*). The succession of diachronic events and their multiplication in space are precisely what creates the diversity of idioms. To justify the associating of two forms, it is enough to show that they are connected by a historical bond, however indirect it may be.

The foregoing oppositions are neither the most striking nor the most profound. One consequence of the radical antimony between the evolutionary and the static fact is that all notions associated with one or the other are to the same extent mutually irreducible. Any notion will point up this truth. The synchronic and diachronic “phenomenon,” for example, have nothing in common. One is a relation between simultaneous elements, the other the substitution of one element for another in time, an event.

We shall also see that diachronic and synchronic identities are two very different things; historically the French negation *pas* is identical to the substantive *pas* ‘step,’ whereas the two forms are distinct in modern French. These observations would suffice to show the necessity of not confusing the two viewpoints, but nowhere is this necessity more apparent than in the distinction we are about to make.

## 6. Synchronic and Diachronic Law

It is a popular practice to speak of laws in linguistics. But are the facts of language actually governed by laws? If so, what are they like? Since language is a social institution, one might assume *a priori* that it is governed by prescriptions analogous to those that control communities. Now every social law has two basic characteristics: it is *imperative* and it is *general*; it comes in by force and it covers all cases – within certain limits of time and place, of course.

Do the laws of language fit this definition? The first step in answering the question – in line with what has just been said – is to separate once more the synchronic and diachronic areas. The two problems must not be confused; speaking of linguistic law in general is like trying to pin down a ghost.

Here are some examples, taken from Greek, in which the two classes are intentionally jumbled:

1. Proto-Indo-European voiced aspirates became voiceless: *\*dhūmos* → *thūmos* ‘breath of life,’ *\*bherō* → *phérō* ‘I bear,’ etc.
2. The accent never falls farther back than the antepenult.
3. All words end in a vowel or in *s*, *n*, or *r*, to the exclusion of all other consonants.

4. Prevocalic initial *s* became *h* (sign of aspiration): \**septm* (Latin *septem*) → *heptá*.
5. Final *m* changed to *n*: \**jugom* → *zugón* (cf. Latin *jugum*).<sup>5</sup>
6. Final occlusives fell: \**gunaik* → *gúnai*, \**epherst* → *éphere*, \**epheront* → *éphenon*.

Law 1 is diachronic: *dh* became *th*, etc. Law 2 expresses a relation between the word-unit and accent, a sort of contract between two coexisting terms; it is a synchronic law. The same is true of Law 3 since it concerns the word-unit and its ending. Laws 4, 5, and 6 are diachronic: *s* became *h*; *-n* replaced *-m*; *-t*, *-k*, etc. disappeared without leaving a trace.

We should also notice that Law 3 is the result of 5 and 6; two diachronic facts created a synchronic fact.

After we separate the two classes of laws, we see that Laws 2 and 3 are basically different from Laws 1, 4, 5, and 6.

The synchronic law is general but not imperative. Doubtless it is imposed on individuals by the weight of collective usage, but here I do not have in mind an obligation on the part of speakers. I mean that *in language* no force guarantees the maintenance of a regularity when established on some point. Being a simple expression of an existing arrangement, the synchronic law reports a state of affairs; it is like a law that states that trees in a certain orchard are arranged in the shape of a quincunx. And the arrangement that the law defines is precarious precisely because it is not imperative. Nothing is more regular than the synchronic law that governs Latin accentuation (a law comparable in every way to Law 2 above); but the accentual rule did not resist the forces of alteration and gave way to a new law, the one of French. In short, if one speaks of law in synchrony, it is in the sense of an arrangement, a principle of regularity.

Diachrony, on the contrary, supposes a dynamic force through which an effect is produced, a thing executed. But this imperativeness is not sufficient to warrant applying the concept of law to evolutionary facts; we can speak of law only when a set of facts obeys the same rule, and in spite of certain appearances to the contrary, diachronic events are always accidental and particular.

The accidental and particular character of semantic facts is immediately apparent. That French *poutre* ‘mare’ has acquired the meaning ‘piece of wood, rafter’ is due to particular causes and does not depend on other changes that might have occurred at the same time. It is only one accident among all those registered in the history of the language.

As for syntactical and morphological transformations, the issue is not so clear from the outset. At a certain time almost all old subject-case forms disappeared in French. Here a set of facts apparently obeys the same law. But such is not the case, for all the facts are but multiple manifestations of one and the same isolated fact. The particular notion of subject was affected, and its disappearance naturally caused a whole series of forms to vanish. For one who sees only the external features of language, the unique phenomenon is drowned in the multitude of its manifestations. Basically, however, there is but one phenomenon, and this historical event is just as isolated in its own order as the semantic change undergone by *poutre*. It takes on the appearance of a “law” only because it is realized within a system. The rigid arrangement of the system creates the illusion that the diachronic fact obeys the same rules as the synchronic fact.

Finally, as regards phonetic changes, exactly the same is true. Yet the popular practice is to speak of phonetic laws. Indeed, it is said that at a given time and in a given area all words having the same phonic features are affected by the same change; for example,

Law 1 (*\*dhūmos* → Greek *thūmos*) affects all Greek words containing a voiced aspirate (cf. *\*nebhos* → *néphos*, *\*medhu* → *méthu*, *\*anghō* → *ánkhō*, etc.); Law 4 (*\*septm* → *heptá*) applies to *\*serpō* → *hérpō*, *\*sūs* → *hús*, and to all words that begin with *s*. This regularity, which has at times been disputed, is apparently firmly established; obvious exceptions do not lessen the inevitability of such changes, for they can be explained either by more special phonetic laws (see the example of *trikhes*: *thríksi*) or by the interference of facts of another class (analogy, etc.). Nothing seems to fit better the definition given above for the word law. And yet, regardless of the number of instances where a phonetic law holds, all facts embraced by it are but manifestations of a single particular fact.

The real issue is to find out whether phonetic changes affect words or only sounds, and there is no doubt about the answer: in *nephos*, *methu*, *ankhō*, etc. a certain phoneme – a voiced Proto-Indo-European aspirate – became voiceless, Proto-Greek initial *s* became *h*, etc.; each fact is isolated, independent also of the other events of the same class, independent also of the words in which the change took place.<sup>6</sup> The phonic substance of all the words was of course modified, but this should not deceive us as to the real nature of the phenomenon.

What supports the statement that words themselves are not directly involved in phonetic transformations? The very simple observation that these transformations are basically alien to words and cannot touch their essence. The word-unit is not constituted solely by the totality of its phonemes but by characteristics other than its material quality. Suppose that one string of a piano is out of tune: a discordant note will be heard each time the one who is playing a melody strikes the corresponding key. But where is the discord? In the melody? Certainly not; the melody has not been affected; only the piano has been impaired. Exactly the same is true in phonetics. Our system of phonemes is the instrument we play in order to articulate the words of language; if one of its elements is modified, diverse consequences may ensue, but the modification itself is not concerned with the words which are, in a manner of speaking, the melodies of our repertory.

Diachronic facts are then particular; a shift in a system is brought about by events which not only are outside the system, but are isolated and form no system among themselves.

To summarize: synchronic facts, no matter what they are, evidence a certain regularity but are in no way imperative; diachronic facts, on the contrary, force themselves upon language but are in no way general.

In a word – and this is the point I have been trying to make – neither of the two classes of facts is governed by laws in the sense defined above, and if one still wishes to speak of linguistic laws, the word will embrace completely different meanings, depending on whether it designates facts of one class or the other.

## 7. Is There a Panchronic Viewpoint?

Up to this point the term law has been used in the legal sense. But cannot the term also be used in language as in the physical and natural sciences, i.e. in the sense of relations that are everywhere and forever verifiable? In a word, can not language be studied from a panchronic viewpoint?

Doubtless. Since phonetic changes have always occurred and are still occurring, this general phenomenon is a permanent characteristic of speech; it is therefore one of the laws of speech. In linguistics as in chess there are rules that outlive all events. But they

are general principles existing independently of concrete facts. When we speak of particular, tangible facts, there is no panchronic viewpoint. Each phonetic change, regardless of its actual spread, is limited to a definite time and territory; no change occurs at all times and in all places; change exists only diachronically. These general principles are precisely what serve as a criterion for determining what belongs to language and what does not. A concrete fact that lends itself to panchronic explanation cannot belong to language. Take the French word *chose* ‘thing’: from the diachronic viewpoint it stands in opposition to the Latin word from which it derives, *causa*; from the synchronic viewpoint it stands in opposition to every word that might be associated with it in Modern French. Only the sounds of the word considered independently (*šɔz*) are susceptible of panchronic observation, but they have no linguistic value. Even from the panchronic viewpoint *šɔz*, considered in a chain like *ün šɔz admirabla* ‘an admirable thing,’ is not a unit but a shapeless mass; indeed, why *šɔz* rather than *qza* or *nšɔ*? It is not a value, for it has no meaning. From the panchronic viewpoint the particular facts of language are never reached.

## 8. Consequences of the Confusing of Synchrony and Diachrony

Two instances will be cited:

- (a) Synchronic truth seems to be the denial of diachronic truth, and one who has a superficial view of things imagines that a choice must be made; this is really unnecessary; one truth does not exclude the other. That French *dépit* ‘spite’ originally meant contempt does not prevent the word from having a completely different meaning now; etymology and synchronic value are distinct. Similarly, traditional grammar teaches that the present participle is variable and shows agreement in the same manner as an adjective in certain cases in Modern French (cf. une eau *courante* ‘running water’) but is invariable in others (cf. une personne *courant* dans la rue ‘a person running in the street’). But historical grammar shows that it is not a question of one and the same form: the first is the continuation of the variable Latin participle (*currentum*) while the second comes from the invariable ablative form of the gerund (*currendō*).<sup>7</sup> Does synchronic truth contradict diachronic truth, and must one condemn traditional grammar in the name of historical grammar? No, for that would be seeing only half of the facts; one must not think that the historical fact alone matters and is sufficient to constitute language. Doubtless from the viewpoint of its origin the participle *courant* has two elements, but in the collective mind of the community of speakers, these are drawn together and fused into one. The synchronic truth is just as absolute and indisputable as the diachronic truth.
- (b) Synchronic truth is so similar to diachronic truth that people confuse the two or think it superfluous to separate them. For example, they try to explain the meaning of French *père* ‘father’ by saying that Latin *pāter* meant the same thing. Another example: Latin short *a* became *i* in noninitial open syllables; beside *faciō* we have *conficiō*, beside *amicus*, *inimicus*, etc. The law is often stated in this way: “The *a* of *faciō* becomes *i* in *conficiō* because it is no longer in the first syllable.” That is not true: never did the *a* “become” *i* in *conficiō*. To re-establish the truth one must single out two periods and four terms. Speakers first said *facio* – *confacio*; then, *confaciō* having been changed to *conficiō* while *faciō* remained unchanged, they said *faciō* – *conficiō*:

<i>faciō ↔ confaciō</i>	Period A
<i>faciō ↔ conficiō</i>	Period B

If a “change” occurred, it is between *confaciō* and *conficiō*; but the rule, badly formulated, does not even mention *confaciō*! Then beside the diachronic change there is a second fact, absolutely distinct from the first and having to do with the purely synchronic opposition between *faciō* and *conficiō*. One is tempted to say that it is not a fact but a result. Nevertheless, it is a fact in its own class; indeed, all synchronic phenomena are like this. The true value of the opposition *faciō: conficiō* is not recognized for the very reason that the opposition is not very significant. But oppositions like *Gast: Gäste* and *gebe: gibt*, though also fortuitous results of phonetic evolution, are nonetheless basic grammatical phenomena of the synchronic class. The fact that both classes are in other respects closely linked, each conditioning the other, points to the conclusion that keeping them apart is not worthwhile; in fact, linguistics has confused them for decades without realizing that such a method is worthless.

The mistake shows up conspicuously in certain instances. To explain Greek *phuktós*, for example, it might seem sufficient to say that in Greek *g* or *kh* became *k* before voiceless consonants, and to cite by way of explanation such synchronic correspondences as *phugeín: phuktós, lékhos: léktron*, etc. But in a case like *tríkhes: thriksí* there is a complication, the “passing” of *t* to *th*. The forms can be explained only historically, by relative chronology. The Proto-Greek theme *\*thrikh*, followed by the ending *-si*, became *thriksí*, a very old development identical to the one that produced *léktron* from the root *lekh-*. Later every aspirate followed by another aspirate in the same word was changed into an occlusive, and *\*thríkhes* became *tríkhes*; naturally *thriksi* escaped this law.

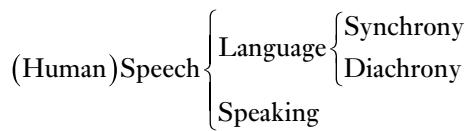

## 9. Conclusions

Linguistics here comes to its second bifurcation. We had first to choose between language and speaking; here we are again at the intersection of two roads, one leading to diachrony and the other to synchrony.

Once in possession of this double principle of classification, we can add that everything diachronic in language is diachronic only by virtue of speaking. It is in speaking that the germ of all change is found. Each change is launched by a certain number of individuals before it is accepted for general use. Modern German uses *ich war, mir waren*, whereas until the sixteenth century the conjugation was *ich was, mir waren* (cf. English *I was, we were*). How did the substitution of *war* for *was* come about? Some speakers, influenced by *waren*, created *war* through analogy; this was a fact of speaking; the new form, repeated many times and accepted by the community, became a fact of language. But not all innovations of speaking have the same success, and so long as they remain individual, they may be ignored, for we are studying language; they do not enter into our field of observation until the community of speakers has adopted them.

An evolutionary fact is always preceded by a fact, or rather by a multitude of similar facts, in the sphere of speaking. This in no way invalidates but rather strengthens the distinction made above since in the history of any innovation there are always two distinct moments: (1) when it sprang up in individual usage; and (2) when it became a fact of language, outwardly identical but adopted by the community.

The following table indicates the rational form that linguistic study should take:

One must recognize that the ideal, theoretical form of a science is not always the one imposed upon it by the exigencies of practice; in linguistics these exigencies are more imperious than anywhere else; they account to some extent for the confusion that now predominates in linguistic research. Even if the distinctions set up here were accepted once and for all, a precise orientation probably could not be imposed on investigations in the name of the stated ideal.

In the synchronic study of Old French, for instance, the linguist works with facts and principles that have nothing in common with those that he would find out by tracing the history of the same language from the thirteenth to the twentieth century; on the contrary, he works with facts and principles similar to those that would be revealed in the description of an existing Bantu language, Attic Greek of 400 B.C. or present-day French, for that matter. These diverse descriptions would be based on similar relations; if each idiom is a closed system, all idioms embody certain fixed principles that the linguist meets again and again in passing from one to another, for he is staying in the same class. Historical study is no different. Whether the linguist examines a definite period in the history of French (for example, from the thirteenth to the twentieth century), Javanese, or any other language whatsoever, everywhere he works with similar facts which he needs only compare in order to establish the general truths of the diachronic class. The ideal would be for each scholar to devote himself to one field of investigation or the other and deal with the largest possible number of facts in this class; but it is very difficult to command scientifically such different languages. Against this, each language in practice forms a unit of study, and we are induced by force of circumstances to consider it alternately from the historical and static viewpoints. Above all else, we must never forget that this unit is superficial in theory, whereas the diversity of idioms hides a profound unity. Whichever way we look in studying a language, we must put each fact in its own class and not confuse the two methods.

The two parts of linguistics respectively, as defined, will be the object of our study.

*Synchronic linguistics* will be concerned with the logical and psychological relations that bind together coexisting terms and form a system in the collective mind of speakers.

*Diachronic linguistics*, on the contrary, will study relations that bind together successive terms not perceived by the collective mind but substituted for each other without forming a system.

## PART TWO

### Synchronic Linguistics

#### *Chapter I: GENERALITIES*

The aim of general synchronic linguistics is to set up the fundamental principles of any idiosyncratic system, the constituents of any language-state. Many of the items already explained in Part One belong rather to synchrony; for instance, the general properties of

the sign are an integral part of synchrony although they were used to prove the necessity of separating the two linguistics.

To synchrony belongs everything called “general grammar,” for it is only through language-states that the different relations which are the province of grammar are established. In the following chapters we shall consider only the basic principles necessary for approaching the more special problems of static linguistics or explaining in detail a language-state.

The study of static linguistics is generally much more difficult than the study of historical linguistics. Evolutionary facts are more concrete and striking; their observable relations tie together successive terms that are easily grasped; it is easy, often even amusing, to follow a series of changes. But the linguistics that penetrates values and coexisting relations presents much greater difficulties.

In practice a language-state is not a point but rather a certain span of time during which the sum of the modifications that have supervened is minimal. The span may cover ten years, a generation, a century, or even more. It is possible for a language to change hardly at all over a long span and then to undergo radical transformations within a few years. Of two languages that exist side by side during a given period, one may evolve drastically and the other practically not at all; study would have to be diachronic in the former instance, synchronic in the latter. An absolute state is defined by the absence of changes, and since language changes somewhat in spite of everything, studying a language-state means in practice disregarding changes of little importance, just as mathematicians disregard infinitesimal quantities in certain calculations, such as logarithms.

Political history makes a distinction between *era*, a point in time, and *period*, which embraces a certain duration. Still, the historian speaks of the Antoninian Era, the Era of the Crusades, etc. when he considers a set of characteristics which remained constant during those times. One might also say that static linguistics deals with eras. But *state* is preferable. The beginning and the end of an era are generally characterized by some rather brusque revolution that tends to modify the existing state of affairs. The word *state* avoids giving the impression that anything similar occurs in language. Besides, precisely because it is borrowed from history, the term *era* makes one think less of language itself than of the circumstances that surround it and condition it; in short, it suggests rather the idea of what we called external linguistics.

Besides, delimitation in time is not the only difficulty that we encounter in defining a language-state: space presents the same problem. In short, a concept of a language-state can be only approximate. In static linguistics, as in most sciences, no course of reasoning is possible without the usual simplification of data.

## *Chapter II: THE CONCRETE ENTITIES OF LANGUAGE*

### 1. Definition: Entity and Unit

The signs that make up language are not abstractions but real objects; signs and their relations are what linguistics studies; they are the *concrete entities* of our science.

Let us first recall two principles that dominate the whole issue:

1. The linguistic entity exists only through the associating of the signifier with the signified. Whenever only one element is retained, the entity vanishes; instead of a concrete object we are faced with a mere abstraction. We constantly risk grasping

only a part of the entity and thinking that we are embracing it in its totality; this would happen, for example, if we divided the spoken chain into syllables, for the syllable has no value except in phonology. A succession of sounds is linguistic only if it supports an idea. Considered independently, it is material for a physiological study, and nothing more than that.

The same is true of the signified as soon as it is separated from its signifier. Considered independently, concepts like "house," "white," "see," etc. belong to psychology. They become linguistic entities only when associated with sound-images; in language, a concept is a quality of its phonic substance just as a particular slice of sound is a quality of the concept.

The two-sided linguistic unit has often been compared with the human person, made up of the body and the soul. The comparison is hardly satisfactory. A better choice would be a chemical compound like water, a combination of hydrogen and oxygen; taken separately, neither element has any of the properties of water.

2. The linguistic entity is not accurately defined until it is *delimited*, i.e. separated from everything that surrounds it on the phonic chain. These delimited entities or units stand in opposition to each other in the mechanism of language.

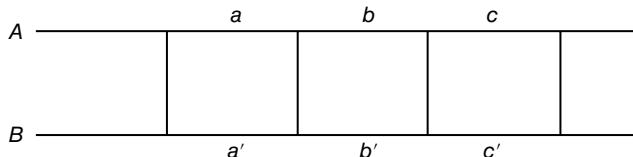

One is at first tempted to liken linguistic signs to visual signs, which can exist in space without becoming confused, and to assume that separation of the significant elements can be accomplished in the same way, without recourse to any mental process. The word "form," which is often used to indicate them (cf. the expression "verbal form," "noun form") gives support to the mistake. But we know that the main characteristic of the sound-chain is that it is linear. Considered by itself, it is only a line, a continuous ribbon along which the ear perceives no self-sufficient and clear-cut division; to divide the chain, we must call in meanings. When we hear an unfamiliar language, we are at a loss to say how the succession of sounds should be analyzed, for analysis is impossible if only the phonic side of the linguistic phenomenon is considered. But when we know the meaning and function that must be attributed to each part of the chain, we see the parts detach themselves from each other and the shapeless ribbon break into segments. Yet there is nothing material in the analysis.

To summarize: language does not offer itself as a set of pre-delimited signs that need only be studied according to their meaning and arrangement; it is a confused mass, and only attentiveness and familiarization will reveal its particular elements. The unit has no special phonic character, and the only definition that we can give it is this: it is *a slice of sound which to the exclusion of everything that precedes and follows it in the spoken chain is the signifier of a certain concept*.

## 2. Method of Delimitation

One who knows a language singles out its units by a very simple method – in theory, at any rate. His method consists of using speaking as the source material of language and picturing it as two parallel chains, one of concepts (*A*) and the other of sound-images (*B*).

In an accurate delimitation, the division along the chain of sound-images (*a*, *b*, *c*) will correspond to the division along the chain of concepts (*a'*, *b'*, *c'*):

Take French *sižlaprā*. Can we cut the chain after *l* and make *sižl* a unit? No, we need only consider the concepts to see that the division is wrong. Neither is the syllabic division *siž-la-prā* to be taken for granted as having linguistic value. The only possible divisions are these: (1) *si-ž-la-prā* (*si je la prends* ‘if I take it’) and (2) *si-ž-l-apprā* (*si je l’apprends* ‘if I learn it’), and they are determined by the meaning that is attached to the words.<sup>8</sup>

To verify the result of the procedure and be assured that we are really dealing with a unit, we must be able in comparing a series of sentences in which the same unit occurs to separate the unit from the rest of the context and find in each instance that meaning justifies the delimitation. Take the two French phrases *laſqſdūvā* (*la force du vent* ‘the force of the wind’), and *abudſqrs* (*à bout de force* ‘exhausted’; literally: ‘at the end of one’s force’). In each phrase the same concept coincides with the same phonic slice, *fors*; thus it is certainly a linguistic unit. But in *ilməforsaparle* (*il me force à parler* ‘he forces me to talk’), *fors* has an entirely different meaning: it is therefore another unit.

### 3. Practical Difficulties of Delimitation

The method outlined above is very simple in theory, but is it easy to apply? We are tempted to think so if we start from the notion that the units to be isolated are words. For what is a sentence except a combination of words? And what can be grasped more readily than words? Going back to the example given above, we may say that the analysis of the spoken chain *sižlaprā* resulted in the delimiting of four units, and that the units are words: *si-je-l-apprends*. But we are immediately put on the defensive on noting that there has been much disagreement about the nature of the word, and a little reflection shows that the usual meaning of the term is incompatible with the notion of concrete unit.

To be convinced, we need only think of French *cheval* ‘horse’ and its plural from *chevaux*. People readily say that they are two forms of the same word; but considered as wholes, they are certainly two distinct things with respect to both meaning and sound. In *mwa* (*mois*, as in *le mois de Septembre* ‘the month of September’) and *mwaz* (*mois*, in *un mois après* ‘a month later’) there are also two forms of the same word, and there is no question of a concrete unit. The meaning is the same, but the slices of sound are different. As soon as we try to liken concrete units to words, we face a dilemma: we must either ignore the relation – which is nonetheless evident – that binds *cheval* and *chevaux*, the two sounds of *mwa* and *mwaz*, etc. and say that they are different words, or instead of concrete units be satisfied with the abstraction that links the different forms of the same word. The concrete unit must be sought, not in the word, but elsewhere. Besides, many words are complex units, and we can easily single out their subunits (suffixes, prefixes, radicals). Derivatives like *pain-ful* and *delight-ful* can be divided into distinct parts, each having an obvious meaning and

function. Conversely, some units are larger than words: compounds (French *porte-plume* ‘penholder’), locutions (*s'il vous plaît* ‘please’), inflected forms (*il a été* ‘he has been’), etc. But these units resist delimitation as strongly as do words proper, making it extremely difficult to disentangle the interplay of units that are found in a sound-chain and to specify the concrete elements on which a language functions.

Doubtless speakers are unaware of the practical difficulties of delimiting units. Anything that is of even the slightest significance seems like a concrete element to them and they never fail to single it out in discourse. But it is one thing to feel the quick, delicate interplay of units and quite another to account for them through methodical analysis.

A rather widely held theory makes sentences the concrete units of language: we speak only in sentences and subsequently single out the words. But to what extent does the sentence belong to language? If it belongs to speaking, the sentence cannot pass for the linguistic unit. But let us suppose that this difficulty is set aside. If we picture to ourselves in their totality the sentences that could be uttered, their most striking characteristic is that in no way do they resemble each other. We are at first tempted to liken the immense diversity of sentences to the equal diversity of the individuals that make up a zoological species. But this is an illusion: the characteristics that animals of the same species have in common are much more significant than the differences that separate them. In sentences, on the contrary, diversity is dominant, and when we look for the link that bridges their diversity, again we find, without having looked for it, the word with its grammatical characteristics and thus fall back into the same difficulties as before.

#### 4. Conclusion

In most sciences the question of units never even arises: the units are delimited from the outset. In zoology, the animal immediately presents itself. Astronomy works with units that are separated in space, the stars. The chemist can study the nature and composition of potassium bichromate without doubting for an instant that this is a well-defined object.

When a science has no concrete units that are immediately recognizable, it is because they are not necessary. In history, for example, is the unit the individual, the era, or the nation? We do not know. But what does it matter? We can study history without knowing the answer.

But just as the game of chess is entirely in the combination of the different chess-pieces, language is characterized as a system based entirely on the opposition of its concrete units. We can neither dispense with becoming acquainted with them nor take a single step without coming back to them; and still, delimiting them is such a delicate problem that we may wonder at first whether they really exist.

Language then has the strange, striking characteristic of not having entities that are perceptible at the outset and yet of not permitting us to doubt that they exist and that their functioning constitutes it. Doubtless we have here a trait that distinguishes language from all other semiological institutions.

### *Chapter III: IDENTITIES, REALITIES, VALUES*

The statement just made brings us squarely up against a problem that is all the more important because any basic notion in static linguistics depends directly on our conception of the unit and even blends with it. This is what I should like successively to demonstrate with respect to the notions of synchronic identity, reality, and value.

*A.* What is a synchronic *identity*? Here it is not a question of the identity that links the French negation *pas* ‘not’ to Latin *passum*, a diachronic identity that will be dealt with elsewhere, but rather of the equally interesting identity by virtue of which we state that two sentences like *je ne sais pas* ‘I don’t know’ and *ne dites pas cela* ‘don’t say that’ contain the same element. An idle question, one might say; there is identity because the same slice of sound carries the same meaning in the two sentences. But that explanation is unsatisfactory, for if the correspondence of slices of sound and concepts is proof of identity (see above, *la force du vent*: à bout de force), the reverse is not true. There can be identity without this correspondence. When *Gentlemen!* is repeated several times during a lecture, the listener has the feeling that the same expression is being used each time, and yet variations in utterance and intonation make for appreciable phonic differences in diverse contexts – differences just as appreciable as those that elsewhere separate different words (cf. French *pomme* ‘apple’ and *paume* ‘palm,’ *goutte* ‘drop’ and *je goute* ‘I taste,’ *fuir* ‘flee,’ and *souir* ‘stuff,’ etc.);<sup>9</sup> besides, the feeling of identity persists even though there is no absolute identity between one *Gentlemen!* and the next from a semantic viewpoint either. In the same vein, a word can express quite different ideas without compromising its identity (cf. French *adopter* une mode ‘adopt a fashion’ and *adopter* un enfant ‘adopt a child,’ *la fleur du pommier* ‘the flower of the apple tree’ and *la fleur de la noblesse* ‘the flower of nobility,’ etc.).

The linguistic mechanism is geared to differences and identities, the former being only the counterpart of the latter. Everywhere then, the problem of identities appears; moreover, it blends partially with the problem of entities and units and is only a complication – illuminating at some points – of the larger problem. This characteristic stands out if we draw some comparisons with facts taken from outside speech. For instance, we speak of the identity of two “8:25 p.m. Geneva-to-Paris” trains that leave at twenty-four hour intervals. We feel that it is the same train each day, yet everything – the locomotive, coaches, personnel – is probably different. Or if a street is demolished, then rebuilt, we say that it is the same street even though in a material sense, perhaps nothing of the old one remains. Why can a street be completely rebuilt and still be the same? Because it does not constitute a purely material entity; it is based on certain conditions that are distinct from the materials that fit the conditions, e.g. its location with respect to other streets. Similarly, what makes the express is its hour of departure, its route, and in general every circumstance that sets it apart from other trains. Whenever the same conditions are fulfilled, the same entities are obtained. Still, the entities are not abstract since we cannot conceive of a street or train outside its material realization.

Let us contrast the preceding examples with the completely different case of a suit which has been stolen from me and which I find in the window of a second-hand store. Here we have a material entity that consists solely of the inert substance – the cloth, its lining, its trimmings, etc. Another suit would not be mine regardless of its similarity to it. But linguistic identity is not that of the garment; it is that of the train and the street. Each time I say the word *Gentlemen!* I renew its substance; each utterance is a new phonic act and a new psychological act. The bond between the two uses of the same word depends neither on material identity nor on sameness in meaning but on elements which must be sought after and which will point up the true nature of linguistic units.

*B.* What is a synchronic *reality*? To what concrete or abstract elements of language can the name be applied?

Take as an example the distinction between the parts of speech. What supports the classing of words as substantives, adjectives, etc.? Is it done in the name of a purely

logical, extra-linguistic principle that is applied to grammar from without like the degrees of longitude and latitude on the globe? Or does it correspond to something that has its place in the system of language and is conditioned by it? In a word, is it a synchronic reality? The second supposition seems probable, but the first could also be defended. In the French sentence *ces gants sont bon marché* ‘these gloves are cheap,’ is *bon marché* an adjective? It is apparently an adjective from a logical viewpoint but not from the viewpoint of grammar, for *bon marché* fails to behave as an adjective (it is invariable, it never precedes its noun, etc.); in addition, it is composed of two words. Now the distinction between parts of speech is exactly what should serve to classify the words of language. How can a group of words be attributed to one of the “parts”? But to say that *bon* ‘good’ is an adjective and *marché* ‘market’ a substantive explains nothing. We are then dealing with a defective or incomplete classification; the division of words into substantives, verbs, adjectives, etc. is not an undeniable linguistic reality.<sup>10</sup>

Linguistics accordingly works continuously with concepts forged by grammarians without knowing whether or not the concepts actually correspond to the constituents of the system of language. But how can we find out? And if they are phantoms, what realities can we place in opposition to them?

To be rid of illusions we must first be convinced that the concrete entities of language are not directly accessible. If we try to grasp them, we come into contact with the true facts. Starting from there, we can set up all the classifications that linguistics needs for arranging all the facts at its disposal. On the other hand, to base the classifications on anything except concrete entities – to say, for example, that the parts of speech are the constituents of language simply because they correspond to categories of logic – is to forget that there are no linguistic facts apart from the phonic substance cut into significant elements.

C. Finally, not every idea touched upon in this chapter differs basically from what we have elsewhere called *values*. A new comparison with the set of chessmen will bring out this point. Take a knight, for instance. By itself is it an element in the game? Certainly not, for by its material make-up – outside its square and the other conditions of the game – it means nothing to the player; it becomes a real, concrete element only when endowed with value and wedded to it. Suppose that the piece happens to be destroyed or lost during a game. Can it be replaced by an equivalent piece? Certainly. Not only another knight but even a figure shorn of any resemblance to a knight can be declared identical provided the same value is attributed to it. We see then that in semiological systems like language, where elements hold each other in equilibrium in accordance with fixed rules, the notion of identity blends with that of value and *vice versa*.

In a word, that is why the notion of value envelops the notions of unit, concrete entity, and reality. But if there is no fundamental difference between these diverse notions, it follows that the problem can be stated successively in several ways. Whether we try to define the unit, reality, concrete entity, or value, we always come back to the central question that dominates all of static linguistics.

It would be interesting from a practical viewpoint to begin with units, to determine what they are and to account for their diversity by classifying them. It would be necessary to search for the reason for dividing language into words – for in spite of the difficulty of defining it, the word is a unit that strikes the mind, something central in the mechanism of language – but that is a subject which by itself would fill a volume. Next we would have to classify the subunits, then the larger units, etc. By determining in this way the elements that it manipulates, synchronic linguistics would completely fulfill its

task, for it would relate all synchronic phenomena to their fundamental principle. It cannot be said that this basic problem has ever been faced squarely or that its scope and difficulty have been understood; in the matter of language, people have always been satisfied with ill-defined units.

Still, in spite of their capital importance, it is better to approach the problem of units through the study of value, for in my opinion value is of prime importance.

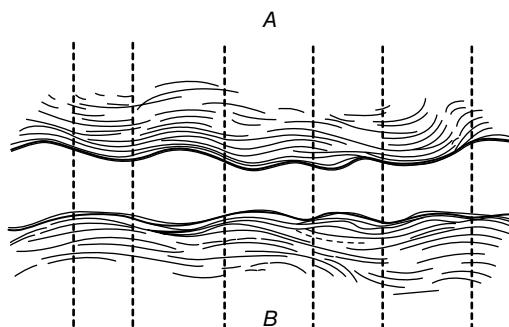

### *Chapter IV: LINGUISTIC VALUE*

#### 1. Language as Organized Thought Coupled with Sound

To prove that language is only a system of pure values, it is enough to consider the two elements involved in its functioning: ideas and sounds.

Psychologically our thought – apart from its expression in words – is only a shapeless and indistinct mass. Philosophers and linguists have always agreed in recognizing that without the help of signs we would be unable to make a clear-cut, consistent distinction between two ideas. Without language, thought is a vague, uncharted nebula. There are no pre-existing ideas, and nothing is distinct before the appearance of language.

Against the floating realm of thought, would sounds by themselves yield predelimited entities? No more so than ideas. Phonic substance is neither more fixed nor more rigid than thought; it is not a mold into which thought must of necessity fit but a plastic substance divided in turn into distinct parts to furnish the signifiers needed by thought. The linguistic fact can therefore be pictured in its totality – i.e. language – as a series of contiguous subdivisions marked off on both the indefinite plane of jumbled ideas (*A*) and the equally vague plane of sounds (*B*). The following diagram gives a rough idea of it:

The characteristic role of language with respect to thought is not to create a material phonic means for expressing ideas but to serve as a link between thought and sound, under conditions that of necessity bring about the reciprocal delimitations of units. Thought, chaotic by nature, has to become ordered in the process of its decomposition. Neither are thoughts given material form nor are sounds transformed into mental entities; the somewhat mysterious fact is rather that “thought-sound” implies division, and that language works out its units while taking shape between two shapeless masses. Visualize the air in contact with a sheet of water; if the atmospheric pressure changes, the surface of the water will be broken up into a series of divisions, waves; the waves resemble the union or coupling of thought with phonic substance.

Language might be called the domain of articulations, using the word as it was defined earlier. Each linguistic term is a member, an *articulus* in which an idea is fixed in a sound and a sound becomes the sign of an idea.

Language can also be compared with a sheet of paper: thought is the front and the sound the back; one cannot cut the front without cutting the back at the same time; likewise in language, one can neither divide sound from thought nor thought from sound; the division could be accomplished only abstractedly, and the result would be either pure psychology or pure phonology.

Linguistics then works in the borderland where the elements of sound and thought combine; *their combination produces a form, not a substance*.

These views give a better understanding of what was said before about the arbitrariness of signs. Not only are the two domains that are linked by the linguistic fact shapeless and confused, but the choice of a given slice of sound to name a given idea is completely arbitrary. If this were not true, the notion of value would be compromised, for it would include an externally imposed element. But actually values remain entirely relative, and that is why the bond between the sound and the idea is radically arbitrary.

The arbitrary nature of the sign explains in turn why the social fact alone can create a linguistic system. The community is necessary if values that owe their existence solely to usage and general acceptance are to be set up; by himself the individual is incapable of fixing a single value.

In addition, the idea of value, as defined, shows that to consider a term as simply the union of a certain sound with a certain concept is grossly misleading. To define it in this way would isolate the term from its system; it would mean assuming that one can start from the terms and construct the system by adding them together when, on the contrary, it is from the interdependent whole that one must start and through analysis obtain its elements.

To develop this thesis, we shall study value successively from the viewpoint of the signified or concept (Section 2), the signifier (Section 3), and the complete sign (Section 4).

Being unable to seize the concrete entities or units of language directly, we shall work with words. While the word does not conform exactly to the definition of the linguistic unit, it at least bears a rough resemblance to the unit and has the advantage of being concrete; consequently, we shall use words as specimens equivalent to real terms in a synchronic system, and the principles that we evolve with respect to words will be valid for entities in general.

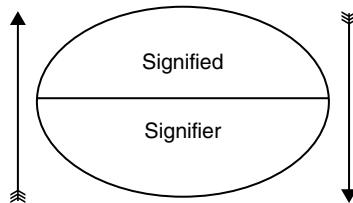

## 2. Linguistic Value from a Conceptual Viewpoint

When we speak of the value of a word, we generally think first of its property of standing for an idea, and this is in fact one side of linguistic value. But if this is true, how does *value* differ from *signification*? Might the two words be synonyms? I think not, although it is easy to confuse them, since the confusion results not so much from their similarity as from the subtlety of the distinction that they mark.

From a conceptual viewpoint, value is doubtless one element in signification, and it is difficult to see how signification can be dependent upon value and still be distinct from it. But we must clear up the issue or risk reducing language to a simple naming-process.

Let us first take signification as it is generally understood and as it was pictured above. As the arrows in the drawing show, it is only the counterpart of the sound-image.

Everything that occurs concerns only the sound-image and the concept when we look upon the word as independent and self-contained.

But here is the paradox: on the one hand the concept seems to be the counterpart of the sound-image, and on the other hand the sign itself is in turn the counterpart of the other signs of language.

Language is a system of interdependent terms in which the value of each term results solely from the simultaneous presence of the others, as in the diagram:

How, then, can value be confused with signification, i.e. the counterpart of the sound-image? It seems impossible to liken the relations represented here by horizontal arrows to those represented above by vertical arrows. Putting it another way – and again taking up the example of the sheet of paper that is cut in two – it is clear that the observable relation between the different pieces A, B, C, D, etc. is distinct from the relation between the front and back of the same piece as in A/A', B/B', etc.

To resolve the issue, let us observe from the outset that even outside language all values are apparently governed by the same paradoxical principle. They are always composed:

1. of a *dissimilar* thing that can be *exchanged* for the thing of which the value is to be determined; and
2. of *similar* things that can be *compared* with the thing of which the value is to be determined.

Both factors are necessary for the existence of a value. To determine what a five-franc piece is worth one must therefore know: (1) that it can be exchanged for a fixed quantity of a different thing, e.g. bread; and (2) that it can be compared with a similar value of the same system, e.g. a one-franc piece, or with coins of another system (a dollar, etc.). In the same way a word can be exchanged for something dissimilar, an idea; besides, it can be compared with something of the same nature, another word. Its value is therefore not fixed so long as one simply states that it can be “exchanged” for a given concept, i.e. that it has this or that signification: one must also compare it with similar values, with other words that stand in opposition to it. Its content is really fixed only by the concurrence of everything that exists outside it. Being part of a system, it is endowed not only with a signification but also and especially with a value, and this is something quite different.

A few examples will show clearly that this is true. Modern French *mouton* can have the same signification as English *sheep* but not the same value, and this for several reasons, particularly because in speaking of a piece of meat ready to be served on the table, English uses *mutton* and not *sheep*. The difference in value between *sheep* and *mouton* is due to the fact that *sheep* has beside it a second term while the French word does not.

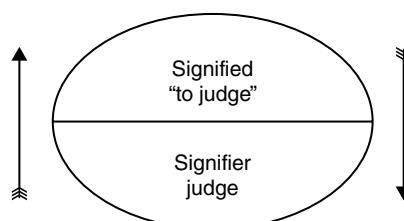

Within the same language, all words used to express related ideas limit each other reciprocally; synonyms like French *redouter* ‘dread,’ *craindre* ‘fear,’ and *avoir peur* ‘be afraid’ have value only through their opposition: if *redouter* did not exist, all its content would go to its competitors. Conversely, some words are enriched through contact with others: e.g. the new element introduced in *décrépit* (un vieillard *décrépit*) results from the co-existence of *décrépi* (un mur *décrépi*). The value of just any term is accordingly determined by its environment; it is impossible to fix even the value of the word signifying “sun” without first considering its surroundings: in some languages it is not possible to say “sit in the sun.”

Everything said about words applies to any term of language, e.g. to grammatical entities. The value of a French plural does not coincide with that of a Sanskrit plural even though their signification is usually identical; Sanskrit has three numbers instead of two (*my eyes, my ears, my arms, my legs*, etc. are dual);<sup>11</sup> it would be wrong to attribute the same value to the plural in Sanskrit and in French; its value clearly depends on what is outside and around it.

If words stood for pre-existing concepts, they would all have exact equivalents in meaning from one language to the next; but this is not true. French uses *louer* (*une maison*) ‘let (a house)’ indifferently to mean both “pay for” and “receive payment for,” whereas German uses two words, *mieten* and *vermieten*; there is obviously no exact correspondence of values. The German verbs *schätzen* and *urteilen* share a number of significations, but that correspondence does not hold at several points.

Inflection offers some particularly striking examples. Distinctions of time, which are so familiar to us, are unknown in certain languages. Hebrew does not recognize even the fundamental distinctions between the past, present, and future. Proto-Germanic has no special form for the future; to say that the future is expressed by the present is wrong, for the value of the present is not the same in Germanic as in languages that have a future along with the present. The Slavic languages regularly single out two aspects of the verb: the perfective represents action as a point, complete in its totality; the imperfective represents it as taking place, and on the line of time. The categories are difficult for a Frenchman to understand, for they are unknown in French; if they were pre-determined, this would not be true. Instead of pre-existing ideas then, we find in all the foregoing examples *values* emanating from the system. When they are said to correspond to concepts, it is understood that the concepts are purely differential and defined not by their positive content but negatively by their relations with the other terms of the system. Their most precise characteristic is in being what the others are not.

Now the real interpretation of the diagram of the signal becomes apparent. Thus

means that in French the concept “to judge” is linked to the sound-image *juger*; in short, it symbolizes signification. But it is quite clear that initially the concept is nothing, that is only a value determined by its relations with other similar values, and that without them the signification would not exist. If I state simply that a word signifies something when I have in mind the associating of a sound-image with a concept, I am making a statement that may suggest what actually happens, but by no means am I expressing the linguistic fact in its essence and fullness.

### 3. Linguistic Value from a Material Viewpoint

The conceptual side of value is made up solely of relations and differences with respect to the other terms of language, and the same can be said of its material side. The important thing in the word is not the sound alone but the phonic differences that make it possible to distinguish this word from all others, for differences carry signification.

This may seem surprising, but how indeed could the reverse be possible? Since one vocal image is no better suited than the next for what it is commissioned to express, it is evident, even *a priori*, that a segment of language can never in the final analysis be based on anything except its noncoincidence with the rest. *Arbitrary* and *differential* are two correlative qualities.

The alteration of linguistic signs clearly illustrates this. It is precisely because the terms *a* and *b* as such are radically incapable of reaching the level of consciousness – one is always conscious of only the *a/b* difference – that each term is free to change according to laws that are unrelated to its signifying function. No positive sign characterizes the genitive plural in Czech *žen*; still the two forms *žena*: *žen* function as well as the earlier forms *žena*: *ženb*; *žen* has value only because it is different.

Here is another example that shows even more clearly the systematic role of phonic differences: in Greek, *éphēn* is an imperfect and *éstēn* an aorist although both words are formed in the same way; the first belongs to the system of the present indicative of *phēmī* ‘I say,’ whereas there is no present *\*síemi*; now it is precisely the relation *phēmī*: *éphēn* that corresponds to the relation between the present and the imperfect (cf. *déíknūmi*: *edéíknūn*, etc.). Signs function, then, not through their intrinsic value but through their relative position.

In addition, it is impossible for sound alone, a material element, to belong to language. It is only a secondary thing, substance to be put to use. All our conventional values have the characteristic of not being confused with the tangible element which supports them. For instance, it is not the metal in a piece of money that fixes its value. A coin nominally worth five francs may contain less than half its worth of silver. Its value will vary according to the amount stamped upon it and according to its use inside or outside a political boundary. This is even more true of the linguistic signifier, which is not phonic but incorporeal – constituted not by its material substance but by the differences that separate its sound-image from all others.

The foregoing principle is so basic that it applies to all the material elements of language, including phonemes. Every language forms its words on the basis of a system of sonorous elements, each element being a clearly delimited unit and one of a fixed number of units. Phonemes are characterized not, as one might think, by their own positive quality but simply by the fact that they are distinct. Phonemes are above all else opposing, relative, and negative entities.

Proof of this is the latitude that speakers have between points of convergence in the pronunciation of distinct sounds. In French, for instance, general use of a dorsal *r* does

not prevent many speakers from using a tongue-tip trill; language is not in the least disturbed by it; language requires only that the sound be different and not, as one might imagine, that it have an invariable quality. I can even pronounce the French *r* like German *ch* in *Bach*, *doch*, etc., but in German I could not use *r* instead of *ch*, for German gives recognition to both elements and must keep them apart. Similarly, in Russian there is no latitude for *t* in the direction of *t'* (palatalized *t*), for the result would be the confusing of two sounds differentiated by the language (cf. *govorit'* ‘speak’ and *goverit* ‘he speaks’), but more freedom may be taken with respect to *th* (aspirated *t*) since this sound does not figure in the Russian system of phonemes.

Since an identical state of affairs is observable in writing, another system of signs, we shall use writing to draw some comparisons that will clarify the whole issue. In fact:

1. The signs used in writing are arbitrary; there is no connection, for example, between the letter *t* and the sound that it designates.
2. The value of letters is purely negative and differential. The same person can write *t*, for instance, in different ways:

The only requirement is that the sign for *t* not be confused in his script with the signs used for *l*, *d*, etc.

3. Values in writing function only through reciprocal opposition within a fixed system that consists of a set number of letters. This third characteristic, though not identical to the second, is closely related to it, for both depend on the first. Since the graphic sign is arbitrary, its form matters little or rather matters only within the limitations imposed by the system.
4. The means by which the sign is produced is completely unimportant, for it does not affect the system (this also follows from characteristic 1). Whether I make the letters in white or black, raised or engraved, with pen or chisel – all this is of no importance with respect to their signification.

#### 4. The Sign Considered in Its Totality

Everything that has been said up to this point boils down to this: in language there are only differences. Even more important: a difference generally implies positive terms between which the difference is set up; but in language there are only differences *without positive terms*. Whether we take the signified or the signifier, language has neither ideas nor sounds that existed before the linguistic system, but only conceptual and phonic differences that have issued from the system. The idea or phonic substance that a sign contains is of less importance than the other signs that surround it. Proof of this is that the value of a term may be modified without either its meaning or its sound being affected, solely because a neighboring term has been modified.

But the statement that everything in language is negative is true only if the signified and the signifier are considered separately; when we consider the sign in its totality, we have something that is positive in its own class. A linguistic system is a series of differences of sound combined with a series of differences of ideas; but the pairing of a certain number of acoustical signs with as many cuts made from the mass of thought engenders a system of values; and this system serves as the effective link between the phonic and psychological elements within each sign. Although both the signified and the signifier are purely differential and negative when considered separately, their combination is a positive fact; it is even the sole type of facts that language has, for maintaining the parallelism between the two classes of differences is the distinctive function of the linguistic institution.

Certain diachronic facts are typical in this respect. Take the countless instances where alteration of the signifier occasions a conceptual change and where it is obvious that the sum of the ideas distinguished corresponds in principle to the sum of the distinctive signs. When two words are confused through phonetic alteration (e.g. French *décrépit* from *décrepus* and *détrépi* from *crispus*), the ideas that they express will also tend to become confused if only they have something in common. Or a word may have different forms (cf. *chaise* ‘chair’ and *chaire* ‘desk’). Any nascent difference will tend invariably to become significant but without always succeeding or being successful on the first trial. Conversely, any conceptual difference perceived by the mind seeks to find expression through a distinct signifier, and two ideas that are no longer distinct in the mind tend to merge into the same signifier.

When we compare signs – positive terms – with each other, we can no longer speak of difference; the expression would not be fitting, for it applies only to the comparing of two sound-images, e.g. *father* and *mother*, or two ideas, e.g. the idea “father” and the idea “mother”; two signs, each having a signified and signifier, are not different but only distinct. Between them there is only *opposition*. The entire mechanism of language, with which we shall be concerned later, is based on oppositions of this kind and on the phonic and conceptual differences that they imply.

What is true of value is true also of the unit. A unit is a segment of the spoken chain that corresponds to a certain concept; both are by nature purely differential.

Applied to units, the principle of differentiation can be stated in this way: *the characteristics of the unit blend with the unit itself*. In language, as in any semiological system, whatever distinguishes one sign from the others constitutes it. Difference makes character just as it makes value and the unit.

Another rather paradoxical consequence of the same principle is this: in the last analysis what is commonly referred to as a “grammatical fact” fits the definition of the unit, for it always expresses an opposition of terms; it differs only in that the opposition is particularly significant (e.g. the formation of German plurals of the type *Nacht*: *Nächte*). Each term present in the grammatical fact (the singular without umlaut or final *e* in opposition to the plural with umlaut and *-e*) consists of the interplay of a number of oppositions within the system. When isolated, neither *Nacht* nor *Nächte* is anything; thus everything is opposition. Putting it another way, the *Nacht*: *Nächte* relation can be expressed by an algebraic formula  $a/b$  in which *a* and *b* are not simple terms but result from a set of relations. Language, in a manner of speaking, is a type of algebra consisting solely of complex terms. Some of its oppositions are more significant than others; but units and grammatical facts are only different names for designating diverse aspects of the same general fact: the functioning of linguistic oppositions. This statement is so true

that we might very well approach the problem of units by starting from grammatical facts. Taking an opposition like *Nacht: Nächte*, we might ask what are the units involved in it. Are they only the two words, the whole series of similar words, *a* and *ä*, or all singulars and plurals, etc.?

Units and grammatical facts would not be confused if linguistic signs were made up of something besides differences. But language being what it is, we shall find nothing simple in it regardless of our approach; everywhere and always there is the same complex equilibrium of terms that mutually condition each other. Putting it another way, *language is a form and not a substance*. This truth could not be overstressed, for all the mistakes in our terminology, all our incorrect ways of naming things that pertain to language, stem from the involuntary supposition that the linguistic phenomenon must have substance.

## **Chapter V: SYNTAGMATIC AND ASSOCIATIVE RELATIONS**

### **1. Definitions**

In a language-state everything is based on relations. How do they function?

Relations and differences between linguistic terms fall into two distinct groups, each of which generates a certain class of values. The opposition between the two classes gives a better understanding of the nature of each class. They correspond to two forms of our mental activity, both indispensable to the life of language.

In discourse, on the one hand, words acquire relations based on the linear nature of language because they are chained together. This rules out the possibility of pronouncing two elements simultaneously. The elements are arranged in sequence on the chain of speaking. Combinations supported by linearity are *syntagms*.<sup>12</sup> The syntagm is always composed of two or more consecutive units (e.g. French *re-lire* ‘re-read,’ *contre tous* ‘against everyone,’ *la vie humaine* ‘human life,’ *Dieu est bon* ‘God is good,’ *s'il fait beau temps, nous sortirons* ‘if the weather is nice, we'll go out,’ etc.). In the syntagm a term acquires its value only because it stands in opposition to everything that precedes or follows it, or to both.

Outside discourse, on the other hand, words acquire relations of a different kind. Those that have something in common are associated in the memory, resulting in groups marked by diverse relations. For instance, the French word *enseignement* ‘teaching’ will unconsciously call to mind a host of other words (*enseigner* ‘teach,’ *renseigner* ‘acquaint,’ etc.; or *armement* ‘armament,’ *changement* ‘amendment,’ etc.; or *éducation* ‘education,’ *apprentissage* ‘apprenticeship,’ etc.). All those words are related in some way.

We see that the co-ordinations formed outside discourse differ strikingly from those formed inside discourse. Those formed outside discourse are not supported by linearity. Their seat is in the brain; they are a part of the inner storehouse that makes up the language of each speaker. They are *associative relations*.

The syntagmatic relation is *in praesentia*. It is based on two or more terms that occur in an effective series. Against this, the associative relation unites terms *in absentia* in a potential mnemonic series.

From the associative and syntagmatic viewpoint a linguistic unit is like a fixed part of a building, e.g. a column. On the one hand, the column has a certain relation to the

architrave that it supports; the arrangement of the two units in space suggests the syntagmatic relation. On the other hand, if the column is Doric, it suggests a mental comparison of this style with others (Ionic, Corinthian, etc.) although none of these elements is present in space: the relation is associative.

Each of the two classes of co-ordination calls for some specific remarks.

## 2. Syntagmatic Relations

The examples above have already indicated that the notion of syntagma applies not only to words but to groups of words, to complex units of all lengths and types (compounds, derivatives, phrases, whole sentences).

It is not enough to consider the relation that ties together the different parts of syntagms (e.g. French *contre* ‘against’ and *tous* ‘everyone’ in *contre tous*, *contre* and *maître* ‘master’ in *contremaître* ‘foreman’);<sup>13</sup> one must also bear in mind the relation that links the whole to its parts (e.g. *contre tous* in opposition on the one hand to *contre* and on the other *tous*, or *contremaître* in opposition to *contre* and *maître*).

An objection might be raised at this point. The sentence is the ideal type of syntagram. But it belongs to speaking, not to language. Does it not follow that the syntagram belongs to speaking? I do not think so. Speaking is characterized by freedom of combinations; one must therefore ask whether or not all syntagms are equally free.

It is obvious from the first that many expressions belong to language. These are the pat phrases in which any change is prohibited by usage, even if we can single out their meaningful elements (cf. *à quoi bon?* ‘what’s the use?’ *allons donc!* ‘nonsense!’). The same is true, though to a lesser degree, of expressions like *prendre la mouche* ‘take offense easily,’<sup>14</sup> *forcer la main à quelqu’un* ‘force someone’s hand,’ *rompre une lance* ‘break a lance,’<sup>15</sup> or even *avoir mal* (*à la tête*, etc.) ‘have (a headache, etc.),’ *à force de* (soins, etc.) ‘by dint of (care, etc.),’ *que vous en semble?* ‘how do you feel about it?’ *pas n’est besoin de ...* ‘there’s no need for ...,’ etc., which are characterized by peculiarities of signification or syntax. These idiomatic twists cannot be improvised; they are furnished by tradition. There are also words which, while lending themselves perfectly to analysis, are characterized by some morphological anomaly that is kept solely by dint of usage (cf. *difficulté* ‘difficulty’ beside *facilité* ‘facility,’ etc., and *mourrai* ‘[I] shall die’ beside *dormirai* ‘[I] shall sleep’).<sup>16</sup>

There are further proofs. To language rather than to speaking belong the syntagmatic types that are built upon regular forms. Indeed, since there is nothing abstract in language, the types exist only if language has registered a sufficient number of specimens. When a word like *indécorable* arises in speaking, its appearance supposes a fixed type, and this type is in turn possible only through remembrance of a sufficient number of similar words belonging to language (*impardonable* ‘unpardonable,’ *intolérable* ‘intolerable,’ *infatigable* ‘indefatigable,’ etc.). Exactly the same is true of sentences and groups of words built upon regular patterns. Combinations like *la terre tourne* ‘the world turns,’ *que vous dit-il?* ‘what does he say to you?’ etc. correspond to general types that are in turn supported in the language by concrete remembrances.

But we must realize that in the syntagram there is no clear-cut boundary between the language fact, which is a sign of collective usage, and the fact that belongs to speaking

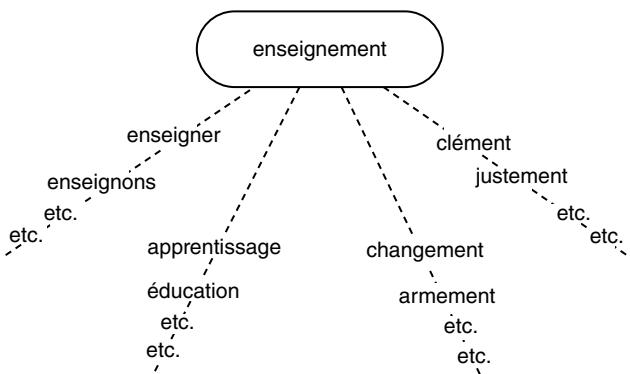

and depends on individual freedom. In a great number of instances it is hard to class a combination of units because both forces have combined in producing it, and they have combined in indeterminable proportions.

### 3. Associative Relations

Mental association creates other groups besides those based on the comparing of terms that have something in common; through its grasp of the nature of the relations that bind the terms together, the mind creates as many associative series as there are diverse relations. For instance, in *enseignement* ‘teaching,’ *enseigner* ‘teach,’ *enseignons* ‘(we) teach,’ etc., one element, the radical, is common to every term; the same word may occur in a different series formed around another common element, the suffix (cf. *enseignement*, *armement*, *changement*, etc.); or the association may spring from the analogy of the concepts signified (*enseignement*, *instruction*, *apprentissage*, *éducation*, etc.); or again, simply from the similarity of the sound-images (e.g. *enseignement* and *justement* ‘precisely’).<sup>17</sup> Thus there is at times a double similarity of meaning and form, at times similarity only of form or of meaning. A word can always evoke everything that can be associated with it in one way or another.

Whereas a syntagm immediately suggests an order of succession and a fixed number of elements, terms in an associative family occur neither in fixed numbers nor in a definite order. If we associate *painful*, *delightful*, *frightful*, etc. we are unable to predict the number of words that the memory will suggest or the order in which they will appear. A particular word is like the center of a constellation; it is the point of convergence of an indefinite number of co-ordinated terms (see the illustration below).

But of the two characteristics of the associative series – indeterminate order and indefinite number – only the first can always be verified; the second may fail to meet the test. This happens in the case of inflectional paradigms, which are typical of associative groupings. Latin *dominus*, *dominī*, *dominō*, etc. is obviously an associative group formed around a common element, the noun theme *domin-*, but the series<sup>18</sup>

<sup>18</sup>The last case is rare and can be classed as abnormal, for the mind naturally

is not indefinite as in the case of *enseignement*, *changement*, etc.; the number of cases is definite. Against this, the words have no fixed order of succession, and it is by a purely arbitrary act that the grammarian groups them in one way rather than in another; in the mind of speakers the nominative case is by no means the first one in the declension, and the order in which terms are called depends on circumstances.

## Notes

- 1 The term sound-image may seem to be too restricted inasmuch as beside the representation of the sounds of a word there is also that of its articulation, the muscular image of the phonational act. But for F. de Saussure language is essentially a depository, a thing received from without. The sound-image is par excellence the natural representation of the word as a fact of potential language, outside any actual use of it in speaking. The motor side is thus implied or, in any event, occupies only a subordinate role with respect to the sound-image. [Ed.]
- 2 Cf. English *goodness!* and *zounds!* (from *God's wounds*). [Tr.]
- 3 It would be wrong to reproach F. de Saussure for being illogical or paradoxical in attributing two contradictory qualities to language. By opposing two striking terms, he wanted only to emphasize the fact that language changes in spite of the inability of speakers to change it. One can also say that it is intangible but not unchangeable. [Ed.]
- 4 From May to July of 1911, Saussure used interchangeably the old terminology (*idea* and *sign*) and the new (*signified* and *signifier*). [Tr.]
- 5 According to Meillet (*Mem. de la Soc. de Ling.*, IX, pp. 365 ff.) and Gauthiot (*La fin du mot indo-européen*, pp. 158 ff.), final *-m* did not exist in Proto-Indo-European, which used only *-n*; if this theory is accepted, Law 5 can be stated in this way: Greek preserved every final *-n*; its demonstrative value is not diminished since the phonetic phenomenon that results in the preservation of a former state is the same in nature as the one that manifests a change. [Ed.]
- 6 Of course the examples cited above are purely schematic: linguistics is right in trying currently to relate to the same initial principle the largest possible series of phonetic changes; for instance, Meillet explains all the transformations of Greek occlusives by progressive weakening of their articulation (see *Mem. de la Soc. de Ling.*, IX, pp. 163 ff.). Naturally the conclusions on the nature of phonetic changes are in the last analysis applicable to these general facts, wherever they exist. [Ed.]
- 7 This generally accepted theory has been recently but, we believe, unsuccessfully attacked by M. E. Larch (*Das invariable Particípium praesentis*, Erlangen, 1913); there was then no reason for eliminating an example that would retain its didactic value. [Ed.]
- 8 Cf. the sounds [jurmain] in English: "your mine" or "you're mine." [Tr.]
- 9 Cf. English *bought: boat, naught: note, far: for: four* (for many speakers). [Tr.]
- 10 Form, function, and meaning combine to make the classing of the parts of speech even more difficult in English than in French. Cf. *ten-foot: ten feet in a ten-foot pole: the pole is ten feet long*. [Tr.]
- 11 The use of the comparative form for two and the superlative for more than two in English (e.g. *may the better boxer win: the best boxer in the world*) is probably a remnant of the old distinction between the dual and the plural number. [Tr.]
- 12 It is scarcely necessary to point out that the study of *syntagms* is not to be confused with syntax. Syntax is only one part of the study of syntagms. [Ed.]
- 13 Cf. English *head* and *waiter* in *headwaiter*. [Tr.]
- 14 Literally 'take the fly.' Cf. English *take the bull by the horns*. [Tr.]
- 15 Cf. English *bury the hatchet*. [Tr.]
- 16 The anomaly of the double *r* in the future forms of certain verbs in French may be compared to irregular plurals like *oxen* in English. [Tr.]
- 17 The last case is rare and can be classed as abnormal, for the mind naturally discards associations that becloud the intelligibility of discourse. But its existence is proved by a lower category of puns based on the ridiculous confusions that can result from pure and simple homonymy like the French statement: "Les musiciens produisent les *sous* ['sounds, bran'] et les grainetiers les vendent" 'musicians produce *sous* and seedsmen sell them.' [Cf. Shakespeare's "Not on thy *sole*, but on thy *soul*." (Tr.)] This is distinct from the case where an association, while fortuitous, is supported by a comparison of ideas (cf. French *ergot* 'spur': *ergoter* 'wrangle'; German *blau* 'blue': *durchblauen* 'thrash soundly'); the point is that one member of the pair has a new interpretation. Folk etymologies like these are of interest in the study of semantic evolution, but from the synchronic viewpoint they are in the same category as *enseigner: enseignement*. [Ed.]
- 18 Cf. English *education* and the corresponding associative series: *educate, educates, etc.; internship, training, etc.; vocation, devotion, etc.; and lotion, fashion, etc.* [Tr.]

# CHAPTER 4

## The Structural Study of Myth

*Claude Lévi-Strauss*

Claude Lévi-Strauss is largely responsible for the rise of Structuralism in France in the post-World War II era. In such highly influential books as *Tristes Tropiques* (1956) and *Structuralist Anthropology* (1958), he developed a description of human society and of human culture that underscored its systematic character and its similarity to the structure of language. In this famous essay, he argues that human myths, when studied for their similar structural elements, reflect a universal concern for resolving cognitive issues in human life. Humans are natural animals, but they are also capable of ideation and the creation of culture. How can humans reconcile those two very different "origins" of human life – one seemingly earthly, the other human? Myths, according to Lévi-Strauss, are ways of achieving cognitive reconciliation. Lévi-Strauss's method owes a great deal to Hegel and Marx's method of dialectics, whereby elements in contradiction with one another are resolved through their mediation as a third term that retains elements of each, and he could be criticized for forcing his evidence to conform to the dialectical model. A more evolutionary anthropological approach, for example, would see the Oedipus story as concerning the danger of harming the social institutions humans developed to quell harmful violence and conflict so that survival could be assured more widely in the human population. The story has more to do with safeguarding the newly invented ideal of civility than with reconciling earthly origins with human ones.

*"It would seem that mythological worlds have been built up only to be shattered again, and that new worlds were built from the fragments."*

– Franz Boas<sup>1</sup>

Despite some recent attempts to renew them, it seems that during the past twenty years anthropology has increasingly turned from studies in the field of religion. At the same time, and precisely because the interest of professional anthropologists has withdrawn from primitive religion, all kinds of amateurs who claim to belong to other disciplines have seized this opportunity to move in, thereby turning into their private playground

*Original publication details:* Claude Levi-Strauss, "The Structural Study of Myth" from *Structural Anthropology*, pp. 206–231. Basic Books, 1963. Reproduced with permission from Basic Books.

what we had left as a wasteland. The prospects for the scientific study of religion have thus been undermined in two ways.

The explanation for this situation lies to some extent in the fact that the anthropological study of religion was started by men like Tylor, Frazer, and Durkheim, who were psychologically oriented although not in a position to keep up with the progress of psychological research and theory. Their interpretations, therefore, soon became vitiated by the outmoded psychological approach which they used as their basis. Although they were undoubtedly right in giving their attention to intellectual processes, the way they handled these remained so crude that it discredited them altogether. This is much to be regretted, since, as Hocart so profoundly noted in his introduction to a posthumous book recently published,<sup>2</sup> psychological interpretations were withdrawn from the intellectual field only to be introduced again in the field of affectivity, thus adding to "the inherent defects of the psychological school ... the mistake of deriving clear-cut ideas ... from vague emotions." Instead of trying to enlarge the framework of our logic to include processes which, whatever their apparent differences, belong to the same kind of intellectual operation, a naïve attempt was made to reduce them to inarticulate emotional drives, which resulted only in hampering our studies.

Of all the chapters of religious anthropology probably none has tarried to the same extent as studies in the field of mythology. From a theoretical point of view the situation remains very much the same as it was fifty years ago, namely, chaotic. Myths are still widely interpreted in conflicting ways: as collective dreams, as the outcome of a kind of esthetic play, or as the basis of ritual. Mythological figures are considered as personified abstractions, divinized heroes, or fallen gods. Whatever the hypothesis, the choice amounts to reducing mythology either to idle play or to a crude kind of philosophic speculation.

In order to understand what a myth really is, must we choose between platitude and sophism? Some claim that human societies merely express, through their mythology, fundamental feelings common to the whole of mankind, such as love, hate, or revenge or that they try to provide some kind of explanations for phenomena which they cannot otherwise understand – astronomical, meteorological, and the like. But why should these societies do it in such elaborate and devious ways, when all of them are also acquainted with empirical explanations? On the other hand, psychoanalysts and many anthropologists have shifted the problems away from the natural or cosmological toward the socio-psychological fields. But then the interpretation becomes too easy: If a given mythology confers prominence on a certain figure, let us say an evil grandmother, it will be claimed that in such a society grandmothers are actually evil and that mythology reflects the social structure and the social relations; but should the actual data be conflicting, it would be as readily claimed that the purpose of mythology is to provide an outlet for repressed feelings. Whatever the situation, a clever dialectic will always find a way to pretend that a meaning has been found.

Mythology confronts the student with a situation which at first sight appears contradictory. On the one hand it would seem that in the course of a myth anything is likely to happen. There is no logic, no continuity. Any characteristic can be attributed to any subject; every conceivable relation can be found. With myth, everything becomes possible. But on the other hand, this apparent arbitrariness is belied by the astounding similarity between myths collected in widely different regions. Therefore the problem: If the content of a myth is contingent, how are we going to explain the fact that myths throughout the world are so similar?

It is precisely this awareness of a basic antinomy pertaining to the nature of myth that may lead us toward its solution. For the contradiction which we face is very similar to that which in earlier times brought considerable worry to the first philosophers concerned with linguistic problems; linguistics could only begin to evolve as a science after this contradiction had been overcome. Ancient philosophers reasoned about language the way we do about mythology. On the one hand, they did notice that in a given language certain sequences of sounds were associated with definite meanings, and they earnestly aimed at discovering a reason for the linkage between those *sounds* and that *meaning*. Their attempt, however, was thwarted from the very beginning by the fact that the same sounds were equally present in other languages although the meaning they conveyed was entirely different. The contradiction was surmounted only by the discovery that it is the combination of sounds, not the sounds themselves, which provides the significant data.

It is easy to see, moreover, that some of the more recent interpretations of mythological thought originated from the same kind of misconception under which those early linguists were laboring. Let us consider, for instance, Jung's idea that a given mythological pattern – the so-called archetype – possesses a certain meaning. This is comparable to the long-supported error that a sound may possess a certain affinity with a meaning: for instance, the “liquid” semi-vowels with water, the open vowels with things that are big, large, loud, or heavy, etc., a theory which still has its supporters.<sup>3</sup> Whatever emendations the original formulation may now call for,<sup>4</sup> everybody will agree that the Saussurean principle of the *arbitrary character of linguistic signs* was a prerequisite for the accession of linguistics to the scientific level.

To invite the mythologist to compare his precarious situation with that of the linguist in the prescientific stage is not enough. As a matter of fact we may thus be led only from one difficulty to another. There is a very good reason why myth cannot simply be treated as language if its specific problems are to be solved; myth *is* language: to be known, myth has to be told; it is a part of human speech. In order to preserve its specificity we must be able to show that it is both the same thing as language, and also something different from it. Here, too, the past experience of linguists may help us. For language itself can be analyzed into things which are at the same time similar and yet different. This is precisely what is expressed in Saussure's distinction between *langue* and *parole*, one being the structural side of language, the other the statistical aspect of it, *langue* belonging to a reversible time, *parole* being non-reversible. If those two levels already exist in language, then a third one can conceivably be isolated.

We have distinguished *langue* and *parole* by the different time referents which they use. Keeping this in mind, we may notice that myth uses a third referent which combines the properties of the first two. On the one hand, a myth always refers to events alleged to have taken place long ago. But what gives the myth an operational value is that the specific pattern described is timeless; it explains the present and the past as well as the future. This can be made clear through a comparison between myth and what appears to have largely replaced it in modern societies, namely, politics. When the historian refers to the French Revolution, it is always as a sequence of past happenings, a non-reversible series of events the remote consequences of which may still be felt at present. But to the French politician, as well as to his followers, the French Revolution is both a sequence belonging to the past – as to the historian – and a timeless pattern which can be detected in the contemporary French social structure and which provides a clue for its interpretation, a lead from which to infer future developments. Michelet, for instance,

was a politically minded historian. He describes the French Revolution thus: "That day ... everything was possible. ... Future became present ... that is, no more time, a glimpse of eternity."<sup>5</sup> It is that double structure, altogether historical and ahistorical, which explains how myth, while pertaining to the realm of *parole* and calling for an explanation as such, as well as to that of *langue* in which it is expressed, can also be an absolute entity on a third level which, though it remains linguistic by nature, is nevertheless distinct from the other two.

A remark can be introduced at this point which will help to show the originality of myth in relation to other linguistic phenomena. Myth is the part of language where the formula *traduttore, traditore* reaches its lowest truth value. From that point of view it should be placed in the gamut of linguistic expressions at the end opposite to that of poetry, in spite of all the claims which have been made to prove the contrary. Poetry is a kind of speech which cannot be translated except at the cost of serious distortions; whereas the mythical value of the myth is preserved even through the worst translation. Whatever our ignorance of the language and the culture of the people where it originated, a myth is still felt as a myth by any reader anywhere in the world. Its substance does not lie in its style, its original music, or its syntax, but in the *story* which it tells. Myth is language, functioning on an especially high level where meaning succeeds practically at "taking off" from the linguistic ground on which it keeps on rolling.

To sum up the discussion at this point, we have so far made the following claims: (1) If there is a meaning to be found in mythology, it cannot reside in the isolated elements which enter into the composition of a myth, but only in the way those elements are combined. (2) Although myth belongs to the same category as language, being, as a matter of fact, only part of it, language in myth exhibits specific properties. (3) Those properties are only to be found *above* the ordinary linguistic level, that is, they exhibit more complex features than those which are to be found in any other kind of linguistic expression.

If the above three points are granted, at least as a working hypothesis, two consequences will follow: (1) Myth, like the rest of language, is made up of constituent units. (2) These constituent units presuppose the constituent units present in language when analyzed on other levels – namely, phonemes, morphemes, and sememes – but they, nevertheless, differ from the latter in the same way as the latter differ among themselves; they belong to a higher and more complex order. For this reason, we shall call them *gross constituent units*.

How shall we proceed in order to identify and isolate these gross constituent units or mythemes? We know that they cannot be found among phonemes, morphemes, or sememes, but only on a higher level; otherwise myth would become confused with any other kind of speech. Therefore, we should look for them on the sentence level. The only method we can suggest at this stage is to proceed tentatively, by trial and error, using as a check the principles which serve as a basis for any kind of structural analysis: economy of explanation; unity of solution; and ability to reconstruct the whole from a fragment, as well as later stages from previous ones.

The technique which has been applied so far by this writer consists in analyzing each myth individually, breaking down its story into the shortest possible sentences, and writing each sentence on an index card bearing a number corresponding to the unfolding of the story.

Practically each card will thus show that a certain function is, at a given time, linked to a given subject. Or, to put it otherwise, each gross constituent unit will consist of a *relation*.

However, the above definition remains highly unsatisfactory for two different reasons. First, it is well known to structural linguists that constituent units on all levels are made up of relations, and the true difference between our *gross* units and the others remains unexplained; second, we still find ourselves in the realm of a non-reversible time, since the numbers of the cards correspond to the unfolding of the narrative. Thus the specific character of mythological time, which as we have seen is both reversible and non-reversible, synchronic and diachronic, remains unaccounted for. From this springs a new hypothesis, which constitutes the very core of our argument: The true constituent units of a myth are not the isolated relations but *bundles of such relations*, and it is only as bundles that these relations can be put to use and combined so as to produce a meaning. Relations pertaining to the same bundle may appear diachronically at remote intervals, but when we have succeeded in grouping them together we have reorganized our myth according to a time referent of a new nature, corresponding to the prerequisite of the initial hypothesis, namely a two-dimensional time referent which is simultaneously diachronic and synchronic, and which accordingly integrates the characteristics of *langue* on the one hand, and those of *parole* on the other. To put it in even more linguistic terms, it is as though a phoneme were always made up of all its variants.

Two comparisons may help to explain what we have in mind.

Let us first suppose that archaeologists of the future coming from another planet would one day, when all human life had disappeared from the earth, excavate one of our libraries. Even if they were at first ignorant of our writing, they might succeed in deciphering it – an undertaking which would require, at some early stage, the discovery that the alphabet, as we are in the habit of printing it, should be read from left to right and from top to bottom. However, they would soon discover that a whole category of books did not fit the usual pattern – these would be the orchestra scores on the shelves of the music division. But after trying, without success, to decipher staffs one after the other, from the upper down to the lower, they would probably notice that the same patterns of notes recurred at intervals, either in full or in part, or that some patterns were strongly reminiscent of earlier ones. Hence the hypothesis: What if patterns showing affinity, instead of being considered in succession, were to be treated as one complex pattern and read as a whole? By getting at what we call *harmony*, they would then see that an orchestra score, to be meaningful, must be read diachronically along one axis – that is, page after page, and from left to right – and synchronically along the other axis, all the notes written vertically making up one gross constituent unit, that is, one bundle of relations.

The other comparison is somewhat different. Let us take an observer ignorant of our playing cards, sitting for a long time with a fortune-teller. He would know something of the visitors: sex, age, physical appearance, social situation, etc., in the same way as we know something of the different cultures whose myths we try to study. He would also listen to the séances and record them so as to be able to go over them and make comparisons – as we do when we listen to myth-telling and record it. Mathematicians to whom I have put the problem agree that if the man is bright and if the material available to him is sufficient, he may be able to reconstruct the nature of the deck of cards being used, that is, fifty-two or thirty-two cards according to the case, made up of four homologous sets consisting of the same units (the individual cards) with only one varying feature, the suit.

Now for a concrete example of the method we propose. We shall use the Oedipus myth, which is well known to everyone. I am well aware that the Oedipus myth has only reached us under late forms and through literary transmutations concerned more with esthetic and moral preoccupations than with religious or ritual ones, whatever these may

have been. But we shall not interpret the Oedipus myth in literal terms, much less offer an explanation acceptable to the specialist. We simply wish to illustrate – and without reaching any conclusions with respect to it – a certain technique, whose use is probably not legitimate in this particular instance, owing to the problematic elements indicated above. The “demonstration” should therefore be conceived, not in terms of what the scientist means by this term, but at best in terms of what is meant by the street peddler, whose aim is not to achieve a concrete result, but to explain, as succinctly as possible, the functioning of the mechanical toy which he is trying to sell to the on-lookers.

The myth will be treated as an orchestra score would be if it were unwittingly considered as a unilinear series; our task is to reestablish the correct arrangement. Say, for instance, we were confronted with a sequence of the type: 1,2,4,7,8,2,3,4,6,8,1,4,5,7,8,1,2,5,7,3,4,5,6,8 ..., the assignment being to put all the 1's together, all the 2's, the 3's, etc.; the result is a chart:

1	2		4			7	8
	2	3	4		6		8
1			4	5		7	8
1	2			5		7	
		3	4	5	6		8

We shall attempt to perform the same kind of operation on the Oedipus myth, trying out several arrangements of the mythemes until we find one which is in harmony with the principles enumerated above. Let us suppose, for the sake of argument, that the best arrangement is the following (although it might certainly be improved with the help of a specialist in Greek mythology):

Cadmos seeks  
his sister Europa,  
ravished by Zeus

Cadmos kills  
the dragon

The Spartoi kill  
one another

Labdacos (Laos'  
father) = *lame* (?)

Oedipus kills  
his father, Laos

Laos (Oedipus'  
father) = *left-sided* (?)

Oedipus kills  
the Sphinx

Oedipus = *swollen-foot* (?)

Oedipus marries  
his mother, Jocasta

Eteocles kills  
his brother,  
Polynices

Antigone buries her  
brother, Polynices,  
despite prohibition

We thus find ourselves confronted with four vertical columns, each of which includes several relations belonging to the same bundle. Were we to *tell* the myth, we would disregard the columns and read the rows from left to right and from top to bottom. But if we want to *understand* the myth, then we will have to disregard one half of the diachronic dimension (top to bottom) and read from left to right, column after column, each one being considered as a unit.

All the relations belonging to the same column exhibit one common feature which it is our task to discover. For instance, all the events grouped in the first column on the left have something to do with blood relations which are overemphasized, that is, are more intimate than they should be. Let us say, then, that the first column has as its common feature the *overrating of blood relations*. It is obvious that the second column expresses the same thing, but inverted: *underrating of blood relations*. The third column refers to monsters being slain. As to the fourth, a few words of clarification are needed. The remarkable connotation of the surnames in Oedipus' father-line has often been noticed. However, linguists usually disregard it, since to them the only way to define the meaning of a term is to investigate all the contexts in which it appears, and personal names, precisely because they are used as such, are not accompanied by any context. With the method we propose to follow the objection disappears, since the myth itself provides its own context. The significance is no longer to be sought in the eventual meaning of each name, but in the fact that all the names have a common feature: All the hypothetical meanings (which may well remain hypothetical) refer to *difficulties in walking straight and standing upright*.

What then is the relationship between the two columns on the right? Column three refers to monsters. The dragon is a chthonian being which has to be killed in order that mankind be born from the Earth; the Sphinx is a monster unwilling to permit men to live. The last unit reproduces the first one, which has to do with the *autochthonous origin* of mankind. Since the monsters are overcome by men, we may thus say that the common feature of the third column is *denial of the autochthonous origin of man*.<sup>6</sup>

This immediately helps us to understand the meaning of the fourth column. In mythology it is a universal characteristic of men born from the Earth that at the moment they emerge from the depth they either cannot walk or they walk clumsily. This is the case of the chthonian beings in the mythology of the Pueblo: Muyingwu, who leads the emergence, and the chthonian Shumaikoli are lame ("bleeding-foot," "sore-foot"). The same happens to the Koskimo of the Kwakiutl after they have been swallowed by the chthonian monster, Tsiakish: When they returned to the surface of the earth "they limped forward or tripped side ways." Thus the common feature of the fourth column is *the persistence of the autochthonous origin of man*. It follows that column four is to column three as column one is to column two. The inability to connect two kinds of relationships is overcome (or rather replaced) by the assertion that contradictory relationships are identical inasmuch as they are both self-contradictory in a similar way. Although this is still a provisional formulation of the structure of mythical thought, it is sufficient at this stage.

Turning back to the Oedipus myth, we may now see what it means. The myth has to do with the inability, for a culture which holds the belief that mankind is autochthonous (see, for instance, Pausanias, VIII, xxix, 4: plants provide a *model* for humans), to find a satisfactory transition between this theory and the knowledge that human beings are actually born from the union of man and woman. Although the problem

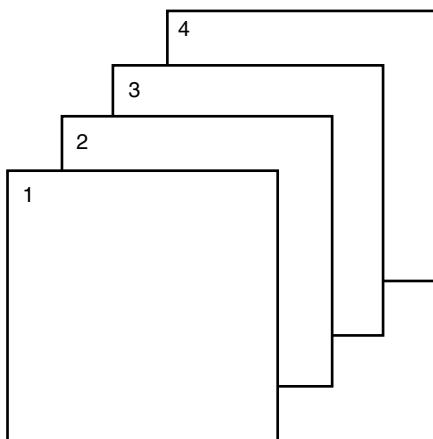

obviously cannot be solved, the Oedipus myth provides a kind of logical tool which relates the original problem – born from one or born from two? – to the derivative problem: born from different or born from same? By a correlation of this type, the overrating of blood relations is to the underrating of blood relations as the attempt to escape autochthony is to the impossibility to succeed in it. Although experience contradicts theory, social life validates cosmology by its similarity of structure. Hence cosmology is true.

Two remarks should be made at this stage.

In order to interpret the myth, we left aside a point which has worried the specialists until now, namely, that in the earlier (Homeric) versions of the Oedipus myth, some basic elements are lacking, such as Jocasta killing herself and Oedipus piercing his own eyes. These events do not alter the substance of the myth although they can easily be integrated, the first one as a new case of auto-destruction (column three) and the second as another case of crippledness (column four). At the same time there is something significant in these additions, since the shift from foot to head is to be correlated with the shift from autochthonous origin to self-destruction.

Our method thus eliminates a problem which has, so far, been one of the main obstacles to the progress of mythological studies, namely, the quest for the *true* version, or the *earlier* one. On the contrary, we define the myth as consisting of all its versions; or to put it otherwise, a myth remains the same as long as it is felt as such. A striking example is offered by the fact that our interpretation may take into account the Freudian use of the Oedipus myth and is certainly applicable to it. Although the Freudian problem has ceased to be that of autochthony *versus* bisexual reproduction, it is still the problem of understanding how *one* can be born from *two*: How is it that we do not have only one procreator, but a mother plus a father? Therefore, not only Sophocles, but Freud himself, should be included among the recorded versions of the Oedipus myth on a par with earlier or seemingly more “authentic” versions.

An important consequence follows. If a myth is made up of all its variants, structural analysis should take all of them into account. After analyzing all the known variants of the Theban version, we should thus treat the others in the same way: first, the tales about Labdacos’ collateral line including Agave, Pentheus, and Jocasta herself; the Theban variant about Lycos with Amphion and Zetos as the city founders; more remote variants concerning Dionysus (Oedipus’ matrilateral cousin); and Athenian legends where Cecrops takes the place of Cadmos, etc. For each of them a similar chart should be drawn and then compared and reorganized according to the findings: Cecrops killing the serpent with the parallel episode of Cadmos; abandonment of Dionysus with abandonment of Oedipus; “Swollen Foot” with Dionysus’ *loxias*, that is, walking obliquely; Europa’s quest with Antiope’s; the founding of Thebes by the Spartoi or by the brothers Amphion and Zetos; Zeus kidnapping Europa and Antiope and the same with Semele; the Theban Oedipus and the Argian Perseus, etc. We shall then have several two-dimensional charts, each dealing with a variant, to be organized in a three-dimensional order, as shown in Figure 16, so that three different readings become possible: left to right, top to bottom, front to back (or vice versa). All of these charts cannot be expected to be identical; but experience shows that any difference to be observed may be correlated with other differences, so that a logical treatment of the whole will allow simplifications, the final outcome being the structural law of the myth.

**Figure 16**

At this point the objection may be raised that the task is impossible to perform, since we can only work with known versions. Is it not possible that a new version might alter the picture? This is true enough if only one or two versions are available, but the objection becomes theoretical as soon as a reasonably large number have been recorded. Let us make this point clear by a comparison. If the furniture of a room and its arrangement were known to us only through its reflection in two mirrors placed on opposite walls, we should theoretically dispose of an almost infinite number of mirror images which would provide us with a complete knowledge. However, should the two mirrors be obliquely set, the number of mirror images would become very small; nevertheless, four or five such images would very likely give us, if not complete information, at least a sufficient coverage so that we would feel sure that no large piece of furniture is missing in our description.

On the other hand, it cannot be too strongly emphasized that all available variants should be taken into account. If Freudian comments on the Oedipus complex are a part of the Oedipus myth, then questions such as whether Cushing's version of the Zuni origin myth should be retained or discarded become irrelevant. There is no single "true" version of which all the others are but copies or distortions. Every version belongs to the myth.

The reason for the discouraging results in works on general mythology can finally be understood. They stem from two causes. First, comparative mythologists have selected preferred versions instead of using them all. Second, we have seen that the structural analysis of *one* variant of *one* myth belonging to *one* tribe (in some cases, even *one* village) already requires two dimensions. When we use several variants of the same myth for the same tribe or village, the frame of reference becomes three-dimensional, and as soon as we try to enlarge the comparison, the number of dimensions required increases until it appears quite impossible to handle them intuitively. The confusions and platitudes which are the outcome of comparative mythology can be explained by the fact that multi-dimensional frames of reference are often ignored or are naïvely replaced by two- or three-dimensional ones. Indeed, progress in comparative mythology depends largely on the cooperation of mathematicians who would undertake to express in symbols multi-dimensional relations which cannot be handled otherwise.

To check this theory,<sup>7</sup> an attempt was made from 1952 to 1954 toward an exhaustive analysis of all the known versions of the Zuni origin and emergence myth: Cushing, 1883 and 1896; Stevenson, 1904; Parsons, 1923; Bunzel, 1932; Benedict, 1934. Furthermore, a preliminary attempt was made at a comparison of the results with

similar myths in other Pueblo tribes, Western and Eastern. Finally, a test was undertaken with Plains mythology. In all cases, it was found that the theory was sound; light was thrown, not only on North American mythology, but also on a previously unnoticed kind of logical operation, or one known so far only in a wholly different context. The bulk of material which needs to be handled practically at the outset of the work makes it impossible to enter into details, and we shall have to limit ourselves here to a few illustrations.

A simplified chart of the Zuni emergence myth would read:

<i>CHANGE</i>		<i>DEATH</i>
mechanical value of plants (used as ladders to emerge from lower world)	emergence led by Beloved Twins	sibling incest (origin of water)
food value of wild plants	migration led by the two Newekwe (ceremonial clowns)	magical contest with People of the Dew (collecting wild food <i>versus</i> cultivation)
food value of cultivated plants		brother and sister sacrificed (to gain victory)
periodical character of agricultural work		brother and sister adopted (in exchange for corn)
food value of game (hunting)		war against the Kyanakwe (gardeners <i>versus</i> hunters)
inevitability of warfare	war led by the two War-Gods	
		salvation of the tribe (center of the World found)
		brother and sister sacrificed (to avoid the Flood)
DEATH		PERMANENCE

As the chart indicates, the problem is the discovery of a life-death mediation. For the Pueblo, this is especially difficult; they understand the origin of human life in terms of the model of plant life (emergence from the earth). They share that belief with the ancient Greeks, and it is not without reason that we chose the Oedipus myth as our first example. But in the American Indian case, the highest form of plant life is to be found in agriculture which is periodical in nature, that is, which consists in an alternation between life and death. If this is disregarded, the contradiction appears elsewhere: Agriculture provides food, therefore life; but hunting provides food and is similar to warfare which means death. Hence there are three different ways of handling the problem. In the Cushing version, the difficulty revolves around an opposition between activities yielding an immediate result (collecting wild food) and activities yielding a delayed result – death has to become integrated so that agriculture can exist. Parsons' version shifts from hunting to agriculture, while Stevenson's version operates the other way around. It can be shown that all the differences between these versions can be rigorously correlated with these basic structures.

Thus the three versions describe the great war waged by the ancestors of the Zuni against a mythical population, the Kyanakwe, by introducing into the narrative significant variations which consist (1) in the friendship or hostility of the gods; (2) in the granting of final victory to one camp or the other; (3) in the attribution of the symbolic function to the Kyanakwe, described sometimes as hunters (whose bows are strung with animal sinews) and sometimes as gardeners (whose bows are strung with plant fibers).

CUSHING	PARSONS	STEVENSON
Gods, Kyanakwe } allied, use fiber string on their bows (gardeners)	Kyanakwe, alone, use fiber string	Gods, } allied, use Men } fiber string
VICTORIOUS OVER	VICTORIOUS OVER	VICTORIOUS OVER
Men, alone, use sinew (until they shift to fiber)	Gods, } allied, use Men } sinew string	Kyanakwe, alone, use sinew string

Since fiber string (agriculture) is always superior to sinew string (hunting), and since (to a lesser extent) the gods' alliance is preferable to their antagonism, it follows that in Cushing's version, men are seen as doubly underprivileged (hostile gods, sinew string); in the Stevenson version, doubly privileged (friendly gods, fiber string); while Parsons' version confronts us with an intermediary situation (friendly gods, but sinew strings, since men begin by being hunters). Hence:

OPPOSITIONS	CUSHING	PARSONS	STEVENSON
gods/men	-	+	+
fiber/sinew	-	-	+

Bunzel's version is of the same type as Cushing's from a structural point of view. However, it differs from both Cushing's and Stevenson's, inasmuch as the latter two explain the emergence as the result of man's need to evade his pitiful condition, while Bunzel's version makes it the consequence of a call from the higher powers – hence the inverted sequences of the means resorted to for the emergence: In both Cushing and Stevenson, they go from plants to animals; in Bunzel, from mammals to insects, and from insects to plants.

Among the Western Pueblo the logical approach always remains the same; the starting point and the point of arrival are simplest, whereas the intermediate stage is characterized by ambiguity:

LIFE (= INCREASE)		
(Mechanical) value of the plant kingdom, taking growth alone into account	ORIGINS	
Food value of the plant kingdom, limited to wild plants		FOOD-GATHERING
Food value of the plant kingdom, including wild and cultivated plants		AGRICULTURE
Food value of the animal kingdom, limited to animals	(but there is a contradiction here, owing to the negation of life = destruction, hence:)	
Destruction of the animal kingdom, extended to human beings		HUNTING
DEATH (= DECREASE)		WARFARE

The fact that contradiction appears in the middle of the dialectical process results in a double set of dioscuric pairs, the purpose of which is to mediate between conflicting terms:

1. 2 divine messengers	2 ceremonial clowns	2 war-gods	
2. homogeneous pair: dioscuri (2 brothers)	siblings (brother and sister)	couple (husband and wife)	heterogeneous pair: (grandmother and grandchild)

We have here combinational variants of the same function in different contexts (hence the war attribute of the clowns, which has given rise to so many queries).

The problem, often regarded as insoluble, vanishes when it is shown that the clowns – gluttons who may with impunity make excessive use of agricultural products – have the same function in relation to food production as the war-gods. (This function appears, in the dialectical process, as *overstepping the boundaries* of hunting, that is, hunting for men instead of for animals for human consumption.)

Some Central and Eastern Pueblos proceed the other way around. They begin by stating the identity of hunting and cultivation (first corn obtained by Game-Father sowing deer-dewclaws), and they try to derive both life and death from that central notion. Then, instead of extreme terms being simple and intermediary ones duplicated as among the Western groups, the extreme terms become duplicated (i.e., the two sisters of the Eastern Pueblo) while a simple mediating term comes to the foreground (for instance, the Poshaiyanne of the Zia), but endowed with equivocal attributes. Hence the attributes of

this "messiah" can be deduced from the place it occupies in the time sequence: good when at the beginning (Zuni, Cushing), equivocal in the middle (Central Pueblo), bad at the end (Zia), except in Bunzel's version, where the sequence is reversed as has been shown.

By systematically using this kind of structural analysis it becomes possible to organize all the known variants of a myth into a set forming a kind of permutation group, the two variants placed at the far ends being in a symmetrical, though inverted, relationship to each other.

Our method not only has the advantage of bringing some kind of order to what was previously chaos; it also enables us to perceive some basic logical processes which are at the root of mythical thought.<sup>8</sup> Three main processes should be distinguished.

The trickster of American mythology has remained so far a problematic figure. Why is it that throughout North America his role is assigned practically everywhere to either coyote or raven? If we keep in mind that mythical thought always progresses from the awareness of oppositions toward their resolution, the reason for these choices becomes clearer. We need only assume that two opposite terms with no intermediary always tend to be replaced by two equivalent terms which admit of a third one as a mediator; then one of the polar terms and the mediator become replaced by a new triad, and so on. Thus we have a mediating structure of the following type:

<i>INITIAL PAIR</i>	<i>FIRST TRIAD</i>	<i>SECOND TRIAD</i>
Life	Agriculture	
		Herbivorous animals
		Carrion-eating animals (raven; coyote)
Hunting		
		Beasts of prey
Death	Warfare	

The unformulated argument is as follows: carrion-eating animals are like beasts of prey (they eat animal food), but they are also like food-plant producers (they do not kill what they eat). Or to put it otherwise, Pueblo style (for Pueblo agriculture is more "meaningful" than hunting): ravens are to gardens as beasts of prey are to herbivorous animals. But it is also clear that herbivorous animals may be called first to act as mediators on the assumption that they are like collectors and gatherers (plant-food eaters), while they can be used as animal food though they are not themselves hunters. Thus we may have mediators of the first order, of the second order, and so on, where each term generates the next by a double process of opposition and correlation.

This kind of process can be followed in the mythology of the Plains, where we may order the data according to the set:

- Unsuccessful mediator between Earth and Sky  
(Star-Husband's wife)
- Heterogeneous pair of mediators  
(grandmother and grandchild)
- Semi-homogeneous pair of mediators  
(Lodge-Boy and Thrown-away)

While among the Pueblo (Zuni) we have the corresponding set:

Successful mediator between Earth and Sky  
(Poshaiyanki)

Semi-homogeneous pair of mediators  
(Uuyewi and Matsailema)

Homogeneous pair of mediators  
(the two Ahaiyuta)

On the other hand, correlations may appear on a horizontal axis (this is true even on the linguistic level; see the manifold connotation of the root *pose* in Tewa according to Parsons: coyote, mist, scalp, etc.). Coyote (a carrion-eater) is intermediary between herbivorous and carnivorous just as mist between Sky and Earth; as scalp between war and agriculture (scalp is a war crop); as corn smut between wild and cultivated plants; as garments between "nature" and "culture"; as refuse between village and outside; and as ashes (or soot) between roof (sky vault) and hearth (in the ground). This chain of mediators, if one may call them so, not only throws light on entire parts of North American mythology – why the Dew-God may be at the same time the Game-Master and the giver of raiments and be personified as an "Ash-Boy"; or why scalps are mist-producing; or why the Game-Mother is associated with corn smut; etc. – but it also probably corresponds to a universal way of organizing daily experience. See, for instance, the French for plant smut (*nielle*, from Latin *nebula*); the luck-bringing power attributed in Europe to refuse (old shoe) and ashes (kissing chimney sweeps); and compare the American Ash-Boy cycle with the Indo-European Cinderella: Both are phallic figures (mediators between male and female); masters of the dew and the game; owners of fine raiments; and social mediators (low class marrying into high class); but they are impossible to interpret through recent diffusion, as has been contended, since Ash-Boy and Cinderella are symmetrical but inverted in every detail (while the borrowed Cinderella tale in America – Zuni Turkey-Girl – is parallel to the prototype). Hence the chart:

	EUROPE	AMERICA
<i>Sex</i>	female	male
<i>Family Status</i>	double family (remarried father)	no family (orphan)
<i>Appearance</i>	pretty girl	ugly boy
<i>Sentimental status</i>	nobody likes her	unrequited love for girl
<i>Transformation</i>	luxuriously clothed with supernatural help	stripped of ugliness with supernatural help

Thus, like Ash-Boy and Cinderella, the trickster is a mediator. Since his mediating function occupies a position halfway between two polar terms, he must retain something of that duality – namely an ambiguous and equivocal character. But the trickster figure is not the only conceivable form of mediation; some myths seem to be entirely devoted to the task of exhausting all the possible solutions to the problem of bridging the gap between *two* and *one*. For instance, a comparison between all the variants of the Zuni

emergence myth provides us with a series of mediating devices, each of which generates the next one by a process of opposition and correlation:

messiah > dioscuri > trickster > bisexual being > sibling pair > married couple > grandmother-grandchild > four-term group > triad

In Cushing's version, this dialectic is associated with a change from a spatial dimension (mediation between Sky and Earth) to a temporal dimension (mediation between summer and winter, that is, between birth and death). But while the shift is being made from space to time, the final solution (triad) re-introduces space, since a triad consists of a dioscuric pair *plus* a messiah, present simultaneously; and while the point of departure was ostensibly formulated in terms of a space referent (Sky and Earth), this was nevertheless implicitly conceived in terms of a time referent (first the messiah calls, *then* the dioscuri descend). Therefore the logic of myth confronts us with a double, reciprocal exchange of functions to which we shall return shortly.

Not only can we account for the ambiguous character of the trickster, but we can also understand another property of mythical figures the world over, namely, that the same god is endowed with contradictory attributes – for instance, he may be *good* and *bad* at the same time. If we compare the variants of the Hopi myth of the origin of Shalako, we may order them in terms of the following structure:

(Masauwu:  $x$ ) ≈ (Muyingwu: Masauwu) ≈ (Shalako: Muyingwu) ≈ ( $y$ : Masauwu)

where  $x$  and  $y$  represent arbitrary values corresponding to the fact that in the two "extreme" variants the god Masauwu, while appearing alone rather than associated with another god, as in variant two, or being absent, as in variant three, still retains intrinsically a relative value. In variant one, Masauwu (alone) is depicted as helpful to mankind (though not as helpful as he could be), and in version four, harmful to mankind (though not as harmful as he could be). His role is thus defined – at least implicitly – in contrast with another role which is possible but not specified and which is represented here by the values  $x$  and  $y$ . In version 2, on the other hand, Muyingwu is relatively more helpful than Masauwu, and in version three, Shalako more helpful than Muyingwu. We find an identical series when ordering the Keresan variants:

(Poshaiyanki:  $x$ ) ≈ (Lea: Poshaiyanki) ≈ (Poshaiyanki: Tiamoni) ≈ ( $y$ : Poshaiyanki)

This logical framework is particularly interesting, since anthropologists are already acquainted with it on two other levels – first, in regard to the problem of the pecking order among hens, and second, to what this writer has called *generalized exchange* in the field of kinship. By recognizing it also on the level of mythical thought, we may find ourselves in a better position to appraise its basic importance in anthropological studies and to give it a more inclusive theoretical interpretation.

Finally, when we have succeeded in organizing a whole series of variants into a kind of permutation group, we are in a position to formulate the law of that group. Although it is not possible at the present stage to come closer than an approximate formulation which will certainly need to be refined in the future, it seems that every

myth (considered as the aggregate of all its variants) corresponds to a formula of the following type:

$$F_x(a):F_y(b) \simeq F_x(b):F_{a-1}(y)$$

Here, with two terms, *a* and *b*, being given as well as two functions, *x* and *y*, of these terms, it is assumed that a relation of equivalence exists between two situations defined respectively by an inversion of *terms* and *relations*, under two conditions: (1) that one term be replaced by its opposite (in the above formula, *a* and *a - 1*); (2) that an inversion be made between the *function value* and the *term value* of two elements (above, *y* and *a*).

This formula becomes highly significant when we recall that Freud considered that *two traumas* (and not one, as is so commonly said) are necessary in order to generate the individual myth in which a neurosis consists. By trying to apply the formula to the analysis of these traumas (and assuming that they correspond to conditions 1 and 2 respectively) we should not only be able to provide a more precise and rigorous formulation of the genetic law of the myth, but we would find ourselves in the much desired position of developing side by side the anthropological and the psychological aspects of the theory; we might also take it to the laboratory and subject it to experimental verification.

At this point it seems unfortunate that with the limited means at the disposal of French anthropological research no further advance can be made. It should be emphasized that the task of analyzing mythological literature, which is extremely bulky, and of breaking it down into its constituent units, requires team work and technical help. A variant of average length requires several hundred cards to be properly analyzed. To discover a suitable pattern of rows and columns for those cards, special devices are needed, consisting of vertical boards about six feet long and four and a half feet high, where cards can be pigeon-holed and moved at will. In order to build up three-dimensional models enabling one to compare the variants, several such boards are necessary, and this in turn requires a spacious workshop, a commodity particularly unavailable in Western Europe nowadays. Furthermore, as soon as the frame of reference becomes multi-dimensional (which occurs at an early stage, as has been shown above) the board system has to be replaced by perforated cards, which in turn require IBM equipment, etc.

Three final remarks may serve as conclusion.

First, the question has often been raised why myths, and more generally oral literature, are so much addicted to duplication, triplication, or quadruplication of the same sequence. If our hypotheses are accepted, the answer is obvious: The function of repetition is to render the structure of the myth apparent. For we have seen that the synchronic-diachronic structure of the myth permits us to organize it into diachronic sequences (the rows in our tables) which should be read synchronically (the columns). Thus, a myth exhibits a "slated" structure, which comes to the surface, so to speak, through the process of repetition.

However, the slates are not absolutely identical. And since the purpose of myth is to provide a logical model capable of over-coming a contradiction (an impossible achievement if, as it happens, the contradiction is real), a theoretically infinite number of slates will be generated, each one slightly different from the others. Thus, myth grows spiral-wise until the intellectual impulse which has produced it is exhausted. Its *growth* is a continuous process, whereas its *structure* remains discontinuous. If this is the case, we should assume that it closely corresponds, in the realm of the spoken word, to a crystal

in the realm of physical matter. This analogy may help us to better understand the relationship of myth to both *langue* on the one hand and *parole* on the other. Myth is an intermediary entity between a statistical aggregate of molecules and the molecular structure itself.

Prevalent attempts to explain alleged differences between the so-called primitive mind and scientific thought have resorted to qualitative differences between the working processes of the mind in both cases, while assuming that the entities which they were studying remained very much the same. If our interpretation is correct, we are led toward a completely different view – namely, that the kind of logic in mythical thought is as rigorous as that of modern science, and that the difference lies, not in the quality of the intellectual process, but in the nature of the things to which it is applied. This is well in agreement with the situation known to prevail in the field of technology: What makes a steel ax superior to a stone ax is not that the first one is better made than the second. They are equally well made, but steel is quite different from stone. In the same way we may be able to show that the same logical processes operate in myth as in science, and that man has always been thinking equally well; the improvement lies, not in an alleged progress of man's mind, but in the discovery of new areas to which it may apply its unchanged and unchanging powers.

## Notes

- 6 We are not trying to become involved with specialists in an argument; this would be presumptuous and even meaningless on our part. Since the Oedipus myth is taken here merely as an example treated in arbitrary fashion, the chthonian nature ascribed to the Sphinx might seem surprising; we shall refer to the testimony of Marie Delcourt: "In the archaic legends, [she is] certainly born of the Earth itself" (*Oedipe ou la légende du conquérant* [Liège: 1944], p. 108). No matter how remote from Delcourt's our method may be (and our conclusions would be, no doubt, if we were competent to deal with the problem in depth), it seems to us that she has convincingly established the nature of the Sphinx in the archaic tradition, namely, that of a female monster who attacks and rapes young men; in other words, the personification of a female being with an inversion of the sign. This explains why, in the handsome iconography compiled by Delcourt at the end of her work, men and women are always found in an inverted "sky/earth" relationship.

As we shall point out below, we selected the Oedipus myth as our first example because of the striking analogies that seem to exist between certain aspects of archaic Greek thought and that of the Pueblo Indians, from whom we have borrowed the examples that follow. In this respect it should be noted that the figure of the Sphinx, as reconstructed by Delcourt, coincides with two figures of North American mythology (who probably merge into one). We are referring, on the one hand, to "the old hag," a repulsive witch whose physical appearance presents a "problem" to the young hero. If he "solves" this problem – that is, if he responds to the advances of the abject creature – he will find in his bed, upon awakening, a beautiful young woman who will confer power upon him (this is also a Celtic theme). The Sphinx, on the other hand, recalls even more "the child-protruding

woman" of the Hopi Indians, that is, a phallic mother par excellence. This young woman was abandoned by her group in the course of a difficult migration, just as she was about to give birth. Henceforth she wanders in the desert as the "Mother of Animals," which she withholds from hunters. He who meets her in her bloody clothes "is so frightened that he has an erection," of which she takes advantage to rape him, after which she rewards him with unfailing success in hunting. See H. R. Voth, "The Oraibi Summer Snake Ceremony," *Field Columbian Museum*, Publication No. 83, Anthropological Series, Vol. III, No. 4 (Chicago: 1903), pp. 352-3 and p. 353, n 1.

# CHAPTER 5

## Mythologies

*Roland Barthes*

Roland Barthes played a major role in the development of Structuralist and Post-Structuralist literary criticism in France from the 1950s to the 1970s. In his early work, *Elements of Semiology* (1965), he introduced the ideas of Saussure to the French intellectual community, and he offered a wide range of exemplary applications of "semiology," or the science of signs, to everything from literature to fashion and cuisine. He went on to write numerous works of Structuralist literary criticism. After 1968, influenced by the work of Jacques Derrida, Barthes turned away from classic Structuralism's concern with the orders of signs and worked instead on the disordering potential of literary semiosis, its tendency to transgress the identities and boundaries (such as the idea of the "author") that define traditional literary study. His essay "Death of the Author" (1968) is something of a Post-Structuralist manifesto, and this stage of Barthes's work achieves its most mature manifestation in his famous *S/Z* (1970), a lengthy reading of a short story by Balzac. These selections from *Mythologies* date from 1957.

# CHAPTER 6

## Discourse in the Novel

*Mikhail Bakhtin*

Mikhail Bakhtin was one of the most influential thinkers of the late twentieth century for literary and cultural studies. Bakhtin drew attention to the way literature weaves discourses together from disparate social sources. Bakhtin also helped reconceptualize literary language. According to the theory, all words exist in dialog with other words. The theory shifts emphasis away from individual literary works and toward the intertextual world in which individual literary works are set. This selection dates from 1934–5.

The novel can be defined as a diversity of social speech types, sometimes even diversity of languages and a diversity of individual voices, artistically organized. The internal stratification of any single national language into social dialects, characteristic group behavior, professional jargons, generic languages, languages of generations and age groups, tendentious languages, languages of the authorities, of various circles and of passing fashions, languages that serve the specific sociopolitical purposes of the day, even of the hour (each day has its own slogan, its own vocabulary, its own emphases) – this internal stratification present in every language of its historical existence is the indispensable prerequisite for the novel as a genre. The novel orchestrates all its themes, the totality of the world of objects and ideas depicted and expressed in it, by means of the social diversity of speech types [*raznorecie*] and by the differing individual voices that flourish under such conditions. Authorial speech, the speeches of narrators, inserted genres, the speech of characters are merely those fundamental compositional unities with whose help heteroglossia [*raznorecie*] can enter the novel; each of them permits a multiplicity of social voices and a wide variety of their links and interrelationships (always more or less dialogized). These distinctive links and interrelationships between utterances and languages, this movement of the theme through different languages and speech types, its dispersion into the rivulets and droplets of social heteroglossia, its dialogization – this is the basic distinguishing feature of the stylistics of the novel.

*Original publication details:* Mikhail Bakhtin, “Discourse in the Novel” from *The Dialogic Imagination: Four Essays* by M.M. Bakhtin, ed. Michael Holquist, trans. Caryl Emerson and Michael Holquist, pp. 262–349. University of Texas Press, 1981. Reproduced with permission of the University of Texas Press.

Such a combining of languages and styles into a higher unity is unknown to traditional stylistics; it has no method for approaching the distinctive social dialogue among languages that is present in the novel...

Language – like the living concrete environment in which the consciousness of the verbal artist lives – is never unitary. It is unitary only as an abstract grammatical system of normative forms, taken in isolation from the uninterrupted process of historical becoming that is characteristic of all living language. Actual social life and historical becoming create within an abstractly unitary national language a multitude of concrete worlds, a multitude of bounded verbal ideological and social belief systems; within these various systems (identical in the abstract) are elements of language filled with various semantic and axiological content and each with its own different sound.

Literary language – both spoken and written – although it is unitary not only in its shared, abstract, linguistic markers but also in its forms for conceptualizing these abstract markers, is itself stratified and heteroglot in its aspect as an expressive system, that is, in the forms that carry its meanings.

This stratification is accomplished first of all by the specific organisms called *genres*. Certain features of language (lexicological, semantic, syntactic) will knit together with the intentional aim, and with the overall accentual system inherent in one or another genre: oratorical, publicistic, newspaper and journalistic genres, the genres of low literature (penny dreadfuls, for instance) or, finally, the various genres of high literature. Certain features of language take on the specific flavor of a given genre: they knit together with specific points of view, specific approaches, forms of thinking, nuances and accents characteristic of the given genre.

In addition, there is interwoven with this generic stratification of language a *professional* stratification of language, in the broad sense of the term “professional”: the language of the lawyer, the doctor, the businessman, the politician, the public education teacher and so forth, and these sometimes coincide with, and sometimes depart from, the stratification into genres. It goes without saying that these languages differ from each other not only in their vocabularies; they involve specific forms for manifesting intentions, forms for making conceptualization and evaluation concrete. And even the very language of the writer (the poet or novelist) can be taken as a professional jargon on a par with professional jargons.

But the situation is far from exhausted by the generic and professional stratification of the common literary language. Although at its very core literary language is frequently socially homogeneous, as the oral and written language of a dominant social group, there is nevertheless always present, even here, a certain degree of social differentiation, a social stratification, that in other eras can become extremely acute. Social stratification may here and there coincide with generic and professional stratification, but in essence it is, of course, a thing completely autonomous and peculiar to itself.

Social stratification is also and primarily determined by differences between the forms used to convey meaning and between the expressive planes of various belief systems – that is, stratification expresses itself in typical differences in ways used to conceptualize and accentuate elements of language, and stratification may not violate the abstractly linguistic dialectological unity of the shared literary language.

What is more, all socially significant world views have the capacity to exploit the intentional possibilities of language through the medium of their specific concrete instancing. Various tendencies (artistic and otherwise), circles, journals, particular newspapers, even particular significant artistic works and individual persons are all capable

of stratifying language, in proportion to their social significance; they are capable of attracting its words and forms into their orbit by means of their own characteristic intentions and accents, and in so doing to a certain extent alienating these words and forms from other tendencies, parties, artistic works and persons.

Every socially significant verbal performance has the ability – sometimes for a long period of time, and for a wide circle of persons – to infect with its own intention certain aspects of language that had been affected by its semantic and expressive impulse, imposing on them specific semantic nuances and specific axiological overtones; thus, it can create slogan-words, curse-words, praise-words and so forth.

In any given historical moment of verbal-ideological life, each generation at each social level has its own language; moreover, every age group has as a matter of fact its own language, its own vocabulary, its own particular accentual system that, in their turn, vary depending on social level, academic institution (the language of the cadet, the high school student, the trade school student are all different languages) and other stratifying factors. All this is brought about by socially typifying languages, no matter how narrow the social circle in which they are spoken. It is even possible to have a family jargon define the societal limits of a language, as, for instance, the jargon of the Irtelevs in Tolstoy, with its special vocabulary and unique accentual system.

And finally, at any given moment, languages of various epochs and periods of socio-ideological life cohabit with one another. Even languages of the day exist: one could say that today's and yesterday's socio-ideological and political "day" do not, in a certain sense, share the same language; every day represents another socio-ideological semantic "state of affairs," another vocabulary, another accentual system, with its own slogans, its own ways of assigning blame and praise. Poetry depersonalizes "days" in language, while prose, as we shall see, often deliberately intensifies difference between them, gives them embodied representation and dialogically opposes them to one another in unresolvable dialogues.

Thus at any given moment of its historical existence, language is heteroglot from top to bottom: it represents the coexistence of socio-ideological contradictions between the present and the past, between differing epochs of the past, between different socio-ideological groups in the present, between tendencies, schools, circles and so forth, all given a bodily form. These "languages" of heteroglossia intersect each other in a variety of ways, forming new socially typifying "languages"...

In actual fact, however, there does exist a common plane that methodologically justifies our juxtaposing them: all languages of heteroglossia, whatever the principle underlying them and making each unique, are specific points of view on the world, forms for conceptualizing the world in words, specific world views, each characterized by its own objects, meanings and values. As such they may be juxtaposed to one another, mutually supplement one another, contradict one another and be interrelated dialogically. As such they encounter one another and coexist in the consciousness of real people – first and foremost, in the creative consciousness of people who write novels. As such, these languages live a real life, they struggle and evolve in an environment of social heteroglossia. Therefore they are all able to enter into the unitary plane of the novel, which can unite in itself parodic stylizations of generic languages, various forms of stylizations and illustrations of professional and period-bound languages, the languages of particular generations, of social dialects and others (as occurs, for example, in the English comic novel). They may all be drawn in by the novelist for the orchestration of his themes and for the refracted (indirect) expression of his intentions and values...

As a result of the work done by all these stratifying forces in language, there are not “neutral” words and forms – words and forms that can belong to “no one”; language has been completely taken over, shot through with intentions and accents. For any individual consciousness living in it, language is not an abstract system of normative forms but rather a concrete heteroglot conception of the world. All words have the “taste” of a profession, a genre, a tendency, a party, a particular work, a particular person, a generation, an age group, the day and hour. Each word tastes of the context and contexts in which it has lived its socially charged life; all words and forms are populated by intentions. Contextual overtones (generic, tendentious, individualistic) are inevitable in the word.

As a living, socio-ideological concrete thing, as heteroglot opinion, language, for the individual consciousness, lies on the borderline between oneself and the other. The word in language is half someone else’s. It becomes “one’s own” only when the speaker populates it with his own intention, his own accent, when he appropriates the word, adapting it to his own semantic and expressive intention. Prior to this moment of appropriation, the word does not exist in a neutral and impersonal language (it is not, after all, out of a dictionary that the speaker gets his words!), but rather it exists in other people’s mouths, in other people’s contexts, serving other people’s intentions: it is from there that one must take the word, and make it one’s own. And not all words for just anyone submit equally easily to this appropriation, to this seizure and transformation into private property; many words stubbornly resist, others remain alien, sound foreign in the mouth of the one who appropriated them and who now speaks them; they cannot be assimilated into his context and fall out of it; it is as if they put themselves in quotation marks against the will of the speaker. Language is not a neutral medium that passes freely and easily into the private property of the speaker’s intentions; it is populated – overpopulated – with the intentions of others. Expropriating it, forcing it to submit to one’s own intentions and accents, is a difficult and complicated process.

Concrete socio-ideological language consciousness, as it becomes creative – that is, as it becomes active as literature – discovers itself already surrounded by heteroglossia and not at all a singly, unitary language, inviolable and indisputable. The actively literary linguistic consciousness at all times and everywhere (that is, in all epochs of literature historically available to us) comes upon “languages,” and not language. Consciousness finds itself inevitably facing the necessity of *having to choose a language*. With each literary-verbal performance, consciousness must actively orient itself amidst heteroglossia, it must move in and occupy a position for itself within it, it chooses, in other words, a “language.” Only by remaining in a closed environment, one without writing or thought, completely off the maps of socio-ideological becoming, could a man fail to sense this activity of selecting a language and rest assured in the inviolability of his own language, the conviction that his language is predetermined.

Even such a man, however, deals not in fact with a single language, but with languages – except that the place occupied by each of these languages is fixed and indisputable, the movement from one to the other is predetermined and not a thought process; it is as if these languages were in different chambers. They do not collide with each other in his consciousness, there is no attempt to coordinate them, to look at one of these languages through the eyes of another language.

Thus an illiterate peasant, miles away from any urban center naively immersed in an unmoving and for him unshakeable everyday world, nevertheless lived in several language systems: he prayed to God in one language (Church Slavonic), sang songs in

another, spoke to his family in a third and, when he began to dictate petitions to the local authorities through a scribe, he tried speaking yet a fourth language (the official-literate language, "paper language"). All these are *different languages*, even from the point of view of abstract socio-dialectological markers. But these languages were not dialogically coordinated in the linguistic consciousness of the peasant; he passed from one to the other without thinking, automatically: each was indisputably in its own place, and the place of each was indisputable. He was not yet able to regard one language (and the verbal world corresponding to it) through the eyes of another language (that is, the language of everyday life and the everyday world with the language of prayer or song, or vice versa).<sup>1</sup>

As soon as a critical interanimation of languages began to occur in the consciousness of our peasant, as soon as it became clear that these were not only various different languages but even internally variegated languages, that the ideological systems and approaches to the world that were indissolubly connected with these languages contradicted each other and in no way could live in peace and quiet with one another – then the inviolability and predetermined quality of these languages came to an end, and the necessity of actively choosing one's orientation among them began.

The language and world of prayer, the language and world of song, the language and world of labor and everyday life, the specific language and world of local authorities, the new language and world of the workers freshly immigrated to the city – all these languages and worlds sooner or later emerged from a state of peaceful and moribund equilibrium and revealed the speech diversity in each.

The prose writer as a novelist does not strip away the intentions of others from the heteroglot language of his works, he does not violate those socio-ideological cultural horizons (big and little worlds) that open up behind heteroglot languages – rather, he welcomes them into his work. The prose writer makes use of words that are already populated with the social intentions of others and compels them to serve his own new intentions, to serve a second master...

In the English comic novel we find a comic-parodic reprocessing of almost all the levels of literary language, both conversational and written, that were current at the time. Almost every...classic representative of this generic type is an encyclopedia of all strata and forms of literary language: depending on the subject being represented, the storyline parodically reproduces first the forms of parliamentary eloquence, then the eloquence of the court, or particular forms of parliamentary protocol, or court protocol, or forms used by reporters in newspaper articles, or the dry business language of the City, or the dealings of speculators, or the pedantic speech of scholars, or the high epic style, or Biblical style, or the style of the hypocritical moral sermon or finally the way one or another concrete and socially determined personality, the subject of the story, happens to speak.

This usually parodic stylization of generic, professional and other strata of language is sometimes interrupted by the direct authorial word (usually as an expression of pathos, of Sentimental or idyllic sensibility), which directly embodies (without any refracting) semantic and axiological intentions of the author. But the primary source of language usage in the comic novel is a highly specific treatment of "common language." This "common language" – usually the average norm of spoken and written language for a given social group – is taken by the author precisely as the *common view*, as the verbal approach to people and things normal for a given sphere of society, as the *going point of view* and the *going value*. To one degree or another, the author distances himself from this common language, he steps back and objectifies it, forcing his own intentions to refract and diffuse

themselves through the medium of this common view that has become embodied in language (a view that is always superficial and frequently hypocritical)...

Against this same backdrop of the “common language,” of the impersonal, going opinion, one can also isolate in the comic novel those parodic stylizations of generic, professional and other languages we have mentioned, as well as compact masses of direct authorial discourse – pathos-filled, moral-didactic, sentimental-elegiac or idyllic. In the comic novel the direct authorial word is thus realized in direct, unqualified stylizations of poetic genres (idyllic, elegiac, etc.) or stylizations of rhetorical genres (the pathetic, the moral-didactic). Shifts from common language to parodying of generic and other languages and shifts to the direct authorial word may be gradual, or may be on the contrary quite abrupt. Thus does the system of language work in the comic novel.

We will pause for analysis on several examples from Dickens, from his novel *Little Dorrit*.

(1)

the conference was held at four or five o’clock in the afternoon, when all the region of Harley Street, Cavendish Square, was resonant of carriage-wheels and double-knocks. It had reached this point when Mr. Merdle came home *from his daily occupation of causing the British name to be more respected in all parts of the civilized globe capable of appreciation of whollwide commercial enterprise and gigantic combinations of skill and capital*. For, though nobody knew with the least precision what Mr. Merdle’s business was, except that it was to coin money, these were the terms in which everybody defined it on all ceremonious occasions, and which it was the last new polite reading of the parable of the camel and the needle’s eye to accept without inquiry. (Book 1, ch. 33)

The italicized portion represents a parodic stylization of the language of ceremonial speeches (in parliaments and at banquets). The shift into this style is prepared for by the sentence’s construction, which from the very beginning is kept within bounds by a somewhat ceremonious epic tone. Further on – and already in the language of the author (and consequently in a different style) – the parodic meaning of the ceremoniousness of Merdle’s labors becomes apparent: such a characterization turns out to be “another’s speech,” to be taken only in quotation marks (“these were the terms in which everybody defined it on all ceremonious occasions”).

Thus the speech of another is introduced into the author’s discourse (the story) in *concealed form*, that is, without any of the *formal* markers usually accompanying such speech, whether direct or indirect. But this is not just another’s speech in the same “language” – it is another’s utterance in a language that is itself “other” to the author as well, in the archaicized language of oratorical genres associated with hypocritical official celebration.

(2)

In a day or two it was announced to all the town, that Edmund Sparkler, Esquire, son-in-law of the eminent Mr. Merdle of worldwide renown, was made one of the Lords of the Circumlocution Office; and proclamation was issued, to all true believers, that this admirable appointment was to be hailed as a graceful and gracious mark of homage, rendered by the graceful and gracious Decimus, to that commercial interest which must ever in a great commercial country – and all the rest of it with blast of trumpet. So, bolstered by this mark of Government homage, the wonderful Bank and all the other wonderful undertakings went on and went up; and gapers came to Harley Street, Cavendish Square, only to look at the house where the golden wonder lived. (Book 2, ch. 12)

Here, in the italicized portion, another's speech in another's (official-ceremonial) language is openly introduced as indirect discourse. But it is surrounded by the hidden, diffused speech of another (in the same official-ceremonial language) that clears the way for the introduction of a form more easily perceived as another's speech and that can reverberate more fully as such. The clearing of the way comes with the word "Esquire," characteristic of official speech, added to Sparkler's name; the final confirmation that this is another's speech comes with the epithet "wonderful." This epithet does not of course belong to the author but to that same "general opinion" that had created the commotion around Merdle's inflated enterprises.

(3)

It was a dinner to provoke an appetite, though he had not had one. The rarest dishes, sumptuously cooked and sumptuously served; the choicest fruits, the most exquisite wines; marvels of workmanship in gold and silver, china and glass; innumerable things delicious to the senses of taste, smell, and sight, were insinuated into its composition. *O, what a wonderful man this Merdle, what a great man, what a master man, how blessedly and enviably endowed* – in one word what a rich man! (Book 2, ch. 12)

The beginning is a parodic stylization of high epic style. What follows is an enthusiastic glorification of Merdle, a chorus of his admirers in the form of the concealed speech of another (the italicized portion). The whole point here is to expose the real basis for such glorification, which is to unmask the chorus's hypocrisy: "wonderful," "great," "master," "endowed" can all be replaced by the single word "rich." This act of authorial unmasking, which is openly accomplished within the boundaries of a single simple sentence, merges with the unmasking of another's speech. The ceremonial emphasis on glorification is complicated by a second emphasis that is indignant, ironic, and this is the one that ultimately predominates in the final unmasking words of the sentence.

We have before us a typical double-accented, double-styled *hybrid construction*.

What we are calling a hybrid construction is an utterance that belongs, by its grammatical (syntactic) and compositional markers, to a single speaker, but that actually contains mixed within it two utterances, two speech manners, two styles, two "languages," two semantic and axiological belief systems. We repeat, there is no formal – compositional and syntactic – boundary between these utterances, styles, languages, belief systems; the division of voices and languages takes place within the limits of a single syntactic whole, often within the limits of a simple sentence. It frequently happens that even one and the same word will belong simultaneously to two languages, two belief systems that intersect in a hybrid construction – and, consequently, the word has two contradictory meanings, two accents (examples below). As we shall see, hybrid constructions are of enormous significance in novel style.

(4)

But Mr. Tite Barnacle was a buttoned-up man, and *consequently* a weighty one. (Book 2, ch. 12)

The above sentence is an example of *pseudo-objective motivation*, one of the forms for concealing another's speech – in this example, the speech of "current opinion." If judged by the formal markers above, the logic motivating the sentence seems to belong to the author, i.e., he is formally at one with it; but in actual fact, the motivation lies within the subjective belief system of his characters, or of general opinion.

Pseudo-objective motivation is generally characteristic of novel style,<sup>2</sup> since it is one of the manifold forms for concealing another's speech in hybrid constructions. Subordinate conjunctions and link words ("thus," "because," "for the reason that," "in spite of" and so forth), as well as words used to maintain a logical sequence ("therefore," "consequently," etc.) lose their direct authorial intention, take on the flavor of someone else's language, become refracted or even completely reified.

Such motivation is especially characteristic of comic style, in which someone else's speech is dominant (the speech of concrete persons, or, more often, a collective voice).<sup>3</sup>

(5)

As a vast fire will fill the air to a great distance with its roar, so the sacred flame which the mighty Barnacles had fanned caused the air to resound more and more with the name of Merdle. It was deposited on every lip, and carried into every ear. There never was, there never had been, there never again should be, such a man as Mr. Merdle. Nobody, as aforesaid, knew what he had done, but *everybody knew him to be the greatest that had appeared.* (Book 2, ch. 13)

Here we have an epic, "Homeric" introduction (parodic, of course) into whose frame the crowd's glorification of Merdle has been inserted (concealed speech of another in another's language). We then get direct authorial discourse; however, the author gives an objective tone to this "aside" by suggesting that "everybody knew" (the italicized portion). It is as if even the author himself did not doubt the fact....

Heteroglossia, once incorporated into the novel (whatever the forms for its incorporation), is *another's speech in another's language*, serving to express authorial intentions but in a refracted way. Such speech constitutes a special type of *double-voiced discourse*...

From this follows the decisive and distinctive importance of the novel as a genre: the human being in the novel is first, foremost and always a speaking human being; the novel requires speaking persons bringing with them their own unique ideological discourse, their own language.

The fundamental condition, that which makes a novel a novel, that which is responsible for its stylistic uniqueness, is the *speaking person and his discourse*.

The topic of a speaking person has enormous importance in everyday life. In real life we hear speech about speakers and their discourse at every step. We can go so far as to say that in real life people talk most of all about what others talk about – they transmit, recall, weigh and pass judgment on other people's words, opinions, assertions, information; people are upset by others' words or agree with them, contest them, refer to them and so forth. Were we to eavesdrop on snatches of raw dialogue in the street, in a crowd, in lines, in a foyer and so forth, we would hear how often the words "he says," "people say," "he said..." are repeated, and in the conversational hurly-burly of people in a crowd, everything often fuses into one big "he says...you say...I say..." Reflect how enormous is the weight of "everyone says" and "it is said" in public opinion, public rumor, gossip, slander and so forth. One must also consider the psychological importance in our lives of what others say about us, and the importance, for us, of understanding and interpreting these words of others ("living hermeneutics").

The importance of this motif is in no way diminished in the higher and better-organized areas of everyday communication. Every conversation is full of transmissions and interpretations of other people's words. At every step one meets a "quotation" or a "reference" to something that a particular person said, a reference to "people say" or "everyone

says,” to the words of the person one is talking with, or to one’s own previous words, to a newspaper, an official decree, a document, a book and so forth. The majority of our information and opinions is usually not communicated in direct form as our own, but with reference to some indefinite and general source: “I heard,” “It’s generally held that...,” “It is thought that...” and so forth. Take one of the most widespread occurrences in our everyday life, conversations about some official meeting: they are all constructed on the transmission, interpretation and evaluation of various kinds of verbal performance resolutions, the rejected and accepted corrections that are made to them and so forth. Thus talk goes on about speaking people and their words everywhere – this motif returns again and again; it either accompanies the development of the other topics in everyday life, or directly governs speech as its leading theme...

The topic of a speaking person takes on quite another significance in the ordinary ideological workings of our consciousness, in the process of assimilating our consciousness to the ideological world. The ideological becoming of a human being, in this view, is the process of selectively assimilating the words of others.

When verbal disciplines are taught in school, two basic modes are recognized for the appropriation and transmission – simultaneously – of another’s words (a text, a rule, a model): “reciting by heart” and “retelling in one’s own words.” The latter mode poses on a small scale the task implicit in all prose stylistics: retelling a text in one’s own words is to a certain extent a double-voiced narration of another’s words, for indeed “one’s own words” must not completely dilute the quality that makes another’s words unique; a retelling in one’s own words should have a mixed character, able when necessary to reproduce the style and expressions of the transmitted text. It is this second mode used in schools for transmitting another’s discourse, “retelling in one’s own words,” that includes within it an entire series of forms for the appropriation while transmitting of another’s words, depending upon the character of the text being appropriated and the pedagogical environment in which it is understood and evaluated.

The tendency to assimilate others’ discourse takes on an even deeper and more basic significance in an individual’s ideological becoming, in the most fundamental sense. Another’s discourse performs here no longer as information, directions, rules, models and so forth – but strives rather to determine the very bases of our ideological interrelations with the world, the very basis of our behavior; it performs here as *authoritative discourse*, and an *internally persuasive discourse*.

Both the authority of discourse and its internal persuasiveness may be united in a single word – one that is *simultaneously* authoritative and internally persuasive – despite the profound differences between these two categories of alien discourse. But such unity is rarely a given – it happens more frequently that an individual’s becoming, an ideological process, is characterized precisely by a sharp gap between these two categories: in one, the authoritative word (religious, political, moral; the word of a father, of adults and of teachers, etc.) that does not know internal persuasiveness, in the other, internally persuasive word that is denied all privilege, backed up by no authority at all, and is frequently not even acknowledged in society (not by public opinion, nor by scholarly norms, nor by criticism), not even in the legal code. The struggle and dialogic interrelationship of these categories of ideological discourse are what usually determine the history of an individual ideological consciousness.

The authoritative word demands that we acknowledge it, that we make it our own; it binds us, quite independent of any power it might have to persuade us internally; we encounter it with its authority already fused to it. The authoritative word is located in a

distanced zone, organically connected with a past that is felt to be hierarchically higher. It is, so to speak, the word of the fathers. Its authority was already *acknowledged* in the past. It is a *prior* discourse. It is therefore not a question of choosing it from among other possible discourses that are its equal. It is given (it sounds) in lofty spheres, not those of familiar contact. Its language is a special (as it were, hieratic) language. It can be profaned. It is akin to taboo, i.e., a name that must not be taken in vain.

We cannot embark here on a survey of the many and varied types of authoritative discourse (for example, the authority of religious dogma, or of acknowledged scientific truth or of a currently fashionable book), nor can we survey different degrees of authoritativeness. For our purposes only formal features for the transmission and representation of authoritative discourse are important, those common to all types and degrees of such discourse.

The degree to which a word may be conjoined with authority – whether the authority is recognized by us or not – is what determines its specific demarcation and individuation in discourse; it requires a *distance vis-à-vis* itself (this distance may be valorized as positive or as negative, just as our attitude toward it may be sympathetic or hostile). Authoritative discourse may organize around itself great masses of other types of discourses (which interpret it, praise it, apply it in various ways), but the authoritative discourse itself does not merge with these (by means of, say, gradual transitions); it remains sharply demarcated, compact and inert: it demands, so to speak, not only quotation marks but a demarcation even more magisterial, a special script, for instance.<sup>4</sup> It is considerably more difficult to incorporate semantic changes into such a discourse, even with the help of a framing context: its semantic structure is static and dead, for it is fully complete, it has but a single meaning, the letter is fully sufficient to the sense and calcifies it.

It is not a free appropriation and assimilation of the word itself that authoritative discourse seeks to elicit from us; rather, it demands our unconditional allegiance. Therefore authoritative discourse permits no play with the context framing it, no play with its borders, no gradual and flexible transitions, no spontaneously creative stylizing variants on it. It enters our verbal consciousness as a compact and indivisible mass; one must either totally affirm it, or totally reject it. It is indissolubly fused with its authority – with political power, an institution, a person – and it stands and falls together with that authority. One cannot divide it up – agree with one part, accept but not completely another part, reject utterly a third part. Therefore the distance we ourselves observe *vis-à-vis* this authoritative discourse remains unchanged in all its projections: a playing with distances, with fusion and dissolution, with approach and retreat, is not here possible.

All these functions determine the uniqueness of authoritative discourse, both as a concrete means for formulating itself during transmission and as its distinctive means for being framed by contexts. The zone of the framing context must likewise be distanced – no familiar contact is possible here either. The one perceiving and understanding this discourse is a distant descendant; there can be no arguing with him.

These factors also determine the potential role of authoritative discourse in prose. Authoritative discourse cannot be represented – it is only transmitted. Its inertia, its semantic finiteness and calcification, the degree to which it is hard-edged, a thing in its own right, the impermissibility of any free stylistic development in relation to it – all this renders the artistic representation of authoritative discourse impossible. Its role in the novel is insignificant. It is by its very nature incapable of being double-voiced; it cannot

enter into hybrid constructions. If completely deprived of its authority it becomes simply an object, a *relic*, a *thing*. It enters the artistic context as an alien body, there is no space around it to play in, no contradictory emotions – it is not surrounded by an agitated and cacophonous dialogic life, and the context around it dies, words dry up. For this reason images of official-authoritative truth, images of virtue of any sort: monastic, spiritual, bureaucratic, moral, etc., have never been successful in the novel. It suffices to mention the hopeless attempts of Gogol and Dostoevsky in this regard. For this reason the authoritative text always remains, in the novel, a dead quotation, something that falls out of the artistic context (for example, the evangelical texts in Tolstoy at the end of *Resurrection*).<sup>5</sup>

Authoritative discourses may embody various contents: authority as such, or the authoritativeness of tradition, of generally acknowledged truths, of the official line and other similar authorities. These discourses may have a variety of zones (determined by the degree to which they are distanced from the zone of contact) with a variety of relations to the presumed listener or interpreter (the apperceptive background presumed by the discourse, the degree of reciprocation between the two and so forth).

In the history of literary language, there is a struggle constantly being waged to overcome the official line with its tendency to distance itself from the zone of contact, a struggle against various kinds and degrees of authority. In this process discourse gets drawn into the contact zone, which results in semantic and emotionally expressive (intonational) changes: there is a weakening and degradation of the capacity to generate metaphors, and discourse becomes more reified, more concrete, more filled with everyday elements and so forth. All of this has been studied by psychology, but not from the point of view of its verbal formulation in possible inner monologues of developing human beings, the monologue that lasts a whole life. What confronts us is the complex problem presented by forms capable of expressing such a (dialogized) monologue.

When someone else's ideological discourse is internally persuasive for us and acknowledged by us, entirely different possibilities open up. Such discourse is of decisive significance in the evolution of an individual consciousness: consciousness awakens to independent ideological life precisely in a world of alien discourses surrounding it, and from which it cannot initially separate itself; the process of distinguishing between one's own and another's discourse, between one's own and another's thought, is activated rather late in development. When thought begins to work in an independent, experimenting and discriminating way, what first occurs is a separation between internally persuasive discourse and authoritarian enforced discourse, along with a rejection of those conglomerates of discourses that do not matter to us, that do not touch us.

Internally persuasive discourse – as opposed to one that is externally authoritative – is, as it is affirmed through assimilation, tightly interwoven with “one's own word.”<sup>6</sup> In the everyday rounds of our consciousness, the internally persuasive word is half-ours and half-someone else's. Its creativity and productiveness consist precisely in the fact that such a word awakens new and independent words, that it organizes masses of our words from within, and does not remain in an isolated and static condition. It is not so much interpreted by us as it is further, that is, freely, developed, applied to new material, new conditions; it enters into interanimating relationships with new contexts. More than that, it enters into an intense interaction, a *struggle* with other internally persuasive discourses. Our ideological development is just such an intense struggle within us for hegemony among various available verbal and ideological points of view, approaches,

directions and values. The semantic structure of an internally persuasive discourse is *not finite*, it is *open*; in each of the new contexts that dialogize it, this discourse is able to reveal ever newer *mays to mean*.

### Notes

- 1 We are of course deliberately simplifying: the real-life peasant could and did do this to a certain extent.
- 2 Such a device is unthinkable in the epic.
- 3 Cf. the grotesque pseudo-objective motivations in Gogol.
- 4 Often the authoritative word is in fact a word spoken by another in a foreign language (cf. for example the phenomenon of foreign-language religious texts in most cultures).
- 5 When analyzing a concrete example of authoritative discourse in a novel, it is necessary to keep in mind the fact that purely authoritative discourse may, in another epoch, be internally persuasive; this is especially true where ethics are concerned.
- 6 One's own discourse is gradually and slowly wrought out of others' words that have been acknowledged and assimilated, and the boundaries between the two are at first scarcely perceptible.

# CHAPTER 7

## What Is an Author?

*Michel Foucault*

One of the influential thinkers of the late twentieth century, Michel Foucault was trained as an historian but his work on power and sexuality had a far-reaching impact beyond the field of history. His early work was in the history of madness; he traced the changing conceptions of madness over time. Doing so, he became aware of how knowledge is anchored in discourse and how knowledge discursively shapes its objects. The medieval discourse of madness was quite different from the more scientific-sounding nineteenth-century discourse, and each discourse conceived of madness quite differently. The same object had a different meaning in each discourse. Each discourse has its own rules of operation that govern the kinds of statements that can be made in it. In the discourse of anti-terrorism, for example, it would be unwise to say, "Maybe we are in the wrong, and they are right." The idea that discourses are characterized by rules governing regularity, consistency, and legitimacy could easily lead to the study of how the dominant discourses in a society (economic, political, sexual) might be used to sustain the power of ruling elites (capitalist, heteronormative, white) by policing not only what can be said in a society but also what might be considered legitimate action that did not merit being branded deviant. Discourse tends to be normative, and the knowledge discourse facilitates further lends itself easily to the workings of power. To "know" the homosexual as an object of knowledge is to be able to better regulate him or her. Surveillance, Foucault found, often goes hand in hand with punishment that maintains the power of ruling elites.

In this early essay, "What Is an Author," Foucault argues the Structuralist point that the subject or individual only appears to be fully in control of its operations. In order to function, human consciousness must float atop a sea of language from which it borrows and which makes possible its thinking and acting. We think about the world in the categories and terms given to us by that world. In regard to literature, this means that the "author," the locus of conscious awareness, is one object of study, but another might be the discourses that flow through that consciousness, the rules and tools for ordering thought and creating new stories. The discourse of humanism in the Renaissance, for

*Original publication details:* Michel Foucault, "What Is an Author?" from *Language, Counter-Memory, Practice*, ed. Donald Bouchard, pp. 113–138. Cornell, 1977. Reproduced with permission from Cornell University Press.

example, shaped conceptions of the world and of life in terms of a distinction between an ideal of virtue defined as the mind's control over bodily urges and the world of bodily emotion and sexuality. This opposition is consistent across "authors" and is not the invention of any one of them. Rather, the discourse supplies the terms in which different authors think in the same way about the world. The ideal of individual creativity, which dominated an older way of thinking about literature in terms almost exclusively of authorial genius, shifts to a more complicated understanding of the nesting of creativity in cultural and discursive environments that enable thought and creativity.

The coming into being of the notion of "author" constitutes the privileged moment of individualization in the history of ideas, knowledge, literature, philosophy, and the sciences. Even today, when we reconstruct the history of a concept, literary genre, or school of philosophy, such categories seem relatively weak, secondary, and super-imposed scissions in comparison with the solid and fundamental unit of the author and the work.

I shall not offer here a sociohistorical analysis of the author's persona. Certainly, it would be worth examining how the author became individualized in a culture like ours, what status he has been given, at what moment studies of authenticity and attribution began, in what kind of system of valorization the author was involved, at what point we began to recount the lives of authors rather than of heroes, and how this fundamental category of "the-man-and-his-work criticism" began. For the moment, however, I want to deal solely with the relationship between text and author and with the manner in which the text points to this figure that, at least in appearance, is outside it and antecedes it.

Beckett nicely formulates the theme with which I would like to begin: "What does it matter who is speaking;" someone said; 'what does it matter who is speaking.'" In this indifference appears one of the fundamental ethical principles of contemporary writing [*écriture*].

I say "ethical" because this indifference is really not a trait characterizing the manner in which one speaks and writes but, rather, a kind of immanent rule, taken up over and over again, never fully applied, not designating writing as something completed, but dominating it as a practice. Since it is too familiar to require a lengthy analysis, this immanent rule can be adequately illustrated here by tracing two of its major themes.

First of all, we can say that today's writing has freed itself from the theme of expression. Referring only to itself; but without being restricted to the confines of its interiority, writing is identified with its own unfolded exteriority. This means that it is an interplay of signs arranged less according to its signified content than according to the very nature of the signifier. Writing unfolds like a game [*jeu*] that invariably goes beyond its own rules and transgresses its limits. In writing, the point is not to manifest or exalt the act of writing, nor is it to pin a subject within language; it is, rather, a question of creating a space into which the writing subject constantly disappears.

The second theme, writing's relationship with death, is even more familiar. This link subverts an old tradition exemplified by the Greek epic, which was intended to perpetuate the immortality of the hero: if he was willing to die young, it was so that his life, consecrated and magnified by death, might pass into immortality; the narrative then redeemed this accepted death. In another way, the motivation, as well as the theme and the pretext of Arabian narratives – such as *The Thousand and One Nights* – was also the eluding of death: one spoke, telling stories into the early morning, in order to forestall

death, to postpone the day of reckoning that would silence the narrator. Scheherazade's narrative is an effort, renewed each night, to keep death outside the circle of life.

Our culture has metamorphosed this idea of narrative, or writing, as something designed to ward off death. Writing has become linked to sacrifice, even to the sacrifice of life: it is now a voluntary effacement that does not need to be represented in books, since it is brought about in the writer's very existence. The work, which once had the duty of providing immortality, now possesses the right to kill, to be its author's murderer, as in the cases of Flaubert, Proust, and Kafka. That is not all, however: this relationship between writing and death is also manifested in the effacement of the writing subject's individual characteristics. Using all the contrivances that he sets up between himself and what he writes, the writing subject cancels out the signs of his particular individuality. As a result, the mark of the writer is reduced to nothing more than the singularity of his absence; he must assume the role of the dead man in the game of writing.

None of this is recent; criticism and philosophy took note of the disappearance – or death – of the author some time ago. But the consequences of their discovery of it have not been sufficiently examined, nor has its import been accurately measured. A certain number of notions that are intended to replace the privileged position of the author actually seem to preserve that privilege and suppress the real meaning of his disappearance. I shall examine two of these notions, both of great importance today.

The first is the idea of the work [*œuvre*]. It is a very familiar thesis that the task of criticism is not to bring out the work's relationships with the author, nor to reconstruct through the text a thought or experience, but rather to analyze the work through its structure, its architecture, its intrinsic form, and the play of its internal relationships. At this point, however, a problem arises: What is a work? What is this curious unity which we designate as a work? Of what elements is it composed? Is it not what an author has written? Difficulties appear immediately. If an individual were not an author, could we say that what he wrote, said, left behind in his papers, or what has been collected of his remarks, could be called a "work"? When Sade was not considered an author, what was the status of his papers? Simply rolls of paper onto which he ceaselessly uncoiled his fantasies during his imprisonment.

Even when an individual has been accepted as an author, we must still ask whether everything that he wrote, said, or left behind is part of his work. The problem is both theoretical and technical. When undertaking the publication of Nietzsche's works, for example, where should one stop? Surely everything must be published, but what is "everything"? Everything that Nietzsche himself published, certainly. And what about the rough drafts for his works? Obviously. The plans for his aphorisms? Yes. The deleted passages and the notes at the bottom of the page? Yes. What if, within a workbook filled with aphorisms, one finds a reference, the notation of a meeting or of an address, or a laundry list: is it a work, or not? Why not? And so on, ad infinitum. How can one define a work amid the millions of traces left by someone after his death? A theory of the work does not exist, and the empirical task of those who naively undertake the editing of works often suffers in the absence of such a theory.

We could go even further. Does *The Thousand and One Nights* constitute a work? What about Clement of Alexandria's *Miscellanies* or Diogenes Laërtes' *Lives*? A multitude of questions arises with regard to this notion of the work. Consequently, it is not enough to declare that we should do without the writer (the author) and study the work itself. The word work and the unity that it designates are probably as problematic as the status of the author's individuality. Another notion which has hindered us from taking full

measure of the author's disappearance, blurring and concealing the moment of this effacement and subtly preserving the author's existence, is the notion of writing [*écriture*]. When rigorously applied, this notion should allow us not only to circumvent references to the author, but also to situate his recent absence. The notion of writing, as currently employed, is concerned with neither the act of writing nor the indication – be it symptom or sign – of a meaning that someone might have wanted to express. We try, with great effort, to imagine the general condition of each text, the condition of both the space in which it is dispersed and the time in which it unfolds.

In current usage, however, the notion of writing seems to transpose the empirical characteristics of the author into a transcendental anonymity. We are content to efface the more visible marks of the author's empiricity by playing off, one against the other, two ways of characterizing writing, namely, the critical and the religious approaches. Giving writing a primal status seems to be a way of retranslating, in transcendental terms, both the theological affirmation of its sacred character and the critical affirmation of its creative character. To admit that writing is, because of the very history that it made possible, subject to the test of oblivion and repression, seems to represent, in transcendental terms, the religious principle of the hidden meaning (which requires interpretation) and the critical principle of implicit signification, silent determinations, and obscured contents (which give rise to commentary). To imagine writing as absence seems to be a simple repetition, in transcendental terms, of both the religious principle of inalterable and yet never fulfilled tradition, and the aesthetic principle of the work's survival, its perpetuation beyond the author's death, and its enigmatic excess in relation to him.

This usage of the notion of writing runs the risk of maintaining the author's privileges under the protection of the *a priori*: it keeps alive, in the gray light of neutralization, the interplay of those representations that formed a particular image of the author. The author's disappearance, which, since Mallarmé, has been a constantly recurring event, is subject to a series of transcendental barriers. There seems to be an important dividing line between those who believe that they can still locate today's discontinuities [*ruptures*] in the historico-transcendental tradition of the nineteenth century and those who try to free themselves once and for all from that tradition.

## §

It is not enough, however, to repeat the empty affirmation that the author has disappeared. For the same reason, it is not enough to keep repeating that God and man have died a common death. Instead, we must locate the space left empty by the author's disappearance, follow the distribution of gaps and breaches, and watch for the openings this disappearance uncovers.

First, we need to clarify briefly the problems arising from the use of the author's name. What is an author's name? How does it function? Far from offering a solution, I shall only indicate some of the difficulties that it presents.

The author's name is a proper name, and therefore it raises the problems common to all proper names. (Here I refer to Searle's analyses, among others.<sup>1</sup>) Obviously, one cannot turn a proper name into a pure and simple reference. It has other than indicative functions: more than an indication, a gesture, a finger pointed at someone, it is the equivalent of a description. When one says "Aristotle," one employs a word that is the equivalent of one, or a series, of definite descriptions, such as "the author of the *Analytics*," "the founder of ontology," and so forth. One cannot stop there, however, because a proper name does not

have just one signification. When we discover that Arthur Rimbaud did not write *La Chasse spirituelle*, we cannot pretend that the meaning of this proper name, or that of the author, has been altered. The proper name and the author's name are situated between the two poles of description and designation: they must have a certain link with what they name, but one that is neither entirely in the mode of designation nor in that of description; it must be a specific link. However – and it is here that the particular difficulties of the author's name arise – the links between the proper name and the individual named and between the author's name and what it names are not isomorphic and do not function in the same way. There are several differences.

If for example, Pierre Dupont does not have blue eyes, or was not born in Paris, or is not a doctor, the name Pierre Dupont will still always refer to the same person, such things do not modify the link of designation. The problems raised by the author's name are much more complex, however. If I discover that Shakespeare was not born in the house we visit today, this is a modification that, obviously, will not alter the functioning of the author's name. But if we proved that Shakespeare did not write those sonnets which pass for his, that would constitute a significant change and affect the manner in which the author's name functions. If we proved that Shakespeare wrote Bacon's *Organon* by showing that the same author wrote both the works of Bacon and those of Shakespeare, that would be a third type of change that would entirely modify the functioning of the author's name. The author's name is not, therefore, just a proper name like the rest.

Many other facts point out the paradoxical singularity of the author's name. To say that Pierre Dupont does not exist is not at all the same as saying that Homer or Hermes Trismegistus did not exist. In the first case, it means that no one has the name Pierre Dupont; in the second, it means that several people were mixed together under one name, or that the true author had none of the traits traditionally ascribed to the personae of Homer or Hermes. To say that X's real name is actually Jacques Durand instead of Pierre Dupont is not the same as saying that Stendhal's name was Henri Beyle. One could also question the meaning and functioning of propositions like "Bourbaki is so-and-so, so-and-so, and so-forth," and "Victor Eremitæ, Climacus, Anticlimacus, Prater Taciturnus, Constantine Constantius, all of these are Kierkegaard."

These differences may result from the fact that an author's name is not simply an element in a discourse (capable of being either subject or object, of being replaced by a pronoun, and the like); it performs a certain role with regard to narrative discourse, assuring a classificatory function. Such a name permits one to group together a certain number of texts, define them, differentiate them from and contrast them to others. In addition, it establishes a relationship among the texts. Hermes Trismegistus did not exist, nor did Hippocrates – in the sense that Balzac existed – but the fact that several texts have been placed under the same name indicates that there has been established among them a relationship of homogeneity, filiation, authentication of some texts by the use of others, reciprocal explication, or concomitant utilization. The author's name serves to characterize a certain mode of being of discourse: the fact that the discourse has an author's name, that one can say "this was written by so-and-so" or "so-and-so is its author," shows that this discourse is not ordinary everyday speech that merely comes and goes, not something that is immediately consumable. On the contrary, it is a speech that must be received in a certain mode and that, in a given culture, must receive a certain status.

It would seem that the author's name, unlike other proper names, does not pass from the interior of a discourse to the real and exterior individual who produced it; instead,

the name seems always to be present, marking off the edges of the text, revealing, or at least characterizing, its mode of being. The author's name manifests the appearance of a certain discursive set and indicates the status of this discourse within a society and a culture. It has no legal status, nor is it located in the fiction of the work; rather, it is located in the break that founds a certain discursive construct and its very particular mode of being. As a result, we could say that in a civilization like our own there are a certain number of discourses endowed with the "author function" while others are deprived of it. A private letter may well have a signer – it does not have an author; a contract may well have a guarantor – it does not have an author. An anonymous text posted on a wall probably has an editor – but not an author. The author function is therefore characteristic of the mode of existence, circulation, and functioning of certain discourses within a society.

### §

Let us analyze this "author function" as we have just described it. In our culture, how does one characterize a discourse containing the author function? In what way is this discourse different from other discourses? If we limit our remarks to the author of a book or a text, we can isolate four different characteristics.

First of all, discourses are objects of appropriation. The form of ownership from which they spring is of a rather particular type, one that has been codified for many years. We should note that, historically, this type of ownership has always been subsequent to what one might call penal appropriation. Texts, books, and discourses really began to have authors (other than mythical, sacralized and sacralizing figures) to the extent that authors became subject to punishment, that is, to the extent that discourses could be transgressive. In our culture (and doubtless in many others), discourse was not originally a product, a thing, a kind of goods; it was essentially an act – an act placed in the bipolar field of the sacred and the profane, the licit and the illicit, the religious and the blasphemous. Historically, it was a gesture fraught with risks before becoming goods caught up in a circuit of ownership.

Once a system of ownership for texts came into being, once strict rules concerning author's rights, author-publisher relations, rights of reproduction, and related matters were enacted – at the end of the eighteenth and the beginning of the nineteenth century – the possibility of transgression attached to the act of writing took on, more and more, the form of an imperative peculiar to literature. It is as if the author, beginning with the moment at which he was placed in the system of property that characterizes our society, compensated for the status that he thus acquired by rediscovering the old bipolar field of discourse, systematically practicing transgression and thereby restoring danger to a writing that was now guaranteed the benefits of ownership.

The author function does not affect all discourses in a universal and constant way, however. In our civilization, it has not always been the same types of texts that have required attribution to an author. There was a time when the texts we today call "literary" (narratives, stories, epics, tragedies, comedies) were accepted, put into circulation, and valorized without any question about the identity of their author, their anonymity caused no difficulties since their ancientness, whether real or imagined, was regarded as a sufficient guarantee of their status. On the other hand, those texts we now would call scientific – those dealing with cosmology and the heavens, medicine and illnesses, natural sciences and geography – were accepted in the Middle Ages, and accepted as "true," only

when marked with the name of their author. "Hippocrates said," "Pliny recounts," were not really formulas of an argument based on authority; they were the markers inserted in discourses that were supposed to be received as statements of demonstrated truth.

A switch takes place in the seventeenth or eighteenth century. Scientific discourses began to be received for themselves, in the anonymity of an established or always redemonstrable truth; their membership in a systematic ensemble, and not the reference to the individual who produced them, stood as their guarantee. The author function faded away, and the inventor's name served only to christen a theorem, proposition, particular effect, property, body, group of elements, or pathological syndrome. By the same token, literary discourses came to be accepted only when endowed with the author function. We now ask of each poetic or fictional text: From where does it come, who wrote it, when, under what circumstances, or beginning with what design? The meaning ascribed to it and the status or value accorded it depend on the manner in which we answer these questions. And if a text should be discovered in a state of anonymity – whether as a consequence of an accident or the author's explicit wish – the game becomes one of rediscovering the author. Since literary anonymity is not tolerable, we can accept it only in the guise of an enigma. As a result, the author function today plays an important role in our view of literary works. (These are obviously generalizations that would have to be refined insofar as recent critical practice is concerned. Criticism began some time ago to treat works according to their genre and type, following the recurrent elements that are enfigured in them, as proper variations around an invariant that is no longer the individual creator. Even so, if in mathematics reference to the author is barely anything any longer but a manner of naming theorems or sets of propositions, in biology and medicine the indication of the author and the date of his work play a rather different role. It is not simply a manner of indicating the source, but of providing a certain index of "reality" in relation to the techniques and objects of experience made use of in a particular period and in such-and-such a laboratory.)

The third characteristic of this author function is that it does not develop spontaneously as the attribution of a discourse to an individual. It is, rather, the result of a complex operation that constructs a certain being of reason that we call "author." Critics doubtless try to give this being of reason a realistic status, by discerning, in the individual, a "deep" motive, a "creative" power, or a "design," the milieu in which writing originates. Nevertheless, these aspects of an individual which we designate as making him an author are only a projection, in more or less psychologizing terms, of the operations we force texts to undergo, the connections we make, the traits we establish as pertinent, the continuities we recognize, or the exclusions we practice. All these operations vary according to periods and types of discourse. We do not construct a "philosophical author" as we do a "poet," just as in the eighteenth century one did not construct a novelist as we do today. Still, we can find through the ages certain constants in the rules of author construction.

It seems, for example that the manner in which literary criticism once defined the author – or, rather, constructed the figure of the author beginning with existing texts and discourses – is directly derived from the manner in which Christian tradition authenticated (or rejected) the texts at its disposal. In order to "rediscover" an author in a work, modern criticism uses methods similar to those that Christian exegesis employed when trying to prove the value of a text by its author's saintliness. In *De Viris illustribus*, Saint Jerome explains that homonymy is not sufficient to identify legitimately authors of more than one work: different individuals could have had the same name, or one man could

have, illegitimately, borrowed another's patronymic. The name as an individual trademark is not enough when one works within a textual tradition.

How, then, can one attribute several discourses to one and the same author? How can one use the author function to determine if one is dealing with one or several individuals? Saint Jerome proposes four criteria: (1) if among several books attributed to an author one is inferior to the others, it must be withdrawn from the list of the author's works (the author is therefore defined as a constant level of value); (2) the same should be done if certain texts contradict the doctrine expounded in the author's other works (the author is thus defined as a field of conceptual or theoretical coherence); (3) one must also exclude works that are written in a different style, containing words and expressions not ordinarily found in the writer's production (the author is here conceived as a stylistic unity); (4) finally, passages quoting statements made or mentioning events that occurred after the author's death must be regarded as interpolated texts (the author is here seen as a historical figure at the crossroads of a certain number of events).

Modern literary criticism, even when – as is now customary – it is not concerned with questions of authentication, still defines the author in much the same way: the author provides the basis for explaining not only the presence of certain events in a work, but also their transformations, distortions, and diverse modifications (through his biography, the determination of his individual perspective, the analysis of his social position, and the revelation of his basic design). The author is also the principle of a certain unity of writing – all differences having to be resolved, at least in part, by the principles of evolution, maturation, or influence. The author also serves to neutralize the contradictions that may emerge in a series of texts: there must be – at a certain level of his thought or desire, of his consciousness or unconscious – a point where contradictions are resolved, where incompatible elements are at last tied together or organized around a fundamental or originating contradiction. Finally, the author is a particular source of expression that, in more or less completed forms, is manifested equally well, and with similar validity, in works, sketches, letters, fragments, and so on. Clearly, Saint Jerome's four criteria of authenticity (criteria that seem totally insufficient for today's exegetes) do define the four modalities according to which modern criticism brings the author function into play.

But the author function is not a pure and simple reconstruction made secondhand from a text given as inert material. The text always contains a certain number of signs referring to the author. These signs, well known to grammarians, are personal pronouns, adverbs of time and place, and verb conjugation. Such elements do not play the same role in discourses provided with the author function as in those lacking it. In the latter, such "shifters" refer to the real speaker and to the spatio-temporal coordinates of his discourse (although certain modifications can occur, as in the operation of relating discourses in the first person). In the former, however, their role is more complex and variable. Everyone knows that, in a novel offered as a narrator's account, neither the first-person pronoun nor the present indicative refers exactly to the writer or to the moment in which he writes but, rather, to an alter ego whose distance from the author varies, often changing in the course of the work. It would be just as wrong to equate the author with the real writer as to equate him with the fictitious speaker; the author function is carried out and operates in the scission itself, in this division and this distance.

One might object that this is a characteristic peculiar to novelistic or poetic discourse, a game in which only "quasi discourses" participate. In fact, however, all discourses endowed with the author function possess this plurality of self. The self that speaks in the preface to a treatise on mathematics – and that indicates the circumstances of the treatise's

composition – is identical neither in its position nor in its functioning to the self speaks in the course of a demonstration, and that appears in the form of “I conclude” or “I suppose.” In the first case, the “I” refers to an individual without an equivalent who, in a determined place and time, completed a certain task; in the second, the “I” indicates an instance and a level of demonstration which any individual could perform provided that he accepted the same system of symbols, play of axioms and set of previous demonstrations. We could also, in the same treatise locate a third self; one that speaks to tell the work’s meaning, the obstacles encountered, the results obtained, and the remaining problems; this self is situated in the field of already existing or yet-to-appear mathematical discourses. The author function is not assumed by the first of these selves at the expense of the other two, which would then be nothing more than a fictitious splitting in two of the first one. On the contrary, in these discourses the author function operates so as to effect the dispersion of these three simultaneous selves.

No doubt, analysis could discover still more characteristic traits of the author function. I will limit myself to these four, however, because they seem both the most visible and the most important. They can be summarized as follows: (1) the author function is linked to the juridical and institutional system that encompasses, determines, and articulates the universe of discourses; (2) it does not affect all discourses in the same way at all times and in all types of civilization; (3) it is not defined by the spontaneous attribution of a discourse to its producer but, rather, by a series of specific and complex operations; (4) it does not refer purely and simply to a real individual, since it can give rise simultaneously to several selves, to several subjects – positions that can be occupied by different classes of individuals.

Up to this point I have unjustifiably limited my subject. Certainly the author function in painting, music, and other arts should have been discussed; but even supposing that we remain within the world of discourse, as I want to do, I seem to have given the term “author” much too narrow a meaning. I have discussed the author only in the limited sense of a person to whom the production of a text, a book, or a work can be legitimately attributed. It is easy to see that in the sphere of discourse one can be the author of much more than a book – one can be the author of a theory, tradition, or discipline in which other books and authors will in their turn find a place. These authors are in a position that I will call “transdiscursive.” This is a recurring phenomenon – certainly as old as our civilization. Homer, Aristotle, and the Church Fathers, as well as the first mathematicians and the originators of the Hippocratic tradition, all played this role. Furthermore, in the course of the nineteenth century, there appeared in Europe another, more uncommon, kind of author, whom one should confuse with neither the “great” literary authors, nor the authors of religious texts, nor the founders of science. In a somewhat arbitrary way we shall call those who belong in this last group “founders of discursivity.”

They are unique in that they are not just the authors of their own works. They have produced something else: the possibilities and the rules for the formation of other texts. In this sense they are very different, for example, from a novelist, who is, in fact, nothing more than the author of his own text. Freud is not just the author of *The Interpretation of Dreams* or *Jokes and Their Relation to the Unconscious*; Marx is not just the author of the *Communist Manifesto* or *Das Kapital*: they both have established an endless possibility of discourse. Obviously, it is easy to object. One might say that it is not true that the author of a novel is only the author of his own text; in a sense, he also, provided that he acquires some “importance,” governs and commands more than that. To take a very simple example, one could say that Ann Radcliffe not only wrote *The Castles of Athlin*

*and Dunbayne* and several other novels but also made possible the appearance of the Gothic horror novel at the beginning of the nineteenth century; in that respect, her author function exceeds her own work. But I think there is an answer to this objection. These founders of discursivity (I use Marx and Freud as examples, because I believe them to be both the first and the most important cases) make possible something altogether different from what a novelist makes possible. Ann Radcliffe's texts opened the way for a certain number of resemblances and analogies which have their model or principle in her work. The latter contains characteristic signs, figures, relationships, and structures that could be reused by others. In other words, to say that Ann Radcliffe founded the Gothic horror novel means that in the nineteenth-century Gothic novel one will find, as in Ann Radcliffe's works, the theme of the heroine caught in the trap of her own innocence, the hidden castle, the character of the black, cursed hero devoted to making the world expiate the evil done to him, and all the rest of it. On the other hand, when I speak of Marx or Freud as founders of discursivity, I mean that they made possible not only a certain number of analogies but also (and equally important) a certain number of differences. They have created a possibility for something other than their discourse, yet something belonging to what they founded. To say that Freud founded psychoanalysis does not (simply) mean that we find the concept of the libido or the technique of dream analysis in the works of Karl Abraham, or Melanie Klein; it means that Freud made possible a certain number of divergences – with respect to his own texts, concepts and hypotheses – that all arise from the psychoanalytic discourse itself.

This would seem to present a new difficulty, however, or at least a new problem: is the above not true, after all, of any founder of a science, or of any author who has introduced some transformation into a science that might be called fecund? After all, Galileo made possible not only those discourses which repeated the laws he had formulated, but also statements very different from what he himself had said. If Georges Cuvier is the founder of biology, or Ferdinand de Saussure the founder of linguistics, it is not because they were imitated, nor because people have since taken up again the concept of organism or sign; it is because Cuvier made possible, to a certain extent, a theory of evolution diametrically opposed to his own fixism; it is because Saussure made possible a generative grammar radically different from his structural analyses. Superficially, then, the initiation of discursive practices appears similar to the founding of any scientific endeavor.

Still, there is a difference, and a notable one. In the case of a science, the act that founds it is on an equal footing with its future transformations; this act becomes in some respects part of the set of modifications that it makes possible. Of course, this belonging can take several forms. In the future development of a science, the founding act may appear as little more than a particular instance of a more general phenomenon that unveils itself in the process. It can also turn out to be marred by intuition and empirical bias; one must then reformulate it, making it the object of a certain number of supplementary theoretical operations that establish it more rigorously, and so on. Finally, it can seem to be a hasty generalization that must be retraced. In other words, the founding act of a science can always be reintroduced within the machinery of those transformations which derive from it.

In contrast, the initiation of a discursive practice is heterogeneous to its subsequent transformations. To expand a type of discursivity such as psychoanalysis as founded by Freud, is not to give it a formal generality it would not have permitted at the outset but, rather, to open it up to a certain number of possible applications. To limit psychoanalysis as a type of discursivity is, in reality, to try to isolate in the founding act an eventually

restricted number of propositions or statements to which, alone, one grants a founding value, and in relation to which certain concepts or theories accepted by Freud might be considered as derived, secondary, and accessory. In addition, one does not declare certain propositions in the work of these founders to be false: instead, when trying to seize the act of founding, one sets aside those statements that are not pertinent, either because they are deemed inessential, or because they are considered “prehistoric” and derived from another type of discursivity. In other words, unlike the founding of a science, the initiation of a discursive practice does not participate in its later transformations. As a result, one defines a proposition’s theoretical validity in relation to the work of the founders – while, in the case of Galileo and Newton, it is in relation to what physics or cosmology is in its intrinsic structure and normativity that one affirms the validity of any proposition those men may have put forth. To phrase it very schematically: the work of initiators of discursivity is not situated in the space that science defines; rather, it is the science or the discursivity which refers back to their work as primary coordinates.

In this way we can understand the inevitable necessity, within these fields of discursivity, for a “return to the origin.” This return which is part of the discursive field itself, never stops modifying it. The return is not a historical supplement that would be added to the discursivity, or merely an ornament; on the contrary, it constitutes an effective and necessary task of transforming the discursive practice itself. Reexamination of Galileo’s text may well change our understanding of the history of mechanics, but it will never be able to change mechanics itself. On the other hand, reexamining Freud’s texts modifies psychoanalysis itself, just as a reexamination of Marx’s would modify Marxism.

What I have just outlined regarding these “discursive instaurations” is, of course, very schematic; this is true, in particular, of the opposition I have tried to draw between discursive initiation and scientific founding. It is not always easy to distinguish between the two; moreover, nothing proves that they are two mutually exclusive procedures. I have attempted the distinction for only one reason: to show that the author function, which is complex enough when one tries to situate it at the level of a book or a series of texts that carry a given signature, involves still more determining factors when one tries to analyze it in larger units, such as groups of works or entire disciplines.

## §

To conclude, I would like to review the reasons why I attach a certain importance to what I have said.

On the one hand, an analysis in the direction that I have outlined might provide for an approach to a typology of discourse. It seems to me, at least at first glance, that such a typology cannot be constructed solely from the grammatical features, formal structures, and objects of discourse: more likely, there exist properties or relationships peculiar to discourse (not reducible to the rules of grammar and logic), and one must use these to distinguish the major categories of discourse. The relationship (or non-relationship) with an author, and the different forms this relationship takes, constitute – in a quite visible manner – one of these discursive properties.

On the other hand, I believe that one could find here an introduction to the historical analysis of discourse. Perhaps it is time to study discourses not only in terms of their expressive value or formal transformations but according to their modes of existence. The modes of circulation, valorization, attribution, and appropriation of discourses vary with each culture and are modified within each. The manner in which they are articulated

according to social relationships can be more readily understood, I believe, in the activity of the author function and in its modifications than in the themes or concepts that discourses set in motion.

It would seem that one could also, beginning with analyses of this type, reexamine the privileges of the subject. I realize that in undertaking the internal and architectonic analysis of a work (be it a literary text, philosophical system, or scientific work), in setting aside biographical and psychological references, one has already called back into question the absolute character and founding role of the subject. Still, perhaps one must return to this question, not in order to reestablish the theme of an originating subject but to grasp the subject's points of insertion, modes of functioning, and system of dependencies. Doing so means overturning the traditional problem, no longer raising the questions: How can a free subject penetrate the density of things and give it meaning? How can it activate the rules of a language from within and thus give rise to the designs that are properly its own? Instead, these questions will be raised: How, under what conditions, and in what forms can something like a subject appear in the order of discourse? What place can it occupy in each type of discourse, what functions can it assume, and by obeying what rules? In short, it is a matter of depriving the subject (or its substitute) of its role as originator, and of analyzing the subject as a variable and complex function of discourse.

Second, there are reasons dealing with the “ideological” status of the author. The question then becomes: How can one reduce the great peril, the great danger with which fiction threatens our world? The answer is: One can reduce it with the author. The author allows a limitation of the cancerous and dangerous proliferation of significations within a world where one is thrifty not only with one's resources and riches but also with one's discourses and their significations. The author is the principle of thrift in the proliferation of meaning. As a result, we must entirely reverse the traditional idea of the author. We are accustomed, as we have seen earlier, to saying that the author is the genial creator of a work in which he deposits, with infinite wealth and generosity, an inexhaustible world of significations. We are used to thinking that the author is so different from all other men, and so transcendent with regard to all languages that, as soon as he speaks, meaning begins to proliferate, to proliferate indefinitely.

The truth is quite the contrary: the author is not an indefinite source of significations that fill a work; the author does not precede the works; he is a certain functional principle by which, in our culture, one limits, excludes, and chooses; in short, by which one impedes the free circulation, the free manipulation, the free composition, decomposition, and recomposition of fiction. In fact, if we are accustomed to presenting the author as a genius, as a perpetual surging of invention, it is because, in reality, we make him function in exactly the opposite fashion. One can say that the author is an ideological product, since we represent him as the opposite of his historically real function. When a historically given function is represented in a figure that inserts it, one has an ideological production. The author is therefore the ideological figure by which one marks the manner in which we fear the proliferation of meaning.

In saying this, I seem to call for a form of culture in which fiction would not be limited by the figure of the author. It would be pure romanticism, however, to imagine a culture in which the fictive would operate in an absolutely free state, in which fiction would be put at the disposal of everyone and would develop without passing through something like a necessary or constraining figure. Although, since the eighteenth century, the author has played the role of the regulator of the fictive; a role quite characteristic of our

era of industrial and bourgeois society, of individualism and private property, still, given the historical modifications that are taking place, it does not seem necessary that the author function remain constant in form, complexity, and even in existence. I think that, as our society changes, at the very moment when it is in the process of changing, the author function will disappear, and in such a manner that fiction and its polysemous texts will once again function according to another mode, but still with a system of constraint – one that will no longer be the author but will have to be determined or, perhaps, experienced [*expérimenter*].

All discourses, whatever their status, form, value, and whatever the treatment to which they will be subjected, would then develop in the anonymity of a murmur. We would no longer hear the questions that have been rehashed for so long: Who really spoke? Is it really he and not someone else? With what authenticity or originality? And what part of his deepest self did he express in his discourse? Instead, there would be other questions, like these: What are the modes of existence of this discourse? Where has it been used, how can it circulate, and who can appropriate it for himself? What are the places in it where there is room for possible subjects? Who can assume these various subject functions? And behind all these questions, we would hear hardly anything but the stirring of an indifference: What difference does it make who is speaking?

### Notes

# CHAPTER 8

## Scripts, Sequences, and Stories: Elements of a Postclassical Narratology

*David Herman*

David Herman is a Professor of English at North Carolina State University and teaches linguistics, literary theory, and twentieth century literature. He is the author of *Universal Grammar and Narrative Form* (1995). In this essay he relies on cognitive science, especially the idea that we simplify complexity by comparing new sensory data to existing "scripts" in our minds, to reformulate the theory of narrative. A range of conditions must be met for narratives to be intelligible and to count as narratives.

Some thirty years ago, narratologists like Claude Bremond and Roland Barthes, inspired by Vladimir Propp's ground-breaking *Morphology of the Folktale* (1928), began to elaborate the idea of the narrative sequence and to catalog some of the sequences they viewed as common, if not universal, ingredients of narrative. This work addresses several questions. What makes certain sequences of events stories – that is, narratively organized sets of occurrences – and not descriptions, deductions, or, in Bremond's phrase, "lyrical effusions" ("Logic" 390)?<sup>1</sup> Are some narrative sequences more amenable than others to processing as stories? Can certain kinds of stories meet the minimal criteria for narrative yet lack features required for the stories to be deemed valuable, interesting, or "effective" (Labov 370) as narratives (see Bruce; Labov and Waletzky; Genette, *Essay 25* and *Revisited 18–19*)?

Consider the following set of propositions:

1. A monkey screeched. Sunlight blazed down upon the sea. The rancher gazed proudly at his bison.

This string of sentences may strike me as a bad parody of surrealist description, but the sentences do not compose a narrative sequence. Nor will anyone confuse a syllogism like 2 with a story:

2. Susan is a narratologist. All narratologists are structuralists. Therefore Susan is a structuralist.

Further, certain conversational openings are used so often that they prompt an interlocutor to coconstruct a particular canonical sequence of utterances:

3. Speaker A: How are you doing?  
Speaker B: Pretty good. How about you?  
Speaker A: Oh, pretty good.

Such two-party sequences are distinguished precisely by their overt unremarkableness, their patent avoidance of any information that might be deemed interesting and thus worthy of narrative communication or telling. Typically such noninformative, even anti-informative, sequences occur in contexts in which neither party wants or offers stories.

On the basis of the following sequence, however, a Gothic tale or maybe an allegorical fable begins to take shape in my imagination:

4. A black-caped figure prowled among the houses. An owl screeched. Three children were borne away into the night.

Example 4 does not explicitly relate what the black-caped figure did while prowling around, but the sequence furnishes enough of a propositional scaffolding for me to reconstruct the figure's nefarious intent, cuing me to infer that the owl screeches just when the prowler abducts the three children. By contrast, though a set of cooking instructions might detail acts and occurrences that follow a particular temporal sequence, it cannot be said to tell a story:

5. "Remove pizza from box and inner wrapper.... [P]lace on preheated cookie sheet. Bake for 16–18 minutes or until center cheese is melted and edges are golden brown."<sup>2</sup>

Given their illocutionary status as commands, the sentences in 5 outline a bare pattern for potential events, a skeleton plan for action, issuing step-by-step directives bearing on the realization of a goal (i.e., the golden-brown pizza). The sequence therefore tells not how something happened, in the manner of a story, but rather how to make something (good) happen, in the manner of a prescription or, more precisely, a recipe. The frozen-pizza instructions differ from the following sequence, whose constituent sentences declare instead of direct. Example 6 organizes a set of individually highly reportable actions and events into a structured whole that I recognize to be (part of) a story:

6. "Mary's fingernails tore at his [Bigger Thomas's] hands and he caught the pillow and covered her entire face with it, firmly. Mary's body surged upward and he pushed downward upon the pillow with all of his weight.... His eyes were filled with the white blur moving toward him in the shadows of the room" (Wright 97–98).

What sets examples 4 and 6 apart from 1, 2, 3, and 5? Why would most people construe 4 and 6 as narrative sequences and the others as a description, a syllogism, an exchange of greetings, and a recipe? Is some critical property – something definitive of stories – built into 4 and 6 but absent in 1, 2, 3, and 5?

In this essay, after reviewing some classical accounts of narrative sequences, I sketch developments in language theory and cognitive science that have occurred after the heyday of structuralist narrative poetics and that may throw further light on the problem of what defines narrative. Of special relevance is research in the field of artificial intelligence on knowledge structures that have been characterized as *schemata*, *scripts*, and *frames*. For Dennis Mercadal a script is a “description of how a sequence of events is expected to unfold.... A script is similar to a frame in that it [a script] represents a set of expectations.... Frames differ from scripts in that frames are used to represent a point in time. Scripts represent a sequence of events that take place in a time sequence” (255). *Schema*, a “term used in psychology literature which refers to memory patterns that humans use to interpret current experiences,” can be defined as “a synonym for framelike structures” (254).<sup>3</sup> This research suggests that the mind draws on a large but not infinite number of “experiential repertoires,” of both static (schematic or framelike) and dynamic (scriptlike) types. Stored in the memory, previous experiences form structured repertoires of expectations about current and emergent experiences. Static repertoires allow me to distinguish a chair from a table or a cat from a bread box; dynamic repertoires help me to know how events typically unfold during common occasions like birthday parties and to avoid mistaking birthday parties for barroom brawls or visits to the barber.

Thus cognitive scientists have studied how stereotypical knowledge reduces the complexity and duration of processing tasks bound up with perceiving, inferring, and so on (Bobrow and Norman; Charniak and McDermott 393–415; Grishman 140–58; Mercadal 109, 255; Minsky, “Framework” and *Society* 244–72). In this research tradition, understanding can be described as “a process by which people match what they see and hear to pre-stored groupings of actions that they have already experienced” (Schank and Abelson 67). Scripts are the knowledge representations that store these finite groupings of causally and chronologically ordered actions – actions that are required for the accomplishment of particular tasks (e.g., eating a meal at a restaurant, making an omelette). The performance of a long or complicated task usually necessitates more than one script; no one can do heart surgery or build a particle accelerator without recourse to a vast assortment of complexly interrelated scripts. Likewise, comprehension of a text or a discourse – a story – requires access to a plurality of scripts. In the absence of stereotypes stored as scripts, readers could not draw textual inferences of the most basic sort – for example, that a masked character described as running out of a bank probably just robbed it.

From this perspective, what distinguishes narrative sequences, like 4 and 6, from nonnarrative ones, like 1, 2, 3, and 5, is not simply the form assumed by each. Narrative also depends on how the form of a sequence is anchored in – or triggers a recipient to activate – knowledge about the world. It is not that stories are recognizable only insofar as they tell what their recipients already know; rather, stories stand in a certain relation to what their readers or auditors know, focusing attention on the unusual and the remarkable against a backdrop made up of patterns of belief and expectation.<sup>4</sup> Telling narratives is a certain way of reconciling emergent with prior knowledge; describing, arguing, greeting, and giving recipes are other ways.

My analysis therefore centers on the interrelations among linguistic form, world knowledge, and narrative structure. Two sets of factors fall under my purview. The first, associated with what I call *narrativeness*, bears on what makes readers and listeners deem stories stories. These factors are criterial for narrative; they determine which event sequences qualify as narratives. The second set bears on the *narrativity* of narrative

sequences, which is a function of the “formal and contextual features making a narrative more or less narrative” (G. Prince, *Dictionary* 64). *Narrativeness* can be conveniently paired with *narrativity* to suggest the contrast between, on the one hand, the minimal conditions for narrative sequences and, on the other, the factors that allow narrative sequences to be more or less readily processed as narratives. After discussing how narrativeness is a function of the way linguistic, textual, or more broadly semiotic features cue story recipients to activate certain kinds of world knowledge, I turn to the problem of narrativity. Sequences that have a minimal narrativity, which distinguishes them from nonnarrative sequences (of zero narrativity, by definition), are less readily configured into chronologically and causally organized wholes – less readily interpreted as stories – than are sequences with higher degrees of narrativity. Narrativity is a function of the pattern of script-activating cues in a sequence. All other things being equal, the greater the number (and diversity) of the repertoires set into play during the processing of a narrative sequence, the more narrativity will the processor ascribe to that sequence. The final part of my study explores some applications of this theoretical model. The concept of scripts not only yields insights into the structures and functions of particular literary narratives; by examining different modalities of the script-story interface, theorists of narrative may be able to rethink the historical development of narrative techniques and to understand better the differences among narrative genres at any given time. A script-based approach to literary history in particular may suggest ways of reframing the concept of intertextuality, as a tool for exploring not so much networks of links or fields of analogies as relations among dominant and recessive world models, in addition to the bearing of these models on the texts that presuppose and encode them.

The early narratologists anticipated subsequent research on knowledge structures. Thus my goal is not to dismiss classical narrative poetics as an outmoded framework for analysis but to argue for its continued usefulness within certain limits. Rethinking the problem of narrative sequences can promote the development of a postclassical narratology that is not necessarily poststructuralist, an enriched theory that draws on concepts and methods to which the classical narratologists did not have access (cf. Herman, “Focalization” and “Textual You”).<sup>5</sup> Although postclassical narratology is being energized by a variety of theoretical models and perspectives – feminist, rhetorical, linguistic, and computational – my purpose in this essay is to assemble some elements of a specifically cognitive approach to narrative discourse (cf. Jahn). Such an approach can potentially recontextualize reader-response theories contrasting shared and idiosyncratic reading strategies, for it shifts the focus from interpretive conventions to general and basic processing mechanisms that give such conventions their force and determine their scope of applicability (on this point, contrast Wolfgang Iser and Richard J. Gerrig).

## Sequences: Classical Accounts and Postclassical Perspectives

As Bremond remarks, for Propp the basic unit or “narrative atom” is the function; narrative functions are actions or events that “when grouped in sequences, generate the narrative” (“Logic” 387). In Propp’s words, the function “is understood as an act of character, defined from the point of view of its significance for the course of the action” (21). The action thus constitutes the function, functions constitute the sequence, and sequences constitute the story or, in Propp’s case, the Russian folktale. To invoke a descriptive lexicon that A. J. Greimas derived from Propp, a story or tale can be analyzed

into a set of actants whose specific deeds, realized linearly in the syntagmatic chain of the discourse, encode a more abstract pattern of actantial roles – a pattern formed by paradigmatic relations linking particular acts performed over the course of the narrative (Greimas 147–48, 176–256; cf. Lévi-Strauss 812–16). The logicosemantic properties of such actantial roles – hero, villain, sender, receiver, and so on – derive from their functional orientation within that emergent totality known as “plot.” In the Proppian tradition, therefore, narrative sequences are representations of the acts and events realized linguistically or textually in narrative discourse. For example, in sequence 6 the story is not (or not simply) that Bigger Thomas smothers Mary Dalton out of fear of detection by her blind mother (the awesome white blur); such a paraphrase refers only elliptically to a network of actantial relations. This network governs the play of functions structuring 6, which is in turn constituted as a narrative sequence precisely by its actantial structure.

However, this model does not indicate how to match linguistic or textual units with the function(s) they purportedly fulfill in any given sequence.<sup>6</sup> Ideally, the procedure for correlating formal units with functions and roles would be explicit and yield uniformly reproducible results, but the functional profile of Bigger Thomas’s deeds in 6, for instance, is so multifarious as to generate competing, even contradictory, interpretations.<sup>7</sup> In the sequence Bigger is simultaneously villain and hero, agent and patient (as a heated classroom discussion of Wright’s novel recently demonstrated to me). Propp, for his part, tried to find constraints that, rooted in the structure of the tale as genre, predetermine the order of the functions occurring in any tale. Such constraints would allow readers to correlate acts with functions in more than just an ad hoc way. Thus, though functions might be omitted or inverted in particular tales (Mandler and Johnson 129–35; Stein 494–96), “[m]orphologically, a tale (*skázka*) may be termed any development proceeding from villainy (A) or a lack (a), through intermediary functions to marriage (W\*), or to other functions employed as a dénouement. Terminal functions are at times a reward (F), a gain or in general the liquidation of misfortune (K), an escape from pursuit (Rs), etc.” (Propp 92). But this solution came with a price; it severely limited the relevance of the model by anchoring it too firmly in a specific narrative genre (Bremond, *Logique* 11–47; cf. Doležel 65–66). The approach also gave an overly deterministic coloration to narrative sequences, a problem that Bremond’s work on virtuality or nonactualization in sequences tried to address. Part of the interest and complexity of narrative depends on the merely probabilistic, not deterministic, links between some actions and events (Doležel 63–64; Culler, “Defining” 136; cf. Ryan 109–74). What makes a story worth telling is, at least in part, that things might not in fact have turned out that way. Bigger Thomas might not have smothered Mary Dalton, or Mary’s mother might have stayed out of the room in the first place; or, in example 4, the black-caped figure might have abducted the entire village.<sup>8</sup>

But the chief difficulty with the Proppian model, possibly the source of its other limitations, is that Propp tried to locate the criteria for narrative in the form of the tale itself, in the ordered incrementation of the tale’s functions and sequences. Francophone structuralists later came to recognize that while linguistic or textual form may trigger the interpretation of a sequence as a story, the form of sequences is not a sufficient condition for a story. Thus, even as Tzvetan Todorov articulates a formal definition of the narrative sequence – “A sequence implies the existence of two distinct situations each of which can be described with the help of a small number of propositions; between at least one proposition of each situation there must exist a relation of transformation” – he refers

back to Viktor Shklovsky's postulation of the "existence, in each of us, of a faculty of judgment (we might say, today, of a competence) permitting us to decide if a narrative sequence is complete or not" (232, 231). A sequence can be processed as a narrative not just because it has a certain form but also because its form cues readers, in structured, nonrandom ways, to interpret the sequence as a narrative. A similar dual commitment to form and context appears in Barthes's "Introduction to the Structural Analysis of Narratives" (1966). On the one hand, the essay sometimes sounds like glossematics (Hjelmslev, *Prolegomena*), as when Barthes calls the narrative sequence "a logical succession of nuclei [narrative hinges, or the elements without which a story would cease to be a story] bound together by a relation of solidarity: the sequence opens when one of its terms has no solidary antecedent and closes when another of its terms has no consequent." (One of his examples is the picking up and putting down of a telephone receiver.) On the other hand, Barthes describes such sequences as "essential headings" of "the narrative language within us" (101, 102). People learn that language by storing a lot of different narratives in memory as schemata, in terms of which they can then read and process other stories (cf. 116–17). Sequences thereby become the output of "naming operations" that allow readers to "grasp every logical succession of actions as a nominal whole" (102); they are the product of readers' prior and ongoing negotiations with narrative discourse, not the atomic or molecular constituents of discourse that was narratively structured before anyone ever got to it. Indeed, in *S/Z* Barthes associates sequences with just one of the codes that can be brought to bear on narrative: the "proairetic" code, by means of which story recipients try "to give a... name to a series of actions, themselves deriving from a patrimonial hoard of human experiences" (204; cf. Bremond, "Logic" 389–90, 406). Whereas Propp sought to isolate the minimal constituents of Russian folktales, Barthes argues that experiential repertoires are what allow readers to recognize a *rescue*, a *seduction*, or any other sequence when they see it in the making.

Subsequent research has, however, provided richer, more nuanced ways of talking about Barthes's patrimonial hoard of experiences. Among these are the knowledge structures that have been termed scripts, or standardized event sequences.<sup>9</sup> Building on Frederick Bartlett's analysis of memory as the organization of prior experience into patterns of expectations for current experience (201–14), cognitive scientists have explored how stereotypical situations and events are stored in the memory and used to guide interpretations of the world. For example, I know what to do when the waiter comes up to me in a restaurant because I have been in restaurants before and remember the standard roles of waiter and customer (Schank and Abelson 42–46). Every trip to a restaurant would be an adventure that consumed too many cognitive resources if I never mastered the appropriate restaurant scripts. As Roger Schank and Robert Abelson put it, "Some episodes are reminiscent of others. As an economy measure in the storage of episodes, when enough of them are alike they are remembered in terms of a standardized generalized episode which we will call a script" (19; cf. van Dijk 179–83), defined as follows:

A script is a structure that describes an appropriate sequence of events in a particular context. A script is made up of slots and requirements about what can fill those slots. The structure is an interconnected whole, and what is in one slot affects what can be in another. Scripts handle stylized everyday situations. They are not subject to much change, nor do they provide the apparatus for handling totally novel situations.<sup>10</sup> Thus, a script is a predetermined, stereotyped sequence of actions that defines a well-known situation (41; cf. Schank 7–12).

Significantly, the concept of scripts was designed to explain how people can build up complex (semantic) representations of stories on the basis of few textual or linguistic cues. Thus when I read

7. "John went to Bill's birthday party. Bill opened his presents. John ate the cake and left" (Schank and Abelson 39)

or even

8. "Mary was invited to Jack's party. She wondered if he would like a kite" (Minsky, *Society* 261)

I can make an astonishing number of inferences about the situations and participants – fill in the blanks of the stories, so to speak – because the sequences unfold against the backdrop of the familiar birthday-party script. The “terminals” or “slots” associated with that script allow me to make certain default assumptions (e.g., that guests give presents at birthday parties) and so to reconstruct the stories from merely skeletal sequences. But the research on scripts suggests that it would be misguided to search for some purely formal property that makes 7 and 8 narrative. Instead, it is the relation between the (form of the) sequences and the party script that accounts for my intuition that 7 and 8 are stories or at least parts of stories.

The notion of scripts provides a finer-grained vocabulary for describing what earlier narratologists characterized as readers’ tendency to organize event sequences into stories (Chatman 45–46; Scholes 100). Every act of telling arguably requires that a listener or reader use scripts to help set the narrative in motion, to cocreate the story. But how might this script-story interface be characterized in detail? Not just any sequence can cue a reader to activate a particular script. Consider this sequence:

9. John went to a get-together for Bill. After some food and festivities, John went home.

If I told you 9 out of the blue, I could not reasonably expect you to infer from the cues provided that it is a story about a birthday party – that John and Bill are children, that parents probably supervised the gathering, that the festivities were over in time for the partygoers’ early bedtimes, and so forth. So the formal features of sequences constrain the kinds of scripts that can be indexed to any story, and conversely they limit the sorts of stories that can be predicated on any script. However, attempting to specify the nature of the constraint in question raises the problem of narrativehood, of what makes a narrative a narrative. For the form of a sequence is neither a necessary nor a sufficient condition for specific components of world knowledge to be activated during the processing of that sequence (Wilensky 425; Emmott).

Suppose that a group of parents have been discussing their children’s birthday parties for a while, and then one of the parents says:

10. John went to Bill's. John ate so much he got sick. Then John had to go home.

Presumably the other parents would conclude that 10 is a story about a birthday party, even though no explicit textual cues license that inference. Thus a particular set of cues need not be present in a story for recipients of it to activate a given script. A discourse context – the total context of utterances exchanged during an occasion of talk – can

imbue sequences it contains with narrative functions that they might not possess in isolation or, for that matter, in other discourse contexts. But neither is the presence of particular textual cues a sufficient condition for a script to be activated. Although example 8 would set the birthday-party script into play in many contexts, it would not do so if presented in, for instance, an account of the retirement of a chief meteorologist named Jack whose colleague Mary runs a program for observation kites.

As the birthday-party examples suggest, the knowledge structures regulating the design and interpretation of narrative sequences have an extremely general provenance; strings of sentences representing actions and events can be interpreted as stories only insofar as they are embedded in global semantic frameworks subtending all thought, speech, and behavior. The question then is how far, and in what fashion, scripts constrain the textual, linguistic, or more broadly semiotic production of particular stories. At what point would 4, 6, or 7, for example, become too skeletal for reconstruction as narrative sequences? In each case, which cues are definitive of a story, and why? I can begin to address these questions by moving from the problem of the membership criteria for the category of narrative to degrees of narrativity – to the way that different versions of a story can strike readers or listeners as more or less narrative. The factors bearing on narrativity may in turn help illuminate the nature of narrativeness. There may be a threshold past which differences of degree effectively become differences of kind; beyond that point a sequence may begin to display so little narrativity that it can no longer be processed as a story at all.

### The Problem of Narrativity: A Thought Experiment

Narratologists differentiate between “tellability” and what they term “narrativity.” Situations and events can be more or less tellable, and the ways in which they are told can be more or less readily processed in narrative terms – can display different degrees of narrativity. Thus, whereas both predicates are scalar, tellability attaches to configurations of facts and narrativity to sequences representing configurations of facts. For example, the facts surrounding a bank robbery are likely to be deemed more tellable than those connected with the daylong movement of a shadow across the ground – although some postmodernist writers have suggested otherwise (e.g., Robbe-Grillet; see also the final section of this essay). But if there are two representations of the facts of the robbery, one (i.e., one version of the story of the robbery) may be deemed to have more narrativity than the other. Imagine an outside observer’s fast-paced report compared to a drawn-out, disoriented account by a badly shaken victim.

But what is it, exactly, that makes one version of a story more narrative than another? What formal or contextual variables correlate with differing degrees of narrativity? Since I cannot engage here in a full-blown analysis of all the variables associated with degrees of narrativity (see Giora and Shen), a brief thought experiment instead may suggest ways to mark off gradations on the scale of narrativity – the continuum stretching from sequences that are nearly impossible to process as narratives to those immediately identifiable as such.

Consider the sequences 11–15, read as much as possible according to the grammar of English:

11. A splubba walked in. A gingy beebed the yuck, and the splubba was orped.

A rudimentary action structure is apparent in this sequence: after the entrance of an actant (the splubba) who has not been previously introduced in the context of the discourse, another new actant (the gingy) does something called beebing to something called a yuck, and this leads to the splubba's being or becoming "orped."<sup>11</sup>

12. A splubba fibblo. Sim a gingy beeble the yuck, i the splubba orpia.

In 12 only the indefinite and definite articles are decipherable. The result is a drastically impoverished action structure, or rather a set of discourse entities that cannot readily be organized into any configuration of actions and events. Nevertheless, the distribution of indefinite and definite noun phrases – patterned in the way that given and new information is typically parceled out in a discourse (Emmott 158–61; Firbas; E. Prince; Schiffрин 197–226) – prompts me to read a kind of narrative structure into 12, along the lines of “first this, then that,” or perhaps even “this, then because of this, that,” although I do not know the meaning of *this* and *that*. Still, I am warranted in saying that 12 has less narrativity than 11. It is not that 11 is more intelligible than 12; for it is not as if, in 11, I know what *beebed* and *orped* mean. Rather, in 12 the deletion of a particular class of morphosyntactic features (verb inflections) removes some of the formal components that cue me to read 11 as an ordered sequence of causally linked events. Arguably, the narrativity of 12 has decreased in proportion to the deletion of such cues.

Sequence 13, however, displays zero narrativity:

13. Oe splubba fibblo. Sim oe gingy beeble ca yuck, i ca splubba orpia.

This string does not meet the criteria for narrativehood. It lacks sufficient grammatical structure for me to infer actants and entities populating a narrated world, let alone read an action structure into one temporal stretch of that world. By contrast, 14 exhibits more narrativity than 11 or 12 (and ipso facto 13), and 15 displays more than 14 because 15 narrates a fully recoverable, if not fully believable, world:

14. A splubba walked in. A gingy pulled the lever, and the splubba was instantaneously inebriated.
15. A bad man walked in. A beneficent sorcerer pulled the lever, and the bad man was instantaneously inebriated.

In comparison with 11, 14 provides additional formal cues for the use of particular kinds of world knowledge – specifically, stereotyped sequences of events such as *pulling a lever* and *becoming inebriated* – during the processing of the sequence. These supplementary cues include a higher percentage of recognizable noun phrases, allowing me to identify more entities populating the narrated world. In addition, the entire morphology of the verbs, not just their inflections, is grammatical, so I can situate story referents in a more fully realized action structure. That structure is constituted by the interplay between the verbs contained in the string and the event sequences encoded into my memory as scripts. Processing 15, a completely grammatical sequence, requires more (and more diverse) experiential repertoires than does processing 14, in which fewer story elements are expressed grammatically and thereby made available for subsumption under scripts.

The sequences should thus be ranked 12, 11, 14, and 15 in order of increasing narrativity. In 11 and 12 there are markers, more or less prominent, of narrative (e.g., logictemporal

operators, indexes of given and new information); I know that I am in the presence of a story without knowing what that story means, what it is or might be all about. In 15 these markers furnish the formal scaffolding for a sequence whose content does lend itself to reconstruction along narrative lines. This increased narrativity stems in turn from the nature and scope of the scripts (and frames) activated during the interpretation of the sequence, from *being a bad man* to *walking in* to *performing sorcery*. Thus there is a direct proportion between a sequence's degree of narrativity and the range and complexity of the world knowledge set into play during the interpretation of (the form of) the given sequence. (See, however, n15.) This thought experiment has suggested that a sequence rooted in a plurality of scripts will be more easily processed as a story, will be deemed more narrative, than one only fitfully anchored in the knowledge frames (Minsky, *Society* 263) bound up with grammatical competence. It has also indicated that a sequence's degree of narrativity is a function not of script use alone but also of a shifting constellation of formal and contextual factors. At stake are a wide range of variables operating at various levels of narrative structure, including morphosyntactic features of the language in which a story is told or written, the grammatical encoding of information about story referents as given or new, the extent to which the form of the sequence facilitates script-aided recognition of a coherent action structure, and the pertinence of intrasequential details to broader, intersequential patterns built up on the basis of generic expectations. The thought experiment brings into focus, too, a specific research strategy for postclassical narratology. Using Hjelmslevian parlance, Gerald Prince argues that what defines narrative is the form of its content side, not the form of its expression side.<sup>12</sup> But, as the experiment suggests, the processing of a sequence as a story can be aided or impeded by features pertaining to its mode of expression. A fuller investigation of narrativity, then, should use the resources of language theory and cognitive science to study how the (form of the) expression side of stories interacts with (the form of) their content side. In other words, to understand why some sequences are more narrative than others, narratologists need new ways of modeling the interrelations between story and discourse, *fabula* and *sjužet*.

Finally, the foregoing experiment reveals that narrative competence can be redescribed as a nested structure of processing strategies operating at different levels – or during different phases – of story comprehension. Spoken or written sequences take on the profile of stories because of the way their form triggers knowledge about (1) the grammar of the language in which they are related, (2) standardized event sequences, among other sorts of experiential repertoires, and (3) other, prior sequences (and groups of sequences) mediating encounters with any particular string. Ranking these processing strategies, determining their order of importance or the stages at which readers and listeners resort to them in interpreting a narrative, requires a separate research project.<sup>13</sup> In the last section of this essay, I want to examine some interconnections between strategies of types 2 and 3, mentioned above – between script-based strategies and strategies rooted in knowledge about intersequential relations.<sup>14</sup> Although schematic, my discussion will, I hope, demonstrate that the script concept can be productive not just for narrative theory but also for the practice of literary interpretation.

Indeed, in setting out the problem of narrative sequences, I have already appealed to knowledge based on intersequential, or generic, patterning. Arguably, generic factors help account for my inclination to process sequence 4 as a (Gothic) story and not as a description like 1. Gothic tales I know predispose me to read a coherent action structure into 4; by contrast, in 1 my search for analogous textual or generic models results in my tending not to organize intrasequential events into a narrative. Moreover, a cognitive

approach to literary narratives suggests that genres – and, for that matter, changes in narrative technique over time – can themselves be redescribed as modes of script use. Narratives can anchor themselves to stored world knowledge in vastly different ways, whether they activate it for their processing or encode it as themes. Hence focusing on the script-story interface may yield new perspectives on the study of literary history and cast new light on the generic categories to which narratives are typically assigned.

## Scripts and Literary Interpretation

Although researchers as diverse as R. A. Buck (71–82), Jonathan Culler (*Poetics* 130–60), Wolfgang Iser (53–85, 103–34), and Wallace Martin (67–68) have worked to implement versions of the script concept in literary-theoretical contexts, more attention needs to be given to the reciprocal relation between scripts and literary texts – to the way scripts shape the design and interpretation of texts and texts in turn affect the production and dissemination of scripts (cf. Segre 26). To this end, I propose two hypotheses, one diachronic and the other synchronic in emphasis, which could be used to generate research strategies for a postclassical narratology:

The nature and scope of the world knowledge required to process literary texts change over time, as do the ways in which the script-story interface is encoded or thematized in texts. Such changes correspond to shifts in the relations among recessive, dominant, and emergent narrative techniques.

Contemporaneous texts can relate differently to prevailing scripts. Texts can pertain more or less critically and reflexively to the scripts circulating when the texts were written. For narrative, these variations correspond to generic classifications used to categorize stories.

Literary history produces an ever-expanding corpus of texts, whose varying designs reveal changing conceptions of how many (and what sorts of) scripts should be activated during textual processing. The formal impetus, the constitutive gesture, of literary fiction has been the rejection or at least the backgrounding of scripts in which prior texts were anchored and the complementary foregrounding of new scripts matched to changing ideas about narrative. Thus *Don Quixote* (1605) opens with a semicomic indictment of the delusive power of outmoded scripts, those of chivalric romance; interpretation of the subsequent series of action sequences requires scripts grounded in an awareness of human potential and limitations rather than in the more restricted world knowledge undergirding idealized quests, knightly courtesy, and so on. Cervantes's novelistic narrative distinguishes itself from romance by demanding richer and more numerous experiential repertoires from readers who would coconstruct his fictional world.

Such changes in scripts and stories are reciprocal: the need for narrative innovation stems from the dominance of certain kinds of world knowledge that, although initially of limited influence, have been reinforced, consolidated, and generalized by prior narrative techniques. Thus, by the time of Diderot's *Jacques le fataliste et son maître* (*Jacques the Fatalist*; 1773), not the romance but rather the novel itself is the repository and source of outworn scripts. A product of the Enlightenment's rethinking of the claims of truth and fiction, knowledge and myth, Diderot's text features a narrator who insists that he is not writing a novel (51, 214) and who implies that to have verisimilitude, a fiction must *not* conform to novelistically patterned sequences of actions, such as pitched battles between

heroes and villains (22, 30, 49). Diderot's antinovel resists such stereotyped action sequences, and promotes script multiplication and enrichment, by constantly foregrounding the contingency, even indeterminacy, of the narrated events, sometimes hesitating between alternative accounts of happenings in the story world (251–54). Narrativizing the philosophical concerns of the French encyclopedists, in particular Enlightenment debates concerning determinism and free will, *Jacques the Fatalist* contains sequences designed to activate several competing processing strategies simultaneously and thus to provoke reflection on deterministic models of human behavior.<sup>15</sup>

Later literary developments suggest that there are other ways of reconfiguring the relations between world models and narrative techniques and other reasons for doing so. For example, Sartre's *La nausée* (*Nausea*; 1938) transforms the antinovel into a metanovel. Thematizing the search for ordered event sequences as a symptom of bad faith – distinguishing the radical fluidity of existence from the stories through which human beings inauthentically seek to congeal it (*Nausea* 37, 39–40) – Sartre's narrative is about the impossibility and undesirability of narrative. Given that the idea of the passage of time is “an invention of man” ‘une invention des hommes’ for Roquentin and that “[e]very existing thing is born without reason, prolongs itself out of weakness and dies by chance” ‘[t]out existant naît sans raison, se prolonge par faiblesse et meurt par rencontre’ (132, 133; 168, 169), telling stories about human lives is an inherently and perniciously (self-)delusional project. The less authentic my attitude toward existence, the more scripts in which I am enmeshed and hence the more stories that I unfortunately begin to understand (*Nausea* 56–57, 95–96). Yet the text's thematic profile is at odds with the processing strategies needed to cocreate the action structures around which its themes are clustered. Thus the experience of Sartre's narrative form is fundamentally dialectical, forcing readers to adopt a stance that is at once authentic and inauthentic: they can reconstruct Roquentin's rejection of previous world models, his striving for a condition of absolute scriptlessness, only by anchoring his gestures in a variety of experiential repertoires.

To be sure, fuller implementation of the script concept in the study of literary history would require an expanded comparison of shifts in narrative form with changing world models, as well as a more comprehensive survey of ways in which the interplay between scripts and stories can itself figure as a theme. The diachronic investigation of script use across time needs to be supplemented, however, with a synchronic investigation of script use across different genres at the same time, in accordance with my second research hypothesis. The recall of previously interpreted sequences, which are recognizable as narratives by virtue of the world knowledge they activate, enables the processing of other sequences as members of larger narrative classes (the diary novel, autobiography, travel narrative, etc.). Thus differences in genre can be correlated with differences in the processing strategies at once necessitated and promoted by particular kinds of sequences. Such strategies, which eventuate in generic codes, can be more or less multidimensional; in particular, different types of sequences relate more or less critically and reflexively to the world models on which their interpretation simultaneously depends.<sup>16</sup>

A few representative sequences may provide a blueprint for further research on the orientation of narrative genres toward prevailing scripts. Sequences 16, 17, and 18 are excerpted from works written within fifteen years of one another. The first sequence belongs to the genre of children's fiction, the second to that of autobiography, and the third to that of experimental literary narrative. In progressing through this series, one must use increasingly multidimensional or reflexive processing strategies. The processing

of narratives is more complex when they inhibit what might be termed the naive application of scripts and promote instead reflection on the limits of applicability of the scripts being invoked. The three stories recount event sequences – *getting one's head stuck in a jar, confronting armed soldiers, going down on all fours and acting like a dog* – that could be transposed into other narrative genres. Correlatively, generic differences stem not from narrative content as such but from the complexity and duration of the interpretive routes that readers take in formulating narrative content (e.g., through story paraphrases like the ones just offered).

Sequence 16 is taken from the point in A. A. Milne's *Winnie-the-Pooh* (1926) when Winnie-the-Pooh is tempted by his craving for honey into his and Piglet's Heffalump Trap, where he gets his head stuck in the jar intended as bait for the nonexistent but much feared Heffalumps:

16. "And all the time Winnie-the-Pooh had been trying to get the honey-jar off his head. The more he shook it, the more tightly it stuck. 'Bother!' he said, inside the jar, and 'Oh, help!' and, mostly 'Owl! And he tried bumping it against things, but as he couldn't see what he was bumping it against, it didn't help him; and he tried to climb out of the Trap, but as he could see nothing but jar, and not much of that, he couldn't find his way. So at last he lifted up his head, jar and all, and made a loud, roaring noise of Sadness and Despair" (67).

This sequence suggests one of the crucial features of children's fiction: the genre is designed to establish and inculcate particular world models (e.g., those associated with delaying gratification or resisting the gratuitous fabrication of monsters). This genre's primary function is not to problematize a world readers only think they know but rather to help them acquire more strategies for getting to know it. Far from presuming the script expertise supporting more-elaborate narrative experiments, children's fiction consolidates and reinforces the scripts on which narrative competence itself depends. Such fiction teaches reading by teaching scripts.

Sequence 17 comes from Maud Gonne MacBride's autobiography, *A Servant of the Queen* (1938), and recounts events surrounding the Irish civil war:

17. "Outside General Mulcahy's house in Portobello, the Women's Prisoners' Defence League had organised a great protest meeting against the murder of prisoners of war for which Mulcahy was held responsible. The Free State soldiers were drawn up inside the railings; some shots had been fired over our heads; a woman's hat had been pierced by a bullet. I heard an order given and the front line of soldiers knelt down with rifles ready, – some of the young soldiers were white and trembling. I got up on the parapet of the railing and smiled contempt at the officer. He had curious rather beautiful pale grey eyes and a thin brown face. We gazed at each other a full minute. The order to fire was not given" (15).

Admittedly, part of what distinguishes 17 from 16 is MacBride's greater descriptive richness; 17 features a more densely populated story world with an independently verifiable history and geography, the parameters of which are established by spatiotemporal indexes such as *in Portobello* and *Free State soldiers*. As a result, reconstructing the action sequence in 17 necessitates considerably more script expertise, familiarity with a greater variety of world models, than does processing 16 as a story. More than this, however, because MacBride's text belongs to the genre of autobiography, interpretation of 17

requires, to a greater degree than does reading *Winnie-the-Pooh*, reliance on and reevaluation of a particular class of world models: scripts and frames bearing on the formation and maintenance of selfhood (cf. Linde 127–91).<sup>17</sup> MacBride's text not only activates experiential repertoires but also compels reflection on their explanatory scope – on the kinds of stories about the self that they do or do not help readers comprehend (Herman, “Autobiography”). At once invoking and suspending models for heroic action created by or centered on men, interpretation of the sequence enriches the repertoire of behaviors that can be used to typify female actants (e.g., facing down a group of armed soldiers); the text thereby exploits existing scripts to generate additional models for understanding who women are and what they can do.

Sequence 18, taken from the ending of Djuna Barnes's experimental novel *Nightwood* (1937), requires processing strategies that are even more multidimensional:

18. “The dog, quivering in every muscle, sprang back, his tongue a stiff curving terror in his mouth; moved backward, back, as she came on, whimpering too, coming forward, her [Robin's] head turned completely sideways, grinning and whimpering. Backed into the farthest corner, the dog reared as if to avoid something that troubled him to such agony that he seemed to rise from the floor; then he stopped, clawing sideways at the wall, his forepaws lifted and sliding. Then head down, dragging her forelocks in the dust, she struck against his side. He let loose one howl of misery and bit at her, dashing about her, barking, and as he sprang on either side of her he always kept his head toward her, dashing his rump now this side, now that, of the wall” (170).

It could be argued that 18 exploits prevailing scripts more critically and reflexively than 17 and that generic differences between 18 and 17 can be measured by the scope and frequency of the script suspensions cued by the texts' narrative form. At stake in *Nightwood* is a gamut of world models, including those bearing on questions of personal identity. The passage conveys a strikingly particularized action structure, which dissolves both human and animal behavior into microsequences of atomistic gestures. The sequence thus provokes reflection on, among other aspects of script construction and usage, the canons of tellability (at what level of detail should event sequences be stored or told? what counts as an action or an event?), models for understanding women's and for that matter human identity (to what extent can scripts indexed to nature and culture be transposed? how have such transpositions contributed to cultural as well as cognitive stereotypes about identity?), and the very concept of purposive action (why would someone mimic and thereby terrorize a dog? on the basis of what world models can readers make sense of such event sequences?).

While constituting only prolegomena for a future narratology, this essay suggests that a rethinking of classical approaches to the problem of narrative sequences will entail a more careful investigation of the interface between script and story. Postclassical narratology contains structuralist theory as one of its “moments” but enriches the older approach with research tools taken from other areas of inquiry. The result is not simply new ways of getting at old problems in narrative analysis but a rearticulation of those problems, including the root problem of how to define stories. Here I have argued that incorporating cognitive tools into narratology can throw new light on some of the most basic issues facing analysts of narrative. Given that scripts and stories are in some sense mutually constitutive, how readers and listeners process a narrative – and indeed whether they are able to process it at all – depends on the nature and scope of the world knowledge

to which it is indexed. Postclassical narratology should therefore study how interpreters of stories are able to activate relevant kinds of knowledge with or without explicit textual cues to guide them. At the same time, it should investigate how narratives, through their forms as well as their themes, work to privilege some world models over others. After all, if the right kind of children's story caught on, people might finally stop worrying about Heffalumps. And in time, splubbas might circumvent the dreaded pulling of the yuck.

## Notes

My thanks go to Manfred Jahn, Emma Kafalenos, Susan Moss, Gerald Prince, and Marie-Laure Ryan for their invaluable feedback on various drafts of this essay. I am especially grateful to Harold F. Mosher, Jr., and Thomas Pavel for their productive questions and criticisms.

- 1 In this essay the terms *narrative* and *story* are coreferential.
- 2 Heating instructions for Red Baron Premium 4-Cheese Frozen Pizza.
- 3 See Bartlett; Crevier; Jacobs and Rau; Schank.
- 4 Rachel Giora and Yeshayahu Shen (450–51), Propp (25–65), Thomas Pavel (14, 17–24), and Marie-Laure Ryan (124–47) have made a stronger claim, arguing that processing sequences of actions as narratives requires readers to make inferences about characters' goals and motivations. For empirical evidence that conflicts with this claim, see Gerrig 36, 53–63.
- 5 On the distinction between classical and postclassical theories, see Plotnitsky; Smith and Plotnitsky.
- 6 Despite Emma Kafalenos's claim that a "named set of functions provides a uniform vocabulary for labelling interpretations of events" (131) and allows at least some of the ingredients of narrative competence to be captured, her modification of the Proppian framework does not directly address the problem of how to match particular (classes of) linguistic or textual units with functions. See Hendricks 40–51.
- 7 Propp discussed this problem when noting that a single function can have a double morphological meaning (66–70). Contrast Ryan 211–22.
- 8 Hence Gerald Prince's definition: "narrative is the representation of at least two real or fictive events or situations in a time sequence, neither of which presupposes or *entails* the other" (*Form* 4; my emphasis). Cf. Ryan on what she calls the principle of semantic diversity in narrative universes (156–66).
- 9 Although the final section of this essay invokes the somewhat broader concept of "world knowledge," which encompasses both scriptlike (dynamic) and framewise (static) knowledge structures, my primary focus throughout is on standardized sequences of events.
- 10 For Schank and Abelson novel situations require more-general planning mechanisms built into intelligence. See also Grishman 146–47.
- 11 Giora and Shen define an action structure in narrative analysis as "a high-order organization which hierarchically connects not only adjacent events... but also events which are remote from one another on the temporal axis of a given discourse. Thus, a story... is more than pairwise relationships among events, but rather, a string of events combined into a psychological whole" (450).
- 12 "Aspects" 50–51; cf. Hjelmsley, "Stratification." Prince's point is that both narratives and nonnarratives can be expressed in various media (film, dance, language, etc.). Furthermore, given that "a narrative, a non-narrative poem, or an essay may deal with the same subjects and develop the same themes" (51), what Hjelmslev would call the substance of the content side does not define narrative either.
- 13 See the important work of May Charles, who has studied how readers draw on world knowledge and text models to construct fictional worlds.
- 14 There are two sorts of intersequential relations: between sequences in a single narrative (see Iser) and between sequences in different narratives in a single genre. In this essay I focus on the second to explore how generic patterning helps readers recognize event sequences as narrative.

- 15 Diderot's text points to an aspect of narrativity not considered in the thought experiment conducted in the previous section. Just as there is a lower limit of narrativity, past which sequences activate so few world models that they cannot be processed as stories, there is an upper limit of narrativity, past which so many scripts are set into play that processors experience cognitive overload and find themselves unable to structure oversaturated sequences into coherent, narratively organized wholes. Sketching this upper limit of narrativity requires a separate study (Herman, *Universal Grammar* 124–38), but what seems to set twentieth-century fictional experiments apart from earlier experiments is the frequency of script oversaturation in narrative contexts.
- 16 Narrative can be viewed as a way of accommodating emergent to existing knowledge. Narrative genres represent distinct strategies – more or less critical and reflexive – for achieving that accommodation.
- 17 The point can be put the other way around: it is because 17 relates in certain ways to a certain class of scripts that readers give it the generic label of autobiography.

# CHAPTER 9

## From Beats to Arcs: Towards a Poetics of Television Narrative

*Michael Newman*

Michael Newman teaches Media Studies at the University of Wisconsin, Milwaukee. He is the author of *Video Revolutions* (2014) and *Legitimating Television* (2011). In this essay, he provides a critical vocabulary (beats, arc) for understanding the structure of television narrative.

Television is a story machine. Every day, thousands of hours of narrative zip through the airwaves and cables and into our sets and minds. Television does more than just tell stories, of course, but its function as a storytelling medium demands analysis, and with this essay I offer a framework for analyzing one kind of television narrative. Unlike some accounts of television as a storytelling medium, however, this one will not isolate the text from its makers and users.<sup>1</sup> My purpose here is to initiate a poetics of television form, an account of storytellers' strategies in crafting narratives that will solicit certain effects in viewers such as suspense and surprise, hope and fear, and aesthetic appreciation.<sup>2</sup> A poetics can help explain why so many people take so much pleasure in television's stories.<sup>3</sup>

In particular I am interested in one form of American television drama, the contemporary scripted prime-time serial, or PTS. For the past twenty-five years there have been two main forms of hour-long prime-time programs. Serials such as *St. Elsewhere* (NBC, 1982–88) dramatize long-form stories in ways similar to daytime soap operas. Shows such as *Law & Order* (NBC, 1990–) have an episodic format in which all of the problems raised in the beginning of an episode are solved by the end and questions do not dangle week after week. Evening serials became an important form of American television programming in the 1980s after the ratings success of *Dallas* (CBS, 1978–91) and the acclaim and awards bestowed on *Hill Street Blues* (NBC, 1981–87).<sup>4</sup> They became a dominant form in the 1990s with shows such as *The X-Files* (Fox, 1993–2002)

*Original publication details:* Michael Newman, "From Beats to Arcs: Towards a Poetics of Television Narrative." *The Velvet Light Trap* 58 (Fall 2006), pp. 16–28. Reproduced with permission from University of Texas Press. Postscript courtesy of M.Z. Newman.

and *ER* (NBC, 1994–) consistently winning both high ratings and critical praise. Later in the 1990s and in the early 2000s the serial saw its presence diminish as episodic programs and reality shows grew in popularity, but as I write it is enjoying a revival at the same time that many sit-coms (e.g., *Arrested Development*, Fox, 2003–) and reality shows (e.g., *Survivor*, CBS, 2000–) are also thoroughly serialized.

Over the quarter-century since the rise of the serial, American television has undergone enormous changes with the introduction of more than one hundred new channels, pervasive new structures of media ownership and synergy, and transformations in the technologies of media production and distribution. But in spite of all these developments, the past twenty-five years have seen a remarkably stable condition obtain in which the most basic narrative conventions of the PTS have not been significantly altered.<sup>5</sup> Throughout the period between *Hill Street* and *Lost* (ABC, 2004–), the general production practices of prime-time television have remained quite constant. A program is overseen by a showrunner who reviews all of the scripts and guides the storytelling; each serial episode resolves some questions but leaves many others dangling; serials tend to focus on ensembles, with each episode interweaving several strands of narrative in alternation scene by scene; a season has approximately twenty-four episodes, begins in fall and ends in spring, and offers sweeps periods every November, February, and May.

As critics have often noted of MTM Productions' seminal dramas of the 1980s, *Hill Street Blues* and *St. Elsewhere*, the PTS is really a hybrid of episodic dramas and serials such as soaps and miniseries.<sup>6</sup> Although evening serials have much in common with their daytime counterparts, prime-time shows still have fewer episodes, smaller casts, and greater episodic closure. And although they share many qualities with episodics, PTSs offer a distinct mode of investment in character, a product of their long-format storytelling. Beginning with those MTM dramas so often figured as “qualityTV,” the PTS has functioned as a distinct group style whose norms of artistic production are shared among its makers. By calling it a group style I mean to assert a basic commonality among many different programs on the level of form. This commonality is independent of any program's “quality” and also of its genre status as cop, doc, legal, sci-fi, family, teen, or spy drama.<sup>7</sup> Programs that seem quite different from one another may still share their basic storytelling principles.

What narrative structures does the PTS adopt? What functions do its storytelling conventions serve in relation to television's commercial logic, and how do these conventions appeal to viewers? To answer these questions we must consider the interplay of commerce and art in the television industry. From the networks' perspective, programming is a means of selling audiences to advertisers. Producers follow a commercial imperative: on a weekly basis, deliver the largest and most desirable audience to the network's clients. Programs attempt to hook viewers and make them want to watch. The PTS's narrative design is a product of this basic industrial condition, the perpetual goal of getting millions of people to tune in and keep tuning in. This condition and the strategies it encourages have not changed over the past several decades.

Contrary to what some critics claim, I contend that within this industrial context network television flourishes artistically, that it rewards its audience and its advertisers at the same time. And it is not in spite of television's commercial logic but because of it that the PTS achieves its effects. Given the incentive to produce narratives that engage audiences week after week, television has developed a powerful mode of storytelling. Narrative practices that originate in maximizing the networks' profits, such as repetitive dialogue to remind viewers of details they might have missed and regular breaks in the

story for advertising spots, might seem to inhibit artistic expression. But in the PTS, these and other constraints designed to boost advertising revenues have been adapted to narrative functions that can deepen and enrich the experiences of viewers. Looking at the PTS's narrative form, we may consider it to have three storytelling levels for analysis: a micro level of the scene or "beat," a middle level of the episode, and a macro level of greater than one episode, such as a multi-episode arc. On all three levels the commercial and aesthetic goals of television's storytellers are held in a mutually reinforcing balance. (Television's political or ideological goals, overt or implicit, are another matter; in such areas the effects of the networks' commercial goals are rather less salutary.)

American television's mission of selling viewers consumer products and services does not negate its possibilities for creative expression. On the contrary, if one function of art is to please its audience, a commercial incentive for spreading and intensifying pleasure dovetails with the goals of the artist. This is assuming, of course, that the artist is interested in gratifying rather than challenging the audience, which intellectuals often think art should do. But as a form of mass art television fosters no such avant-garde intentions. Mass art strives for accessibility and ease of comprehension. One way it does so is by appealing to emotions such as fear, anger, joy, and surprise.<sup>8</sup> The PTS aims to accomplish these goals by developing clear, ongoing stories about compelling characters facing difficult obstacles. It appeals to viewers by satisfying their desires for knowledge about these characters and for forging an emotional connection with them. How television achieves such effects is the topic of this essay.

### **Micro Level: Beats**

Following a narrative is a process of accumulating information. Television writers strive to parcel out this information in such a way that it will seem urgent, surprising, and emotionally resonant. The way the story is unfolded bit by bit encourages viewers to take an interest in it, and as the unfolding progresses the storyteller seeks to intensify this interest. Thus television's most basic aesthetic and economic goals overlap: engaging the viewer's attention. This begins on the micro level, the smallest node of narrative.

On this level of storytelling most television narratives look quite similar. Situation comedies, episodics, and serial dramas all organize their stories into rather short segments, often less than two minutes in length. Viewers might call these scenes, but writers call them "beats," and they are television's most basic storytelling unit. The length of individual beats and consequently the number of them in an episode are variable to a degree, but it is exceedingly rare to see long, drawn-out beats on prime-time television. The networks bristle at scenes that take up more than two and a half script pages, with a page of script roughly equivalent to a minute of screen time.<sup>9</sup> They believe that the audience's attention is unlikely to be sustained for much longer than that. In a fast-paced story a long scene can derail the sense of forward progress. Given the commercial imperative of keeping the audience interested, most forms of television present a rapid succession of short segments.

Thinking in short segments is a constraint on writers, demanding that their storytelling be clear and efficient. No moment is without a dramatic function, no scene is redundant with other scenes or digressive from the narrative's forward progress. This isn't to say that every beat advances the plot in the traditional sense. Many beats consist of reactions rather than actions, especially on shows centered principally around interpersonal

relationships. But a reaction is a new bit of narrative information and is often the point of a beat. Each beat tells us something new, something we want – need – to know, and amplifies our desire to know more.<sup>10</sup> Each one solicits feelings in relation to this information, such as satisfaction, excitement, worry, puzzlement, or frustration on a character's behalf. Each beat also usually reminds us about several old bits of information before offering us the new bit. With these missions accomplished one beat gives way to the next.

When writers approach the creation of a television script, their first task is to “break” the story into a moment-by-moment outline, or “beat-sheet,” a task often done collaboratively by a writing staff.<sup>11</sup> The writers know in the most basic terms what the episode has to accomplish before they beat out the story, but the story only takes shape when they begin to think of it as a series of moments. Each episode has a total of between twenty and forty beats; the average might be twenty-five.<sup>12</sup> This means that each of the four acts in an hour-long show has around six beats.<sup>13</sup> PTSs are typically ensemble dramas, and each episode has multiple, intertwined plots. Major plots (“A plots” in teleplay jargon) involving a main character have at least six beats, often more. An episode usually has two or more A plots and several B or C plots with a smaller number of beats each. Each act ideally includes at least one beat from all of the episode’s plots.

In breaking stories for *Judging Amy* (1999–2005) its showrunners would demand that a plotline set in Amy’s courtroom have six to eight beats to make it dramatic and engaging – a three-beat situation would not suffice. They told an interviewer that freelancers would sometimes pitch dramatic ideas that were not suitable for the PTS’s format: “For example, a kid goes missing. The beats are: (1) a kid goes missing, (2) call the cops and (3) the cops find him or they don’t find him. That’s not enough. That’s a [dead-end] idea.”<sup>14</sup> To make the idea suitable for an hour show it would need to unfold with more intricacy, with a measured pattern of revelations and developments taking us through this series of eight moments and holding our attention across four commercial breaks. Since A plots involve the characters portrayed by a show’s stars, giving them eight beats per episode keeps them on screen at regular intervals. Very convoluted stories and very simplistic ones are unsuitable to the formula. Thus the reliance on twists and turns in the plot; one way of adding beats to a straightforward story is to introduce complications and reversals. By demanding that scenes be short, the networks create the conditions for a sophisticated mode of ensemble storytelling.

In general, then, the patterning of two-minute beats aims to hold the audience’s attention and make the story lines cleverly unpredictable. Out of industrial constraints come aesthetic strategies. Given a set amount of weekly programming time, a cast of actors under contract, and a need to show the audience something new at least every two minutes, writers work out a system of parceling the narrative into small pieces in regular alternation, each of which makes a new claim on the audience’s interest and aims to intensify its emotional response.

In addition to new information many scenes also contain what we might call old information, expository material that regular viewers already well know. Recapping is a ubiquitous feature of television in all genres.<sup>15</sup> Television assumes that we don’t watch everything and can always use a bit of reminding when it comes to the most important things to know. In serialized narratives recapping is especially important because of the large quantity of data about the story world that forms the background of any new developments. It takes many forms, one of which is the perpetual naming of characters: in every beat, characters address each other by name, often several times in a two-minute

segment. Along with naming comes role reiteration: *Alias* (ABC, 2001–) constantly reminds us that Jack and Irina are Sydney's parents; Giles is always reminding Buffy (*Buffy the Vampire Slayer*, WB, 1997–2001; UPN, 2001–03) that he is her watcher; Joel on *Northern Exposure* (CBS, 1990–95) is often called "Dr. Fleishman," even away from his practice, and his favorite leisure activity, golfing, reinforces his role stereotype.

A more elaborate form of recapping restates the show's basic premise in episode after episode. *Veronica Mars*'s (UPN, 2004–) voice-overs in its first season reiterate the known details of the Lily Kane murder and investigation and Veronica's ostracism from the popular crowd at Neptune High. *Buffy* characters remind us that Sunnydale sits above a Hellmouth. Episode after episode of *Northern Exposure* works in references to New York City, Joel's hometown. Many also reiterate the deal he made with the state of Alaska that in exchange for funding his medical education it would get his services as a doctor.

Dialogue also recaps recent events, often redundantly with the "previously" segment that precedes most shows but in a way that contextualizes the information and clarifies its relevance to the present situation. It is a norm of PTS storytelling that events should be recapped, and, given this constraint, writers have to find ways of accomplishing this redundancy without irritating the audience. Indeed, this norm seems to have the opposite effect, riveting the audience to the screen. Often this redundancy is accomplished with remarkable elegance and economy without seeming at all like clunky exposition. This is a matter of motivating the dialogue that conveys the redundant expository material.

One way of accomplishing this is by structuring storytelling as a series of revelations from one character to the next, a standard narrational strategy of melodrama in film and television, making action less significant than *reaction* and *interaction*.<sup>16</sup> In the May sweeps episodes of *Gilmore Girls*'s (WB, 2000–) fifth season, Rory has a series of encounters with the family of her blue-blooded Yale boyfriend, Logan Huntzberger.<sup>17</sup> After being insulted by the Huntzbergers over dinner when they openly disapprove of Rory as a match for Logan, Rory is offered a plum internship at Logan's father's newspaper. At the end of her stint at the paper the elder Huntzberger tells Rory quite bluntly that she is not suited to a career in journalism, which has been her lifelong aspiration, and she is crushed. These events are recapped by Rory in conversations with her mother, Lorelai, and by Lorelai in conversations with her parents, Richard and Emily.

But these bits of dialogue are not only repeating what we already know; the moments of recapping are important bits of plotting because they are revelations, and we have been primed to notice the interlocutors' reactions. For many viewers, one of serial narrative's greatest pleasures comes from the tension-resolution pattern of anticipating how a character will respond to a narrative detail they already know and witnessing the moment of revelation. Rory is hesitant to tell Lorelai about the internship because she thinks her mother disapproves of Logan. When Rory slips in the news, it is a moment of tentativeness between the mom and daughter, who often act more like best friends than like family, and we are invited to wonder if Lorelai's breeziness in response to Rory's news is feigned. Thus the recapping of Rory's news about interning with Logan's father's paper is turned into a beat in the mother–daughter plotline and an opportunity to consider the characters' emotions. It is also a device aimed at engaging *our* emotions, encouraging our fear for the Gilmore girls that Logan will cause a rift to form between them and our hope for them that it will not.

An even bigger plot point comes in the season finale, after Rory is devastated by her conversation with Mr. Huntzberger. Lorelai reports to her parents not only about Rory

being told she is unsuitable to be a reporter but also about how the Huntzbergers insulted Rory over dinner, recapping events of several episodes earlier that are essential to understanding the conflict. This is the first that Richard and Emily have heard of this, and it makes them both furious with Logan's family, affronted by their behavior, and sympathetic with Rory, reversing their eagerness to see the two youngsters get engaged. Again, this recapping solicits an emotional connection: regular viewers were likely already angry at the Huntzbergers and frustrated and disappointed on Rory's behalf, but in this scene we are invited to share Richard and Emily's anger and sympathy even as we might get a superior sense of satisfaction – which we likely share with Lorelai – from seeing them realize that they were mistaken about Logan's family. Because the characters' relationships are multiple and complex, considering old information in a new context is designed to generate a fresh charge of feeling.

The repetitiveness of PTS storytelling originates in a commercial function of making the narrative easily comprehended even by viewers who watch sporadically, who pay only partial attention, or who miss part of an episode when the phone rings or the baby cries. The same contextual factors result in similar kinds of repetition in many kinds of television storytelling, from soaps and news magazines to reality programs and sit-coms. Consider, for example, the number of times in an episode of *Survivor* that we are reminded of the contestants' names: during the credit sequence, when contestants are addressed by the host, when they are referenced in other contestants' interviews, when they are addressed directly by other contestants, and when their names (and occupations) are printed onscreen during their own interviews. Redundancy in many forms of television is aimed at maximizing accessibility. But this adaptation has an additional benefit. Television's redundancy has its causes in making narratives intelligible, but it turns out that it can also allow even regular viewers to be gratified by being reminded constantly of who the characters are, what they do, why they do it, and what is at stake in their story. Our interest and engagement can be increased when the narrative makes its most important elements clear and relevant, artfully underlining what we should pay most attention to and care most about. Redundancy functions not only to make stories comprehensible but, more importantly, to make stories more interesting and to deepen our experience by appealing to our emotions.

To paraphrase Christian Metz, there are no television police. No one forces us to watch these weekly dramas. But the structure of television storytelling on the micro level – the way a story is broken into beats and the way each beat works – functions to compel our attention. Television storytellers, more than their counterparts in literary, dramatic, or cinematic storytelling, are under an obligation constantly to arouse and rearouse our interest. Beating out the story as they do has a strong rhetorical force, giving us reasons to care about characters and to want to know more.

## Middle Level: Episodes

Given the ongoing nature of its stories, one might assume that the PTS lacks closure on the level of the episode. According to one critic, daytime serials dispense with beginnings and endings in favor of "an indefinitely expandable middle."<sup>18</sup> Scholars refer to serial form as "open,"<sup>19</sup> and some propose that the pleasure of watching serials is heavily invested in this formal openness. Soap opera viewers, according to John Fiske, experience "pleasure as ongoing and cyclical rather than climactic and final."<sup>20</sup> In this section I

argue, however, that an emphasis on openness misses much of what is interesting about television's evening serials. Each episode of a PTS leaves some causal chains dangling, but seldom at the expense of sacrificing resolution and coherence, seldom in a way that promotes textual instability or radical, modernist aperture. The serials I am considering have not only closure in their story lines, which is also true of soap operas,<sup>21</sup> but a rigorous formal unity on the level of the episode, a quality daytime dramas rarely display. Thus there are two kinds of closure and aperture we can consider: the resolution of narrative cause–effect chains, as in the culmination of a courtship in marriage, and the unification of themes and motifs into an orderly, integrated whole. Both of these kinds of formal unity offer pleasures that underlie other appeals of the narrative.

While some cause–effect apertures may run across many months of a PTS, the main action of any given episode tends to be resolved.<sup>22</sup> Most typically, certain questions go unanswered for episode after episode, but they are not the kind of questions that obstruct narrative clarity. Highly focused questions that determine the outcome of the main events of a particular episode may be deferred by a cliffhanger and promptly answered in the beginning of the next episode, as is often done on thrillers such as *Alias*, but less focused questions can be deferred long-term. This kind of balance between episodic closure and serial deferment is standard in many forms of serial storytelling, from Victorian fiction to contemporary Hollywood cycles such as *Star Wars*. A strong dose of episodic unity mitigates any textual instability caused by serialized aperture. Without this unity, casual viewers are less likely to watch. And while the regular audience may relish being strung along by the ongoing story lines, it also may dislike feeling frustrated at the end of an episode. Like all of the formal devices I consider here, effects of closure are aimed at satisfying the audience, in this case its desire not only for resolution but also for coherence.

There is a commercial rationale underlying these effects beyond the value to a network and producer of their programs telling good stories. Prime-time shows, in contrast to their daytime counterparts, depend on off-network syndication contracts to earn a profit. PTS producers want their programs to play well in reruns. According to the industry's conventional wisdom, heavily serialized storytelling makes reruns less likely to attract viewers.<sup>23</sup> In the 1990s and early 2000s the astonishing success of *Law & Order* repeats on A&E and TNT demonstrated that hour-long episodic narratives can achieve impressive ratings in syndication to the point that the audience for original episodes on the network might increase.<sup>24</sup> *Law & Order* is the most profitable drama on television and is also a success in foreign markets.<sup>25</sup> Episodic closure is thus a product of an industrial context in which serials are under increasing pressure to offer episodic pleasures to casual viewers at the same time that they offer additional, serialized pleasures to their faithful regulars. Episodic unity pays off to the viewer, casual or committed, but also to the producer and the network.

The PTS thus patterns its weekly episodes into structures of problems and solutions so that the central conflict introduced in the beginning of an episode has often been overcome by the end. The standard architecture of the PTS organizes the hour into four acts of roughly equal length, each of which is followed by a commercial break.<sup>26</sup> The first and last acts of a four-act episode correspond to the first and last acts of the three-act Hollywood film. In both media the first act is the set-up and the last act is the resolution. The middle two acts of a television show correspond to the second act of a movie: complication and development.<sup>27</sup> Television dramas introduce problems in the first act and end it with a surprise. Characters respond to complications caused by this surprise in the second act, see the stakes raised in the third act, and resolve the problems in the fourth act.

Unlike movies, television acts have strongly punctuated endings, often with a clearly focused question, sometimes with a cliffhanger, typically with a fade to black and a cut to a commercial.<sup>28</sup> Different writers have different names for act endings; following theater usage I will call them “curtains.”<sup>29</sup> Writers often compose backward from the curtains, beginning with the fourth-act curtain that concludes the episode.<sup>30</sup> In the *Felicity* (WB, 1998–2002) episode “The Fugue” (2 March 1999), the fourth-act curtain, the most significant dramatic moment in the episode, comes when Felicity decides to sleep with an acquaintance from her art class, Eli. This tentatively answers the main question posed in the first act: will Felicity and her boyfriend Noel stay together or break up? At the fourth-act curtain not only are they apart, but Felicity has moved on to someone else. Each of the previous curtains functions to pose a question or problem. The precredit teaser asks what Noel’s ex-girlfriend, Hannah, is really doing in New York City. The first-act curtain has Noel and Hannah kiss. The second-act curtain has a confrontation between Noel and Felicity. By the third-act curtain Noel has left Felicity for Hannah, and at the act’s end Felicity goes off with Eli to retrieve some sketches from the art studio, focusing the question of whether she will get together with him, which is answered at the final curtain.

As in a stage melodrama, a television program’s curtains crystallize the dramatic developments of the act and sometimes introduce a surprise or *coup de théâtre*, as in the act 1 curtain of “The Fugue,” when Noel and Hannah kiss. Like the PTS’s beat structure, its curtains function to rivet the audience to the screen.<sup>31</sup> One teleplay manual puts it like this: “Remember your goal. It’s to pull ‘em back from the refrigerator.”<sup>32</sup> It is thus standard that writers save their strongest beats for the curtains. It is also typical for a curtain to fall on a reaction shot of the main character, a classic soap opera device that intensifies our interest in character psychology.

This act structure is another example of how the interplay of commercial and aesthetic functions structures television storytelling. There is no natural reason for the segmentation of the narrative to be in four equal portions with breaks each quarter-hour, but this formal arrangement serves a variety of interests, not least the economic one of interspersing advertisements at regular intervals during the broadcast. From an aesthetic perspective a four-act structure achieves a sense of proportion and symmetry, ensures steadily rising action, and organizes patterns of attention and expectation, with first acts opening causal chains that are carried across the second and third acts to be resolved (at least partially) in the fourth.

On legal shows the first act may introduce the case, the fourth may bring a decision. *Buffy* unveils a threat to Sunnydale in act 1 and removes it in act 4. Dramas with a stronger focus on the domestic still raise focused questions in act 1, as in the *thirtysomething* (ABC, 1987–91) episode “Prelude to a Bris” (29 September 1990). When their son, Leo, is born, Hope and Michael must decide if he will have a bris, and Michael must decide whether being Jewish is an important part of his identity. Act 4: the bris, a symbolic moment not only of the child’s entry into the world but also of Michael’s embrace of his heritage. Of course, these episodes also have narrative elements that continue across the span of a season or series (the birth of Leo is a moment in the Steadman family arc), but they tend to raise and resolve significant plot problems each week.

This tight dramatic act structure satisfies the audience’s desire for resolution – not totally but adequately. It is gratifying to discover novel but apt solutions to well-posed problems, as television narratives often do week after week. But this is not the only means by which episode-specific structures appeal to the audience. Another perennial

option is thematic parallelism. It would seem an obvious one when dealing with multiple story lines: have them inflect and play off each other, revealing contrasts and similarities.<sup>33</sup> The most straightforward kind of parallelism has a pair of A plots share a theme. The final act of “The Fugue” uses crosscutting to establish parallelism. Shots of Noel and Hannah are alternated with shots of Felicity and Eli, while sounds of rain and of Hannah’s piano composition bleed over from one scene into the next to tie them together. Congruent thematic material is also frequently ironically inverted, as in the *Lost* episode “Do No Harm” (6 April 2005), in which one character is born at the same time that another dies.

In a typical *Judging Amy* episode Judge Amy Gray’s juvenile court case and her mother, Maxine’s social work case and the various family story lines are all tied up in the same set of thematic concerns, with inversions and variations running up against one another. “Spoil the Child” (11 January 2000) has Amy and Maxine both face instances connecting children and violence. As is often the case not only with *Judging Amy* but with programs as different as *Rescue Me* (FX, 2004–) and *Once and Again* (ABC, 1999–2002) the episode’s title keys us into the theme. In Amy’s case a father’s custody is challenged on the grounds that he spanks his children. In Maxine’s case it is the child who is violent, striking her when she tries to counsel him. As well, the main characters face inverse career-defining questions: Amy is up for a promotion from juvenile to criminal court, while Maxine considers quitting her job with the Department of Children and Families because of the stress it causes her. In the course of offering her the promotion Amy’s boss derides the juvenile bench as “social work,” making it clear to the audience that Amy and her mother both toil at the same kind of job despite many differences. The work of helping children and families is at stake in both characters’ choices.

As in most *Judging Amy* episodes, the troubled families depicted in the professional plots are a foil for the Gray family. However, in this episode both Amy’s and Maxine’s performances as mother are questioned. As always, Amy must balance her obligations as a judge and as a single mom, and in the first act of “Spoil the Child” she takes her six-year-old daughter, Lauren, to pick up a butterfly outfit for her dance recital. Because Amy’s life is so busy she has put this errand off too long. The shop has sold out of butterflies, and Lauren throws a tantrum. The only option left is for Amy to sew the outfit herself, and Lauren fears it will be different from the other kids’ costumes. With all of the family looking on before dinner Lauren shouts, “You’re a bad mommy and I hate you! You ruined my life!” Meanwhile, Amy is upset with Maxine because she has never come to her courtroom to see her on the bench, and when she tells her mother this Maxine becomes angry and says, “It’s not my job to make you feel better.” Thus the six year old’s dance recital and her mother’s job as a judge are parallel performances where a mother, as spectator, is supposed to take pride in the child. Each mother is accused of failing to make the performance happen.

As is often the case, a question before Amy in court – how should a parent treat a child? – is one she faces in her own family. It is also typical that Amy’s inability to have her own life go smoothly is an ironic contrast against the role she takes on as a judge, assuredly making crucial decisions affecting other people’s lives. It is typical of *Judging Amy* that episodes are built on this kind of complex structural coherence.

How does “Spoil the Child” resolve its situations? Amy stays on the juvenile bench, affirming her commitment to “social work.” Maxine continues at her job, fighting for a psychiatric placement for her assailant. The Gray women affirm their commitment to public service on behalf of children and families. Amy also stays up all night sewing

Lauren's costume, and the dance recital is a success. Most important, Maxine attends Amy's court session and hears her judgment on the spanking case. Amy rules that the parent may not strike his child and speaks eloquently about the importance of the parent-child bond, absorbing and reiterating all of her mother's teachings. Maxine's eyes well up with tears, and after Amy is finished her mother turns to the person next to her and says, "That's my daughter." This scene epitomizes the way *Judging Amy* works: in a single moment all of the narrative threads of the episode are brought together in an affirmation of reciprocal familial obligations and pleasures.

As "Spoil the Child" makes clear, closure is not simply a matter of questions being answered, problems being solved. A closed form is one in which the elements all hang together in an integrated pattern. The parallelisms in "Spoil the Child" give the episode a clear shape and can make the experience of watching it satisfying not only because of its affirmation of ethics that the audience likely shares, not only because of the emotional charge of the sentimental ending, but also because of an aesthetic sophistication that can bring its own rewards. It has harmony that no open form can claim, a counterpoint of narrative voices that satisfies a desire not only for resolution but also for formal unity and thematic clarity. *Judging Amy* achieved similar effects week after week, balancing its episodic "case" plots with arcing story lines about Amy's family and coworkers and integrating all of them thematically. It is the epitome of the post-*Law & Order* serial poised to snag casual viewers in reruns while also satisfying its loyal fans week after week.

### Macro Level: Arcs

What most distinguishes the PTS from other forms of programming is the way it is invested in character.<sup>34</sup> It is not merely plots that carry over week after week but characters whose lives these plots define. We don't just want to know what's going to happen but what's going to happen to Pembleton and Bayliss (*Homicide: Life on the Street*, NBC, 1993–99), Buffy and Spike, Angela and Jordan (*My So-Called Life*, ABC, 1994–95). Continuing stories make characters more likely to undergo significant life events and changes.<sup>35</sup> In reaction to these changes in circumstances the characters themselves are more likely to change or at least to grow.

Characters in serials demand an investment in time. They invite regular viewing over a long term, charting a progression of the characters' life events. It is true that in episodic forms such as the traditional sit-com there may also be a strong investment in character, but it is of a different nature, based more on the familiarity bred by repetition than on engagement with unfolding events. In a given episode of *Happy Days* (ABC, 1974–84) the viewer's interest in character is often a product of recognizing familiar bits of action, mise-en-scène, and dialogue: taking dates to Inspiration Point, eating at Arnold's, asking Fonzie's advice in the men's room, blue cardigans for the boys, long skirts for the girls, Fonzie's jacket, Chachi's bandana, "Aaaay," "Yowza," "I found my thrill," "I still got it," "Mrs. C," "wa wa wa." In contrast, the investment in a serial character is based on a more novelistic progression of events over a long duration, with episodes like chapters in an ongoing saga rather than self-contained stories.<sup>36</sup> (It is arguable that in its later seasons *Happy Days* began to offer some of these pleasures as the characters grew up and changed.) Characterization in the PTS is more likely to have a certain kind of depth as the audience knows more about the characters' inner lives in serials than in many episodic shows. Especially in comparison to the episodic drama

represented by the recent crop of procedurals in the mold of *Law & Order*, the PTS is a character-driven form, and this is one thing that makes it more easily figured as “quality TV” in popular and critical discourse.

It is sometimes incorrectly said that on episodic shows characters seem to have no memory of the previous week’s events.<sup>37</sup> What is more important than character memory, however, is that *viewers* of episodic shows need no memory of the previous episodes to understand and appreciate the present one. Episodes may be seen in any order and may be skipped without compromising future comprehension and engagement. The PTS, on the other hand, makes significant demands on the audience, which it rewards with a much fuller experience of character. The audience is expected – ideally – to watch the episodes in sequence, to track character and plot developments carefully, and to tune in every week.

The device that best ensures this commitment to the narrative is the character arc. Arc is to character as plot is to story. Put slightly differently, arc is plot stated in terms of character. An arc is a character’s journey from A through B, C, and D to E. This term has remarkable utility in describing PTS storytelling: although each episode, sweeps period, season, and series may have its own shape and unity, each character’s story can be individuated, spatialized as an arc overlapping all of these and all of the other characters’ arcs.<sup>38</sup>

Character arcs may stretch across many episodes, seasons, and the entirety of a series. The shape of the largest character arcs are those of the life span, with its progression from youth to adulthood, innocence to experience. Some call this a show’s “emotional through line.”<sup>39</sup> It is not only children such as Angela Chase, Lindsay Weir, and Willow Rosenberg who grow up on television shows. Joel Fleishman gains the folk wisdom of his Alaskan neighbors as a complement to his formal schooling. Boomer on *St. Elsewhere* begins as a greenhorn intern and grows through his survival of multiple traumas. The detectives on *Homicide* each come to grips, at some point, with a life-changing moment that marks a passage into greater maturity.

These life-span arcs operate on the level of the series, but there are more manageable-sized arcs that writers deal with more commonly in crafting stories. Like beat and episode structures, arc structures function under commercial and aesthetic imperatives. There are two salient commercial constraints. First, in addition to focused cliffhangers connecting the end of one episode and the beginning of another, the questions that dangle week after week serve to maintain suspense. On *Dawson’s Creek* (WB, 1998–2003) will Joey tell Dawson that she is in love with him? On *Homicide* what if any consequences will Kellerman face for killing Luther Mahoney? Perhaps the most famous of these danglers has its own slang term – a will-they-or-won’t-they – as on *Moonlighting* (ABC, 1985–89): will Maddie and David sleep together or won’t they? By posing these questions programs strive to maintain our viewership, to keep us interested and drive up ratings.

Another commercial imperative has to do with the organization of the season into segments.<sup>40</sup> The season has at least five definable segments: fall premieres (September–October), fall sweeps (November), a holiday rerun period (December–January), winter sweeps (February), another rerun period (March–April), and spring sweeps/season finales (May). Most PTSs run around twenty-four episodes per season. Networks save new episodes for sweeps periods, on the basis of which advertising rates are set according to each show’s Nielsen ratings. They avoid reruns at the beginning of the season, figuring that new episodes will maintain and increase interest in a show. This gives the network at

least eight weeks of episodes to begin the season and another eight to air during the winter and spring sweeps for a total of sixteen episodes. The remaining episodes are aired in December, January, March, or April.

The implications of this season segmentation for narrative form are clear. Just as episodes build toward strong curtains, seasons build toward strong sweeps episodes. Some shows have definable arcs that stretch across a whole season, but the demands of the three sweeps periods make arcs more easily constructed in units of around six or eight episodes than in units of twenty-four. Thus we may think of the season, as well as the episode, as having acts. Each season has three.

When writing staffs begin to work on a season they will sometimes plot out the most major developments of the whole year of shows. Some writers' rooms keep an outline of the whole season's story on the wall. But even on a show such as *24* (Fox, 2001–), which has a tightly focused season structure, the conception of arcs happens in a more piece-meal fashion. *24* does not plot out its whole season in advance. Its staff breaks the story in groups of six or eight episodes.<sup>41</sup> Eight, it turns out, is a much more manageable chunk of story to break. This isn't to say that the eight episodes have the same kind of coherence as an individual episode. But across these larger segments of story – call them “season acts” – definable problems are introduced, developed, and resolved. Intuitively it makes sense, moreover, that viewers experience television stories in segments larger than episodes but smaller than seasons. We engage with the narrative on an ongoing basis but certainly do not have the memory that would allow us to hold a whole season, as it were, in our heads.

Since the main plots of any given PTS episode may be largely self-contained, many an arc is strung along episode after episode with a few lines of dialogue or a scene or two that just barely pushes it forward. On *Judging Amy* Peter and Gillian's quest to have a child takes two seasons to resolve fully, with no single episode in which it is an A plot. It is, however, broken up into smaller units of storytelling, beginning with the pilot: considering and trying in vitro, pursuing an adoption, losing Ned when his birth mother changes her mind, and so on, until finally during May sweeps of the second season they have their son back for good.<sup>42</sup> Although this is a very long arc, it is broken up into more manageable chunks that overlap with the season acts.

Season acts made up of several episodes do not necessarily coincide neatly with character arcs, and the idea of an arc suggests that each character's may begin and end at different points. But there is considerable overlap between the season act and the main characters' arcs, if for no other reason than because plot and character are not independent of one another. Rory's arc in the fifth-season episodes of *Gilmore Girls* discussed above offers a clear example. The shape of season act 3 is defined by Rory's encounters with the Huntzbergers. Just as individual episodes present problems and solutions, so do season acts. What will happen with Rory and Logan? How will the Huntzbergers, Lorelai, Richard, and Emily respond? What implications will these events have for Rory's future? These questions span the series of episodes culminating in the season finale, when Rory decides to quit Yale and move in with her grandparents.

Arcs also share a shape with season acts because characters' lives are intertwined, with each character's goals shaped by the other characters' goals. Lorelai Gilmore's arc in season act 3 could be independent of Rory's and often seems so. Lorelai faces a cluster of related questions that scarcely involve her daughter. What kind of relationship should she have with her meddlesome, snobbish parents? Should she sell the Dragonfly Inn and take a job that might mean moving away from Stars Hollow? What will happen in her

relationship with Luke? Unbeknownst to Lorelai, during all of this time Luke is planning on asking her to marry him, considering buying a new house where they both will live, and hoping eventually to have children together. So Rory's arc with Logan and the internship and Lorelai's arc with Richard and Emily, the Dragonfly, and Luke are hardly intertwined.

In the season finale, "A House Is Not a Home" (17 May 2005), they come together when Lorelai responds to Rory's decision to quit school. She reluctantly goes to her parents to ask them for help in convincing Rory to return to Yale, and they agree, only to go back on their word and allow Rory to move in with them and take time off. This answers question number one: Lorelai will return to her policy of having nothing to do with Richard and Emily. But when she tells Luke about this he becomes hyperbolically irate and insists that they kidnap Rory and force her to go to school every day. In this moment Lorelai is so moved by Luke's concern for her and Rory that she asks him to marry her, a cliffhanger season-ending curtain. This suggests likely answers to questions two and three: at the end of season five it seems likely that Lorelai will not sell the Dragonfly and that her relationship with Luke will progress to marriage, if not to the new house and kids of his dreams. What's most important to this discussion, however, is the way the various characters' arcs resolve in unison. Rory's decision to quit school and move in with her grandparents and Lorelai's proposal to Luke are caught up in the same dramatic progression. Rory's actions affect Lorelai's, which affect Luke's, which affect Lorelai's. The arcs resolve as one, making the May sweeps episodes into a coherent unit of narrative. This pattern of coalescing arcs means that in any given episode the various plots might not seem to be connected. Ultimately, however, they can be brought together as part of a single pattern of dramatic resolution. Again the PTS form tends toward narrative unity and coherence.

What, then, of units of storytelling larger than a season act? What about the season as a unit of storytelling? Cable dramas such as *Nip/Tuck* (FX, 2003–) and *The L Word* (Showtime, 2004–) have thirteen-episode seasons, making it easier to think of the season as a meaningful narrative unit. Each *Buffy* season has a season-spanning conflict in which the characters confront a "big bad." But each season has many episodes in which the "big bad" figures only marginally into the conflict. Certainly *24*, with its high-concept narrative structure, demands to be considered as a season. But *24* segments the season's conflicts into subconflicts. The first few episodes of season four follow the attempted assassination of a cabinet secretary; when this is averted the characters realize there is a nuclear attack under way and turn their attention to averting it; and so on. Their overarching goal is to defeat the terrorists, but this is accomplished through subgoals that structure smaller units of narrative as other shows do. In general, the season is at best a loose kind of narrative unit, but the season acts culminating during sweeps function as tight, coherent segments.

Arcs, like beats and episodes, have their own functions and effects. They are a way of managing story material, of crafting it into a meaningful whole. Arcs and the season acts subtending them are, no less than beats and episodes, a product of an advertising-driven industrial context of narrative production. They are a means of compelling weekly viewing and of maximizing ratings when it matters most to the networks. But they also come with the aesthetic functions of generating interest in character, of engaging the audience in the struggles and discoveries, the lives and loves of their TV friends, and of maximizing formal unity. As at all levels of television storytelling the largest, macro level is designed to best please the audience.

## Conclusion

These are a handful of narrative givens shared among writers and viewers of hundreds of different programs. Beats, episodes, and arcs offer proven means of winning audiences over. But the direction of influence is not simply from the corporate office to the writers' room. Although they serve commercial functions, once these become norms of storytelling practice the networks recognize their narrative utility, and thus a kind of feedback loop is initiated between the creative and corporate branches of the industry. A device like redundancy is seen to serve everyone's interests. A network's executives might not appreciate true originality, but they respect the proven storytelling resources of television's craft tradition. Other means of prospective profit boosting than those I have considered have come along (e.g., interactivity, product placement, sweeps season cross-overs, and "super-size" episodes). Whether they originate in the writers' room or the boardroom, if they ultimately do not amount to a way for television to tell better stories, they are unlikely to become integrated into narrative television's norms.<sup>43</sup>

One veteran writer of television dramas sums up her job as follows: "Once I have decided on a story to tell, I then get out the entire bag of writer's tricks in order to make the audience feel what I need it to feel – otherwise, I won't hold its interest, and it won't hear anything I have to say....I always write with the audience in mind."<sup>44</sup> The bag of tricks, the audience in mind: the television artist is as attuned as any storyteller to the effects of narrative. The programs I have discussed here are at once a source of handsome profits and intense pleasures. These profits and pleasures transcend critical judgments of quality. The practices that produce them – the tricks in the bag – compel the attention of anyone interested in the narratives of popular culture.

## Notes

I would like to thank Elana Levine and the *Velvet Light Trap* editorial board for the help they offered me in completing this article.

- 1 Sarah Kozloff, "Narrative Theory," *Channels of Discourse, Reassembled: Television and Contemporary Criticism*, ed. Robert C. Allen, 2nd ed. (Chapel Hill: U of North Carolina P, 1992) 67–100, asserts that narrative theory "leaves to other critical methods questions about where the story comes from ... and the myriad effects (psychological or sociological) that the text has upon its audience" (68). Cf. Michael J. Porter, "The Structure of Television Narratives," *Critical Approaches to Television*, ed. Leah R. Vande Berg, Lawrence A. Wenner, and Bruce E. Gronbeck (Boston: Houghton Mifflin, 1998) 140–57.
- 2 My conception of poetics comes from Aristotle's *Poetics* and from David Bordwell's call for a historical poetics of cinema. See, for example, Bordwell, *Ozu and the Poetics of Cinema* (Princeton: Princeton UP, 1988) and *Making Meaning: Inference and Rhetoric in the Interpretation of Cinema* (Cambridge: Harvard UP, 1989) 263–74. See also Henry Jenkins, "Historical Poetics," in Joanne Hollows and Marc Jancovich, eds., *Approaches to Popular Film* (Manchester: Manchester UP, 1995).
- 3 Other approaches such as ethnographic or reception studies also illuminate aspects of the audience's experience, but poetics takes as its central object of study the text itself and offers insights about its origins and uses on the basis of its design features. Thus poetics might logically be seen as a first – but certainly not last – step in understanding how a narrative text functions within the contexts of its modes of production and reception. Other approaches might better explain the social circulation and the political use value of narratives; poetics seeks to illuminate a text's aesthetic strategies.

- 4 There are antecedents of the prime-time serial in the 1960s (*Peyton Place*, ABC, 1964–69) and the 1970s (*Family*, ABC, 1976–80). As well, at least since the 1970s in shows such as *Soap* (ABC, 1977–82) and *Mary Hartman, Mary Hartman* (syn., 1976–78), situation comedies have also been increasingly serialized, so some of my points here apply to some sit-coms as well.
- Why did the serial emerge in the late 1970s and early 1980s as a major prime-time form? One must consider a complex interaction of social and industrial forces in speculating about this kind of phenomenon, and no body of research has yet offered a thorough consideration of them. Julie D'Acci, *Defining Women: Television and the Case of "Cagney & Lacey"* (Chapel Hill: U of North Carolina P, 1994) 72, briefly considers the “soapoperafication” of prime time in relation to the construction of a “working woman” audience in the early 1980s. This topic is an important and intriguing one for future research.
- 5 Although many of my examples are of fairly recent programs (those most easily available to me to watch), I intend my points to apply to the PTS in general, not only to recent examples.
- 6 Jane Feuer, “Quality Drama in the U.S.: The New ‘Golden Age?’” *The Television History Book*, ed. Michele Hilmes (London: BFI, 2003) 99; Robin Nelson, “*Hill Street Blues*,” *Fifty Key Television Programs*, ed. Glen Creeber (London: Arnold, 2003) 104, refers to *Hill Street* as the program that “paved the way for the dominance of the series/serial hybrid”; Thomas Schatz, “*St. Elsewhere* and the Evolution of the Ensemble Series,” *Television: The Critical View*, ed. Horace Newcomb, 4th ed. (New York: Oxford, 1987) 94, writes that *St. Elsewhere* “struck a compromise between ... episodic and serial strategies.” See also Jane Feuer, Paul Kerr, and Tise Vahimagi, *MTM: “Quality Television”* (London: BFI, 1984) 25–26, 85–100.
- 7 Robert J. Thompson, *Television’s Second Golden Age: From Hill Street Blues to ER* (Syracuse: Syracuse UP, 1996), argues that some prime-time serials of the 1980s and 1990s constitute a genre of “quality TV.” He thus links a formal criterion – serialized, ensemble storytelling – to one of aesthetic value, though he notes that at least one critic uses the terms “quality drama” as a put-down (13). This confuses categories of narrative form and critical judgment. Unlike Thompson, I am interested in understanding what instances of the PTS generally have in common regardless of any program’s “quality” or lack of it, however construed.
- 8 Noël Carroll, *A Philosophy of Mass Art* (Oxford: Oxford UP, 1998) 245–90.
- 9 Madeline DiMaggio, *How to Write for Television* (New York: Prentice-Hall, 1990) 88. Certainly the actors’ pace of delivery affects this page-to-minute ratio, and scripts for shows such as *Gilmore Girls* have longer page counts than less talky, slower-paced programs.
- 10 Larry Brody, *Television Writing from the Inside Out: Your Channel to Success* (New York: Applause, 2003) 77, 150–51.
- 11 Some writers call this “cracking” or “beating” the story. A good description of this process of group story construction can be found in John Wells, “Team Writing,” in Julian Friedman, ed., *Writing Long-Running Television Series* (Shoreham-by-Sea, UK: Gwynprint, 1996) 2:194–205; Amy Sherman-Palladino discusses her experiences with team writing on *Roseanne*, *Veronica’s Closet*, and *Gilmore Girls* in a 5 May 2005 radio interview on “Fresh Air with Terry Gross,” archived online at [www.npr.org](http://www.npr.org).
- 12 Brody 76.
- 13 Ibid., 92. According to Brody, first acts usually have more, shorter beats and last acts fewer, longer ones. See also Douglas Heil, *Prime-Time Authorship: Works about and by Three TV Dramatists* (Syracuse: Syracuse UP, 2002) 133–34.
- 14 Rich Whiteside, “The Small Screen: Judging Amy,” *scr(i)pt* 9.1 (Jan.–Feb. 2003). I accessed this and other *scr(i)pt* sources either online at [www.scriptmag.com](http://www.scriptmag.com) or through interlibrary loans delivered as PDF files; in both formats the page numbers were not available.
- 15 Robert C. Allen, “*The Guiding Light*: Soap Opera as Economic Product and Cultural Document,” in Newcomb 150 (4th ed.), analyzes this repetitive exposition in daytime drama.
- 16 David Bordwell, *Narration in the Fiction Film* (Madison: U of Wisconsin P, 1988) 70–73; Tania Modleski, “The Rhythms of Reception: Daytime Television and Women’s Work,” *Regarding Television: Critical Approaches – An Anthology*, ed. E. Ann Kaplan (Los Angeles: American Film Institute, 1983) 67–74.

- 17 These *Gilmore Girls* episodes are “But I’m a Gilmore” (26 April 2005), “How Many Kropogs to Cape Cod?” (3 May 2005), “Blame Booze and Melville” (10 May 2005), and “A House Is Not a Home” (17 May 2005).
- 18 Dennis Porter, “Soap Time: Thoughts on a Commodity Art Form,” *Television: The Critical View*, ed. Horace Newcomb, 2nd ed. (New York: Oxford UP, 1979) 89.
- 19 Robert C. Allen, *Speaking of Soap Operas* (Chapel Hill: U of North Carolina P, 1985) 82–84; Ellen Seiter, “Eco’s TV Guide – The Soaps,” *Tabloid 5* (Winter 1982): 35–43. Allen and Seiter’s usage follows Umberto Eco, *The Role of the Reader: Explorations in the Semiotics of Texts* (Bloomington: Indiana UP, 1979), which contains a reprint of his 1959 essay, “The Poetics of the Open Work,” 47–66. See also Jane Feuer, *Seeing Through the Eighties* (Durham, NC: Duke UP, 1995) 121–30. Allen, Seiter, and Feuer all apply Eco’s notion of the open work to soap operas.

- 22 Feuer, *Seeing Through the Eighties* 122, makes a similar point about episodic closure in the serial form.
- 23 Brian Lowry and Jim Benson, “New Hours of Power?” *Variety* 24 Oct. 1994: 39; John Dempsey, “FX Hopes for Big Effects of New Buys,” *Variety* 1 Oct. 2001: 30; Brian Lowry, “Tuning In,” *Variety* 4 Apr. 2005: 19.
- 24 Gary Levin, “Reruns Have Some Viewers Seeing Double,” *USA Today* 30 Sept. 1999: 3D; John Dempsey, “Wolf Pack Leads Cable with ‘Law & Order,’” *Variety* 6 Oct. 2003: 26.
- 25 Elizabeth Guider, “Franchise Mints Global Coin,” *Daily Variety* 18 Nov. 2003, special section 1: A1.
- 26 Many shows today begin with a teaser, one or two beats that precede the credit sequence, which functions as part of act 1. Some, including *Lost* and *The O.C.* (Fox, 2003–), break act 4 into two shorter segments. However the commercial breaks are distributed, a four-act structure obtains as a norm of the PTS, even in premium cable shows, as Kristin Thompson, *Storytelling in Film and Television* (Cambridge: Harvard UP, 2003) 51–55, has shown in an analysis of *The Sopranos*.
- In the 2005–06 season there seems to be a new near-universal practice of having more than four segments per hour, with some programs such as *Commander-in-Chief* (ABC, 2005–) having some nonteaser segments of less than five minutes. The 2005–06 season has also revived the convention of the “tag,” a short epilogue scene before the closing credits that was standard in the 1970s. It remains to be seen whether inserting extra commercial breaks and segments will force a reconsideration of the notion of a four-act structure, which may obtain regardless of where the breaks are inserted.
- 27 Indeed, Kristin Thompson, *Storytelling in the New Hollywood* (Cambridge: Harvard UP, 1999), has convincingly argued that Hollywood movies are better understood as having four rather than three acts, and in *Storytelling in Film and Television* 40–55, she shows that the same four-act pattern applies in television storytelling.
- 28 Syndicated reruns often rearrange the commercial breaks to add extra ones, doing a kind of violence to the text by betraying the viewer’s expectations of forward progress midact and of a pause at act’s end.
- 29 Two industry terms for the end of an act are “act end” and “act out,” but neither of these has the strength of connotation that “curtain” has.
- 30 DiMaggio 90; Brody 126; Rich Whiteside, “The Small Screen: *Alias*,” *scr(i)pt* 9.2 (Mar.–Apr. 2003).
- 31 It is a television industry mantra that the second-act curtain should be the strongest because the commercial break on the half-hour is twice as long as those on the quarter-hours, but I have not noticed a difference in the strength of curtains between acts 1 and 2, both of which are typically quite forceful. My sense, however, is that third-act curtains are less likely to be as dramatic or surprising. On the second-act “cliffhanger” see DiMaggio 44–45.
- 32 Ibid., 45.
- 33 On some shows, such as *Nip/Tuck*, coming up with the theme precedes breaking the story. See Rich Whiteside, “The Small Screen: *Nip/Tuck* – A Slice of the New Americana,” *scr(i)pt* 10.1 (Jan.–Feb. 2004): 56–59. The writers on *Judging Amy* claim that they begin with ideas for Gray family stories, then find their themes, and only then conceive of cases for Amy and Maxine. See Whiteside, “The Small Screen: *Judging Amy*.”

- 34 Porter asserts that this is a general feature of television without distinguishing between serials and episodic shows ("The Structure" 141). He then goes on to analyze an episode of *ER*, a serial narrative.
- 35 This kind of serialization is increasingly common on half-hour shows such as *Friends* (NBC, 1994–2004) and *Sex and the City* (HBO, 1998–2004), and many of my points in this section would apply to them.
- 36 In some ways these observations about *Happy Days* apply as well to traditional episodic dramas such as *Baywatch* (syn., 1989–2001), which draw heavily on the repetition of motifs. But some episodic dramas, such as *Magnum P.I.* (CBS, 1980–88) and *The Closer* (TNT, 2005–), combine minor serial arcs with an overriding emphasis on weekly cases. As such, they combine the appeals of sit-com repetition and serialized long-format character engagement. Recent sit-coms such as *Friends* and *Sex and the City* offer a similar mix, with the emphasis more heavily on the serialized mode as the programs matured through their runs.
- 37 Kozloff calls this a "truism of television criticism" (91).
- 38 Because television writing advice is aimed at aspiring writers who have not yet made it to staff positions, their focus is on writing spec scripts of episodes. Thus there is scant treatment of long-form storytelling in books and articles on teleplay writing. Ironically, arcs come up more in movie screenwriting manuals than in those for television, though the term most likely originates in TV, not film. See, for example, Linda Seger, *Advanced Screenwriting: Raising Your Script to the Academy Award Level* (Los Angeles: Silman-James P, 2003) 167 ff.
- 39 LaDuke 133.
- 40 One hears many reports that the September-to-May season is a thing of the past, but the six networks still debut new episodes of most shows in the fall, conclude them in the spring, and rerun them in the summer. Furthermore, as long as the main sweeps seasons are in the fall, winter, and spring, the networks are likely to save many of their best episodes for these periods. In cases in which high-profile network programs (e.g., *Survivor*, *The O.C.*) have aired during the summer, it has almost always been a stunt to attract attention before the regular season has begun. Such programs tend to fall into the regular schedule once they become fixtures on a network's slate of shows.

Fox continues to premiere many programs in August rather than September because of its contract to air baseball games during prime time in October, which puts its regular programming on hiatus. But in most ways Fox still adheres to the traditional season; the aesthetics of season-long storytelling are not affected by this practice.

- 42 "Grounded" (8 May 2001).
- 43 I am not suggesting here that television writers have no motive for narrative experimentation or that commercial factors stifle the desire to try new things. I am also not implying that all narrative virtues have a source in the networks' profit motives. I am only arguing that the PTS as a group style is unlikely to adopt *as a stable, consistent norm* any commercially motivated innovation that is not also a means of telling stories efficiently or effectively.

# “From Beats to Arcs” 2015 Postscript

*Michael Z. Newman*

Ten years have passed since I wrote “From Beats to Arcs.” Television and the kind of shows I wrote about have changed in many ways major and minor in that time. From the vantage point of the present, disruptions can appear more prominent than continuities, and despite some of the shifts and novelties I observe in TV storytelling (along with TV as business, technology, and experience), I also see a stable and adaptable system. Advertising-supported TV narrative is still written around commercial breaks and seasons. Beats and arcs are no more or less significant than they were generally speaking as tools of narrative design and construction, though many network shows break for ads more frequently than in the past. In all genres of TV, episodic unity tends to be a strong value. Like anyone who has been paying attention, though, I have been aware of emerging forms and new modes of viewing.

I made a point to discuss broadcast network shows in “From Beats to Arcs” and avoided focusing on the more prestigious premium cable dramas like *The Sopranos*, which seemed in some ways to differ in narrative form. Their lack of commercials, shorter seasons, and apparent absence of industrial constraints often make them appear altogether different from network serials, which by contrast sometimes look quite formulaic. I emphasized commercial network fare in order to appreciate its aesthetic achievements in the face of widespread denigration. The network/cable dichotomy is often oversold, even more now than ten years ago, and can function as much to affirm conservative taste distinction as to identify two sets of conventions.<sup>1</sup> But the differences reveal that some forms of serialized TV storytelling work according to their own constraints and opportunities, which we can appreciate by looking at one exemplar of the cable style of the past decade: *Mad Men*, which ran from 2007–2015.

Like any television show, *Mad Men* is the product of extensive collaboration, but its creative authorship is strongly attributed to the showrunner Matthew Weiner, whose previous work included both network comedies and *The Sopranos*.<sup>2</sup> As a prestige product adding luster to the basic cable channel AMC’s brand identity, *Mad Men* draws on the cachet of premium cable HBO, whose original dramas have set a standard for artistry in television. It follows the HBO style in many ways.

While, unlike HBO, AMC is advertising-supported and breaks the episodes of *Mad Men* into segments between commercial breaks, the episodes are clearly written and shot without these pauses in mind. Like many cable series, a season consists not of 22 or more episodes as remains typical on broadcast networks, but thirteen (the seventh season has fourteen, divided into two halves of seven). These two conventions of the cable drama, the absence of breaks and the shorter season, are both products of their own commercial logic. Success might not be defined as much by how many viewers watch a

live airing, and audiences tend to be smaller though perhaps more desirable for their affluence. But unlike networks, cable channels earn income from cable or satellite providers per subscriber (“carriage fees”) and have an interest in being desirable both to consumers and cable and satellite companies. It would be an odd blunder to see cable channels, whether they are ad-supported or not, as somehow less commercial than broadcast networks.

What is the effect of episodes having no clearly marked acts? Acts in conventional TV storytelling build toward endings. In many instances, the break to commercial comes at the moment of greatest tension and uncertainty. Visual and musical techniques amplify these moments. A need to bring the drama to such a point four or more times in an hour produces patterns of rising action, raised stakes, complication and development. By ignoring the need for such moments, *Mad Men* perversely calls attention to the interruptive quality of commercial breaks. Perhaps a more ideal viewing situation is a binge on DVDs or streaming video. When viewing this way it is impossible to tell where the commercials would have appeared. And perhaps by refusing to adapt to the convention of interruption, Weiner signals his desire for autonomy from commercialism, adding authority to his creative identity.

And yet there is still pattern and rhythm in *Mad Men*'s episodes. Many of them introduce a new character, client, or situation in the first few scenes, leading up to a series of further events, some of which are resolved within the hour, and some of which provide material for further storytelling. An episode might be based around a trip to California or the development of a new campaign to be pitched at a meeting. Many episodes build toward parties, whether at home, in the office, or in another location. In the fourth-season episode “Waldorf Stories,” the Clio awards are first mentioned in the expository scenes, and later the contingent from the ad agency wins their Clio and faces implications and consequences of the characters’ drunkenness after the ceremony. This pattern is not so different from less prestigious shows like *Revenge* typically building up to their third- or fourth-act parties with their confrontations and revelations.

Unlike many network shows, *Mad Men*'s beats tend to lack recapitulations of basic information. The subtle style of storytelling here avoids recapping, and rewards the audience for having paid close attention all along. For viewers who track the characters' trajectories carefully over the seasons, there are pleasures in knowing what characters must be thinking without being reminded overtly. In the first few episodes of season three, the developments from the end of season two are never formally explained in dialog, and the control of Sterling Cooper by the British firm Puttnam, Powell, and Lowe is taken as understood. So many elements of the story work like this: you need to remember them. You need to remember that Don is Dick, that Peggy had Pete's baby, that Joan was Roger's mistress, and who knows what about whom. Occasionally, at moments of heightened drama and as payoff to a long series of episodes of development, one character learns another character's story, as happens at the end of season two with Peggy telling Pete that she had his child and gave the baby away, and at the end of season three with Betty learning of Don's past identity and family history. At these moments characters narrate their secrets in dialog, and the audience is granted the pleasure or pain of witnessing the characters' reactions to deeply meaningful news. But the ordinary recapping in dialog scene-by-scene and episode-by-episode is absent.

While it might be tempting to see this as an aesthetic advantage, perhaps we can also see tradeoffs. The more obvious style of beats that introduce new information while reminding the audience of old information produces its own pleasures. The *Mad Men*

style, while more obscure, emphasizes unspoken thematic or symbolic meaning often as a complement to more action-oriented plot developments. And by saving the repetition of key plot information for so many episodes, it boosts their impact. The dedicated, attentive viewer is rewarded for their insight and interpretive work, and their long-term investment in a slowly, elegantly unfolding canvas rich with historical and psychological insight and attention to detail in the show's *mise en scène*.

Network and cable styles need not exist in hierarchy. *Mad Men* and “quality TV” more generally is addressed at more than one audience, and increasingly the afterlife of such shows is not so much cable reruns as DVD or Blu-ray discs, video on demand, and streaming services like Netflix. In all of these secondary distribution outlets, viewers often watch many episodes in rapid succession, rendering recapping somewhat superfluous. The network drama is also addressed at this market, but its live audience (the audience for “linear TV”) is still most crucial to the business model of the broadcast networks who sell audiences to advertisers. AMC’s business model is more complicated, and more than the networks, it has an interest in burnishing its brand identity. AMC’s reputation as a source of high-quality original programs, which *Mad Men* established, helped its clout in negotiations over carriage fees with cable providers, which ultimately increased its revenue from subscriber fees.<sup>3</sup> Many observers saw putting *Mad Men* on as a way for AMC to become the next HBO, a cable channel with “brand buzz.”<sup>4</sup> *Mad Men*, according to an industry trade paper, put AMC “on the map with ad buyers and cable operators.”<sup>5</sup> Unlike the typical broadcast program, then, *Mad Men* has been a loss leader for the network putting it on, appealing as prestige programming to bring benefits in addition to revenue from advertisements during breaks between segments. Its value is not equal only to the revenue it has earned from advertising, which does not cover the program’s costs.<sup>6</sup> *Mad Men* is a product not of a less commercial production context, merely of a different one.

As for the macro units of the narrative, the unity absent from many seasons of network TV is much stronger in a shorter cable season. This is evident from the heavy marketing and promotion at the debut of each new season, and from the packaging of the show, like many other upscale cable series, in DVD and Blu-ray box sets and iTunes and Amazon downloads by season for sale to consumers. The logic of the aftermarket in TV distribution is strongly invested in seasons as a unit of narrative consumption and of meaning. *Mad Men*, like any show, is produced a season at a time. The writers break the story into thirteen episodes, seeing a shape for the story in advance, a task more likely in a thirteen-episode season than in a longer form.

A season of *Mad Men* forms a well-defined arc. Season three, for instance, has a strong dimension of narrative unity as the intersecting stories of Don and the Draper family, the agency, and the other key characters (particularly Roger, Pete, Joan, and Peggy) have patterns of rising action, complication, and climax. When watching the season finale, “Shut the Door, Have a Seat,” many of the threads of the plot are revealed in the significance they might not have had all along. We see the story of the family’s breakdown and Betty’s impending marriage to Henry; the agency’s struggles suffering under foreign control, only to break away in establishing a new firm; Peggy’s effort to assert her independence in her new professional role and be taken seriously by the men, until finally she is recognized (and tells Roger she won’t get him coffee); Pete’s business acumen being seldom rewarded until he is chosen over his rival Ken to join the new firm; and Joan’s return to the agency after her absence, having suffered from Greg’s failure to be named chief surgical resident, which showed the danger of a woman’s fortunes being tied up in

her husband's. (Roger's conflict with his ex-wife and daughter after marrying the much younger Jane, culminating in the matching trauma of the Kennedy assassination and his daughter's wedding on the same day, happens in the penultimate episode.) One of the effects of watching the season-ending episode is regarding the previous twelve installments as moments leading up to the climactic plot developments: the Drapers' failure to keep their family together and the agency breaking off on its own. So many of the points along the way (such as the introduction of the at-first mysterious characters of Conrad Hilton and Henry Francis) were in anticipation of these events, which then push us forward into season four as we are introduced to a new office space for the firm with new characters, a new family for Betty, a new apartment for Don, new clients to pitch, and a new set of narrative questions to be answered over thirteen more hours.

One way *Mad Men* and shows like it have much in common with conventional TV network dramas is in the unity of their episodes. Despite a fair bit of open-endedness, a typical *Mad Men* has strong coherence both in its plot and its theme. Episode titles convey, perhaps obliquely, not just a key moment of plot made into an abstract for the story, but often an allusion suggesting deeper meanings: "Babylon," "The Wheel," "The Gold Violin," "Meditations in an Emergency," "The Chrysanthemum and the Sword," "Tomorrowland," "Lady Lazarus," "The Monolith." Sometimes questions raised in the early scenes of an episode are answered by the closing credits, but just as often they are deferred, as is typical of serial narratives. The third season episode "The Arrangements" is a good example of *Man Men*'s episodic unity. The episode's heaviest moment is the death of Betty's father Eugene, presaged by one scene in which he shows her the arrangements of the title for what to do in the event of his passing, and another in which he gives his grandson a dead German soldier's helmet he brought home from the First World War. But there are two other storylines about relations between parents and their adult children that resonate with the death of Grandpa Gene: Peggy disappoints her mother by moving to Manhattan with a new roommate, and upsets her mother further by giving the gift of a television set (as if it can substitute for a daughter's presence). And the agency takes on a new client, a rich kid who wants to make jai-alai into a major sport in the US (clearly folly), and whose exasperated father is a friend of the agency's founder Bert Cooper. The satisfaction of "The Arrangements," a combination of episodic and long-arching storytelling, is in some ways not much different from any serialized narrative, no matter how distinctive the upscale cable style of this particular program.

There is no natural reason why a serialized television series would have episodes with strong coherence and unity. It is a convention of production and reception, and it would seem no less vital to cable than to network series. Episodic unity works well in a system where episodes are the unit of consumption, whether in weekly doses or more rapidly. It works well in a system of production for managing labor and resources. Whether the unity is of story or theme, this convention works to the advantage of both the audience and the television industry. Episodes fit into patterns of both media work and audience leisure.

It is tempting to see the creative autonomy of quality TV writers and producers as a value in opposition to the compromised commercialism of traditional broadcasting. But it also functions within the capitalist media system as an appeal in its own right, a selling point to a desirable market segment and a means of product differentiation. And like all creative agency under capitalism, this autonomy always works in tension with the imperative of economic productivity. No action is unconstrained. The art of the cable drama

is not greater or lesser than that of the network drama, and perhaps not even less bound by convention, but it is a somewhat different form as a product of its own industrial circumstances.

## Notes

- 1 Network and cable are simplifications, as both categories admit a fair bit of variety within, and Netflix, Amazon, and other streaming online venues for programming overlap with cable without being traditional TV channels.

# CHAPTER 10

## Theory in Practice *The Subplot as Simplification in King Lear*

*Bridget Gellert Lyons*

Bridget Gellert Lyons taught English at Rutgers University. Her books include *Voices of Melancholy* (1971), *Reading in an Age of Theory* (1997), and *Chimes at Midnight* (1989).

LEAR'S WORDS just before his death have always eluded the attempts of critics to label what he sees, does, or feels at the moment that he utters them:

Pray you, undo this button: thank you, Sir.  
Do you see this? Look on her, look, her lips,  
Look there, look there! [*Dies*  
(5.3.309–11)

If we are rigorous in our analysis of this passage, we reject speculations like Bradley's about whether the king is dying of joy or grief: 'this' in line 310 lacks an antecedent and is therefore unclear. But there are other grounds for hesitating to fill in the gaps of Lear's fragmented requests and exclamations, and these grounds are related to the very different way in which we have learned of Gloucester's death shortly before. This event is narrated by Edgar and is not seen by the audience at all:

and in this habit  
Met I my father with his bleeding rings,  
Their precious stones new lost; became his guide,  
Led him, begg'd for him, sav'd him from despair;  
Never – O fault! – reveal'd myself unto him,  
Until some half-hour past, when I was arm'd;  
Not sure, though hoping, of this good success,  
I ask'd his blessing, and from first to last

*Original publication details:* Bridget Gellert Lyons, "The Subplot as Simplification in *King Lear*" from *Some Facets of King Lear: Essays in Prismatic Criticism*, ed. Rosalie Colie and F.T. Flahiff, pp. 23–38. University of Toronto Press, 1978. Reproduced with permission from University of Toronto Press.

Told him my pilgrimage: but his flaw'd heart,  
Alack, too weak the conflict to support!  
'Twixt two extremes of passion, joy and grief,  
Burst smilingly.

(5.3.188–99)

What this account lacks in immediacy it gains in coherence. We see Gloucester's death through the mediation of a narrator who structures the event in terms of known forms by which life and literature pattern themselves ('List a brief tale' in 5.3.181; 'my pilgrimage'), and who cannot speak of eyes without expressing their analogical value. Motives and moral evaluations are clearly spelled out, and there is no mystery about the death itself: the allusion to the conflict of passions which literally broke Gloucester's heart assumes the interlocking systems – moral, physiological, psychological – by which people of the Renaissance conventionally interpreted behaviour.<sup>1</sup> The passage's ornate figures ('Their precious stones new lost,' 'Burst smilingly') are also heightened expressions of its intelligibility.

Edgar's account, understandable in the way Bradley wanted Lear's death to be, points to some of the most characteristic differences between plot and subplot in the play. The Gloucester story intensifies our experience of the central action by supplying a sequence of parallels, impressed upon us by frequent commentary by the characters themselves:

GLOU. This villain of mine comes under the prediction; there's son  
against father: the King falls from bias of nature; there's father  
against child. We have seen the best of our time...

(1.2.114–18)

EDG. How light and portable my pain seems now  
When that which makes me bend makes the king bow;  
He childed as I father'd!

(3.6.111–13)

LEAR Let copulation thrive; for Gloucester's bastard son  
Was kinder to his father than my daughters  
Got 'tween the lawful sheets.

(4.6.117–19)

But repetition alone cannot supply dramatic interest, and the characters' consciousness of the existence of a mirror does not mean that the reflection is exact. Hamlet too sees Laertes as a 'foil,' but the audience is as much aware of the differences between the responses of the two characters as of the analogous situations that provoke those responses. The same point has been cogently made by Sigurd Burckhardt about the double plot in *King Lear*:

I submit that Shakespeare, in this tragedy and in no other, constructed parallel plots of considerable rigor, and that we must assume that he meant something by this structure. He cannot have meant the plots to be merely parallel, one reinforcing the other; for then the subplot would become a mere redundancy, and if ever an action needed no reinforcement of its impact, it is Lear's. There is every reason to think that the apparent similarity of the two plots is like that of controlled experiments, and that the meaning of both lies in the one element which accounts for the difference.<sup>2</sup>

The element of difference on which I would like to concentrate lies in the way the subplot simplifies the central action, translating its concerns into familiar (and therefore easily apprehensible) verbal and visual patterns. The subplot is easier to grasp because its characters tend to account for their sufferings in traditional moral language; it also pictorializes the main action, supplying interpreted visual emblems for some of the play's important themes. The clarity of the subplot and its didacticism are related, furthermore, to the old-fashioned literary forms, like the morality play and the chivalric romance, through which it represents experience.<sup>3</sup> These give expression to the idea of convention, and therefore to a world of recognizably structured perceptions and values – the very opposite of dislocation and madness. But the verbal and visual simplifications of the subplot do not merely provide a contrast with what goes on elsewhere in the play; they help to reveal the nature of Lear's experience by being so obviously inadequate to it. Lear's sufferings are heroic because they cannot be accommodated by traditional formulas, moral or literary, and the subplot exists partly to establish that fact.

The simplifications of the subplot can be seen first of all in its method of defining character. The behaviour of Edmund the Bastard, for example, is more comprehensible than that of Lear's bad daughters because his depravity is largely explained by his illegitimacy. He is what so-called 'natural' children were supposed to be; and his definition of 'nature' as circumventing law, custom, and order is in keeping with the application of the word 'natural' to children who were born outside of society's laws and excluded from its benefits. Legal treatises of the later Middle Ages, often compendia of commonplace morality, demonstrate the extent to which traditional moral thinking made the bastard susceptible of emblematic treatment. In Sir John Fortescue's commendation of the English laws of the fifteenth century, for example, he particularly praises their intransigence towards illegitimate children (their exclusion from inheritance even if their parents eventually married) as being in accord with biblical examples. He goes on to explain that bastards are actually contaminated by the sinful circumstances of their begetting: they have more than their share of the sin that all inherit, and nature brands them 'by setting as it were a natural mark or blemish on the natural children, though secretly impressed upon the mind.'<sup>4</sup> Gloucester's initial action in disinheriting the bastard son whom by his own admission he loves as much as his legitimate son is entirely in accord with this legal notion of justice: bastards were living emblems of their parents' sin in begetting them.

Moral and legal ideas about bastards had already been translated into dramatic conventions by the time *King Lear* appeared on the stage, and Edmund's behaviour was recognizable also in terms of a dramatic tradition. The Elizabethan stage abounds with bastards (Shakespeare's Don John in *Much Ado about Nothing* and Tourneur's Spurio in *The Revenger's Tragedy* are examples) who are envious and villainous because they are dispossessed and whose actions reveal the 'secret blemish' of their minds.<sup>5</sup> The important contrast in *King Lear* is between Edmund's conventionally explicable villainy and the seemingly incomprehensible evil of Goneril and Regan. The two daughters, who have been given 'all,' must remain the subject of unanswered questions about what in nature breeds such 'hard hearts.' Their behaviour is as much of a mystery as Cordelia's goodness, defying explanation in terms of natural causes like heredity:

KENT                    It is the stars,  
                         The stars above us, govern our conditions;  
                         Else one self mate and mate could not beget  
                         Such different issues.

(4.3.33–6)

Lear twice attempts to explain his older daughters' nature on the grounds of their bastardy and their consequent lack of kinship with him (1.4.262–3; 2.4.130–4); Edmund, though his father's son, does what he does because he acts in accordance with a well-established moral and dramatic tradition.

Edgar too illustrates how the conventionality of the subplot's roles expresses the more clearly defined nature of its concerns. Undeveloped at the beginning except in his function as a virtuous dupe, he later purposefully assumes a disguise as a Bedlam lunatic which is in direct contrast with Lear's uncontrolled, real madness. The difference between the two kinds of madness is expressed through dramatic roles: Edgar's pose is an imitative one whose stereotyped nature has been alluded to earlier by Edmund ('my cue is villainous melancholy, with a sigh like Tom o' Bedlam,' 1.2.142–3), and for which there were prescribed costumes and gestures:

The country gives me proof and precedent  
Of Bedlam beggars, who, with roaring voices,  
Strike in their numb'd and mortified bare arms  
Pins, wooden pricks, nails, sprigs of rosemary;  
And with this horrible object, from low farms,  
Poor pelting villages, sheep-cotes, and mills,  
Sometime with lunatic bans, sometime with prayers,  
Enforce their charity.

(2.3.13–20)

While the king wildly imagines a variety of impossible roles for himself, from that of the avenging fury to being the 'pattern of all patience,' Edgar's mad pose is one for which there was 'proof and precedent' in the social and dramatic world. His conscious control of all the roles that he chooses is embodied in their stereotyped, fixed quality – Bedlam, rustic with a typical stage dialect, knight.

Closely related to the greater conventionality of the subplot's characters are two of its other most striking features: its pictorial nature and its archaism. First, the subplot often provides emblems, or pictures with clearly stated meanings, for the benefit of the audience as well as for Lear and the Fool. The appearance of Edgar on the heath as a poor and naked Bedlam beggar, for example, supplies the physical actuality of the poverty and nakedness that preoccupy Lear, stripped of his retinue and position:

Is man no more than this? Consider him well. Thou ow'st the worm no  
silk, the beast no hide, the sheep no wool, the cat no perfume. Ha!  
here's three on's are sophisticated; thou art the thing itself;  
unaccommodated man is no more but such a poor, bare, forked animal  
as thou art.

(3.4.105–11)

While Lear soon tries to imitate Edgar and act out the metaphor of nakedness, it is Edgar who serves as a living example and a lesson, a subject for meditation ('Consider him well'). Gloucester's entrance with a torch immediately afterwards inspires the Fool to similar emblematic imaginations on a different subject:

Now a little fire in a wild field were like an old lecher's heart; a small  
spark, all the rest on's body cold. Look! here comes a walking fire.

(3.4.114–17)

Later, when the mad king meets the blinded Gloucester at Dover, Lear uses him as a source of emblems: the blind man is ‘blind Cupid’ (4.6.138) and ‘Goneril, with a white beard’ (4.6.97), in each case a picture that we associate, in its context in the play, with lust. These images prompted by Gloucester also become assimilated to Lear’s vision of injustice:

Get thee glass eyes;  
And, like a scurvy politician, seem  
To see the things thou dost not.  
(4.6.172–4)

The function of emblems, with their detachable meanings, whether conventional or assigned, is to clarify and to teach; this was the aim of many of the numerous emblem books of the period. But emblems were often excessively ingenious, even arbitrary, in creating pictorial embodiments of moral truths on figures of speech, and therefore the continuously emblematic nature of Lear’s imaginings becomes a sign of their insanity, even while they suggest a higher order of insight. His emblems portray the obsessive moral imagination of the character who creates them and at the same time they provide physical analogues for some of the play’s important themes – nakedness, appetite, injustice. Edgar and Gloucester, in the examples cited, constitute the pictorial parts of the emblems for which Lear supplies the text.

The pictorial simplifications of the subplot contribute to the particular nature of its archaic quality: it often evokes a medieval legal morality, with its direct translation into codes of justice of biblical injunctions and metaphors. The blindness of Gloucester, a physical representation of a lack of moral perception, also illustrates the tendency of the subplot to lend itself to old-fashioned moral simplicities. In the early Middle Ages, biblical notions of justice and redemption, that an eye should be exacted for an eye, or that an offending eye or limb should be removed if it was an obstacle to salvation, were physically acted out. For example, blinding (as well as castration) was a penalty for rape, justified on the grounds of exact and literal retribution: ‘Let him thus lose his eyes which gave him sight of the maiden’s beauty.’<sup>6</sup>

Gloucester’s blinding lends itself to this sort of construction by the characters involved in a way that Lear’s sufferings never do. While the actual mutilation first strikes any audience or reader as a dreadful display of brutality, Edgar and Gloucester later interpret the experience as having some sort of connection with justice, forcing us to redefine our response to its physical horror. Edgar speaks sententiously to Edmund of the blinding in terms of legalistic notions of punishment for lust:

The Gods are just, and of our pleasant vices  
Make instruments to plague us;  
The dark and vicious place where thee he got  
Cost him his eyes.  
(5.3.170–3)

Even Gloucester himself defines his blindness as the appropriate expression or symbol of his previous errors of judgment, and perhaps also as an inadvertent blessing:

I stumbled when I saw. Full oft ’tis seen,  
Our means secure us, and our mere defects  
Prove our commodities.  
(4.1.19–21)

Gloucester's blindness pictorializes his sin and his folly because the significance of the eyeless man's presence on the stage is clarified for us, by himself and Edgar, in moralized language.

Sententious language most obviously reflects the tendency towards stereotype in the characters of the subplot; Edmund's kinship with his brother and father is evident in the way in which he moralizes his own end: 'The wheel is come full circle; I am here' (5.3.174). The contrast between Edgar's stock of formulations and the language of Lear's visions in their respective madnesses is as striking as the general difference which we have already observed between an imitated role and an involuntary condition. As a madman, Edgar invokes the most familiar moral formulas, the seven deadly sins and the ten commandments,<sup>7</sup> both in his self-characterization and in the advice he dispenses:

- EDG. Take heed o' th' foul fiend. Obey thy parents; keep thy word's justice; swear not; commit not with man's sworn spouse; set not thy sweet heart on proud array.  
Tom's a-cold.
- LEAR What hast thou been?
- EDG. A servingman, proud in heart and mind; that curl'd my hair, wore gloves in my cap, serv'd the lust of my mistress' heart, and did the act of darkness with her; swore as many oaths as I spake words, and broke them in the sweet face of Heaven; one that slept in the contriving of lust, and wak'd to do it. Wine lov'd I deeply, dice dearly, and in woman out-paramour'd the Turk: false of heart, light of ear, bloody of hand; hog in sloth, fox in stealth, wolf in greediness, dog in madness, lion in prey.

(3.4.80–95)

Edgar's picture of himself as a madman and epitome of sinfulness is conveyed in terms of unmistakably traditional categories and emblems ('hog in sloth,' etc.). Structurally, both of the speeches quoted above are organized in syntactic series that emphasize the formulaic nature of their content, despite the supposed madness of the character who utters them.

Lear's mad visions differ substantively and structurally from Edgar's 'lunacy,' as well as from Gloucester's sanity. Lear alludes, for example, to the sin of adultery in such a way as to undermine it as a moral category and associate it with a general vision of lechery:

I pardon that man's life. What was thy cause?  
Adultery?  
Thou shalt not die: die for adultery! No:  
The wren goes to 't, and the small gilded fly  
Does lecher in my sight.

(4.6.112–16)

Contrary to the formal structure of Edgar's syntactic series and parallels, Lear's hypothetical interrogation of an offender sounds spontaneous and becomes a spoken dialogue in his own mind: 'Thou shalt not die: die for adultery! No.' Furthermore, the small animals that Lear evokes do not illustrate exemplary couplings, as in Edgar's case; they are animated sources of his visions.

Gloucester's most striking simile about his sufferings – 'As flies to wanton boys, are we to th' Gods; / They kill us for their sport' (4.1.36–7) – offers another kind of contrast with Lear's mad language. Gloucester's figure sets up an exact proportion between the

terms of comparison, clearly limiting itself as a figure of speech. Lear's visions, on the other hand, are characterized by a confusion of the general and the particular that gives excessive (and obsessive) personal concreteness to abstractions ('I tax you not, you elements, with unkindness; / I never gave you kingdom, call'd you children' [3.2.16–17]), or creates universalizing emblems out of personal particulars:

Dost thou squiny at me?  
No, do thy worst, blind Cupid; I'll not love.  
(4.6.138–9)

Whereas sententious speech tends to submerge individual feelings in known formulas, Lear's language does the opposite, stressing the personal motivation behind each generalization. The mistake of quoting Gloucester's observation about the malignancy of the gods as an objective statement about life could therefore hardly be made with Lear's speeches, which through their disproportions insist upon themselves too strongly as personal, motivated utterances, even while they discuss the nature of the world or the universe.

The distinctive features of the subplot characters and their language – didactic, sententious, occasionally archaic, and pictorially clarifying – extend to entire episodes. The scene on what Gloucester takes to be Dover cliff, for example, can be perceived as an enactment of Regan's earlier words to Lear:<sup>8</sup>

O, Sir! you are old;  
Nature in you stands on the very verge  
Of her confine; you should be rul'd and led  
By some discretion that discerns your state  
Better than you yourself.  
(2.4.147–51)

Edgar later makes the imaginary cliff visually intelligible, organizing it spatially like a painting which self-consciously makes sense of mere sight:

Come on, sir; here's the place: stand still. How fearful  
And dizzy 'tis to cast one's eyes so low!  
The crows and choughs that wing the midway air  
Show scarce so gross as beetles; half way down  
Hangs one that gathers sampire, dreadful trade!  
Methinks he seems no bigger than his head.  
The fishermen that walk upon the beach  
Appear like mice, and yond tall anchoring bark  
Diminish'd to her cock, her cock a buoy  
Almost too small for sight.  
(4.6.11–20)

The unseeing old man, obviously 'led' by Edgar, is also metaphorically 'ruled' by him, brought to believe in the steep cliff of which he stands near the 'extreme verge' (4.6.26), and in its moral significance.

But the abortive leap from the 'cliff,' like the blinding of Gloucester, is the physical enactment of a larger metaphor as well. Levin has observed that Gloucester's fall

suggests the fall of man, or the kind of fall that is central to tragedy.<sup>9</sup> It may be even more precise to see it as a rendering of the ‘fortunate fall,’ the Christian paradox whereby man’s original fall was interpreted as happy because it enabled him to receive more grace and be redeemed.<sup>10</sup> Gloucester’s attempt to kill himself is deflected in dramatic terms by Edgar into what could be comedy or farce (a man’s falling flat on his face when he has other expectations); but whereas the joke is usually that one who is pompously upright is unexpectedly brought low, here the man who had already been humbled (he takes the plunge from his knees), and who expects to fall, by his own wish, even more catastrophically, is prevented from doing so. Gloucester’s ‘fall’ is interpreted by Edgar, who has arranged the whole scene, as miraculous (‘Thy life’s a miracle,’ 4.6.55); the suicide attempt leads Gloucester to the resolution that he must bear his life.

The moral emphasis of the scene, its function as a lesson, is closely connected with its formal evocations of the morality play. Edgar externalizes Gloucester’s suicidal intentions, suggesting that it was a fiend who led him to the edge of the cliff, and that the ‘clearest Gods’ have preserved him from the mad beggar who was really a fantastic devil:

As I stood here below methought his eyes  
Were two full moons; he had a thousand noses,  
Horns whelk’d and wav’d like the enridged sea:  
It was some fiend...

(4.6.69–72)

The imaginative mode of the moralities appears as a simplification of experience because of the discrepancy between Edgar’s presentation of the scene and Gloucester’s reception of it. Edgar’s performance – his exploitation of his disguise as a fiend-haunted Bedlam, his minute descriptions and rapid changes of voice – draws attention to itself as invention and fantasy, exuberant and almost superfluous in the exactness of its details. But Gloucester accepts it simply and literally, in the spirit of the moralities, which literalized abstractions. This artistic deception is as successful as the creation of the cliff itself:

I do remember now; henceforth I’ll bear  
Affliction till it do cry out itself  
‘Enough, enough,’ and die. That thing you speak of  
I took it for a man; often ’twould say  
‘The Fiend, the Fiend’: he led me to that place.

(4.6.75–9)

When Gloucester prays later (‘Let not my worser spirit tempt me again / To die before you please,’ 4.6.219–20), his language shows that the impact of the lessons he has had is inseparable from his imaginative apprehension of it as a morality play.

The self-consciously archaic artistry of the subplot, as well as its more limited scope, can be seen even more clearly in the presentation of its climactic episode, the duel between Edgar and Edmund. Like the curious scene on Dover cliff, the combat – chivalric and medieval – is out of keeping with the main story of *King Lear*. In this scene the idea of justice is rendered in the archaic mode of the romances. The duel proves not only that Edgar is the stronger, but also that his claim is right, his assertion, formally delivered, of Edmund’s treachery, true.

The trial by combat portrays the idea of law in its perfect form: ideally the just man won because of the rightness of his cause,<sup>11</sup> just as in earlier primitive trials like the

ordeal, a suppurating wound became infected only if the defendant was guilty. In the play, the stylized battle therefore gives form to an archaic conception of the way in which divine justice manifested itself in human affairs. It is contrasted not only with Lear's visions of the inadequacy of existing forms of justice to the world's radical evils (his mad parodies of arraignments and assizes), but also with the sacrifice of justice to power by Cornwall and Goneril. Cornwall explicitly associates his power with 'wrath' rather than with justice when he blinds Gloucester:

Though well we may not pass upon his life  
Without the form of justice, yet our power  
Shall do a court'sy to our wrath, which men  
May blame but not control.

(3.7.24–7)

Goneril's response to Edmund's fall in the duel is just as outspokenly Machiavellian: she is willing to take advantage of the law if it favours or protects her interests, but otherwise she disregards it. When Edmund falls she invokes the minutiae of the rules governing duels to prove that he was not really defeated:

This is practice, Gloucester:  
By th' law of war thou wast not bound to answer  
An unknown opposite; thou art not vanquish'd,  
But cozen'd and beguil'd.

(5.3.151–4)

But when Albany confronts her immediately afterwards with the proof of her own treachery, she asserts that she is above the law:

the laws are mine, not thine:  
Who can arraign me for't?

(5.3.158–9)

Her claim to be a ruler who is outside the law is exactly opposite to the idea of rule-under-law for a medieval monarch, whose conception of justice is evoked by the trial by combat. Her despotic definition of privileges, more primitive and more modern, is reminiscent of her father's original ascription of power to his own word – his arbitrary division of his kingdom, or his denial, by kingly fiat, of Cordelia's filial 'bond.' The ceremony by which justice is celebrated in the duel scene, on the other hand, is an expression of custom and tradition.

Trial by battle was supposed to demonstrate not only the identity of law and justice; it rested also on the belief that word and ritual reflected reality. The form of the challenge was exactly prescribed and had to be returned verbatim by the defendant,<sup>12</sup> as Edmund makes a show of doing when he first returns Albany's challenge and then Edgar's. The whole procedure is appropriately formalized in the play: Albany's challenge and the exchange of gloves, the herald and three trumpets that summon Edgar as champion, Edgar's elaborate diction in his challenge (5.3.126–41). The vindication of ceremony in the duel, the consonance of appearance with reality, is set in contrast not only with the play's first scene, where verbal show proves deceptive, but also with the substance

of Lear's visions later in the play. He is obsessed, in his arraignments of evil and injustice, by the discrepancy between appearance and reality that he discounted earlier:

hide thee, thou bloody hand,  
Thou perjur'd, and thou simular of virtue  
That art incestuous; caitiff, to pieces shake,  
That under covert and convenient seeming  
Has practis'd on man's life...

(3.2.53–7)

Behold yond simp'ring dame,  
Whose face between her forks presages snow...  
The fitchew nor the soiled horse goes to't  
With a more riotous appetite.

(4.6.120–5)

Forms of justice bear no relation to the truth, according to Lear's vision, in a world where the judge is indistinguishable from the thief (4.6.151–6). There could not be a greater contrast when Edgar, the anonymous but noble-looking and well-spoken champion (5.3.142–3), fulfils the expectations of any real or literary audience:

ALB. Methought thy very gait did prophesy  
A royal nobleness.

(5.3.175–6)

The formal expression of Edgar's triumph contrasts with the fragmented form of Lear's visions, as well as with their substance. In what is perhaps the king's maddest moment in the fourth act, the ingredients of the trial by battle become grotesque in his imagination. The gauntlet and the formal challenge are qualified first of all by being associated with much less romantic images of war:

There's your press-money. That fellow handles his bow like a crow-keeper: draw me a clothier's yard. Look, look! a mouse. Peace, peace! this piece of toasted cheese will do't. There's my gauntlet; I'll prove it on a giant. Bring up the brown bills. O! well flown bird...

(4.6.86–92)

The stylized combat, its meaningful language and its symmetry, are distorted in a series of associations that work by arbitrary similarities of sound (peace/piece) and by sheer incongruity: the formidable gigantic opponent is a mouse, and the challenging gauntlet is a piece of toasted cheese. A little later the idea of the incongruous and ineffective challenge is developed even further:

LEAR Read thou this challenge; mark but the penning of it.  
GLOU. Were all thy letters suns, I could not see.

(4.6.140–1)

A madman's challenge is delivered to a blind man who cannot read it. Although the allusion to the challenge is not developed, it gives the impression of being connected with the vision of perverted justice that follows, as if Lear (somewhat less explicitly at

this point than Titus Andronicus with his mad letters to the gods) were ineffectively challenging the order of things.

The chivalric duel in the last act, then, reminds us of the possibility of a more orderly world by ritualizing what is distorted in Lear's imagination and experience. But its placement in the play, following the defeat of Lear and Cordelia's forces and preceding the even more appalling catastrophe of Cordelia's hanging and Lear's death, points also to the limitations of the order that it suggests. The main action complicates the subplot in various ways, and shows the inadequacies, in a truly tragic situation, of its moral and literary formulas. After the Dover cliff episode, for example, the sight of the dishevelled, mad king modifies our response to Gloucester's cure. Lear's frantic efforts to evade his benevolent captors, whose prisoner he finally regards himself, and the uncompromising nature of his visions, which defy 'sweetening,' make Gloucester's submission, physical and imaginative, to Edgar's 'rule' seem very simple. At the end of the play we see how Edgar, who exhorted his blind father to 'look up' after his fall and succeeded in a spiritual sense, is unable to change anything with the same injunction to Lear (5.3.312).<sup>13</sup> Lear's sufferings outweigh any optimistic or encouraging words, whether Edgar's or Albany's, and they are told by Kent that pain should be allowed to end in death.

Albany's language at the end of the play becomes even more ineffectually formulaic than Edgar's, and this suggests a final important if obvious point about the subplot: its language (like its action) overlaps with that of the main plot, even while it is partly distinct. Albany has been inclined towards pious optimism in his interpretation of earlier events:

This shows you are above,  
You justicers, that these our nether crimes  
So speedily can venge!  
(4.2.78-80)

(4.2.78–80)

As the play's ranking figure just before Lear's death, he speaks a conclusion appropriate to one of the Dukes of the comedies:

(5.3.298–304)

The formula is destroyed by actuality: the sight of the king's sufferings, his insistence on the lifelessness of Cordelia, and his death. The simplifications that are so obviously concentrated in the subplot, its suggestions of non-tragic forms, extend to the language of minor characters like Albany in the main plot as well, because the two actions are never entirely separate – it is Edgar who finally declares that we must ‘Speak what we feel, not what we ought to say’ (5.3.324). Contrary to a play like Middleton and Rowley’s *The Changeling*, whose two plots seem to present imaginative worlds that are distinct despite the verbal and thematic connections between them, the two actions of *King Lear* never become remote from each other, even if they have different emphases.

The analogous stories in *King Lear*, then, illuminate each other by offering related but contrasting ways of structuring experience. The subplot functions partly as didactic illustration. Though it never transposes the concerns of the main action into a radically different, archaic style (as the Gonzago play does in *Hamlet*), it evokes old-fashioned literary modes – the romance of chivalry, the medieval morality play – that asserted the intelligibility and purposefulness of action. Characters like the Bastard show the relation between simple dramatic conventions and intelligibility: he is a machiavel, while Lear's older daughters, mysteriously, are Machiavellian. Furthermore, the language, moral and circumscribed, of Edgar, Gloucester, and at the end, of Edmund, contributes to the effect of the subplot as limited and apprehensible in its moral meanings. Its didactic emphasis colours our view of the main plot as well, inviting us repeatedly to impose its patterns on Lear's experience. Our sense of the redemptive value of Lear's sufferings comes not only from the pity that he feels on the heath for the poor, but from the similarities between his situation and Gloucester's. The eyeless man is a physical image, an emblem, of Lear's condition also. Because Gloucester says that he stumbled when he saw, we are more likely to assume that Lear's recognition that he is old and foolish (even though this was originally Regan and Goneril's contention) represents a positive apprehension of truth.

The formulations of the subplot, however, are somewhat over-simplified even on their own terms. Gloucester's sententious observations after his eyes are put out are not adequate to the horror of that event, and the ordered world of the duel, where ritual reflects reality and power is joined to virtue, is an archaic one. The main action shows up such simplifications even more pointedly; for better and for worse, Lear's experience cannot be accounted for in the way that Gloucester's is. On the one hand, the king's agonies are incommensurate with any evil that he may have committed, irreducible, by himself and others, to notions of justice. He is more sinned against than sinning; he and Cordelia are 'not the first / Who, with best meaning, have incur'd the worst' (5.3.3–4). Where Edgar can see some kind of justice in his father's blinding, Cordelia refuses to consider the nature of Lear's crimes or mistakes at all, let alone any idea of retribution: 'No cause, no cause!' But the corollary to this transcendence of commonplace or legalistic judgment is that the patterns by which Gloucester's destiny is ordered and given meaning do not apply to Lear. Neither his sufferings nor the nature of his children are explicable, as Gloucester's are, by dramatic stereotype and moral aphorism, for in the two plots, formal devices and substantive material are fused. Lear's experience is truly tragic and heroic not merely because he suffers – Gloucester suffers too – but because the literary forms that avoid tragedy are so clearly inadequate to express what he goes through.

## Notes

- 1 See for example the discussion of the dangers of excessive or contradictory passions in Peter de la Primaudaye *The French Academy* tr. T.B. (London 1594) 33.
- 2 'King Lear: The Quality of Nothing,' in *Shakespearean Meanings* (Princeton 1968) 238.
- 3 See Maynard Mack's suggestion that the relation of subplot to plot is not dramatic so much as 'homiletic,' 'King Lear' in *Our Time* (Berkeley 1965) 7. See also Alvin B. Kernan, 'Formalism and Realism in Elizabethan Drama: The Miracles in *King Lear*', *Renaissance Drama* IX (1966) 59–66, for an interpretation of the Dover cliff scene as a morality play.
- 4 *De Laudibus Angliae: A Treatise in Commendation of the Laws of England* tr. Francis Gregor (Cincinnati 1874) 156 and 150ff.

- 5 A rare exception is the Bastard in *King John*, who had all the potential for villainy, being a ‘man of the time’ and a corrosive scoffer at custom, but who is placed in a world where these attributes become virtues. For an interesting analysis of this character and his contrast to Edmund, see John F. Danby *Shakespeare’s Doctrine of Nature: A Study of ‘King Lear’* (London 1959) 57ff. It is worth noting that treatment of aristocratic bastards, at least, was radically ameliorated during the sixteenth century in England.

- 7 Mack, in ‘*King Lear*’ in *Our Time* 61, comments on this and likens Edgar to the fallen hero of the morality plays.
- 8 On this connection, and on the scene in general, see Harry Levin, ‘The Heights and the Depths: A Scene from *King Lear*,’ in *More Talking of Shakespeare* ed. John Garrett (London 1959) 87–103, and Kernan, ‘Formalism and Realism.’
- 9 ‘The Heights and the Depths,’ 100.
- 10 The background of the ‘felix culpa’ tradition is described by Arthur O. Lovejoy, ‘Milton and the Paradox of the Fortunate Fall,’ *Essays in the History of Ideas* (Baltimore 1948) 277–95.
- 11 ‘[The trial by combat] was instituted upon this reason, that in respect the Tenant had lost his Evidence, or that the same were burnt or imbezeled, or that his witnesses were dead, the Law permitted him to try it by combat between his Champion and the Champion of the Demandant, hoping that God would give the victory to him that right had...’ (Coke’s commentary on Fortescue, quoted in John Beames *A Translation of Glanville* [Washington 1900] 35n). In the play, Edgar must have recourse to the duel because the very evidence of his identity, his name, has been usurped by Edmund (5.3.119–22).
- 12 See for instance Beames *A Translation of Glanville* 36: if the duel is accepted, the defendant ‘must deny the right of the Demandant, word for word as the Demandant has set it forth.’
- 13 See Levin, ‘The Heights and the Depths,’ 103.

# CHAPTER 11

## Theory in Practice *The Stories of “Passion”: An Empirical Study*

*Susan Lohafer*

Susan Lohafer, who teaches at the University of Iowa, explores in this essay the narrative strategies of Alice Munro’s story “Passion” by drawing on the reading skills of her students. She asked her students to reorder the sentences of the final paragraph of the story and explores the consequences for the narrative. She concludes that Munro, while she is not a metafictionalist, does experiment with and subvert the traditional forms of story-telling.

If you think “Passion” is about Grace, you are right. Most of the story takes place during the summer when this vibrant girl, who is poor and adventurous, meets the Travers family, who are ... complicated. Now, more than forty years later, Grace has driven back to the scene of the romance, or the crime, or both. Though traditional in structure – an initiation-story within a frame-tale – the narrative isn’t simple. That younger self, on the cusp of adult life, is recalled by the sixty-something woman we meet on the first and final pages. She is driving, alone, through a landscape both familiar and strange, looking for a house that once belonged to the people who changed her life.

For the literary critic trying to achieve the fullest understanding of Grace’s character; for the story-grammarian trying to parse the narrative sentence of her life; for the short fiction theorist seeing Munro as a challenge; and, last but not least, for the undergraduate student wondering, “Who is this woman, and what’s going on?” – for all these readers, there is a hole in the text. Grace is absent between her twenties and her sixties, living, it seems, in Australia. Those decades are missing. And yet the narrative presumes them, else the frame wouldn’t matter. And obviously, it does. It positions us to look back over a void to encounter a mystery. We’re to wonder about that girl whose life turned so many corners within the space of a few months. What was she like then? Was she naïve or self-serving, willful or rudderless ... the driver or the passenger? Because we meet

*Original publication details:* Susan Lohafer, “The Stories of ‘Passion’: An Empirical Study.” *Narrative* 20.2 (May 2012), pp. 226–238. Ohio State University Press, 2012. Reproduced with permission from Ohio State University Press.

Grace in a short story, we cannot ask these questions without noting the typology of the narrative she inhabits. In this genre, whose brevity and integrity descend from the anecdote, the exemplum, and the folk-tale, it is more than a quip to say “character is sequence, and sequence is character.” To learn who Grace is, we need, in a very technical sense, to graph the route she’s traversed with the help of the Traverses. Yet the path disappears.

When I am faced by a nagging problem in a short story, I look for insight – into that text and into the nature of the genre itself – by drawing upon the unconscious wisdom of ordinary readers. By the age of five, humans have developed a form of “story-competence,” an ability to recognize what constitutes, in their culture, a tellable, stand-alone segment from an endless string of narrative. It is a commonplace to say that stories are a primal mode of knowing, the very currency of culture. Hence the popularity, now somewhat faded, of studies in orality and communal story-telling. Newer work by linguists, neurologists, and cognitive scientists suggests that the future of genre theory lies in the study of brain-function. Nevertheless, believing that readers’ ingrained sense of storyness is an invaluable resource for humanists as well, I have looked for *literary* ways of tapping into this hidden vein of knowledge, to use its primacy to advantage in a study of this art form.

For many years, I did so by asking readers to identify preclosure points within a text. I looked at the series of putative – and often paradigmatic – stories embedded within the actual text on its way to real closure. Those were experiments in narrative interruption. What I am going to be discussing now is an experiment in narrative continuity, aimed at helping me to understand Grace, Alice Munro, and the contour of “Passion.”

My participants were the students in two undergraduate literature classes at The University of Iowa, plus one visiting scholar from China, for a total of 46 readers. Most of these readers had never heard of Munro, and I was reasonably sure that none of them had read “Passion.” Each was given the first paragraph of the story. Half of the readers saw the paragraph as Munro wrote it, in the third person; half saw a first-person version of the same text. All were asked to choose the one word in the given text – I’ll call it a keyword – that seemed most loaded with implication for what might follow in the rest of the narrative. All were then asked to compose a sentence – I’ll call it a continuer – that could logically and meaningfully follow the paragraph they had just read. I asked a number of other questions, too, that I’ll talk about later.

Here is the first paragraph of the story, in the original third person:

Not too long ago, Grace went looking for the Traverses’ summer house in the Ottawa Valley. She had not been in that part of the country for many years, and of course there had been changes. Highway 7 now avoided towns that it used to go right through, and it went straight in places where, as she remembered, there used to be curves. And this part of the Canadian Shield has many small lakes, which the usual sort of map has no room to identify. Even when she had located Little Sabot Lake, or thought she had, there seemed to be too many roads leading into it from the county road, and then, when she had chosen one of those roads, too many paved roads crossing it, all with names that she did not recall. In fact there had not been any street names when she had been here over forty years ago. And there was no pavement. There was just the one dirt road running towards the lake, then the one dirt road running rather haphazardly along the lake’s edge. (159–60)

The most favored keyword was “haphazardly,” in the last line. Perhaps we hear the warning buzz of “hazard” beneath the hollow ache of “hapless.” Road-related terms (“highway,” “curves,” “map,” “roads,” “paved,” “street”) were the second-most common choice, not surprisingly. The journey of life, forks in the road – the trope is

ubiquitous. The third favorite keyword was “changes.” Taken together, “haphazardly” and “changes” – destabilizing terms – were chosen by 52% of the respondents. Every life – and every Munro story – is about chance on the one hand and choice on the other. My readers didn’t know that they knew this already.

In the frequent manner of short fiction theorists, I will be focusing on the beginning and the ending of the story in order to bring the center into focus, all the more urgently because, in “Passion,” the middle is both irrelevant (those missing forty years) and definitive (those crucial summer months). Later, I will turn to the final sentences in the story, but let me start with Munro’s first paragraph and those 46 continuers invented by the respondents. By isolating various features of these add-ons, I hope to learn something about the way my readers interpreted the opening paragraph, but also something about their instincts for narrative continuity, for extending fictional agency through imaginary space-time.

The respondents were disproportionately women (36:10), making the influence of gender hard to tell. Nevertheless, I marked each continuer MALE or FEMALE. Then I asked whether the state or activity depicted, expressed, or referred to in the sentence was mainly INTERNAL (as in the case of a wish, perception, or memory) or mainly EXTERNAL (as in the case of a reported action or condition of the outer world). As this was a pilot study, I relied on my own judgment, although surely it would be useful, on a grander scale, to employ a bevy of scorers, to correct for the errors or biases of one person.

For now, admitting my subjectivity, I asked whether the stance of the sentence – as much a residue of attitude and tone as of outright declaration – was mainly POSITIVE, NEUTRAL, or NEGATIVE. Was the state or activity set mainly in the PRESENT (i.e., continuing in the same time period as the opening paragraph of the story), or mainly in the PAST (i.e., reflecting or recapturing a time *before* the opening scene)? Did the sentence put a period to a state or activity, or did it point forward, to unknown possibility; that is, was it CLOSED or was it OPEN? Finally, did it recycle any of the keywords identified in the story’s first paragraph, thus reinforcing – or *continuing* – their impact?

By way of demonstration, here is a sentence that happened to be written by a female reading the third-person (original) version of the paragraph. I judged this continuer to be mostly EXTERNAL, PRESENT, POSITIVE, and CLOSED, with a recycling of the “road” keyword:

She followed the road around Little Sabot Lake, slowly and carefully, and finally the shore seemed familiar.

Although the sentence ends with an inner conclusion (finding the scene “familiar”), the main action is the outward drive around the lake, leading to a match between what is actually seen and what is stored in the driver’s memory. The action continues in the same time-frame as the opening paragraph, with Grace on the road. The search for the Travers home encounters an obstacle (changes in the landscape that disorient the seeker), the conflict is resolved (reorientation occurs), and the goal is – or seems about to be – achieved. What happens here is hardly a very satisfying story, but it is, on its own terms, complete. As a successful mini-quest, it calls for only a very small “bravo,” but that’s enough to make the sentence feel CLOSED, with a POSITIVE valence.

Here, for comparison, is a continuer I judged to be INTERNAL, PAST, NEGATIVE, and OPEN (it, too, keyed on the word “road”). This sentence was also written by a woman, though she was reading the altered text with the first-person narrator.

I remember driving down that dirt road with Bob like it was yesterday, not knowing that would be the last time I saw him alive.

Cast entirely into the domain of memory, the action is internalized. While the act of remembrance is occurring in the “now” of the story, the informational burden of the sentence points backward, referring to an earlier drive and a last glimpse of “Bob.” The references to a dead fellow-traveler were undoubtedly suggested by later information in the questionnaire, where I mention Grace’s ride with her fiancé’s half-brother, who subsequently dies in a car crash. While I had influenced this reader’s focus on death, *she* was responsible for the urgency of the memory (“like it was yesterday”), the retroactive melancholy of *any* last-time event, and the shadow of regret, all of which give the sentence a NEGATIVE valence. Far from resolving any issues, this continuer introduces information not present in the story’s first paragraph. As a continuation of what begins *there*, this sentence raises more questions than it answers: *Who is Bob, how did he die, and what does his death mean to the narrator?* This is, therefore, an OPEN continuer.

Granting that other investigators might code the continuers differently, I trusted at least in my consistency. The first step, then, was to spread out the broad conclusions supported by the data. Most of the continuers – 70% of them – remain in the time-frame of the initial paragraph (PRESENT), although the preference is slightly more pronounced – 83% – among the respondents who were reading the first-person version of the opening paragraph. Overall, there is a slight preference for continuers that are INTERNAL (54%) and for those that are OPEN (56%). What matters here isn’t the preference but its slightness. All four options – INTERNAL, EXTERNAL, OPEN, CLOSED – were viable and robust. A more decided preference emerged from the data on valence. As might be expected from the tone of the opening paragraph, there is a strong preference for the downbeat: 61% of the continuers are NEGATIVE, 24% NEUTRAL, and 13% POSITIVE, with one fragment too brief to assign (2%). Overall, then, the continuers, whose authors were mostly FEMALE, tend to be PRESENT, INTERNAL, OPEN, and NEGATIVE. By large or small margins, these are the norms of this sample.

To complete the overview, here are some other questions I posed to the readers. Based on the opening paragraph they had been given, did they think they were reading a NOVEL or a MEMOIR – i.e., fiction or nonfiction? More than half said fiction, but a surprising 41% of the readers thought the text was *nonfiction*. It has the chatty frankness of a travel diary, a memoir-in-disguise. On this point, my naïve readers were experts-in-disguise; scholars, too, note the authenticity of Munro’s story-worlds. Intuition failed, however, when dating the story. I was surprised – as Munro might be – to find that more than half of the readers (61%) thought the text was published in the SIXTIES, though possibly they only favored the mid-point on the time-line. Twenty percent (20%) relegated it to the TWENTIES, but only 15% chose the true period – CONTEMPORARY. (Two persons, 4%, failed to answer the question.) Apparently, to the young readers in today’s college classroom, Munro sounds a bit dated, though not too old-fashioned.

While only a fifth of the readers thought the text came from the TWENTIES, that was the era picked by 30% of those writing CLOSED continuers. Shifting my focus to look at all of the CLOSED continuers, I saw that 55% of them were EXTERNAL (as opposed to the norm of 46%) and 20% were POSITIVE (as opposed to the norm of 13%). The margins are small, but still there’s an affinity among CLOSED, EXTERNAL, and POSITIVE. In a curiously backhanded yet unsolicited way, these data confirm the assumption that “old” fiction tends to be more resolved and more resolute. There is no clustering

of features around the CONTEMPORARY designation, though one datum stands out. Chosen by only 15% of the readers overall, this period was cited by an amazing 45% of the small group who wrote NEUTRAL continuers. No conclusions can be drawn, but it is tempting to see another stereotype confirmed, linking present-day fiction with low-affect indeterminacy.

Then again, some numbers just aren't meaningful, even if they sparkle. For example, 60% of the women wrote INTERNAL continuers, whereas, in a complete flip, 60% of the men wrote *external* continuers. Eye-catching, indeed, but useless, given the hugely disproportionate number of women in the sample, and the clichéd nature of any speculations about women's focus on interior experience vs. men's preference for observable action. I was hardly in a position to draw "Venus vs. Mars" conclusions, even if I had wanted to. Perhaps another researcher, with a larger and better sample, might try.

On the other hand, two reliably-defined types of readers also broke with the general preference for INTERNAL continuers, favored by 56% of the group. *Outward* action was preferred by 64% of those writing NEUTRAL continuers, and by 56% of those who wrote PRESENT continuers. These alignments made sense to me. Neutrality went naturally with a focus on uneventful action in the outer world (driving around back roads), rather than on perturbations in the inner world (retracing psychic maps). Nor was I surprised that exterior action dominated the PRESENT continuers. These were sentences that merely took the first paragraph another step on its way, rather than back-tracking for perspective. Munro's first paragraph is, on the surface, a record of EXTERNAL actions: "Grace went looking," but the roads had "changed"; the lakes were still around, but she couldn't find the right one. She drove here and there.

It takes an acute eye, of the kind we hope to train in our classrooms, to read between the lines, where the action is *internal* and the valence more NEGATIVE. No doubt these were the readers who sensed the anxiety caused by unpredictable change, by "too many" of this and "too many" of that; who noted the failure of "the usual sort of map," the absence of street signs (directional guides), and the rawness and incipience of dirt roads vs. the solidity of paved highways. Grace is entering a maze within herself. Most of the readers in my sample were English majors, and I would have expected most of them to bring these latencies to the surface, to write, as indeed they did, continuers that were INTERNAL and NEGATIVE.

As noted above, I did check the continuers for keywords. No one used the word "haphazardly" (which had just occurred in the last sentence of the opening paragraph), but many referred to roads and related imagery. Mentions of passages-through (including not only roads but streets, highways, routes, paths, driveways, etc.) appear 34 times, in sentences composed by 25 people, or 54% of the respondents. References to blocked or diverted passageways (including words like "labyrinth," "maze," "twisted," "lost," "turnoff," "disorientation") occur 16 times. If you include references to the lake or to water – barriers to a bee-line – the number doubles to 32 references, made overall by 22 persons, or 48% of the group. When these readers stepped into the role of story-writers, as they did when composing the continuers, they were dominated by the road imagery, but, in the aggregate, they found a tension between passage and blockage, an elemental form of conflict, and, to a suggestive degree, a cognate of the fork-in-the-road story schema.

By analyzing the characteristics of the continuers in relation to what prompted them, I could see how, for a small group of college-educated readers, narrative was propelled.

I could see storyness instantiated. Once again, let me remind you that these readers had not read the whole story. They did not know that Grace does, indeed, face many choices between one path and another, most crucially whether to align herself with Neil or with Maury, with the exciting but unstable son who resembled his mother and offered new if illicit experience, or with the earnestly bourgeois son who resembled his father and wanted to marry her. Munro's own continuer ("Now there was a village") is PRESENT, EXTERNAL, OPEN, and NEUTRAL, as she makes a leisurely approach to the narrative flashback. Unlike the readers in my experiment, she is not blind to the curves ahead, but neither, it would seem, is she indifferent to the collective recognition of a narrative schema of passages and blockages. She triggers and exploits it. Grace's day with Neil is a classic road story, a series of chosen pathways, a penetration into new territory, an acquisition of knowledge (*en route*, Grace learns, in many ways, how to "drive"), and a series of destinations. But, of course, the story is more than its schema, as a Picasso portrait is more than its iconography. Could my experiment shed light on the "more" of "Passion"?

So far, I have been concentrating on the entrance to the story. Now let me focus on the exit. After a space-break, the story closes with four paragraphs, a sort of epilogue, although the action takes place only a short while later. Grace has effectively broken her engagement with Maury by rejecting his offer, by letter, to believe she was forced to accompany Neil on their trip through the countryside. No, she replies, "*I did want to go*" (196; emphasis original). But now she will receive another offer, one that's harder to refuse, from Mr. Travers. He hands her an envelope with a check, implicitly bribing her to break off not only her relationship with Maury, but her friendship with Mrs. Travers – in short, any contact with the Travers clan altogether. Among them, she is *persona non grata*.

She *had* been a welcome guest. On that fateful Thanksgiving Day at the Travers' house, after Grace had cut her foot and was waiting for the charismatic Neil to drive her to the hospital, Mrs. Travers had privately urged Grace to steer him away from alcohol, that refuge from his demons. Later, by choosing to leave the hospital with Neil rather than with Maury (who had arrived to reclaim her), by following him into new sensual and psychic territory where she instinctively feels connected, Grace betrays not only her fiancé but Neil's wife, not to mention the commission from Mrs. Travers. By understanding the cool despair that drives Neil to suicide, Grace challenges the world-according-to-Mr.-Travers, who breezily attributes Neil's death to mere alcoholism. He is the sort of man who believes nervous disorders can be medicated away, embarrassments bribed to disappear, and tragedies cured by a "vacation ... somewhere warm" (196). The story closes with 7 sentences about the bribe he offers Grace, and how she responds to it.

The scene occurs at the inn where Grace has been working that summer as a waitress. The time is shortly after she has returned from her eye-opening, flesh-tingling, mind-blowing journey with Neil, and soon after she has heard the news-item about Neil's suicide. Mr. Travers has arrived to clean up the part of the mess that Grace represents, and he is "polite and businesslike, firm, cool, not unkind" (196). On the questionnaire, I listed the same 7 sentences, *but in a different order*, which I will call the "Test Order." I did not scramble the sentences randomly, but instead created a sequence that would offer a meaningful contrast to the original text. In a prefatory note, I explained to the readers that Maury's father, Mr. Travers, had come to see Grace after Neil's death. Here are the sentences in the order found on the questionnaire:

- |     |   |
|-----|---|
| T-1 | As he shook her hand good-bye he put an envelope into it.   |
| T-2 | "We both hope you'll make good use of this," he said.   |
| T-3 | Then he said that he had to be going, many things to do.  |
| T-4 | The cheque was for one thousand dollars.  |
| T-5 | In those days, it was enough money to insure her a start in life.   |
| T-6 | Immediately, she thought of sending it back or tearing it up, and sometimes even now she thinks that would have been a grand thing to do. |
| T-7 | But in the end, of course, she was not able to do it.   |

**Figure 1** Test Order

Each respondent was asked to create his or her own order by redistributing the sentences on the questionnaire to create a personally satisfying or reasonable sequence to end the story. I could easily have invented alternate sentence-orders myself, but that would have been cheating, and it would have deprived me of the very information I was seeking. I needed my students to act as story-tellers, to make decisions about an excerpt from a putative text (this time from its end rather than its beginning), and then to act upon the given passage in a way that exercised *their* built-in sense of storyness. My goal, of course, was to compare *their* suggestions with Munro's decisions, *their* instincts with Munro's artistry. I was going to articulate, in my own language and according to my own lights, what my informants unwittingly knew.

I was struck at once by how many readers began *their* sequence with T-2 ("We both hope you'll make good use of this," he said"), even though there was now no antecedent for "this." The following categories of readers favored this choice: those reading the first-person version of the opening paragraph; those reading the third-person version; those who thought they were reading nonfiction; and those who thought they were reading fiction. The only way I can explain the ubiquity of this preference is to concede the overwhelming power of convention: ever since Hemingway, modern narrative, both fictional and nonfictional, has favored abrupt beginnings, *in medias res*. As we shall see, Munro's way of starting the sequence was different. How so? To what end?

Before I could think about those questions, I had to look at the other end of the line-up, the far more significant *closural* slot. What preferences did the readers show when choosing *their* final sentence? Forty-six percent (46%) of them chose the same concluding sentence as in the "Test Order" – i.e., T-7.<sup>1</sup> Twenty-six percent (26%) used T-6 in the final slot, and 17% put T-5 there. No other sentences were chosen often enough to matter, so I concentrated on just those three. As putative endings to the story, they represent closure – a feature of stories I have been studying for years. I was able to draw upon that earlier work, and in particular, a system I developed for identifying closural signals or markers in story-sentences.<sup>2</sup> My first step, therefore, was to put those three sentences under the microscope.

Closural markers can be divided into global and local categories, the former tied to patterns in the story as a whole, the latter contained within the sentence itself. Here are my findings:

T-5: In those days, it was enough money to insure her a start in life.

GLOBAL: SYNTACTIC: *obstacle overcome* | socioeconomic barrier removed

GLOBAL: SYNTACTIC: *equilibrium achieved* | money » opportunity

LOCAL: LEXICAL: closural words: *absolute/extreme state* | "enough"; "insure"

LOCAL: LEXICAL: closural words: *temporal shift* | [now]>"in those days"

LOCAL: LEXICAL: keywords: *natural prominence* | "money"; "life"

SUMMARY: T-5 is a neutral, declarative statement equating a quantity of money with a quantity of power/choice. The sentence has no moral or character-destiny component, but simply posits an economic reality at a particular time.

The eight readers who put this sentence in the closural slot were privileging factual/historical circumstances, highlighting a practical rather than moral or psychological frame of reference. Men favored this choice, and conventional wisdom might say “No surprise here,” but, as noted before, there were too few men in the sample to make gender an issue. More reliably, this fact-of-life sentence was *not* considered closure-worthy by *any* of those who wrote POSITIVE continuers to the opening paragraph, or *any* of those who placed their continuers in a PAST time before the opening action. Those would-be story-tellers looked elsewhere for closure, drawn to sentences that offered a more definitive outcome for Grace’s quest, with its roots in the past.

T-6: Immediately, she thought of sending it back or tearing it up, and sometimes even now she thinks that would have been a grand thing to do.

GLOBAL: SYNTACTIC: *return to prior state* | rejecting the money undoes complicity

GLOBAL: SYNTACTIC: *antithesis or paradox* | actual deed vs. imagined deed

LOCAL: SYNTACTIC: repetition: *alliteration* | “thought” // “thinks”

LOCAL: SYNTACTIC: repetition: *identity-relationship* | “thought” // “thinks”

LOCAL: LEXICAL: closural words: *absolute/extreme state* | “tearing it up”

LOCAL: LEXICAL: closural words: *logical reversal* | “tearing up” reverses “giving to”

LOCAL: LEXICAL: closural words: *temporal shift* | “immediately” > “even now”

LOCAL: LEXICAL: keywords: *story-specific meaning* | “grand”

SUMMARY: T-6 has a strong sense of reversal, undoing Grace’s complicity with Mr. Travers and canceling her status as a bribe-taker. Of course, the “action” is entirely within her mind: she can hypothesize a deed she can’t actually carry out.

The twelve readers who put this sentence in the closural slot were privileging Grace’s capacity to recognize the moral high road. No group of readers favored this choice inordinately, although, in terms of percentages, it was more attractive to men, to those who thought they were reading NONFICTION, to those who wrote NEGATIVE continuers, and to those who wrote OPEN continuers. Without further experiments targeting this issue, I cannot say why these readers chose to put Grace in the kindest light possible at the very end.

T-7: But in the end, of course, she was not able to do it.

GLOBAL: SYNTACTIC: *obstacle overcome* | out-of-character impulse overcome

GLOBAL: SYNTACTIC: *return to earlier state/event* | reversion to taking what she can get

LOCAL: SYNTACTIC: repetition | all words are monosyllabic except “able”

LOCAL: LEXICAL: closural words: *absolute/extreme state* | “of course”

LOCAL: LEXICAL: closural words: *logical reversal* | “but”

LOCAL: LEXICAL: keywords: *story-specific meaning* | “able”; “do”

LOCAL: LEXICAL: closural words: *naming final condition* | “end”

SUMMARY: T-7 emphasizes Grace’s fundamental character trait of taking the most she can get. She has recognized the morally superior option, but is not “able” (allowed by her nature) to choose it. Perhaps not coincidentally, the word “able” evokes Mrs. Travers’ housecleaner – “a woman Mrs. Travers called ‘my friend the able Mrs. Abel’” (168). Grace, a *quondam* waitress and chair-caner, rejects the serviceability of these “able” occupations in favor of a more self-fulfilling life.

The twenty-one readers who put this sentence in the closural slot were privileging character-determinism over moral imagination as the dominant (final) influence on Grace's behavior. Every group except men favored this sentence as the finale. The groups that completely avoided T-5, perhaps for its neutrality, rously supported T-7. It was chosen by 83% of those who wrote POSITIVE continuers, and 62% of those whose continuers reached into the PAST. These figures simply highlight the general preference for T-7.

Is it any wonder that this sentence was the favored choice for the exit-line of the story? There is probably no stronger closural phrase in the English language than "in the end." Sleepy children, hearing a story read to them, know "The End" means lights out. Once again, there was general agreement among the four groups of readers I singled out before: those reading the first-person version of the opening paragraph, those reading the third-person version, those who thought they were reading nonfiction, and those who thought they were reading fiction. *All* favored T-7 in the 7<sup>th</sup> slot. Any way you mince the data, it would seem that more people ended the story with this sentence than with any other.

Here is the favored sequence constructed by the readers *as a group*. It is a composite; only four readers made these exact choices. Many readers chose radically different sequences, but not in sufficient numbers to change the outcome.

You will notice that this line-up differs only slightly from the one offered on the ques-

- |     |   |
|-----|---|
| N-1 | "We both hope you'll make good use of this," he said. 63%   |
| N-2 | Then he said that he had to be going, many things to do. 33%  |
| N-3 | As he shook her hand good-bye he put an envelope into it. 46%   |
| N-4 | The cheque was for one thousand dollars. 28%  |
| N-5 | In those days, it was enough money to insure her a start in life. 33%   |
| N-6 | Immediately, she thought of sending it back or tearing it up, and sometimes even now she thinks that would have been a grand thing to do. 33% |
| N-7 | But in the end, of course, she was not able to do it. 46%   |

**Figure 2** Normative Order

tionnaire (the "Test Order"). Only the first three sentences follow a different order. As noted before, readers insisted on opening with the snippet of dialogue. They also tended to believe that Mr. Travers would announce his departure and *then* take Grace's hand. In any case, both the "Test Order" and the "Normative Order" make clear that money is exchanged rather furtively. A gratuity finessed by a handshake. It's a reminder of Grace's lower social status – she is, in fact, a waitress used to receiving tips – and it raises the question of what service she has performed, or will be expected to perform.

The remaining sentences follow the same order in both the "Test Order" and the "Normative Order." In the pivotal #4 slot, the purchasing power of the money is revealed, making it clear that Mr. Travers isn't just brushing Grace off with a pittance. He's offering her an escape from poverty, an exit from Ottawa. Her inability to pass up this opportunity fills the closural slot. "In the end," we meet the Grace of T-7, in whom character-determinism quells moral imagination. This is the girl who has consistently chosen the fork in the road that satisfies her urge to widen her experience. She has neither the principles nor the willpower to refuse a gratuity that is, in effect, a bribe, but also a windfall. A donation to the Grace-project. There is a logic to this conclusion. It follows a normative script in synch with familiar plot-lines: small-town-girl-makes-good;

innocence-becomes-experience. Readers were exercising their sense of storyness, and they overwhelming chose to end the tale with Grace's concession to greed, or, at least, self-advancement.

Munro, however, did not. It's time, now, to look at the sequence *she* chose.

- |     |   |
|-----|---|
| S-1 | Then he said that he had to be going, many things to do.  |
| S-2 | As he shook her hand good-bye he put an envelope into it.   |
| S-3 | "We both hope you'll make good use of this," he said.   |
| S-4 | The cheque was for one thousand dollars.  |
| S-5 | Immediately, she thought of sending it back or tearing it up, and sometimes even now she thinks that would have been a grand thing to do. |
| S-6 | But in the end, of course, she was not able to do it.   |
| S-7 | In those days, it was enough money to insure her a start in life.   |

Figure 3 Story Order

The sentence beginning "In the end" is not *at* the end. Its earlier placement is counterintuitive for a plurality of readers, as we've seen, but for Munro, it was strategically appropriate. It left the closural slot empty for a note on the purchasing power of the money. *Her* story ends with the transactional value of the check – it can buy a new life. Gift or bribe doesn't matter. Munro isn't harkening back to Grace's appetite for life or even her taste for the dramatic, but to the part of her that studied more subjects in high school than she had any use for, because she "just wanted to learn everything you could learn for free" (166). This is a kind of opportunism, yes, but also a kind of dogged economy. She is "not able" to give the money back not because her moral fiber is constitutionally weak (although it may be), and not because her flair for the dramatic is still untrained, but because she is intellectually and emotionally a forager by nature. Hers is the built-in value-meter of the underprivileged, an habitual practicality rather than a self-serving plan.

Earlier I noted how my readers gravitated toward ingrained models of storyness. In their reconstructions, they tended to open with dialogue and end with "the end." Their choices were a graphic illustration of perceptions of storyness in action. Nor did their instincts entirely mislead them. On the macro-level, Munro does, indeed, offer a classic fork-in-the-road story, a familiar narrative typology. But look closely at her choices on the micro-level – say, between two ways of ordering the final sentences – and the text tells a different story. When we compare the sequence chosen by the composite "reader" with the one chosen by Munro, we see at once that the actual text departs most radically from the normative one at the two points where the readers were most confident in their guesses. It would seem as though Munro was toying with the scripts she so handily invoked.<sup>3</sup>

I cannot, of course, make any such claim. On the contrary, experience with my own and others' story-telling argues against any such calculated set-up. Great writers do not instantiate scripts – but they do echo, bend, violate, and play with them, both consciously and unconsciously. Writers are, after all, readers themselves, conditioned by the same cognitive and cultural ways of organizing strings of information into narrative sequences.<sup>4</sup> Recurrently, the short story has been seen as a formula-prone genre. That is not surprising, given its roots in Proppian folklore and its heyday in "slick" magazines, but I would argue that, in the case of a Munro, the background presence of familiar typologies is not so much a constraint as a resource. All that my reading experiments can do is tease these

background layers into the open, quantify them for salience, and selectively but systematically examine them. However flawed and subjective my analyses may be, however ungainly the material they isolate, the goal is to catch sight, indirectly, of the way models of storyness are deployed by the author and perceived by the reader.

I hoped the present experiment would help me understand why Munro, an acknowledged mistress of the short story, is problematic for narrative theorists who find her work “novelistic,” and how “Passion,” a story with a hole in the middle, finds integrity as a narrative. The answers to both questions are, not surprisingly, codependent. The evidence provided by my untrained but savvy readers helped me see the Munro-ishness of “Passion,” its daring way of invoking, omitting, and re-formulating the sequence of events and decisions that would fill a *bildungsroman*, in order to produce the highly-selective order of sentences that say “Passion.”

My study of the continuers to the opening paragraph made me realize just how insistently Munro uses the imagery of passages and barriers to inaugurate the fork-in-the-road typology. Looking at the very end of the story, comparing the readers’ instincts with the author’s artistry, I saw the impact of micro-managed decisions about order.

Munro does not write metafiction, but she makes canny use of traditional story-types by invoking and subverting them. That is what my naïve readers unintentionally made clear to me. “Passion” is far from being a typical short story, but neither is it “novelistic.” It achieves its effects by triggering and twisting models of storyness in order to reveal character.

What sort of person is Grace, and what kind of route has she followed? In short stories, these are questions about the layout of sentences, about beginnings and endings, and about the roadmaps we follow between them. In the end, I came to see Grace as neither the driver nor the passenger but as the vehicle itself, nosing forward through the maze of life, gauging distance by the gallon, and rounding each corner as it comes.

## Notes

- 1 It could be argued that respondents were unduly influenced by the order of the sentences in the questionnaire. On the other hand, the instructions, which asked each respondent to create a personal order, could be viewed as a deterrent to copying the given order.
- 2 For a more detailed exposition of this coding system, please see Lohafer, *Reading for Storyness* 59–60. For general inspiration and for suggestions about global closure in short stories, I am indebted to John Gerlach, *Toward the End: Closure and Structure in the American Short Story*.
- 3 I am indebted to Michael Trussler for suggesting (without necessarily agreeing with) the possibility that this sabotage is not only deliberate on Munro’s part but symptomatic of her unique approach to narrative.

# CHAPTER 1

## Introduction *Situations of Knowledge/Relations with Others*

*Julie Rivkin and Michael Ryan*

In the eighteenth century, German philosopher Immanuel Kant, responding to earlier philosophers who contended that our ideas arose from sense impressions on our brains, argued that the mind's innate powers shape sensory experience. Knowledge does not consist of the registration on our brains of sensory information alone. That information has to be ordered temporally and spatially and submitted to principles of reason. And the mind's innate intuitive abilities are responsible for that ordering.

Once he had established the mind's powers in regard to experience, Kant set about applying the idea to art and ethics. He found that our judgments regarding art were largely sensory, while our judgments regarding ethics were largely rational. The most one could say about art was that it seemed to have a purpose or goal, but the purpose or goal was not real. Art pretends to have a reason behind it, but it is “purposefulness without a purpose.”

Ethics, which considers and regulates our behavior with others, has to be more rational and purposeful. In this realm of human interaction, Kant found that it was possible to state clearly what the mind's activity should be in shaping our ethical decisions and actions. We should always behave as if our behavior manifested a rule that we could easily imagine being binding on everyone. Each action should embody a universal and general principle. A principle, or a general rule applicable to all individual instances, should inform our ethical decisions regarding how we act for ourselves and in regard to others.

Kant's focus on the mind's innate capacities was largely forgotten for a century and a half until another German philosopher, Edmund Husserl, once again evoked the mind's powers while attempting to rebut the philosophy that became dominant in the nineteenth century – Positivism. Positivism held that empirical facts alone constituted knowledge, and such knowledge should be measured according to how useful it was – not according to how well it embodied universal principles. One did not need to worry about the mind or how it worked. The mind was a simple recording device that measured the utility of facts.

But if the mind was driven by sensory data, how was philosophy to arrive at principles for deciding what was true or for deciding between good action and bad? If all we had to go by were sensory facts and useful data, there could be no rational principles to guide knowledge and behavior.

Husserl sought to solve this problem by noting that all knowledge of things in the world is in fact knowledge of knowledge. What we know or see in our mind is not the thing itself, the object before our eyes, but rather the image of the object on consciousness. Those mental objects are called “phenomena,” and the philosophy Husserl developed to talk about them was “phenomenology.”

Like Kant, Husserl believed the mind transformed sensory data into universally binding principles that were formal or abstract. He turned to the example of geometry. In geometry, one can imagine a perfect triangle. It exists as a mental construct, yet, no actual triangle in the world achieves that degree of formal perfection. In a similar way, the mind arrives at truth by extracting from data a purely formal mental construct, the idea of the thing. The idea of a thing, not the thing itself, is what is true.

The innate intuitive operations of the mind are therefore necessary when thinking about the world. They allow us to grasp transcendental principles of truth that are not limited to the sensory data our mind takes in.

The pendulum swung in the other direction as the twentieth century progressed. Philosophers such as John Dewey, Martin Heidegger, Ludwig Wittgenstein, and Jean-Paul Sartre argued that we know as we live in the world, and even if a very abstract formal kind of knowledge that transcends sense data is possible, all knowledge takes place in the world and in our lives as real beings existing in space and time.

Theoretical developments in the late twentieth and early twenty-first century deepened these insights. A number of thinkers, from Emmanuel Levinas to Jacques Derrida and Martha Nussbaum, argued that our relationship to others is a profound ingredient of our make-up as human actors. Ethics, in their eyes, has more to do with how we relate to others than with abstract principles. The “Other” limits our selfishness and obliges us to be responsible and dutiful towards others.

The sense that knowledge is situated in worldly contexts also gave rise to insights regarding how literature exists over time. A literary work may be produced and published, but how it is received as much determines what it is and what it means. How the mind of the reader or receiver processes the work is an essential part of its constitution. Literature is therefore inherently relational and unstable. One cannot say that it means only one thing if it means differently to people in a variety of distinct historical and social situations.

Wolfgang Iser (*The Implied Reader*, 1974) argued that literature addresses an audience, and a reader is implicit in the text. Radicalizing phenomenology, Stanley Fish (*Is There a Text in This Class?*, 1980) suggested that literary texts are latent until activated by the reader’s mind. In a sense, the text does not exist unless read. Hans Robert Jauss (*Towards an Aesthetic of Reception*, 1982) emphasized the social and historical dimension of a text’s reception. Texts change meaning in different eras, as they are read differently by quite distinct audiences. Pierre Bourdieu (*Distinction: A Social Critique of the Judgment of Taste*, 1984) noted that different social classes process art differently. Highly educated upper class readers equate quality with formal experimentation, while less educated readers and viewers think concrete realism is more true to life because more practically useful. Bourdieu pointed out that Kant’s idea that aesthetic is a matter of purposefulness without purpose applied only to a certain social stratum. Judgments about art are reflexes of educational and income levels.

We have clustered phenomenology, reception, and ethics together because it can be argued that our relationship to literary texts and to literary characters is both a testing and training ground for ethics. How our minds engage with literature – creating as much as absorbing meaning – is an important way to develop empathy. Essential to ethics is care for others and the ability to imagine their lives as if those lives were one’s own. It is a bit like reading a novel while living one’s life.

# CHAPTER 2

## Transcendental Aesthetic

*Immanuel Kant*

First published in 1781, Kant's *Critique of Pure Reason* argued that the mind is an active constructor of our knowledge of the world. While earlier philosophers had noted that experience (the empirical sensation of objects by the mind) played a role in building mental concepts, according to Kant they failed to account for the mind's own *a priori* operations. Such operations occur before experience and make it possible.

### General Observations on Transcendental Aesthetic

- I. To avoid all misapprehension, it is necessary to explain, as clearly as possible, what our view is regarding the fundamental constitution of sensible knowledge in general.

What we have meant to say is that all our intuition is nothing but the representation of appearance; that the things which we intuit are not in themselves what we intuit them as being, nor their relations so constituted in themselves as they appear to us, and that if the subject, or even only the subjective constitution of the senses in general, be removed, the whole constitution and all the relations of objects in space and time, nay space and time themselves, would vanish. As appearances, they cannot exist in themselves, but only in us. What objects may be in themselves, and apart from all this receptivity of our sensibility, remains completely unknown to us. We know nothing but our mode of perceiving them – a mode which is peculiar to us, and not necessarily shared in by every being, though, certainly, by every human being. With this alone have we any concern. Space and time are its pure forms, and sensation in general its matter. The former alone can we know *a priori*, that is, prior to all actual perception; and such knowledge is therefore called pure intuition. The latter is that in our knowledge which leads to its being called *a posteriori* knowledge, that is, empirical intuition. The former inhere in our sensibility with absolute necessity, no matter of what kind our sensations may be; the latter can exist in varying modes. Even if we could bring our intuition to the highest degree of clearness, we should not thereby come any nearer to the constitution of objects in themselves. We should still know only our mode of intuition, that is, our sensibility.

*Original publication details:* Immanuel Kant, “Transcendental Aesthetic” from *Kant’s Critique of Pure Reason*, pp. 82–91. Macmillan, 1929.

We should, indeed, know it completely, but always only under the conditions of space and time – conditions which are originally inherent in the subject. What the objects may be in themselves would never become known to us even through the most enlightened knowledge of that which is alone given us, namely, their appearance.

The concept of sensibility and of appearance would be falsified, and our whole teaching in regard to them would be rendered empty and useless, if we were to accept the view that our entire sensibility is nothing but a confused representation of things, containing only what belongs to them in themselves, but doing so under an aggregation of characters and partial representations that we do not consciously distinguish. For the difference between a confused and a clear representation is merely logical, and does not concern the content. No doubt the concept of ‘right’, in its common-sense usage, contains all that the subtlest speculation can develop out of it, though in its ordinary and practical use we are not conscious of the manifold representations comprised in this thought. But we cannot say that the common concept is therefore sensible, containing a mere appearance. For ‘right’ can never be an appearance; it is a concept in the understanding, and represents a property (the moral property) of actions, which belongs to them in themselves. The representation of a body in intuition, on the other hand, contains nothing that can belong to an object in itself, but merely the appearance of something, and the mode in which we are affected by that something; and this receptivity of our faculty of knowledge is termed sensibility. Even if that appearance could become completely transparent to us, such knowledge would remain *toto coelo* different from knowledge of the object in itself.

The philosophy of Leibniz and Wolff, in thus treating the difference between the sensible and the intelligible as merely logical, has given a completely wrong direction to all investigations into the nature and origin of our knowledge. This difference is quite evidently transcendental. It does not merely concern their [logical] form, as being either clear or confused. It concerns their origin and content. It is not that by our sensibility we cannot know the nature of things in themselves in any save a confused fashion; we do not apprehend them in any fashion whatsoever. If our subjective constitution be removed, the represented object, with the qualities which sensible intuition bestows upon it, is nowhere to be found, and cannot possibly be found. For it is this subjective constitution which determines its form as appearance.

We commonly distinguish in appearances that which is essentially inherent in their intuition and holds for sense in all human beings, from that which belongs to their intuition accidentally only, and is valid not in relation to sensibility in general but only in relation to a particular standpoint or to a peculiarity of structure in this or that sense. The former kind of knowledge is then declared to represent the object in itself, the latter its appearance only. But this distinction is merely empirical. If, as generally happens, we stop short at this point, and do not proceed, as we ought, to treat the empirical intuition as itself mere appearance, in which nothing that belongs to a thing in itself can be found, our transcendental distinction is lost. We then believe that we know things in themselves, and this in spite of the fact that in the world of sense, however deeply we enquire into its objects, we have to do with nothing but appearances. The rainbow in a sunny shower may be called a mere appearance, and the rain the thing in itself. This is correct, if the latter concept be taken in a merely physical sense. Rain will then be viewed only as that which, in all experience and in all its various positions relative to the senses, is determined thus, and not otherwise, in our intuition. But if we take this empirical object in its general character, and ask, without considering whether or not it is the same for all human sense,

whether it represents an object in itself (and by that we cannot mean the drops of rain, for these are already, as appearances, empirical objects), the question as to the relation of the representation to the object at once becomes transcendental. We then realise that not only are the drops of rain mere appearances, but that even their round shape, nay even the space in which they fall, are nothing in themselves, but merely modifications or fundamental forms of our sensible intuition, and that the transcendental object remains unknown to us.

The second important concern of our Transcendental Aesthetic is that it should not obtain favour merely as a plausible hypothesis, but should have that certainty and freedom from doubt which is required of any theory that is to serve as an organon. To make this certainty completely convincing, we shall select a case by which the validity of the position adopted will be rendered obvious ...

Let us suppose that space and time are in themselves objective, and are conditions of the possibility of things in themselves. In the first place, it is evident that in regard to both there is a large number of *a priori* apodeictic and synthetic propositions. This is especially true of space, to which our chief attention will therefore be directed in this enquiry. Since the propositions of geometry are synthetic *a priori*, and are known with apodeictic certainty, I raise the question, whence do you obtain such propositions, and upon what does the understanding rely in its endeavour to achieve such absolutely necessary and universally valid truths? There is no other way than through concepts or through intuitions; and these are given either *a priori* or *a posteriori*. In their latter form, namely, as *empirical* concepts, and also as that upon which these are grounded, the *empirical* intuition, neither the concepts nor the intuitions can yield any synthetic proposition except such as is itself also merely empirical (that is, a proposition of experience), and which for that very reason can never possess the necessity and absolute universality which are characteristic of all geometrical propositions. As regards the first and sole means of arriving at such knowledge, namely, in *a priori* fashion through mere concepts or through intuitions, it is evident that from mere concepts only analytic knowledge, not synthetic knowledge, is to be obtained. Take, for instance, the proposition, "Two straight lines cannot enclose a space, and with them alone no figure is possible," and try to derive it from the concept of straight lines and of the number two. Or take the proposition, "Given three straight lines, a figure is possible," and try, in like manner, to derive it from the concepts involved. All your labour is vain; and you find that you are constrained to have recourse to intuition, as is always done in geometry. You therefore give yourself an object in intuition. But of what kind is this intuition? Is it a pure *a priori* intuition or an empirical intuition? Were it the latter, no universally valid proposition could ever arise out of it — still less an apodeictic proposition — for experience can never yield such. You must therefore give yourself an object *a priori* in intuition, and ground upon this your synthetic proposition. If there did not exist in you a power of *a priori* intuition; and if that subjective condition were not also at the same time, as regards its form, the universal *a priori* condition under which alone the object of this outer intuition is itself possible; if the object (the triangle) were something in itself, apart from any relation to you, the subject, how could you say that what necessarily exist in you as subjective conditions for the construction of a triangle, must of necessity belong to the triangle itself? You could not then add anything new (the figure) to your concepts (of three lines) as something which must necessarily be met with in the object, since this object is [on that view] given antecedently to your knowledge, and not by means of it. If, therefore, space (and the same is true of time) were not merely a form of your intuition, containing

conditions *a priori*, under which alone things can be outer objects to you, and without which subjective conditions outer objects are in themselves nothing, you could not in regard to outer objects determine anything whatsoever in an *a priori* and synthetic manner. It is, therefore, not merely possible or probable, but indubitably certain, that space and time, as the necessary conditions of all outer and inner experience, are merely subjective conditions of all our intuition, and that in relation to these conditions all objects are therefore mere appearances, and not given us as things in themselves which exist in this manner. For this reason also, while much can be said *a priori* as regards the form of appearances, nothing whatsoever can be asserted of the thing in itself, which may underlie these appearances.

II. In confirmation of this theory of the ideality of both outer and inner sense, and therefore of all objects of the senses, as mere appearances, it is especially relevant to observe that everything in our knowledge which belongs to intuition – feeling of pleasure and pain, and the will, not being knowledge, are excluded – contains nothing but mere relations; namely, of locations in an intuition (extension), of change of location (motion), and of laws according to which this change is determined (moving forces). What it is that is present in this or that location, or what it is that is operative in the things themselves apart from change of location, is not given through intuition. Now a thing in itself cannot be known through mere relations; and we may therefore conclude that since outer sense gives us nothing but mere relations, this sense can contain in its representation only the relation of an object to the subject, and not the inner properties of the object in itself. This also holds true of inner sense, not only because the representations of the *outer senses* constitute the proper material with which we occupy our mind, but because the time in which we set these representations, which is itself antecedent to the consciousness of them in experience, and which underlies them as the formal condition of the mode in which we posit them in the mind, itself contains [only] relations of succession, coexistence, and of that which is coexistent with succession, the enduring. Now that which, as representation, can be antecedent to any and every act of thinking anything, is intuition; and if it contains nothing but relations, it is the form of intuition. Since this form does not represent anything save in so far as something is posited in the mind, it can be nothing but the mode in which the mind is affected through its own activity (namely, through this positing of its representation), and so is affected by itself; in other words, it is nothing but an inner sense in respect of the form of that sense. Everything that is represented through a sense is so far always appearance, and consequently we must either refuse to admit that there is an inner sense, or we must recognise that the subject, which is the object of the sense, can be represented through it only as appearance, not as that subject would judge of itself if its intuition were self-activity only, that is, were intellectual. The whole difficulty is as to how a subject can inwardly intuit itself; and this is a difficulty common to every theory. The consciousness of self (apperception) is the simple representation of the 'I', and if all that is manifold in the subject were given by the *activity of the self*, the inner intuition would be intellectual. In man this consciousness demands inner perception of the manifold which is antecedently given in the subject, and the mode in which this manifold is given in the mind must, as non-spontaneous, be entitled sensibility. If the faculty of coming to consciousness of oneself is to seek out (to apprehend) that which lies in the mind, it must affect the mind, and only in this way can it give rise to an intuition of itself. But the form of this intuition, which exists antecedently in the mind, determines, in the representation of time, the mode in which the manifold is together in the mind,

since it then intuits itself not as it would represent itself if immediately self-active, but as it is affected by itself, and therefore as it appears to itself, not as it is.

III. When I say that the intuition of outer objects and the self-intuition of the mind alike represent the objects and the mind, in space and in time, as they affect our senses, that is, as they appear, I do not mean to say that these objects are a mere *illusion*. For in an appearance the objects, nay even the properties that we ascribe to them, are always regarded as something actually given. Since, however, in the relation of the given object to the subject, such properties depend upon the mode of intuition of the subject, this object as *appearance* is to be distinguished from itself as object *in itself*. Thus when I maintain that the quality of space and of time, in conformity with which, as a condition of their existence, I posit both bodies and my own soul, lies in my mode of intuition and not in those objects in themselves, I am not saying that bodies merely *seem* to be outside me, or that my soul only *seems* to be given in my self-consciousness. It would be my own fault, if out of that which I ought to reckon as appearance, I made mere illusion.<sup>1</sup> That does not follow as a consequence of our principle of the ideality of all our sensible intuitions – quite the contrary. It is only if we ascribe *objective reality* to these forms of representation, that it becomes impossible for us to prevent everything being thereby transformed into mere *illusion*. For if we regard space and time as properties which, if they are to be possible at all, must be found in things in themselves, and if we reflect on the absurdities in which we are then involved, in that two infinite things, which are not substances, nor anything actually inhering in substances, must yet have existence, nay, must be the necessary condition of the existence of all things, and moreover must continue to exist, even although all existing things be removed, – we cannot blame the good Berkeley for degrading bodies to mere illusion. Nay, even our own existence, in being made thus dependent upon the self-subsistent reality of a non-entity, such as time, would necessarily be changed with it into sheer illusion – an absurdity of which no one has yet been guilty.

IV. In natural theology, in thinking an object [God], who not only can never be an object of intuition to us but cannot be an object of sensible intuition even to himself, we are careful to remove the conditions of time and space from his intuition – for all his knowledge must be intuition, and not *thought*, which always involves limitations. But with what right can we do this if we have previously made time and space forms of things in themselves, and such as would remain, as *a priori* conditions of the existence of things, even though the things themselves were removed? As conditions of all existence in general, they must also be conditions of the existence of God. If we do not thus treat them as objective forms of all things, the only alternative is to view them as subjective forms of our inner and outer intuition, which is termed sensible, for the very reason that it is *not original*, that is, is not such as can itself give us the existence of its object – a mode of intuition which, so far as we can judge, can belong only to the primordial being. Our mode of intuition is dependent upon the existence of the object, and is therefore possible only if the subject's faculty of representation is affected by that object.

This mode of intuiting in space and time need not be limited to human sensibility. It may be that all finite, thinking beings necessarily agree with man in this respect, although we are not in a position to judge whether this is actually so. But however universal this mode of sensibility may be, it does not therefore cease to be sensibility. It is derivative (*intuitus derivativus*), not original (*intuitus originarius*), and therefore not an intellectual intuition. For the reason stated above, such intellectual intuition seems to belong solely to the primordial being, and can never be ascribed to a dependent being,

dependent in its existence as well as in its intuition, and which through that intuition determines its existence solely in relation to given objects.<sup>2</sup> This latter remark, however, must be taken only as an illustration of our aesthetic theory, not as forming part of the proof.

### Conclusion of the Transcendental Aesthetic

Here, then, in pure *a priori* intuitions, space and time, we have one of the factors required for solution of the general problem of transcendental philosophy: *how are synthetic a priori judgments possible?* When in *a priori* judgment we seek to go out beyond the given concept, we come in the *a priori* intuitions upon that which cannot be discovered in the concept but which is certainly found *a priori* in the intuition corresponding to the concept, and can be connected with it synthetically. Such judgments, however, thus based on intuition, can never extend beyond objects of the senses; they are valid only for objects of possible experience.

### Notes

- 1 The predicates of the appearance can be ascribed to the object itself, in relation to our sense, for instance, the red colour or the scent to the rose. [But what is illusory can never be ascribed as predicate to an object (for the sufficient reason that we then attribute to the object, taken by itself, what belongs to it only in relation to the senses, or in general to the subject), for instance, the two handles which were formerly ascribed to Saturn.] That which, while inseparable from the representation of the object, is not to be met with in the object in itself, but always in its relation to the subject, is appearance. Accordingly the predicates of space and time are rightly ascribed to the objects of the senses, as such; and in this there is no illusion. On the other hand, if I ascribe redness to the rose *in itself* [handles to Saturn], or extension to all outer objects *in themselves*, without paying regard to the determinate relation of these objects to the subject, and without limiting my judgment to that relation, illusion then first arises. [The passage enclosed in brackets conflicts with the main argument, and is probably a later addition carelessly inserted.]
- 2 [May be more freely translated as: "through that intuition is conscious of its own existence only in relation to given objects".]

# CHAPTER 3

## The Phenomenology of Reading

*Georges Poulet*

One of the most influential philosophers of the eighteenth century, Immanuel Kant, argued that the mind brings to the world an ability to shape and order the manifold of sensuous experiences that impinge on it through the senses. Without such an innate ordering ability, Kant argued, the mind would not function. In the early twentieth century, Edmund Husserl sought to deepen Kant's insight by exploring how the mind experienced what he called "phenomena," the mental objects that are representations of objects in the world. All of our experience of the world and of life is of such phenomena. One version of phenomenology or the science of conscious experience would be to consider how the mind and its objects interact and come into contact with one another as the flow of everyday experience occurs. But if knowledge is limited to that flow, no certain truth could ever hope to be established. Husserl argued that the mind was capable of purifying its experience of ideas by reducing out all the contingent, happenstance elements of everyday experience. What resulted was a pure idea of an object. Several European literary theorists in the twentieth century, such as Georges Poulet and Roman Ingarden, explored the reader's experience of the work of literature, and in the United States, a school of criticism called "Reader Response" emerged led by Stanley Fish.

Georges Poulet was a Professor of French Literature at Johns Hopkins University and later taught at the University of Zurich and the University of Nice. He was a major figure associated with the *nouvelle critique* (New Criticism) of French literature and the Geneva School of Literary Criticism in the 1950s and 1960s. Poulet authored works such as *Studies in Human Time* (1956), *Metamorphoses of the Circle* (1966), and *La Pensée indéterminée, vols. 1–3* (1985–90).

At the beginning of Mallarmé's unfinished story, *Igitur*, there is the description of an empty room, in the middle of which, on a table there is an open book. This seems to me the situation of every book, until someone comes and begins to read it. Books are objects. On a table, on bookshelves, in store windows, they wait for someone to come and deliver

*Original publication details:* Georges Poulet, "The Phenomenology of Reading." *New Literary History* 1.1, pp. 53–68. Johns Hopkins University Press, 1989.

them from their materiality, from their immobility. When I see them on display, I look at them as I would at animals for sale, kept in little cages, and so obviously hoping for a buyer. For – there is no doubting it – animals do know that their fate depends on a human intervention, thanks to which they will be delivered from the shame of being treated as objects. Isn't the same true of books? Made of paper and ink, they lie where they are put, until the moment someone shows an interest in them. They wait. Are they aware that an act of man might suddenly transform their existence? They appear to be lit up with that hope. Read me, they seem to say. I find it hard to resist their appeal. No, books are not just objects among others.

This feeling they give me – I sometimes have it with other objects. I have it, for example, with vases and statues. It would never occur to me to walk around a sewing machine or to look at the under side of a plate. I am quite satisfied with the face they present to me. But statues make me want to circle around them, vases make me want to turn them in my hands. I wonder why. Isn't it because they give me the illusion that there is something in them which, from a different angle, I might be able to see? Neither vase nor statue seems fully revealed by the unbroken perimeter of its surfaces. In addition to its surfaces it must have an interior. What this interior might be, that is what intrigues me and makes me circle around them, as though looking for the entrance to a secret chamber. But there is no such entrance (save for the mouth of the vase, which is not a true entrance since it gives only access to a little space to put flowers in). So the vase and the statue are closed. They oblige me to remain outside. We can have no true rapport – whence my sense of uneasiness.

So much for statues and vases. I hope books are not like them. Buy a vase, take it home, put it on your table or your mantel, and, after a while, it will allow itself to be made a part of your household. But it will be no less a vase, for that. On the other hand, take a book, and you will find it offering, opening itself. It is this openness of the book which I find so moving. A book is not shut in by its contours, is not walled-up as in a fortress. It asks nothing better than to exist outside itself, or to let you exist in it. In short, the extraordinary fact in the case of a book is the falling away of the barriers between you and it. You are inside it; it is inside you; there is no longer either outside or inside.

Such is the initial phenomenon produced whenever I take up a book, and begin to read it. At the precise moment that I see, surging out of the object I hold open before me, a quantity of significations which my mind grasps, I realize that what I hold in my hands is no longer just an object, or even simply a living thing. I am aware of a rational being, of a consciousness; the consciousness of another, no different from the one I automatically assume in every human being I encounter, except that in this case the consciousness is open to me, welcomes me, lets me look deep inside itself, and even allows me, with unheard-of licence, to think what it thinks and feel what it feels.

Unheard-of, I say. Unheard-of, first, is the disappearance of the “object.” Where is the book I held in my hands? It is still there, and at the same time it is there no longer, it is nowhere. That object wholly object, that thing made of paper, as there are things made of metal or porcelain, that object is no more, or at least it is as if it no longer existed, as long as I read the book. For the book is no longer a material reality. It has become a series of words, of images, of ideas which in their turn begin to exist. And where is this new existence? Surely not in the paper object. Nor, surely, in external space. There is only one place left for this new existence: my innermost self.

How has this come about? By what means, through whose intercession? How can I have opened my own mind so completely to what is usually shut out of it? I do not know.

I know only that, while reading, I perceive in my mind a number of significations which have made themselves at home there. Doubtless they are still objects: images, ideas, words, objects of my thought. And yet, from this point of view, there is an enormous difference. For the book, like the vase, or like the statue, was an object among others, residing in the external world: the world which objects ordinarily inhabit exclusively in their own society or each on its own, in no need of being thought by my thought; whereas in this interior world where, like fish in an aquarium, words, images and ideas disport themselves, these mental entities, in order to exist, need the shelter which I provide; they are dependent on my consciousness.

This dependence is at once a disadvantage and an advantage. As I have just observed, it is the privilege of exterior objects to dispense with any interference from the mind. All they ask is to be let alone. They manage by themselves. But the same is surely not true of interior objects. By definition they are condemned to change their very nature, condemned to lose their materiality. They become images, ideas, words, that is to say purely mental entities. In sum, in order to exist as mental objects, they must relinquish their existence as real objects.

On the one hand, this is cause for regret. As soon as I replace my direct perception of reality by the words of a book, I deliver myself, bound hand and foot to the omnipotence of fiction. I say farewell to what is, in order to feign belief in what is not. I surround myself with fictitious beings; I become the prey of language. There is no escaping this take-over. Language surrounds me with its unreality.

On the other hand, the transmutation through language of reality into a fictional equivalent, has undeniable advantages. The universe of fiction is infinitely more elastic than the world of objective reality. It lends itself to any use; it yields with little resistance to the importunities of the mind. Moreover – and of all its benefits I find this the most appealing – this interior universe constituted by language does not seem radically opposed to the *me* who thinks it. Doubtless what I glimpse through the words are mental forms not divested of an appearance of objectivity. But they do not seem to be of a nature other than my mind which thinks them. They are objects, but subjectified objects. In short, since everything has become part of my mind, thanks to the intervention of language, the opposition between the subject and its objects has been considerably attenuated. And thus the greatest advantage of literature is that I am persuaded by it that I am freed from my usual sense of incompatibility between my consciousness and its objects.

This is the remarkable transformation wrought in me through the act of reading. Not only does it cause the physical objects around me to disappear, including the very book I am reading, but it replaces those external objects with a congeries of mental objects in close *rapport* with my own consciousness. And yet the very intimacy in which I now live with my objects is going to present me with new problems. The most curious of these is the following: I am someone who happens to have as objects of his own thought, thoughts which are part of a book I am reading, and which are therefore the cogitations of another. They are the thoughts of another, and yet it is I who am their subject. The situation is even more astonishing than the one noted above. I am thinking the thoughts of another. Of course, there would be no cause for astonishment if I were thinking it as the thought of another. But I think it as my very own. Ordinarily there is the *I* which thinks, which recognizes itself (when it takes its bearings) in thoughts which may have come from elsewhere but which it takes upon itself as its own in the moment it thinks them. This is how we must take Diderot's declaration "Mes pensées sont mes catins" ("My thoughts are my whores"). That is, they sleep with everybody without ceasing to belong to their

author. Now, in the present case things are quite different. Because of the strange invasion of my person by the thoughts of another, I am a self who is granted the experience of thinking thoughts foreign to him. I am the subject of thoughts other than my own. My consciousness behaves as though it were the consciousness of another.

This merits reflection. In a certain sense I must recognize that no idea really belongs to me. Ideas belong to no one. They pass from one mind to another as coins pass from hand to hand. Consequently, nothing could be more misleading than the attempt to define a consciousness by the ideas which it utters or entertains. But whatever these ideas may be, however strong the tie which binds them to their source, however transitory may be their sojourn in my own mind, so long as I entertain them I assert myself as subject of these ideas; I am the subjective principle for whom the ideas serve for the time being as the predication. Furthermore, this subjective principle can in no wise be conceived as a predication, as something which is discussed, referred to. It is I who think, who contemplate, who am engaged in speaking. In short, it is never a *HE* but an *I*.

Now what happens when I read a book? Am I then the subject of a series of predication which are not *my* predication? That is impossible, perhaps even a contradiction in terms. I feel sure that as soon as I think something, that something becomes in some indefinable way my own. Whatever I think is a part of *my* mental world. And yet here I am thinking a thought which manifestly belongs to another mental world, which is being thought in me just as though I did not exist. Already the notion is inconceivable and seems even more so if I reflect that, since every thought must have a subject to think it, this *thought* which is alien to me and yet in me, must also have in me a *subject* which is alien to me. It all happens, then, as though reading were the act by which a thought managed to bestow itself within me with a subject not myself. Whenever I read, I mentally pronounce an *I*, and yet the *I* which I pronounce is not myself. This is true even when the hero of a novel is presented in the third person, and even when there is no hero and nothing but reflections or propositions: for as soon as something is presented as *thought*, there has to be a thinking subject with whom, at least for the time being, I identify, forgetting myself, alienated from myself. "JE est un autre." said Rimbaud. Another *I*, who has replaced my own, and who will continue to do so as long as I read. Reading is just that: a way of giving way not only to a host of alien words, images, ideas, but also to the very alien principle which utters them and shelters them.

The phenomenon is indeed hard to explain, even to conceive, and yet, once admitted, it explains to me what might otherwise seem even more inexplicable. For how could I explain, without such take-over of my innermost subjective being, the astonishing facility with which I not only understand but even *feel* what I read. When I read as I ought, i.e. without mental reservation, without any desire to preserve my independence of judgment, and with the total commitment required of any reader, my comprehension becomes intuitive and any feeling proposed to me is immediately assumed by me. In other words, the kind of comprehension in question here is not a movement from the unknown to the known, from the strange to the familiar, from outside to inside. It might rather be called a phenomenon by which mental objects rise up from the depths of consciousness into the light of recognition. On the other hand – and without contradiction – reading implies something resembling the apperception I have of myself, the action by which I grasp straightway what I think as being thought by a subject (who, in this case, is not, I). Whatever sort of alienation I may endure, reading does not interpret my activity as subject.

Reading, then, is the act in which the subjective principle which I call *I*, is modified in such a way that I no longer have the right, strictly speaking, to consider it as my *I*. I am on loan to another, and this other thinks, feels, suffers, and acts within me. The phenomenon appears in its most obvious and even naivest form in the sort of spell brought about by certain cheap kinds of reading, such as thrillers, of which I say "It gripped me." Now it is important to note that this possession of myself by another takes place not only on the level of objective thought, that is with regard to images, sensations, ideas which reading affords me, but also on the level of my very subjectivity. When I am absorbed in reading, a second self takes over, a self which thinks and feels for me. Withdrawn in some recess of myself, do I then silently witness this dispossession? Do I derive from it some comfort or, on the contrary, a kind of anguish? However that may be, someone else holds the center of the stage, and the question which imposes itself, which I am absolutely obliged to ask myself, is this: "Who is the usurper who occupies the forefront? What is this mind who all alone by himself fills my consciousness and who, when I say *I*, is indeed that *I*?"

There is an immediate answer to this question, perhaps too easy an answer. This *I* who thinks in me when I read a book, is the *I* of the one who writes the book. When I read Baudelaire or Racine, it is really Baudelaire or Racine who thinks, feels, allows himself to be read within me. Thus a book is not only a book, it is the means by which an author actually preserves his ideas, his feelings, his modes of dreaming and living. It is his means of saving his identity from death. Such an interpretation of reading is not false. It seems to justify what is commonly called the biographical explication of literary texts. Indeed every word of literature is impregnated with the mind of the one who wrote it. As he makes us read it, he awakens in us the analogue of what he thought or felt. To understand a literary work, then, is to let the individual who wrote it reveal himself to us *in us*. It is not the biography which explicates the work, but rather the work which sometimes enables us to understand the biography.

But biographical interpretation is in part false and misleading. It is true that there is an analogy between the works of an author and the experiences of his life. The works may be seen as an incomplete translation of the life. And further, there is an even more significant analogy among all the works of a single author. Each of the works, however, while I am reading it, lives in me its own life. The subject who is revealed to me through my reading of it is not the author, either in the disordered totality of his outer experiences, or in the aggregate, better organized and concentrated totality, which is the one of his writings. Yet the subject which presides over the work can exist only in the work. To be sure, nothing is unimportant for understanding the work, and a mass of biographical, bibliographical, textual, and general critical information is indispensable to me. And yet this knowledge does not coincide with the internal knowledge of the work. Whatever may be the sum of the information I acquire on Baudelaire or Racine, in whatever degree of intimacy I may live with their genius, I am aware that this contribution (*apport*) does not suffice to illuminate for me in its own inner meaning, in its formal perfection, and in the subjective principle which animates it, the particular work of Baudelaire or Racine the reading of which now absorbs me. At this moment what matters to me is to live, from the inside, in a certain identity with the work and the work alone. It could hardly be otherwise. Nothing external to the work could possibly share the extraordinary claim which the work now exerts on me. It is there within me, not to send me back, outside itself, to its author, nor to his other writings, but on the contrary to keep my attention riveted on itself. It is the work which traces in me the very boundaries within which this

consciousness will define itself. It is the work which forces on me a series of mental objects and creates in me a network of words, beyond which, for the time being, there will be no room for other mental objects or for other words. And it is the work, finally, which, not satisfied thus with defining the content of my consciousness, takes hold of it, appropriates it, and makes of it that *I* which, from one end of my reading to the other, presides over the unfolding of the work, of the single work which I am reading.

And so the work forms the temporary mental substance which fills my consciousness; and it is moreover that consciousness, the *I*-subject, the continued consciousness of what is, revealing itself within the interior of the work. Such is the characteristic condition of every work which I summon back into existence by placing my consciousness at its disposal. I give it not only existence, but awareness of existence. And so I ought not to hesitate to recognize that so long as it is animated by this vital inbreathing inspired by the act of reading, a work of literature becomes (at the expense of the reader whose own life it suspends) a sort of human being, that it is a mind conscious of itself and constituting itself in me as the subject of its own objects.

## II

The work lives its own life within me; in a certain sense, it thinks itself, and it even gives itself a meaning within me.

This strange displacement of myself by the work deserves to be examined even more closely.

If the work thinks itself in me, does this mean that, during a complete loss of consciousness on my part, another thinking entity invades me, taking advantage of my unconsciousness in order to think itself without my being able to think it? Obviously not. The annexation of my consciousness by another (the other which is the work) in no way implies that I am the victim of any deprivation of consciousness. Everything happens, on the contrary, as though, from the moment I become a prey to what I read, I begin to share the use of my consciousness with this being whom I have tried to define and who is the conscious subject ensconced at the heart of the work. He and I, we start having a common consciousness. Doubtless, within this community of feeling, the parts played by each of us are not of equal importance. The consciousness inherent in the work is active and potent; it occupies the foreground; it is clearly related to its *own* world, to objects which are *its* objects. In opposition, I myself, although conscious of whatever it may be conscious of, I play a much more humble role, content to record passively all that is going on in me. A lag takes place, a sort of schizoid distinction between what I feel and what the other feels; a confused awareness of delay, so that the work seems first to think by itself, and then to inform me what it has thought. Thus I often have the impression, while reading, of simply witnessing an action which at the same time concerns and yet does not concern me. This provokes a certain feeling of surprise within me. I am a consciousness astonished by an existence which is not mine, but which I experience as though it were mine.

This astonished consciousness is in fact the consciousness of the critic: the consciousness of a being who is allowed to apprehend as its own what is happening in the consciousness of another being. Aware of a certain gap, disclosing a feeling of identity, but of identity within difference, critical consciousness does not necessarily imply the total disappearance of the critic's mind in the mind to be criticized. From the partial and

hesitant approximation of Jacques Rivi  re to the exalted, digressive and triumphant approximation of Charles Du Bos, criticism can pass through a whole series of nuances which we would be well advised to study. That is what I now propose to do. By discovering the various forms of identification and non-identification to be found in recent critical writing in French literature, I shall be able perhaps to give a better account of the variations of which this relationship – between criticizing subject and criticized object – is capable.

Let me take a first example. In the case of the first critic I shall speak of, this fusion of two consciousnesses is barely suggested. It is an uncertain movement of the mind toward an object which remains hidden. Whereas in the perfect identification of two consciousnesses, each sees itself reflected in the other, in this instance the critical consciousness can, at best, attempt but to draw closer to a reality which must remain forever veiled. In this attempt it uses the only mediators available to it in this quest, that is the senses. And since sight, the most intellectual of the five senses, seems in this particular case to come up against a basic opacity, the critical mind must approach its goal blindly, through the tactile exploration of surfaces, through a groping exploration of the material world which separates the critical mind from its object. Thus, despite the immense effort on the part of the sympathetic intelligence to lower itself to a level where it can, however lamely, make some progress in its quest toward the consciousness of the other, this enterprise is destined to failure. One senses that the unfortunate critic is condemned never to fulfill adequately his role as reader. He stumbles, he puzzles, he questions awkwardly a language which he is condemned never to read with ease; or rather, in trying to read the language, he uses a key which enables him to translate but a fraction of the text.

This critic is Jacques Rivi  re.

And yet it is from this failure that a much later critic will derive a more successful method of approaching a text. With this later critic, as with Rivi  re, the whole project begins with an attempt at identification on the most basic level. But this most primitive level is the one in which there flows, from mind to mind, a current which has only to be followed. To identify with the work means here, for the critic, to undergo the same experiences, beginning with the most elementary. On the level of indistinct thought, of sensations, emotions, images, and obsessions of preconscious life, it is possible for the critic to repeat, within himself, that life of which the work affords a first version, inexhaustibly revealing and suggestive. And yet such an imitation could not take place, in a domain so hard to define, without the aid of a powerful auxiliary. This auxiliary is language. There is no critical identification which is not prepared, realized, and incarnated through the agency of language. The deepest sentient life, hidden in the recesses of another's thoughts, could never be truly transposed, save for the mediation of words which allow a whole series of equivalences to arise. To describe this phenomenon as it takes place in the criticism I am speaking of now, I can no longer be content with the usual distinctions between the signifier (*signifiant*) and the signified (*signifie*) for what would it mean here to say that the language of the critic *signifies* the language of the literary work? There is not just equation, similitude. Words have attained a veritable power of recreation; they are a sort of material entity, solid and three-dimensional, thanks to which a certain life of the senses is reborn, finding in a network of verbal connotations the very conditions necessary for its replication. In other words, the language of criticism here dedicates itself to the business of mimicking physically the apperceptual world of the author. Strangely enough, the language of this sort of mimetic criticism becomes even more tangible, more tactile than the author's own; the poetry of the critic becomes more

“poetic” than the poet’s. This verbal *mimesis*, consciously exaggerated, is in no way servile, nor does it tend at all toward the pastiche. And yet it can reach its object only insofar as that object is deeply enmeshed in, almost confounded with, physical matter. This form of criticism is thus able to provide an admirable equivalent of the vital substratum which underlies all thought, and yet it seems incapable of attaining and expressing thought itself. This criticism is both helped and hindered by the language which it employs; helped, insofar as this language allows it to express the sensuous life in its original state, where it is still almost impossible to distinguish between subject and object; and yet hindered, too, because this language, too congealed and opaque, does not lend itself to analysis, and because the subjectivity which it evokes and describes is as though forever mired in its objects. And so the activity of criticism in this case is somehow incomplete, in spite of its remarkable successes. Identification relative to objects is accomplished almost too well; relative to subjectivity it is barely sketched.

This, then, is the criticism of Jean-Pierre Richard.

In its extreme form, in the abolition of any subject whatsoever, this criticism seems to extract from a literary work a certain condensed matter, a material essence.

But what, then, would be a criticism which would be the reverse, which would abolish the object and extract from the texts their most *subjective* elements?

To conceive such a criticism, I must leap to the opposite extreme. I imagine a critical language which would attempt deliberately to strip the literary language of anything concrete. In such a criticism it would be the artful aim of every line, of every sentence, of every metaphor, of every word, to reduce to the near nothingness of abstraction the images of the real world reflected by literature. If literature, by definition, is already a transportation of the real into the unreality of verbal conception, then the critical act in this case will constitute a transposition of this transposition, thus raising to the second power the “derealization” of being through language. In this way, the mind puts the maximum distance between its thought and what *is*. Thanks to this withdrawal, and to the consequent dematerialization of every object thus pushed to the vanishing point, the universe represented in this criticism seems not so much the equivalent of the perceivable world, or of its literary representation, as rather its image crystallized through a process of rigorous intellectualization. Here criticism is no longer *mimesis*; it is the reduction of all literary forms to the same level of insignificance. In short, what survives this attempted annihilation of literature by the critical act? Nothing perhaps save a consciousness ceaselessly confronting the hollowness of mental objects, which yield without resistance, and an absolutely transparent language, which, by coating all objects with the same clear glaze, makes them (“like leaves seen far beneath the ice”) appear to be infinitely far away. Thus, the language of this criticism plays a role exactly opposite to the function it has in Jean-Pierre Richard’s criticism. It does indeed bring about the unification of critical thought with the mental world revealed by the literary work; but it brings it about at the expense of the work. Everything is finally annexed by the dominion of a consciousness detached from any object, a *hyper-critical* consciousness, functioning all alone, somewhere in the void.

Is there any need to say that this hyper-criticism is the critical thought of Maurice Blanchot?

I have found it useful to compare the criticism of Richard to the criticism of Blanchot. I learn from this confrontation that the critic’s linguistic apparatus can, just as he chooses, bring him closer to the work under consideration, or can remove him from it indefinitely. If he so wishes, he can approximate very closely the work in question, thanks

to a verbal mimesis which transposes into the critic's language the sensuous themes of the work. Or else he can make language a pure crystallizing agent, an absolute translucence, which, suffering no opacity to exist between subject and object, promotes the exercise of the cognitive power on the part of the subject, while at the same time accentuating in the object those characteristics which emphasize its infinite distance from the subject. In the first of the two cases, criticism achieves a remarkable *complicity*, but at the risk of losing its minimum lucidity; in the second case, it results in the most complete dissociation; the maximum lucidity thereby achieved only confirms a separation instead of a union.

Thus criticism seems to oscillate between two possibilities: a union without comprehension, and a comprehension without union. I may identify so completely with what I am reading that I lose consciousness not only of myself, but also of that other consciousness which lives within the work. Its proximity blinds me by blocking my prospect. But I may, on the other hand, separate myself so completely from what I am contemplating that the thought thus removed to a distance assumes the aspect of a being with whom I may never establish any relationship whatsoever. In either case, the act of reading has delivered me from egocentricity: another's thought inhabits me or haunts me, but in the first case I lose myself in that alien world, and in the other we keep our distance and refuse to identify. Extreme closeness and extreme detachment have then the same regrettable effect of making me fall short of the total critical act: that is to say, the exploration of that mysterious interrelationship which, through the mediation of reading and of language, is established to our mutual satisfaction between the work read and myself.

Thus extreme proximity and extreme separation each have grave disadvantages. And yet they have their privileges as well. Sensuous thought is privileged to move at once to the heart of the work and to share its own life; clear thought is privileged to confer on its objects the highest degree of intelligibility. Two sorts of insight are here distinguishable and mutually exclusive: there is penetration by the senses and penetration by the reflective consciousness. Now rather than contrasting these two forms of critical activity, would there not be some way, I wonder, not of practicing them simultaneously, which would be impossible, but at least of combining them through a kind of reciprocation and alternation?

Is not this perhaps the method used today by Jean Starobinski? For instance, it would not be difficult to find in his work a number of texts which relate him to Maurice Blanchot. Like Blanchot he displays exceptional lucidity and an acute awareness of distance. And yet he does not quite abandon himself to Blanchot's habitual pessimism. On the contrary, he seems inclined to optimism, even at times to a pleasant utopianism. Starobinski's intellect in this respect is analogous to that of Rousseau, yearning for an immediate transparency of all beings to each other which would enable them to understand each other in an ecstatic happiness. From this point of view, is not the ideal of criticism precisely represented by the *fête citadine* (street celebration) or *fête champêtre* (rustic feast)? There is a milieu or a moment in the feast in which everyone communicates with everyone else, in which hearts are open like books. On a more modest scale, doesn't the same phenomenon occur in reading? Does not one being open its innermost self? Is not the other being enchanted by this opening? In the criticism of Starobinski we often find that crystalline tempo of music, that pure delight in understanding, that perfect sympathy between an intelligence which enters and that intelligence which welcomes it.

In such moments of harmony, there is no longer any exclusion, no inside or outside. Contrary to Blanchot's belief, perfect translucence does not result in separation.

On the contrary, with Starobinski, all is perfect agreement, joy shared, the pleasure of understanding and of being understood. Moreover, such pleasure, however intellectual it may be, is not here exclusively a pleasure of the mind. For the relationship established on this level between author and critic is not a relationship between pure minds. It is rather between incarnate beings, and the particularities of their physical existence constitute not obstacles to understanding, but rather a complex of supplementary signs, a veritable language which must be deciphered and which enhances mutual comprehension. Thus for Starobinski, as much physician as critic, there is a reading of *bodies* which is likened to the reading of *minds*. It is not of the same nature, nor does it bring the intelligence to bear on the same area of human knowledge. But for the critic who practices it, this criticism provides the opportunity for a reciprocating exchange between different types of learning which have, perhaps, different degrees of transparency.

Starobinski's criticism, then, displays great flexibility. Rising at times to the heights of metaphysics, it does not disdain the farthest reaches of the subconscious. It is sometimes intimate, sometimes detached; it assumes all the degrees of identification and non-identification. But its final movement seems to consist in a sort of withdrawal, contradistinction with its earlier accord. After an initial intimacy with the object under study, this criticism has finally to detach itself, to move on, but this time in solitude. Let us not see this withdrawal as a failure of sympathy but rather as a way of avoiding the encumbrances of too prolonged a life in common. Above all we discern an acute need to establish bearings, to adopt the judicious perspective, to assess the fruits of proximity by examining them at a distance. Thus, Starobinski's criticism always ends with a view from afar, or rather from above, for while moving away it has also moved imperceptibly toward a dominating (*surplombante*) position. Does this mean that Starobinski's criticism like Blanchot's is doomed to end in a philosophy of separation? This, in a way, must be conceded, and it is no coincidence that Starobinski treats with special care the themes of melancholy and nostalgia. His criticism always concludes with a double farewell. But this farewell is exchanged by two beings who have begun by living together; and the one left behind continues to be illuminated by that critical intellect which moves on.

The sole fault with which I might reproach such criticism is the excessive ease with which it penetrates what it illuminates.

By dint of seeing in literary works only the thoughts which inhabit them, Starobinski's criticism somehow passes through their forms, not neglecting them, it is true, but without pausing on the way. Under its action literary works lose their opacity, their solidity, their objective dimension; like those palace walls which become transparent in certain fairy tales. And if it is true that the ideal act of criticism must seize (and reproduce) that certain relationship between an object and a mind which is the work itself, how could the act of criticism succeed when it suppresses one of the (polar) terms of this relationship?

My search must continue, then, for a criticism in which this relationship subsists. Could it perhaps be the criticism of Marcel Raymond and Jean Rousset? Raymond's criticism always recognizes the presence of a double reality, both mental and formal. It strives to comprehend almost simultaneously an inner experience and a perfected form. On the one hand, no one allows himself to be absorbed with such complete self-forgetfulness into the thought of another. But the other's thought is grasped not at its highest, but at its most obscure, at its cloudiest point, at the point at which it is reduced to being a mere self-awareness scarcely perceived by the being which entertains it, and which yet to the eyes of the critic seems the sole means of access by which he can penetrate within the precincts of the alien mind.

But Raymond's criticism presents another aspect which is precisely the reverse of this confused identification of the critic's thought with the thought criticized. It is then the reflective contemplation of a formal reality which is the work itself. The work stands *before* the critical intelligence as a perfected object, which is in fact an enigma, an external thing existing in itself and with which there is no possibility of identification nor of inner knowledge.

Thus Raymond perceives sometimes a subject, sometimes an object. The subject is pure mind; it is a sheer indefinable presence, an almost inchoate entity, into which, by very virtue of its absence of form, it becomes possible for the critic's mind to penetrate. The work, on the contrary, exists only within a definite form, but this definition limits it, encloses it within its own contours, at the same time constraining the mind which studies it to remain on the outside. So that, if on the one hand the critical thought of Raymond tends to lose itself within an undefined subjectivity, on the other it tends to come to a stop before an impenetrable objectivity.

Admirably gifted to submit his own subjectivity to that of another, and thus to immerse itself in the obscurest depths of every mental entity, the mind of Raymond is less well equipped to penetrate the obstacle presented by the objective surface of the works. He then finds himself marking time, or moving in circles around the work, as around the vase or the statue mentioned before. Does Raymond then establish an insurmountable partition between the two realities – subjective, objective – unified though they may be in the work? No, indeed, at least not in his best essays, since in them, by careful intuitive apprehension of the text and participation by the critic in the powers active in the poet's use of language, there appears some kind of link between the objective aspects of the work and the undefined subjectivity which sustains it. A link not to be confused with a pure relation of identity. The perception of the formal aspects of the work becomes somehow an analogical language by means of which it becomes possible for the critic to go, within the work, beyond the formal aspects it presents. Nevertheless this association is never presented by Raymond as a dialectical process. The usual state described by his method of criticism is one of plenitude, and even of a double plenitude. A certain fulness of experience detected in the poet and re-lived in the mind of the critic, is connected by the latter with a certain perfection of form; but why this is so, and how it does become so, is never clearly explained.

Now is it then possible to go one step further? This is what is attempted by Jean Rousset, a former student of Raymond and perhaps his closest friend. He also dedicates himself to the task of discerning the structure of a work as well as the depth of an experience. Only what essentially matters to him is to establish a connection between the objective reality of the work and the organizing power which gives it shape. A work is not explained for him, as for the structuralists, by the exclusive interdependence of the objective elements which compose it. He does not see in it a fortuitous combination, interpreted *a posteriori* as if it were an *a priori* organization. There is not in his eyes any system of the work without a principle of systematization which operates in correlation with that work and which is even included in it. In short, there is no spider-web without a center which is the spider. On the other hand, it is not a question of going from the work to the psychology of the author, but of going back, within the sphere of the work, from the objective elements systematically arranged, to a certain power of organization, inherent in the work itself, as if the latter showed itself to be an intentional consciousness determining its arrangements and solving its problems. So that it would scarcely be an abuse of terms to say that it speaks, by means of its structural elements, an authentic

language, thanks to which it discloses itself and means nothing but itself. Such then is the critical enterprise of Jean Rousset. It sets itself to use the objective elements of the work in order to attain, beyond them, a reality not formal, nor objective, written down however in forms and expressing itself by means of them. Thus the understanding of forms must not limit itself merely to the recording of their objective aspects. As Focillon demonstrated from the point of view of art history, there is a "life of forms" perceptible not only in the historic development which they display from epoch to epoch, but within each single work, in the movement by which forms tend therein sometimes to stabilize and become static, and sometimes to change into one another. Thus the two contradictory forces which are always at work in any literary writing, the will to stability and the protean impulse, help us to perceive by their interplay how much forms are dependent on what Coleridge called a shaping power which determines them, replaces them and transcends them. The teaching of Raymond finds then its most satisfying success in the critical method of Jean Rousset, a method which leads the seeker from the continuously changing frontiers of form to what is beyond form.

It is fitting then to conclude this inquiry here, since it has achieved its goal, namely to describe, relying on a series of more or less adequate examples, a critical method having as guiding principle the relation between subject and object. Yet there remains one last difficulty. In order to establish the interrelationship between subject and object, which is the principle of all creative work and of the understanding of it, two ways, at least theoretically, are opened, one leading from the objects to the subject, the other from the subject to the objects. Thus we have seen Raymond and Rousset, through perception of the objective structures of a literary work, strive to attain the subjective principle which upholds it. But, in so doing, they seem to recognize the precedence of the subject over its objects. What Raymond and Rousset are searching for in the objective and formal aspects of the work, is something which is previous to the work and on which the work depends for its very existence. So that the method which leads from the object to the subject does not differ radically at bottom from the one which leads from subject to object, since it does really consist in going from subject to subject through the object. Yet there is the risk of overlooking an important point. The aim of criticism is not achieved merely by the understanding of the part played by the subject in its interrelation with objects. When reading a literary work, there is a moment when it seems to me that the subject *present* in this work disengages itself from all that surrounds it, and stands alone. Had I not once the intuition of this, when visiting the Scuola de San Rocco in Venice, one of the highest summits of art, where there are assembled so many paintings of the same painter, Tintoretto? When looking at all these masterpieces brought there together and revealing so manifestly their unity of inspiration, I had suddenly the impression of having reached the common essence present in all the works of a great master, an essence which I was not able to perceive, except when emptying my mind of all the particular images created by the artist. I became aware of a subjective power at work in all these pictures, and yet never so clearly understood by my mind as when I had forgotten all their particular configurations.

One may ask oneself: What is this subject left standing in isolation after all examination of a literary work? Is it the individual genius of the artist, visibly present in his work, yet having an invisible life independent of the work? Or is it, as Valéry thinks, an anonymous and abstract consciousness presiding, in its aloofness, over the operations of all more concrete consciousness? Whatever it may be, I am constrained to acknowledge that all subjective activity present in a literary work is not entirely explained by its

relationship with forms and objects within the work. There is in the work a mental activity profoundly engaged in objective forms; and there is, at another level, forsaking all forms, a subject which reveals itself to itself (and to me) in its transcendence over all which is reflected in it. At this point, no object can any longer express it, no structure can any longer define it; it is exposed in its ineffability and in its fundamental indeterminacy. Such is perhaps the reason why the critic, in his elucidation of works, is haunted by this transcendence of mind. It seems then that criticism, in order to accompany the mind in this effort of detachment from itself, needs to annihilate, or at least momentarily to forget, the objective elements of the work, and to elevate itself to the apprehension of a subjectivity without objectivity.

# CHAPTER 4

## Teaching, Studying, and Theorizing the Production and Reception of Literary Texts

*Kathleen McCormick*

Kathleen McCormick teaches literature and writing at Purchase College, SUNY, in New York. Her areas of specialization are Irish literature, James Joyce, Italian-American literature, and the culture of reading. In this essay, she traces the evolution of the study of reading and of readership and applies the lessons of reception theory to the figure of Molly Bloom in Joyce's *Ulysses*.

Over the last decade, many researchers and theorists in cultural studies have reacted against determinist positions that regard audiences as powerless subjects merely "spoken" by the cultural discourses that traverse them. Arguing against the textual determinist position made most popular by "Screen theory" (MacCabe), theorists such as Stuart Hall, Paul Willemen, and David Morley have contended that readers are not simply the "subject of the text," but also "social subjects" who live in a particular social formation, and who are immersed in a variety of complex cultural systems, of which a text is only a single component (Hall 136–38; Willemen 48; Morley, "Texts" 170–71). While texts are thought to encourage readers to construct a "preferred" meaning, it has been argued that most readers will, to some extent, create a "negotiated" version of the text which contains both "adaptive" and "oppositional" elements (Hall 137). Recognizing that readers will construct meaning differently depending on their "knowledges, prejudices, [and] resistances" (Morley, "Texts" 171) has led to significant developments in theories of subjectivity, particularly in the areas of television and film spectatorship, as the reader/viewer has come to be regarded as an active, potentially resistant agent.

The position of reader or spectator is increasingly seen as balanced between autonomy and social determination – a view that has gained validity in part by the difficulty

*Original publication details:* Kathleen McCormick, "Teaching, Studying, and Theorizing the Production and Reception of Literary Texts." *College Literature* 19.2, *Cultural Studies: Theory Praxis Pedagogy* (June 1992), pp. 4–18. Johns Hopkins University Press, 1992. Reproduced with permission from Johns Hopkins University Press.

researchers have had predicting the ways actual audiences would negotiate a text on the basis of their class, gender, or race (Morley, *Nationwide*; Hobson, "Housewives," *Crossroads*) – and the nature of that balance between autonomy and determination is still being theorized. In his most recent ethnographic study, for example, Morley takes as his primary goal "to formulate a position from which we can see the person actively producing meanings from the restricted range of cultural resources which his or her structural position has allowed ... access to" (*Family Television* 43). Deidre Pribram, in her introduction to *Female Spectators*, emphasizes how enabling this expanding theory of subjectivity has been in film studies: "a method of analysis which argues that the viewing process includes the active participation of spectators means that film's codes can be implemented, by both producer and consumer, to allow for alternative usage" (5), and the essays collected in *Female Spectators* examine female viewers from various subject positions – as individuals, as historically constituted groups, and as viewers of particular texts (5).

Rethorizing the discursive positions of audiences also has had significant impact on education practices (Masterman; Giroux and Simon et al.). Len Masterman, for example, has argued that "within media education, if the full implications of work on the significance of audience responses has [sic] been fully grasped, it is scarcely possible to pursue a pedagogy within which students are treated as the recipients of pre-ordained information and ideas, rather than as active makers of meaning in their own right" (30). It is the pedagogical implications of such retheorizing for the teaching of literary texts that are the primary focus of this paper. For the reader of a literary text, no less than the television spectator, is also a subject "within different social practices in determinate social formations" (Morley, "Texts" 170), and, in creating meaning, the literary reader is also balanced between autonomy and determination. In what follows, I will argue, on both theoretical and practical pedagogical grounds, that one of the ways in which student readers of literature can be enabled to work with critical awareness in that balance between autonomy and determination is by being given access to discourses that can allow them to read and study literary texts from the standpoint of their *production and reception*.

As theorists from Gramsci to Althusser to Bourdieu have noted, the schools form one of the major ideological apparatuses by which discourses – or "cultural capital" – are distributed. If readers and viewers are regarded as active producers of meaning – within specific cultural constraints – then it follows that rather than positioning students as mere passive receivers of knowledge, schools should encourage them to engage actively in the production of knowledge and meaning: schooling should enable students to articulate their own readings of cultural objects and introduce them to discourses that can help them explore the ways in which cultural objects are historically and socially produced. Further, if students are to become "active makers of meaning" of literary texts, they must also be given access to discourses that can help them to historicize their own reading position, to see reading as a process of production in dialectical relation to other readings in the past, and to enable them to make the text address their own historical condition.

While having access to new discourses will not automatically produce new reading capabilities in students (to argue this would be to take up a fully deterministic position), the discourses will "exercise a limit on ... the formation of the discursive space" that readers inhabit, which will then have "a determinate effect on the practice of readings at the level of particular text-reader encounters" (Morley, "Texts" 173). If students come

to inhabit a discursive space in which they recognize the constructed nature of both the texts they read and their responses to them, it will be possible for them to develop more historicized, self-reflective, and resistant readings of texts, and thus to become more active producers of meaning. While such “critically literate” reading practices are part of a much larger movement of radical pedagogy (see, for example, Freire; Giroux; Giroux and Simon et al.; Willinsky), they have been quite readily taken up by media pedagogy at least in part because of the active and participatory theory of the subject that dominates that area of study.

On the theoretical level, my approach synthesizes ideas from a number of literary perspectives and adapts to a literary context some of the work done in cultural studies on audience analysis. Any study of the material and historical conditions under which literary texts are produced owes its most obvious debt to contemporary Marxist criticism. In different though overlapping ways, Terry Eagleton, Pierre Macherey, and Fredric Jameson insist on the importance of exploring the historical formation in which the text was produced not only to understand the contexts to which it explicitly refers, but also to read it *symptomatically*, that is, for symptoms of the tensions or contradictions of the social formation within which the text was produced and which are then reproduced, often unconsciously, within the text. Macherey talks of reading the text for its “absences,” that which is not explicitly *in* the text, but which is nonetheless a part of the history of the text, what, as he puts it, the text is “*compelled* to say in order to say what it *wants to say*” (94). In articulating these absences, criticism is thought to be able to make the text reveal the ways in which ideology works to attain coherence by suppressing the intolerable contradictions of existence that are suggested by these absences.

Marxist criticism, however, has had little to say about the material and historical circumstances of the reception of literary texts: it tends to focus primarily on the conditions of their production. While Eagleton, for example, recognizes in *Criticism and Ideology* that “the act of consumption is itself constitutive” of the “existence” of the literary text (62), and while his work is filled with brief suggestions of how the process of reading could be analyzed from the perspective of materialist criticism, he does not elaborate on these suggestions. Macherey’s notion of “absences” similarly is uneasy before a consideration of the reading experience. He assumes that the absences one discovers in a text are related solely to the conditions of the text’s production; yet since the questions one asks of the text’s history must necessarily come from one’s position in the present, the absences one “finds” are surely determined as much by the social formation in which the text is being read as by the social formation in which it was written. In *The Political Unconscious*, Jameson appears briefly to take reception as seriously as production when he performs symptomatic historical analysis on modes of criticism as well as on literary texts. Yet because his interest in reception is on a “macro” level, his tendency is to focus on exponents of large interpretive systems such as structuralism or psychoanalysis; thus, his discussions of actual acts of reading are abstract and do not address the myriad of different critical responses to a text that can occur within any particular reading formation.

It is interesting to speculate why Marxism has avoided extended discussions of reception, although a full consideration of the question is beyond the scope of this article. It is perhaps for fear of devolving into what Eagleton calls the “consumer-centeredness” (86) of the liberal humanist notion of the reader as a self-coherent individual whose response supposedly ensures the “authenticity” of the text (86). While it is true that American reader-response criticism, especially in the seventies, did tend to treat the

reader as an autonomous individual and granted priority to the reader's supposedly "subjective" response to the text (Bleich), it is quite possible – as theories of media reception have done – to construct a theory of the subject as balanced between autonomy and social construction. To develop such an active notion of the subject, however, many of the fundamentals of Marxist criticism may have to be rethought.

From different perspectives, Tony Bennett and Hans R. Jauss both attempt some of this rethinking. In work that spans literary and popular cultural analyses, Bennett and Janet Woollacott have argued that production and reception so impinge upon each other that it is impossible to speak of "the text itself": "there is no fixed boundary between the extra-textual and the intra-textual which prevents the former from pressing in upon the latter and reorganizing it" (263). In *Formalism and Marxism*, Bennett offers a critique of, among others, the positions of Macherey and Eagleton for unwittingly reifying the literary text as the *source* of Marxist "discoveries" of absences and contradictions and for failing to recognize that it is the very *way of reading* advocated by Marxist criticism that enables those contradictions to be perceived: "It [Marxist criticism] does not restore to the text contradictions which were 'always there' but hidden from view; it *reads contradictions into the text*" (146). Since any way of reading is necessarily interested, the process of reading itself needs to be historicized: "the concept of the *text* must be replaced by the concept of the concrete and varying, historically specific *functions and effects* which accrue to 'the text' as a result of the different determinations to which it is subjected during the history of its appropriation" (148). Bennett's work constitutes the most promising move within a historical materialist model to recognize the place of readers and acts of reading, and I will draw on it throughout this essay.

Jauss's *rezeptionsästhetik* provides the most extensive analysis of the history of the reception of literary texts. His notion of understanding, drawn from Gadamerian hermeneutics, is of a "fusion of horizons" between the text, with all of its past history – norms, assumptions, values, and its prior critical reception – and the present cultural perspective. Jauss argues that:

History of literature is a process of aesthetic reception and production that takes place in the realization of literary texts on the part of the receptive reader, the reflective critic, and the author in his continuing productivity. ... A literary event can continue to have an effect only if those who come after it still or once again respond to it – if there are readers who again appropriate the past work or authors who want to imitate, outdo, or refute it. (21–22)

Thus Jauss, like Bennett, emphasizes that literary texts are historically active entities whose meanings and effects are contingent on the circumstances in which they are read. But while Jauss claims to recognize the importance of larger ideological issues in the reception of a text – "the task of literary history is ... only completed when literary production is ... seen as 'special history' in its own unique relationship to 'general history'" (39) – his work tends to focus too exclusively on aesthetic history, and the reader is usually conceived of as a subject of the text or of dominant aesthetic codes rather than as a subject of broader cultural systems. Jauss's model of the dialogic process of reading, therefore, needs to be extended to include not only the history of the text's criticism, but also the political, institutional, and ideological contexts in which that criticism is written.

Taking up some of Bennett's and Jauss's points, and linking them with the work of Morley and others on subjectivity, I want to suggest an approach to theorizing reading,

which I can sketch only summarily in this essay, that breaks down apparently commonsensical distinctions between production and reception and sees reception as a form of production; which studies reading as a dialectical and historical process; and which regards the reader as actively constructing meaning, not as a free individual, but as a subject in history who nonetheless possesses some degree of agency.<sup>1</sup>

The very juxtaposition of the terms “production” and “reception” suggests a hierarchy in which “production,” with its connotations of activity and ontological priority, appears to be the dominant term, and reception, in contrast, is passive, a mere “receiving” of something that was actively created at an earlier point. Even if one substitutes “reproduction” for “reception,” one is still faced with the same dilemma, for “reproduction” seems to privilege an originary moment in which production could occur and suggests not only that reproduction is a mere repeating of what has already been done, but that it is in some way counterfeit. This apparently commonsensical distinction underlies the long tradition of reifying “the text itself” and of valorizing the “text’s meaning” or the “author’s intention” over the reader’s mere “significances.” To counter such commonsensical notions, one needs to examine reception from a historical perspective.

For far from being a passive intaking of an objective given, the process of reading is a continually changing dialogue between the past and the present, as the present encourages readers to ask questions of a text that might not have seemed “natural” to ask in the past. Bennett has introduced the term “reading formation” to describe the relationship among texts, readers, and contexts that determines the ways texts are read at any particular point in history (*Texts 7–11*). His concept of the reading formation looks similar to Jauss’s “horizon of expectation,” but its advantage is that it explicitly emphasizes larger social and historical forces including but extending beyond the aesthetic. Bennett contends that because the reading situation is both socially and discursively overdetermined, it cannot be argued that either particular textual features or particular social factors *cause* readers to make certain reading moves. It is this complex social and discursive overdetermination that Bennett refers to as the reading formation. Thus Bennett helps us to recognize that while we may, for ease of analysis, separate out particular literary or general ideological factors in the study of a text, we need to develop ways of thinking about reading that do not reduce the complexity – and historically active nature – of the reading situation.

While there will be dominant modes of reading within any particular reading formation, there will always be competing and contradictory positions. Raymond Williams’s observation in *Marxism and Literature* that within any historical conjuncture there will always exist dominant, residual, and emergent ideological positions helps to underscore the overdetermined nature of reading formations. But Jauss’s emphasis on aesthetic history as a major factor in the history of a text’s reception should not be overlooked. A particular reading formation in which a text is read is determined not only by current literary and general ideological preoccupations but also by the history of the text’s production and reception in past reading formations – as this is constructed from the perspective of the current reading formation (see Eagleton 63). To acknowledge that a text’s history is repeatedly reconstructed (and that it continues to accrue over time) is to recognize the dialogic and dialectical nature of both reading and history.

But of course – and here we move to a point that neither the Marxist tradition nor the tradition of *rezeptionsästhetik* represented by Jauss can easily incorporate – textual meaning and history do not just “get reconstructed” by amorphous reading formations: actual readers perform this reconstruction. How is it possible to account for the role of the

reader in the reading process while simultaneously acknowledging that readers' actions are delimited by ideological forces? Literary theory – which generally elides the distinction between real readers and constructed readers – can sharpen its perspective on this question by adapting some insights from media theory, which recognizes, as Willemen notes, that

There remains an *unbridgeable gap* between “real” readers/authors and “inscribed” ones, *constructed and marked in and by the text*. Real readers are subjects in history, living in social formations, rather than mere subjects of a single text. The two types of subject are not commensurate. But for the purposes of formalism, real readers are supposed to coincide with the constructed readers. (63–64)

This “gap” between real and constructed readers is most apparent in the literature classroom when students’ readings fail to coincide with those of the teacher or the teacher’s sense of the implied reader of the text. When told to read literary texts “on their own,” students are often overwhelmed or intimidated because they may lack access to cultural, historical, literary, or theoretical discourses that would enable them actively to construct meaning from the text. Yet students can be equally overwhelmed when teachers simply “give” them the background knowledge they supposedly need to interpret a text. Both ways of teaching can mystify the literary text by encouraging students to believe that they themselves are incapable of reading such texts, which appear to contain secret and transcendent knowledge. If, however, students are given access to theoretical discourses of production and reception that can demystify the literary text – or any other cultural object – and provide a discursive space for concrete cultural and historical analysis, it becomes possible for them to develop the capacity to teach themselves and each other about the historical conditions in which texts were written and have been interpreted. Further, within this discursive space, students can begin to pose their own culturally and historically situated questions to the text to make it address their own historical condition, and, thereby, take up active roles in which they – as “interdiscursive subjects” (Morley, “Texts” 164) inhabiting conflicting reading formations – also come to intervene in the process of reproducing a text.

I turn back now to a particular classroom situation in which I use literary and media theories of production and reception to teach a course on the production and reception of the modern novel. Although I have found this approach to be successful with various novels such as John Fowles’s *The Magus*, Doris Lessing’s *The Golden Notebook*, and D. M. Thomas’s *The White Hotel*, I will use students’ work on James Joyce’s *Ulysses* as an example in this paper. Because *Ulysses* is such a difficult text for students, many teachers might be reluctant to add to it a significant body of “extra” theoretical and historical work for fear that they would completely overwhelm their students. Yet, it is just such work in production and reception that has enabled my students to demystify *Ulysses*, to actively confront, enjoy, and resist it, and to make it address their own historical condition.

The course is organized so that we spend the first four weeks discussing theories of production and reception before we begin two weeks studying contexts of the production of *Ulysses*, four weeks reading *Ulysses*, and then repeating the process with another novel.<sup>2</sup> When introducing these theories to the class, I suggest that they have the potential to alter both the traditional relations between a literary text and a reader, and the traditional relations between teachers and students. The process by which

students begin to learn to read with critical and historical awareness occurs in roughly three stages.

First, they construct a reading – necessarily perspectival – of the historical formation in which *Ulysses* was produced. They do this not simply to learn “background” – i.e., material about the personages, political events, religious practices, etc., those supposedly stable entities to which the text “refers” – but rather to read the text *symptomatically*, that is, to look for “symptoms” of the tensions or contradictions of the social formation within which the text was produced and which are then reproduced – often unconsciously – within the text. So, for example, when reading the “Cyclops” chapter, a student who wishes to present the chapter within the contradictions and struggles of Irish politics might note that various of the interpolations – the linguistic excesses that intrude on the actual scene in Barney Kernan’s pub – parody the rhetoric of Irish nationalism while at the same time making clear reference to the British oppression of the Irish.<sup>3</sup> With a perspective consciously focusing on Irish politics in Joyce’s time and after, the student might also explore ways in which the formal text strategy of the interpolations, like the Irish nationalism that it so often parodies, can be seen as what Jameson calls a “strategy of containment” (53–54), as something that creates a substitute truth – in this case, Irish nationalists are full of hot air and completely ineffectual – to repress the intolerable totality of the British domination of the Irish.

In reconstructing a symptomatic history of *Ulysses*, students come to regard the text, as Macherey puts it, not as “*created* by an intention” but as “*produced* under determinate conditions” (78). In the second stage of reading, students expand this perspective to include a study of the determinate conditions in which *Ulysses* has been *reproduced* throughout its history. They explore how and why different reading formations have asked different questions of the text, or to put it another way, how they have *used* or *appropriated* the text – often unwittingly – for particular ideological ends. Such an investigation involves examining *Ulysses* in the context both of the history of its reception and of larger historical and ideological forces that have produced successive rereadings of it.

I often use the history of the criticism of Molly Bloom to illustrate the complexity of the ideological relationships that exist in a particular reading formation and to bring into sharp relief an example of changing reading formations. While in the thirties and forties, the dominant critical position on Molly was to extol her as an “earth mother” (see, for example, Gilbert, Levin, Tindall, Budgen), she was also criticized for her “obscenities of thought” (Budgen 263), her “animal placidity” (Levin 125; see also Tindall 232–35 and Blackmur 114–15), and her apparent lack of respect for men (Tindall 233, Gilbert 389–95, Budgen 264–65). While in the fifties and sixties, dominant interpretations of Molly decried her as a whore and an embodiment of evil and destruction (see, for example, Kenner, Adams, Morse, O’Brien), her sexuality was also depicted as alluring (see Adams, *Common Sense* 166; O’Brien 143–49; Shechner 217). Over the last two decades, feminist theorists have sought to establish cultural and historical contexts for Molly’s soliloquy, regarding it not so much as the product of an individual woman (or man), but as part of larger cultural discourses (see, for example, Unkeless; Scott, *Joyce and Feminism*; Shloss, Devlin, Attridge). Yet some feminists have also queried whether Molly’s soliloquy is an example of what Luce Irigaray has termed *écriture féminine* – an endless contradictory and timeless female voice which “sets off in all directions leaving ‘him’ unable to discern the coherence of any meaning” (Irigaray 28; see, for example, Scott, *James Joyce*; Levitt; Henke, *Politics*).

From symbol of fertility, to satanic mistress, to product of cultural contradictions, to the voice of all women – such differing interpretations are not simply varying readings of the “same” text; they are, rather, the (re)production of multiple texts. The variability of Molly Bloom’s ideological significations suggests that the “Penelope” chapter has been drawn “into the orbit of activity of … different sets of ideological and cultural concerns” (Bennett and Woollacott 233–34) by the critical texts that surround the chapter, what Bennett and Woollacott call “textual shifters.” They contend that textual shifters “do not act solely upon the reader to produce different readings of ‘the same text’ but also act upon the text, shifting its very signifying potential so that it is no longer what it once was because, in terms of its cultural location, it is no longer where it once was” (248). These “shifters” are produced not only by “academic” or purely literary concerns, but also by broader historical and ideological forces, as readers continually attempt to construct texts that can address their changing historical conditions. In the second stage of reading, students seek out such textual shifters, and attempt to account for them within the complex ideological network in which they are embedded.

At the third stage of reading (and again, I wish to emphasize that these “stages” are not clearly separable in practice), students develop their own reading of the text, not from a position of either autonomy or as a subject solely of the text, but as a social subject immersed in contradictory cultural systems, balanced between autonomy and determination. Thus, with at least an incipient awareness of the interdiscursivity of their subject positions, students attempt to read the text in its subsequent history, asking questions of it that come out of their own historical condition, questions that could not have been asked at the moment of the text’s production but that it can be made to address. At this moment of reading, students analyze the dialectical relation of their “new” questions and interpretations to those of the past, bearing in mind that in posing such “later” questions – and in reconstructing prior reading formations – they are repositioning and reappropriating the text for particular ends, not discovering transcendent truths about its “original” meanings or subsequent, secondary, readings.

The discursive space opened up by theories of production and reception has the potential not only to change students’ relations with literary texts, but also to change classroom relations between students and teachers. The theory of the course can function in part for pedagogical ends: to establish a situation in which the teacher and students can engage in a dialogue that enables students to develop the critical thinking and reading skills necessary to participate both in creating new knowledge and in actively directing the focus of much of the course (see Freire 66–74, Masterman 27–37, Giroux and Simon 3–14). For if interpretations of texts are always historically situated, then the knowledge teachers have about a particular text, while it may likely exceed that of their students, should not be mystified by either teachers or students: teachers know particular things because they have read, thought, and sometimes written about them, not because their positions inherently give them access to secret truths. Thus, my primary role in teaching *Ulysses* in this course becomes what Paulo Freire calls a “problem poser,” that is, one who helps students gain access to the texts that surround *Ulysses* so that they themselves can assess and begin to take part in the continual process of its reinterpretation.

To this end, I assign my students two projects in which they write essays of five to six pages in length, which they distribute to all members of the class at least one class period prior to our discussing them, and which are graded by all class members. These essays serve as our primary resource material throughout the course. For the first assignment,

groups of three students write collaborative essays on contexts for the production of *Ulysses* including such areas as Modernism, Irish politics, the Irish literary revival, Irish popular culture, and the status of women in turn-of-the-century Dublin. For the second essay, each student writes an individual essay focusing on the reception of one chapter of *Ulysses*. These short papers are not traditional background studies. Whether students are writing on a production topic or on the reception of an individual chapter of *Ulysses*, the focus on production and reception requires them not just to reproduce what has already been said about a given topic, but to read their sources critically by situating them in larger contexts and to attempt to assess their own places in the history of *Ulysses* criticism.<sup>4</sup>

Let us turn to an example of an essay from the first assignment. While researching the social and political roles of Irish women at the turn of the century, a group of students “discovered” a concrete illustration of one of the theoretical premises of the course: that the past is repeatedly reconstructed from the perspective of the present. In reading over various histories of Ireland, the students observed that many fairly traditional histories, particularly older ones, did not discuss the cultural positions of women at all. Had the students read these books before being introduced to discourses that can enable the historicizing of textual production and reception, they might simply have dismissed them as having nothing to say about their topic. They now, however, began to read these histories “symptomatically,” and asked whether their silence said as much – if not more – about women’s status *at the time the books were written* as it did about women’s status at the turn of the century. Students, of course, also had to acknowledge that their own seemingly “natural” interest in women’s social roles derived in large part from their particular place in history in which feminism has legitimized such concerns and brought them, to some extent, into the popular consciousness.

The students discovered that a number of more recent histories not only assume that women’s roles in society are important to investigate, but also contend that women played more active roles in turn-of-the-century Dublin than they have often been credited with (see, for example, Murphy). The students thus focussed their paper on examples of historical difference – not only between their contemporary positions as women and those of Irish women at the turn of the century (as I had anticipated), but also between older and more recent historical accounts of Irish women.

While such differences in the representation of women arise from changing, historically explicable questions, actually confronting these differences among various histories was a jarring experience for the students writing the paper; the most pressing implication for them was that contemporary representations of women – and men – were conflicting and “unreliable.” They thus ended their paper by asking the class to consider some of the ways in which women and men are represented in contemporary culture, to explore some of the contradictions in those representations, and to try to imagine some of their effects. They took the class in a direction I had not anticipated, but which ultimately led to significant insights about the culturally inscribed nature of gender, as well as to some concrete analysis of the conflicting representations of women in turn-of-the-century Dublin. We found that we returned to this discussion when we read the “Penelope” chapter, not only to help us consider why Molly Bloom is depicted as she is – in bed, menstruating, frequently misinformed, etc. – but also to enable us to begin to analyze and historically situate the contradictory ways in which Molly has been interpreted by critics.

This paper, therefore, was successful pedagogically as well as theoretically. The students not only began to find examples in various Irish histories of the theoretical

premises they had been studying, but they also took control of their knowledge in a way they could not when they were simply reading and trying to understand the theorists. While theory is crucial to establish a framework for their reading and research, it is only when students are asked to put that theory into practice and to share the responsibilities for teaching and learning that they are able to shift their roles from passive learners to active producers of knowledge.

While all “production” papers are not as insightful as this one, they almost always bring some new knowledge into the class, which the students generally feel freer to discuss, question, and supplement because it is presented by other students rather than the teacher. Further, on a number of occasions, the students will have read books or articles with which I am unfamiliar, so that when I pose questions to them, it is often from the perspective of a learner. As the course develops and more students undertake projects and gain expertise in particular areas, it becomes possible to establish a learning situation in which, as Freire writes, “the teacher is no longer merely the-one-who-teaches, but one who is himself [sic] taught in dialogue with the students, who in turn while being taught also teach” (67).

The “production” essay I chose to discuss not only followed the assignment, but also clearly illustrated some of the theoretical premises of the course. I want now to look at a “reception” essay that inhabited the classroom situation more dialectically. A student writing on “Nausicaa” contended that the “text itself” is inherently feminist in impulse because, in giving Gerty MacDowell the sentimental “feminine” language of pulp fiction and women’s magazines, Joyce was “obviously” satirizing the society that constructed female subjectivity in such a manner. In asserting this opinion, the student briefly reviewed, but quickly dismissed, most of what critics writing before 1980 had to say about the chapter. Two basic responses occurred in class to the student’s argument. The first, and by far the stronger, suggested that by merging her position with the text’s, the student failed to account both for the historical difference between her reading and past readings of the chapter and for the critical and political significances of her position within the current reading formation, thus undercutting the radical potential of her own argument. The second response, which was less clearly articulated, but which helped us to restore a more dialectical attitude towards reading, suggested that while the student did not in fact historicize her position (and hence did not quite “fulfill the assignment”), she clearly did attempt to make the text address her historical condition, and the strategies that she employed – feminist critique combined with the language of objectivity – made her argument both powerful and convincing, particularly given her institutional position as a student and the dominant style of writing she encountered in the criticism.

Let us look at each of these responses in more detail. The first response was sparked by a relatively simple question by one student which reminded us of the need to historicize one’s response to a text: “How can someone say that the chapter is ‘really a feminist text’ if nobody thought it was until recently?” Once this question was raised, the class asked the student to review the history of the chapter’s reception, and to talk about the political climate in which Joyce wrote *Ulysses* – which she was quite capable of doing. The student’s research on the reception of the chapter, supplemented by various comments from me, indicated that early readers indeed had seen nothing inherently feminist about it nor did they conceive of problematizing Gerty’s discourse conventions. While most critics generally recognized the parallels of style between the first half of “Nausicaa” and Maria Cummings’ popular novel, *The Lamplighter*, there was little attempt until the

last decade to distance an analysis of Gerty from an analysis of this style. Thus Richard Kain speaks of Gerty's "cheap sentimentality" (44). Stanley Sultan contends that Gerty is a parody of all "the mass of people blighted by self-deluding sentimentality" (273) – readers, characters, and authors alike. Robert Adams finds the "perhaps overextended parody" of "Nausicaa" to be directed primarily at "Lady novelists" (224). It is only the more recent feminist critics such as Suzette Henke or Bonnie Kime Scott who attempt to explore the complex relationship between Gerty's language and the society that constructed her (Henke, *Moraculous* 153–72; Scott, *James Joyce* 62–67). In tracing and discussing this history, the class reconfirmed a number of the theoretical tenets of the course: that it is not enough to ask whether a reading is "correct" with reference to the text (since all of these critics were presumably expert readers of *Ulysses*); that one must attempt to ask what relationship these readings have to their particular reading formations; that when constructing one's own interpretation, one must explore the tensions and dynamics of one's own social formation to ask what interpretations seem not only possible, but responsible to take up.

It was perhaps at this point in the discussion that an alternative response to the student's paper began to take shape. For while the student did not analyze the history of the reception of the chapter in any detail, her position was clearly informed by that history and was written in opposition to it. Further, the student's basic argument not only seemed "responsible" to take up, but it also addressed her historical condition and spoke to that of a number of other women in the class as well. Her strategy of making the text address, indeed, "be about," her own position as a gendered subject was a powerful way for her to assert and legitimize her historicity. Given most of the criticism the students had read, and most of the training they had received in school, attributing meanings or intentions to "the text itself" was – despite the work we had done in this course on production and reception – the interpretive strategy historically most available to them, and institutionally, the one that is still accorded the most status. Finally, although I think I would be reading too much into her essay to say that in embracing the legitimizing force of "the text itself," the student's essay constituted an intentional act of resistance to the dominant theoretical discourse developed in this course, her essay nonetheless helped us to recognize the potential of any theory – even a supposedly dialectical theory of production and reception – to normalize responses, and paradoxically, to inhibit our thinking historically and dialogically.

My discussion here is certainly more abstract than what occurred in the classroom, but that my students were able to raise such issues about the "Nausicaa" chapter suggests that when allowed to take up the role of teacher as well as learner, and when given some theoretical tools for critical and historical investigation, students are enabled to engage intellectually and emotionally with *Ulysses*, to pose their own questions to it in dialogic relation to those of the past, and most importantly, to develop interpretations of it that make it address their historical condition. The tensions the group felt in response to the student's paper on "Nausicaa" provide just one example of the ways in which a genuine dialogic relationship among a group can lead to the development of dialectical thinking, which, as Masterman writes, "recognises the internal contradictions and tensions which exist within the group and within each individual, and which understands that such contradictions are inherent in all situations and issues which the group explores" (33). When undertaken from the theoretical orientation of production and reception, such a dialogic relationship provides a site wherein students can problematize their own and each other's readings of all cultural objects – including literary texts as

difficult as *Ulysses* – in ways that allow them to confront the dialogic nature of reading and history and their own status as subjects in history – and very specifically as subjects in the institutional setting of a classroom.

## Notes

- 1 The argument will be developed in more detail in my *Reading: Cognition, Institutions, Ideology* (Manchester: Manchester UP, in progress).
- 2 For ways of analyzing the material conditions underlying the *production* of a text, I find it useful to have students read chapters 2, 3, and 5 from Eagleton's *Criticism and Ideology*, and Macherey's *A Theory of Literary Production* (particularly pages 69–101), which develops a theory of reading literary texts to make them reveal the larger ideological forces silently underlying them. For studies of the history of the reception of literary texts, we read Jauss's "Literary History as a Challenge to Literary Theory" and Bennett's "Texts in History." Finally, we read Morley's "Texts, Readers, Subjects" for a discussion of the role of the reader as a subject in history. The teacher could select different texts for this introductory unit depending on the level of the course and the familiarity of the students with theory. Kathleen McCormick and Gary Waller's *Reading Texts* (Chapter 2) provides an introductory level discussion of many of these concepts. Robert Holub's *Reception Theory: A Critical Introduction* contains a useful and readable summary and analysis of reception theory, including a substantive discussion of Jauss's early work (53–82). Bennett's *Marxism and Formalism*, particularly chapters 5 through 8, provides a clear overview of Marxist theories of production as well as the beginnings of a Marxist theory of reception.
- 3 See, for example, interpolation 18 (12.897–938), a mock newspaper account of a meeting on the revival of ancient Gaelic sports in which the manner of delivery of a speech by Joe Hynes – "the usual high standard of excellence" (12.903–05) – is discussed in more detail than its substance.
- 4 Although students do other writing in the course – notes on the theoretical essays, a journal on their reading of *Ulysses*, and a final paper – I focus my discussion here on the short essays because they direct our reading of *Ulysses*.

# CHAPTER 5

## Distinction

*Pierre Bourdieu*

In this selection from *Distinction* (1979), French sociologist Pierre Bourdieu argues that all taste in literature is an effect of prior determinants. One's class position, one's training in culture, one's education – all of these factors classify us as readers and sort us into groups who favor one kind of literature over another.

### Classes and Classifications

*If I have to choose the lesser of two evils, I choose neither.*

Karl Kraus

Taste is an acquired disposition to ‘differentiate’ and ‘appreciate’,<sup>1</sup> as Kant says – in other words, to establish and mark differences by a process of distinction which is not (or not necessarily) a distinct knowledge, in Leibniz’s sense, since it ensures recognition (in the ordinary sense) of the object without implying knowledge of the distinctive features which define it.<sup>2</sup> The schemes of the habitus, the primary forms of classification, owe their specific efficacy to the fact that they function below the level of consciousness and language, beyond the reach of introspective scrutiny or control by the will. Orienting practices practically, they embed what some would mistakenly call *values* in the most automatic gestures or the apparently most insignificant techniques of the body – ways of walking or blowing one’s nose, ways of eating or talking – and engage the most fundamental principles of construction and evaluation of the social world, those which most directly express the division of labour (between the classes, the age groups and the sexes) or the division of the work of domination, in divisions between bodies and between relations to the body which borrow more features than one, as if to give them the appearances of naturalness, from the sexual division of labour and the division of sexual labour. Taste is a practical mastery of distributions which makes it possible to

*Original publication details:* Pierre Bourdieu, extracts from *Distinction: A Social Critique of the Judgement of Taste*, trans. Richard Nice, pp. 466–84, 596–97. Harvard University Press, 1984. sense or intuit what is likely (or unlikely) to befall – and therefore to befit – an individual occupying a given position in social space. It functions as a sort of social orientation, a ‘sense of one’s place’, guiding the occupants of a given place in social space towards the social positions adjusted to their properties, and towards the practices or goods which befit the occupants of that position. It implies a practical anticipation of what the social meaning and value of the chosen practice or thing will probably be, given their distribution in social space and the practical knowledge the other agents have of the correspondence between goods and groups.

Thus, the social agents whom the sociologist classifies are producers not only of classifiable acts but also of acts of classification which are themselves classified. Knowledge of the social world has to take into account a practical knowledge of this world which pre-exists it and which it must not fail to include in its object, although, as a first stage, this knowledge has to be constituted *against* the partial and interested representations provided by practical knowledge. To speak of habitus is to include in the object the knowledge which the agents, who are part of the object, have of the object, and the contribution this knowledge makes to the reality of the object. But it is not only a matter of putting back into the real world that one is endeavouring to know, a knowledge of the real world that contributes to its reality (and also to the force it exerts). It means conferring on this knowledge a genuinely constitutive power, the very power it is denied when, in the name of an objectivist conception of objectivity, one makes common knowledge or theoretical knowledge a mere reflection of the real world.

Those who suppose they are producing a materialist theory of knowledge when they make knowledge a passive recording and abandon the ‘active aspect’ of knowledge to idealism, as Marx complains in the *Theses on Feuerbach*, forget that all knowledge, and in particular all knowledge of the social world, is an act of construction implementing schemes of thought and expression, and that between conditions of existence and practices or representations there intervenes the structuring activity of the agents, who, far from reacting mechanically to mechanical stimulations, respond to the invitations or threats of a world whose meaning they have helped to produce. However, the principle of this structuring activity is not, as an intellectualist and anti-genetic idealism would have it, a system of universal forms and categories but a system of internalized, embodied schemes which, having been constituted in the course of collective history, are acquired in the course of individual history and function in their *practical state, for practice* (and not for the sake of pure knowledge).

## Embodied Social Structures

This means, in the first place, that social science, in constructing the social world, takes note of the fact that agents are, in their ordinary practice, the subjects of acts of construction of the social world; but also that it aims, among other things, to describe the social genesis of the principles of construction and seeks the basis of these principles in the social world.<sup>3</sup> Breaking with the anti-genetic prejudice which often accompanies recognition of the active aspect of knowledge, it seeks in the objective distributions of properties, especially material ones (brought to light by censuses and surveys which all presuppose selection and classification), the basis of the systems of classification which agents apply to every sort of thing, not least to the distributions themselves. In contrast to what is sometimes called the ‘cognitive’ approach, which, both in its ethnological

form (structural anthropology, ethnoscience, ethnosemantics, ethnobotany etc.) and in its sociological form (interactionism, ethnomethodology etc.), ignores the question of the genesis of mental structures and classifications, social science enquires into the relationship between the principles of division and the social divisions (between the generations, the sexes etc.) on which they are based, and into the variations of the use made of these principles according to the position occupied in the distributions (questions which all require the use of statistics).

The cognitive structures which social agents implement in their practical knowledge of the social world are internalized, ‘embodied’ social structures. The practical knowledge of the social world that is presupposed by ‘reasonable’ behaviour within it implements classificatory schemes (or ‘forms of classification’, ‘mental structures’ or ‘symbolic forms’ – apart from their connotations, these expressions are virtually interchangeable), historical schemes of perception and appreciation which are the product of the objective division into classes (age groups, genders, social classes) and which function below the level of consciousness and discourse. Being the product of the incorporation of the fundamental structures of a society, these principles of division are common to all the agents of the society and make possible the production of a common, meaningful world, a common-sense world.

All the agents in a given social formation share a set of basic perceptual schemes, which receive the beginnings of objectification in the pairs of antagonistic adjectives commonly used to classify and qualify persons or objects in the most varied areas of practice. The network of oppositions between high (sublime, elevated, pure) and low (vulgar, low, modest), spiritual and material, fine (refined, elegant) and coarse (heavy, fat, crude, brutal), light (subtle, lively, sharp, adroit) and heavy (slow, thick, blunt, laborious, clumsy), free and forced, broad and narrow, or, in another dimension, between unique (rare, different, distinguished, exclusive, exceptional, singular, novel) and common (ordinary, banal, commonplace, trivial, routine), brilliant (intelligent) and dull (obscure, grey, mediocre), is the matrix of all the commonplaces which find such ready acceptance because behind them lies the whole social order. The network has its ultimate source in the opposition between the ‘élite’ of the dominant and the ‘mass’ of the dominated, a contingent, disorganized multiplicity, interchangeable and innumerable, existing only statistically. These mythic roots only have to be allowed to take their course in order to generate, at will, one or another of the tirelessly repeated themes of the eternal sociodicy, such as apocalyptic denunciations of all forms of ‘levelling’, ‘trivialization’ or ‘massification’, which identify the decline of societies with the decadence of bourgeois houses, i.e., a fall into the homogeneous, the undifferentiated, and betray an obsessive fear of number, of undifferentiated hordes indifferent to difference and constantly threatening to submerge the private spaces of bourgeois exclusiveness.<sup>4</sup>

The seemingly most formal oppositions within this social mythology always derive their ideological strength from the fact that they refer back, more or less discreetly, to the most fundamental oppositions within the social order: the opposition between the dominant and the dominated, which is inscribed in the division of labour, and the opposition, rooted in the division of the labour of domination, between two principles of domination, two powers, dominant and dominated, temporal and spiritual, material and intellectual etc. It follows that the map of social space previously put forward can also be read as a strict table of the historically constituted and acquired categories which organize the idea of the social world in the minds of all the subjects belonging to that world and shaped by it. The same classificatory schemes (and the oppositions in which they are

expressed) can function, by being specified, in fields organized around polar positions, whether in the field of the dominant class, organized around an opposition homologous to the opposition constituting the field of the social classes, or in the field of cultural production, which is itself organized around oppositions which reproduce the structure of the dominant class and are homologous to it (e.g., the opposition between bourgeois and avant-garde theatre). So the fundamental opposition constantly supports second, third or  $n^{\text{th}}$  rank oppositions (those which underlie the ‘purest’ ethical or aesthetic judgments, with their high or low sentiments, their facile or difficult notions of beauty, their light or heavy styles etc.), while euphemizing itself to the point of misrecognizability.

Thus, the opposition between the heavy and the light, which, in a number of its uses, especially scholastic ones, serves to distinguish popular or petit-bourgeois tastes from bourgeois tastes, can be used by theatre criticism aimed at the dominant fraction of the dominant class to express the relationship between ‘intellectual’ theatre, which is condemned for its ‘laborious’ pretensions and ‘oppressive’ didacticism, and ‘bourgeois’ theatre, which is praised for its tact and its art of skimming over surfaces. By contrast, ‘intellectual’ criticism, by a simple inversion of values, expresses the relationship in a scarcely modified form of the same opposition, with lightness, identified with frivolity, being opposed to profundity. Similarly, it can be shown that the opposition between right and left, which, in its basic form, concerns the relationship between the dominant and the dominated, can also, by means of a first transformation, designate the relations between dominated fractions and dominant fractions within the dominant class; the words right and left then take on a meaning close to the meaning they have in expressions like ‘right-bank’ theatre or ‘left-bank’ theatre. With a further degree of ‘de-realization’, it can even serve to distinguish two rival tendencies within an avant-garde artistic or literary group, and so on.

It follows that, when considered in each of their uses, the pairs of qualifiers, the system of which constitutes the conceptual equipment of the judgement of taste, are extremely poor, almost indefinite, but, precisely for this reason, capable of eliciting or expressing the sense of the indefinable. Each particular use of one of these pairs only takes on its full meaning in relation to a universe of discourse that is different each time and usually implicit – since it is a question of the system of self-evidences and presuppositions that are taken for granted in the field in relation to which the speakers’ strategies are defined. But each of the couples specified by usage has for undertones all the other uses it might have – because of the homologies between the fields which allow transfers from one field to another – and also all the other couples which are interchangeable with it, within a nuance or two (e.g., fine/crude for light/heavy), that is, in slightly different contexts.

The fact that the semi-codified oppositions contained in ordinary language reappear, with very similar values, as the basis of the dominant vision of the social world, in all class-divided social formations (consider the tendency to see the ‘people’ as the site of totally uncontrolled appetites and sexuality) can be understood once one knows that, reduced to their formal structure, the same fundamental relationships, precisely those which express the major relations of order (high/low, strong/weak etc.) reappear in all class-divided societies. And the recurrence of the triadic structure studied by Georges Dumézil, which Georges Duby shows in the case of feudal society to be rooted in the social structures it legitimates, may well be, like the invariant oppositions in which the relationship of domination is expressed, simply a necessary outcome of the intersection of the two principles of division which are at work in all class-divided societies – the

division between the dominant and the dominated, and the division between the different fractions competing for dominance in the name of different principles, *bellatores* (warriors) and *oratores* (scholars) in feudal society, businessmen and intellectuals now.<sup>5</sup>

## Knowledge without Concepts

Thus, through the differentiated and differentiating conditionings associated with the different conditions of existence, through the exclusions and inclusions, unions (marriages, affairs, alliances etc.) and divisions (incompatibilities, separations, struggles etc.) which govern the social structure and the structuring force it exerts, through all the hierarchies and classifications inscribed in objects (especially cultural products), in institutions (for example, the educational system) or simply in language, and through all the judgements, verdicts, gradings and warnings imposed by the institutions specially designed for this purpose, such as the family or the educational system, or constantly arising from the meetings and interactions of everyday life, the social order is progressively inscribed in people's minds. Social divisions become principles of division, organizing the image of the social world. Objective limits become a sense of limits, a practical anticipation of objective limits acquired by experience of objective limits, a 'sense of one's place' which leads one to exclude oneself from the goods, persons, places and so forth from which one is excluded.

The *sense* of limits implies *forgetting* the limits. One of the most important effects of the correspondence between real divisions and practical principles of division, between social structures and mental structures, is undoubtedly the fact that primary experience of the social world is that of doxa, an adherence to relations of order which, because they structure inseparably both the real world and the thought world, are accepted as self-evident. Primary perception of the social world, far from being a simple mechanical reflection, is always an act of cognition involving principles of construction that are external to the constructed object grasped in its immediacy; but at the same time it is an act of miscognition, implying the most absolute form of recognition of the social order. Dominated agents, who assess the value of their position and their characteristics by applying a system of schemes of perception and appreciation which is the embodiment of the objective laws whereby their value is objectively constituted, tend to attribute to themselves what the distribution attributes to them, refusing what they are refused ('That's not for the likes of us'), adjusting their expectations to their chances, defining themselves as the established order defines them, reproducing in their verdict on themselves the verdict the economy pronounces on them, in a word, condemning themselves to what is in any case their lot, *ta beautou*, as Plato put it, consenting to be what they have to be, 'modest', 'humble' and 'obscure'. Thus the conservation of the social order is decisively reinforced by what Durkheim called 'logical conformity',<sup>6</sup> i.e., the orchestration of categories of perception of the social world, which, being adjusted to the divisions of the established order (and thereby to the interests of those who dominate it) and common to all minds structured in accordance with those structures, present every appearance of objective necessity.<sup>7</sup>

The system of classificatory schemes is opposed to a taxonomy based on explicit and explicitly concerted principles in the same way that the dispositions constituting taste or ethos (which are dimensions of it) are opposed to aesthetics or ethics. The sense of social realities that is acquired in the confrontation with a particular form of social necessity is

what makes it possible to act *as if* one knew the structure of the social world, one's place within it and the distances that need to be kept.

The ideology of the utopian thinker, rootless and unattached, 'free-floating', without interests or profits, together with the correlative refusal of that supreme form of materialistic vulgarity, the reduction of the unique to the class, the explanation of the higher by the lower, the application to the would-be unclassifiable of explanatory models fit only for the 'bourgeois', the petit-bourgeois, the limited and common, scarcely inclines intellectuals to conceptualize the sense of social position, still less their own position and the perverse relation to the social world it forces on them. (The perfect example is Sartre, whose whole work and whole existence revolve around this affirmation of the intellectual's subversive point of honour. This is seen particularly clearly in the passage in *Being and Nothingness* on the psychology of Flaubert, which can be read as a desperate effort to save the person, in the person of the intellectual, an uncreated creator, begotten by his own works, haunted by 'the project of being God', from every sort of reduction to the general, the type, the class, and to affirm the transcendence of the ego against 'what Comte called *materialism*, that is, explaining the higher by the lower.')<sup>8</sup>

The practical mastery of classification has nothing in common with the reflexive mastery that is required in order to construct a taxonomy that is simultaneously coherent and adequate to social reality. The practical 'science' of positions in social space is the competence presupposed by the art of behaving *comme il faut* with persons and things that have and give 'class' ('smart' or 'unsmart'), finding the right distance, by a sort of practical calculation, neither too close ('getting familiar') nor too far ('being distant'), playing with objective distance by emphasizing it (being 'aloof', 'stand-offish') or symbolically denying it (being 'approachable', 'hobnobbing'). It in no way implies the capacity to situate oneself explicitly in the classification (as so many surveys on social class ask people to do), still less to describe this classification in any systematic way and state its principles.

There is no better opportunity to observe the functioning of this sense of the place one occupies than in condescension strategies, which presuppose both in the author of the strategy and in the victims a practical knowledge of the gap between the place really occupied and the place fictitiously indicated by the behaviour adopted (e.g., in French, use of the familiar *tu*). When the person 'naturally' identified with a Rolls Royce, a top hat or golf (see appendix 4) takes the metro, sports a flat cap (or a polo neck) or plays football, his practices take on their meaning in relation to this attribution by status, which continues to colour the real practices, as if by superimposition. But one could also point to the variations that Charles Bally observed in the style of speech according to the social gap between the interlocutors, or the variations in pronunciation according to the addressee: the speaker may, as appropriate, move closer to the 'accent' of an addressee of (presumed) higher status or move away from it by 'accentuating' his ordinary accent.<sup>9</sup>

The practical ‘attributive judgement’ whereby one puts someone in a class by speaking to him in a certain way (thereby putting oneself in a class at the same time) has nothing to do with an intellectual operation implying conscious reference to explicit indices and the implementation of classes produced by and for the concept. The same classificatory opposition (rich/poor, young/old etc.) can be applied at any point in the distribution and reproduce its whole range within any of its segments (common sense tells us that one is always richer or poorer than someone, superior or inferior to someone, more right-wing or left-wing than someone – but this does not entail an elementary relativism).

In a series of interviews ( $n = 30$ ) on the social classes, based on a test which involved classifying thirty occupations (written on cards), the respondents often first asked how many classes the set should be divided into, and then several times modified the number of classes and the criteria of classification, so as to take account of the different dimensions of each occupation and therefore the different respects in which it could be evaluated; or they spontaneously suggested that they could carry on sub-dividing indefinitely. (They thereby exposed the artificiality of the situation created by a theoretical inquiry which called for the adoption of a theoretical attitude to which, as their initial uncertainty indicated, the respondents were quite unaccustomed.) And yet they almost always agreed on the ranks of the different occupations when taken two by two. (Lenski made similar observations in an experiment in which the respondents were asked to rank the families in a small town in New England.)<sup>10</sup>

It is not surprising that it is possible to fault the practical sense of social space which lies behind class-attributive judgement; the sociologists who use their respondents’ self-contradictions as an argument for denying the existence of classes simply reveal that they understand nothing of how this ‘sense’ works or of the artificial situation in which they are making it work. In fact, whether it is used to situate oneself in social space or to place others, the sense of social space, like every practical sense, always refers to the particular situation in which it has to orient practices. This explains, for example, the divergences between surveys of the representation of the classes in a small town (‘community studies’) and surveys of class on a nationwide scale.<sup>11</sup> But if, as has often been observed, respondents do not agree either on the number of divisions they make within the group in question, or on the limits of the ‘strata’ and the criteria used to define them, this is not simply due to the fuzziness inherent in all practical logics. It is also because people’s image of the classification is a function of their position within it.

So nothing is further removed from an act of cognition, as conceived by the intellectualist tradition, than this sense of the social structure, which, as is so well put by the word *taste* – simultaneously ‘the faculty of perceiving flavours’ and ‘the capacity to discern aesthetic values’ – is social necessity made second nature, turned into muscular patterns and bodily automatisms. Everything takes place as if the social conditionings linked to a social condition tended to inscribe the relation to the social world in a lasting, generalized relation to one’s own body, a way of bearing one’s body, presenting it to others, moving it, making space for it, which gives the body its social physiognomy. Bodily hexis, a basic dimension of the sense of social orientation, is a practical way of experiencing and

expressing one's own sense of social value. One's relationship to the social world and to one's proper place in it is never more clearly expressed than in the space and time one feels entitled to take from others; more precisely, in the space one claims with one's body in physical space, through a bearing and gestures that are self-assured or reserved, expansive or constricted ('presence' or 'insignificance') and with one's speech in time, through the interaction time one appropriates and the self-assured or aggressive, careless or unconscious way one appropriates it.<sup>12</sup>

There is no better image of the logic of socialization, which treats the body as a 'memory-jogger', than those complexes of gestures, postures and words – simple interjections or favourite clichés – which only have to be slipped into, like a theatrical costume, to awaken, by the evocative power of bodily mimesis, a universe of ready-made feelings and experiences. The elementary actions of bodily gymnastics, especially the specifically sexual, biologically pre-constructed aspect of it, charged with social meanings and values, function as the most basic of metaphors, capable of evoking a whole relationship to the world, 'lofty' or 'submissive', 'expansive' or 'narrow', and through it a whole world. The practical 'choices' of the sense of social orientation no more presuppose a representation of the range of possibilities than does the choice of phonemes; these enacted choices imply no acts of choosing. The logocentrism and intellectualism of intellectuals, combined with the prejudice inherent in the science which takes as its object the psyche, the soul, the mind, consciousness, representations, not to mention the petit-bourgeois pretension to the status of 'person', have prevented us from seeing that, as Leibniz put it, 'we are automatons in three-quarters of what we do', and that the ultimate values, as they are called, are never anything other than the primary, primitive dispositions of the body, 'visceral' tastes and distastes, in which the group's most vital interests are embedded, the things on which one is prepared to stake one's own and other people's bodies. The sense of distinction, the *discretio* (discrimination) which demands that certain things be brought together and others kept apart, which excludes all misalliances and all unnatural unions – i.e., all unions contrary to the common classification, to the *diacrisis* (separation) which is the basis of collective and individual identity – responds with visceral, murderous horror, absolute disgust, metaphysical fury, to everything which lies in Plato's 'hybrid zone', everything which passes understanding, that is, the embodied taxonomy, which, by challenging the principles of the incarnate social order, especially the socially constituted principles of the sexual division of labour and the division of sexual labour, violates the mental order, scandalously flouting common sense.

It can be shown that socialization tends to constitute the body as an analogical operator establishing all sorts of practical equivalences between the different divisions of the social world – divisions between the sexes, between the age groups and between the social classes – or, more precisely, between the meanings and values associated with the individuals occupying practically equivalent positions in the spaces defined by these divisions. And it can be shown that it does so by integrating the symbolism of social domination and submission and the symbolism of sexual domination and submission into the same body language – as is seen in etiquette, which uses the opposition between the straight and the curved or, which amounts to the same thing, between raising (oneself) and lowering (oneself), as one of the generative principles of the marks (of respect, contempt etc.) used to symbolize hierarchical relations.

## Advantageous Attributions

The basis of the pertinence principle which is implemented in perceiving the social world and which defines all the characteristics of persons or things which can be perceived, and perceived as positively or negatively interesting, by all those who apply these schemes (another definition of common sense), is based on nothing other than the interest the individuals or groups in question have in recognizing a feature and in identifying the individual in question as a member of the set defined by that feature; interest in the aspect observed is never completely independent of the advantage of observing it. This can be clearly seen in all the classifications built around a stigmatized feature which, like the everyday opposition between homosexuals and heterosexuals, isolate the interesting trait from all the rest (i.e., all other forms of sexuality), which remain indifferent and undifferentiated. It is even clearer in all 'labelling judgements', which are in fact accusations, *categoremes* in the original Aristotelian sense, and which, like insults, only wish to know one of the properties constituting the social identity of an individual or group ('You're just a ...'), regarding, for example, the married homosexual or converted Jew as a 'closet queen' or covert Jew, and thereby in a sense doubly Jewish or homosexual. The logic of the stigma reminds us that social identity is the stake in a struggle in which the stigmatized individual or group, and, more generally, any individual or group insofar as he or it is a potential object of categorization, can only retaliate against the partial perception which limits it to one of its characteristics by highlighting, in its self-definition, the best of its characteristics, and, more generally, by struggling to impose the taxonomy most favourable to its characteristics, or at least to give to the dominant taxonomy the content most flattering to what it has and what it is.

Those who are surprised by the paradoxes that ordinary logic and language engender when they apply their divisions to continuous magnitudes forget the paradoxes inherent in treating language as a purely logical instrument and also forget the social situation in which such a relationship to language is possible. The contradictions or paradoxes to which ordinary language classifications lead do not derive, as all forms of positivism suppose, from some essential inadequacy of ordinary language, but from the fact that these socio-logical acts are not directed towards the pursuit of logical coherence and that, unlike philological, logical or linguistic uses of language – which ought really to be called scholastic, since they all presuppose *schole*, i.e., leisure, distance from urgency and necessity, the absence of vital stakes, and the scholastic institution which in most social universes is the only institution capable of providing all these – they obey the logic of the parti pris, which, as in a court-room, juxtaposes not logical judgements, subject to the sole criterion of coherence, but charges and defences. Quite apart from all that is implied in the oppositions, which logicians and even linguists manage to forget, between the art of convincing and the art of persuading, it is clear that scholastic usage of language is to the orator's, advocate's or politician's usage what the classificatory systems devised by the logician or statistician concerned with coherence and empirical adequacy are to the categorizations and categoremes of daily life. As the etymology suggests, the latter belong to the logic of the trial.<sup>13</sup> Every real inquiry into the divisions of the social world has to analyse the interests associated with membership or non-membership. As is shown by the attention devoted to strategic, 'frontier' groups such as the 'labour aristocracy', which hesitates between class struggle and class collaboration, or the 'cadres', a category of bureaucratic statistics, whose nominal, doubly negative unity conceals its real dispersion both from the 'interested parties' and from their opponents and most observers, the laying down of boundaries between the classes is inspired by the strategic aim of

'counting in' or 'being counted in', 'cataloguing' or 'annexing', when it is not the simple recording of a legally guaranteed state of the power relation between the classified groups.

Leaving aside all cases in which the statutory imposition of an arbitrary boundary (such as a 30-kilo limit on baggage or the rule that a vehicle over two tons is a van) suffices to eliminate the difficulties that arise from the sophism of the heap of grain,<sup>14</sup> boundaries – even the most formal-looking ones, such as those between age-groups – do indeed freeze a particular state of social struggles, i.e., a given state of the distribution of advantages and obligations, such as the right to pensions or cheap fares, compulsory schooling or military service. And if we are amused by Alphonse Allais's story of the father who pulls the communication cord to stop the train at the very moment his child becomes three years old (and so needs a ticket to travel), it is because we immediately see the sociological absurdity of an imaginary variation which is as impeccably logical as those on which logicians base their beloved paradoxes. Here the limits are frontiers to be attacked or defended with all one's strength, and the classificatory systems which fix them are not so much means of knowledge as means of power, harnessed to social functions and overtly or covertly aimed at satisfying the interests of a group.

A number of ethical, aesthetic, psychiatric or forensic classifications that are produced by the 'institutional sciences', not to mention those produced and inculcated by the educational system, are similarly subordinated to social functions, although they derive their specific efficacy from their apparent neutrality. They are produced in accordance with the specific logic, and in the specific language, of relatively autonomous fields, and they combine a real dependence on the classificatory schemes of the dominant habitus (and ultimately on the social structures of which these are the product) with an apparent independence. The latter enables them to help to legitimate a particular state of the classification struggle and the class struggle. Perhaps the most typical example of these semi-autonomous systems of classification is the system of adjectives which underpins scholastic 'appreciations'.<sup>15</sup>

Commonplaces and classificatory systems are thus the stake of struggles between the groups they characterize and counterpose, who fight over them while striving to turn them to their own advantage. Georges Duby shows how the model of the three orders, which fixed a state of the social structure and aimed to make it permanent by codifying it, was able to be used simultaneously and successively by antagonistic groups: first by the bishops, who had devised it, against the heretics, the monks and the knights; then by the aristocracy, against the bishops and the king; and finally by the king, who, by setting himself up as the absolute subject of the classifying operation, as a principle external and superior to the classes it generated (unlike the three orders, who were subjects but also objects, judges but also parties), assigned each group its place in the social order, and established himself as an unassailable vantage-point.<sup>16</sup> In the same way it can be shown that the schemes and commonplaces which provide images of the different forms of domination, the opposition between the sexes and age-groups as well as the opposition between the generations, are similarly manipulated. The 'young' can

accept the definition that their elders offer them, take advantage of the temporary licence they are allowed in many societies ('Youth must have its fling'), do what is assigned to them, revel in the 'specific virtues' of youth, *virtù*, virility, enthusiasm, and get on with their own business – knight-errantry for the scions of the mediaeval aristocracy,<sup>17</sup> love and violence for the youth of Renaissance Florence, and every form of regulated, ludic wildness (sport, rock etc.) for contemporary adolescents – in short, allow themselves to be kept in the state of 'youth', that is, irresponsibility, enjoying the freedom of irresponsible behaviour in return for renouncing responsibility.<sup>18</sup> In situations of specific crisis, when the order of successions is threatened, 'young people', refusing to remain consigned to 'youth', tend to consign the 'old' to 'old age'. Wanting to take the responsibilities which define adults (in the sense of socially complete persons), they must push the holders of responsibilities into that form of irresponsibility which defines old age, or rather retirement. The wisdom and prudence claimed by the elders then collapse into conservatism, archaism or, quite simply, senile irresponsibility. The newcomers, who are likely to be also the biologically youngest, but who bring with them many other distinctive properties, stemming from changes in the social conditions of production of the producers (i.e., principally the family and the educational system), escape the more rapidly from 'youth' (irresponsibility) the readier they are to break with the irresponsible behaviour assigned to them and, freeing themselves from the internalized limits (those which may make a 50-year-old feel 'too young reasonably to aspire' to a position or an honour), do not hesitate to push forward, 'leap-frog' and 'take the escalator' to precipitate their predecessors' fall into the past, the outdated, in short, social death. But they have no chance of winning the struggles over the limits which break out between the age-groups when the sense of the limits is lost, unless they manage to impose a new definition of the socially complete person, including in it characteristics normally (i.e., in terms of the prevailing classificatory principle) associated with youth (enthusiasm, energy and so on) or characteristics that can supplant the virtues normally associated with adulthood.

In short, what individuals and groups invest in the particular meaning they give to common classificatory systems by the use they make of them is infinitely more than their 'interest' in the usual sense of the term; it is their whole social being, everything which defines their own idea of themselves, the primordial, tacit contract whereby they define 'us' as opposed to 'them', 'other people', and which is the basis of the exclusions ('not for the likes of us') and inclusions they perform among the characteristics produced by the common classificatory system.

Social psychologists have observed that any division of a population into two groups, however arbitrary, induces discriminatory behaviour favourable to members of the agents' own group and hostile to members of the other group, even if it has adverse effects for the former group.<sup>19</sup> More generally, they describe under the term 'category differentiation' the operations whereby agents construct their perception of reality, in particular the process of accentuating differences vis-à-vis 'outsiders' (dissimilation) and reinforcing similarities with insiders (assimilation).<sup>20</sup> Similarly, studies of racism have shown that whenever different groups are juxtaposed, a definition of the approved, valorized behaviour tends to be contrasted with the despised, rejected behaviour of the other group.<sup>21</sup> Social identity lies in

difference, and difference is asserted against what is closest, which represents the greatest threat. Analysis of stereotyping, the propensity to assume a correspondence between membership of a category (e.g., Nordic or Mediterranean, Western or Oriental) and possession of a particular property, so that knowledge of a person's category strongly influences judgements of him, is in line with analysis of that sort of social stereotyping in which all the members of a social formation tend to concur in attributing certain properties to members of the different social classes.

The fact that, in their relationship to the dominant classes, the dominated classes attribute to themselves strength in the sense of labour power and fighting strength – physical strength and also strength of character, courage, manliness – does not prevent the dominant groups from similarly conceiving the relationship in terms of the scheme strong/weak; but they reduce the strength which the dominated (or the young, or women) ascribe to themselves to brute strength, passion and instinct, a blind, unpredictable force of nature, the unreasoning violence of desire, and they attribute to themselves spiritual and intellectual strength, a self-control that predisposes them to control others, a strength of soul or spirit which allows them to conceive their relationship to the dominated – the ‘masses’, women, the young – as that of the soul to the body, understanding to sensibility, culture to nature.

### **The Classification Struggle**

Principles of division, inextricably logical and sociological, function within and for the purposes of the struggle between social groups; in producing concepts, they produce groups, the very groups which produce the principles and the groups against which they are produced. What is at stake in the struggles about the meaning of the social world is power over the classificatory schemes and systems which are the basis of the representations of the groups and therefore of their mobilization and demobilization: the evocative power of an utterance which puts things in a different light (as happens, for example, when a single word, such as ‘paternalism’, changes the whole experience of a social relationship) or which modifies the schemes of perception, shows something else, other properties, previously unnoticed or relegated to the background (such as common interests hitherto masked by ethnic or national differences); a separative power, a distinction, *diacrisis, discretio*, drawing discrete units out of indivisible continuity, difference out of the undifferentiated.

Only in and through the struggle do the internalized limits become boundaries, barriers that have to be moved. And indeed, the system of classificatory schemes is constituted as an objectified, institutionalized system of classification only when it has ceased to function as a sense of limits so that the guardians of the established order must enunciate, systematize and codify the principles of production of that order, both real and represented, so as to defend them against heresy; in short, they must constitute the doxa as orthodoxy. Official systems of classification, such as the theory of the three orders, do explicitly and systematically what the classificatory schemes did tacitly and practically. Attributes, in the sense of predicates, thereby become *attributions*, powers, capacities, privileges, prerogatives, attributed to the holder of a post, so that war is no

longer what the warrior does, but the *officium*, the specific function, the *raison d'être*, of the *bellator*. Classificatory *discretio*, like law, freezes a certain state of the power relations which it aims to fix forever by enunciating and codifying it. The classificatory system as a principle of logical and political division only exists and functions because it reproduces, in a transfigured form, in the symbolic logic of differential gaps, i.e., of discontinuity, the generally gradual and continuous differences which structure the established order; but it makes its own, that is, specifically symbolic, contribution to the maintenance of that order only because it has the specifically symbolic power to make people see and believe which is given by the imposition of mental structures.

Systems of classification would not be such a decisive object of struggle if they did not contribute to the existence of classes by enhancing the efficacy of the objective mechanisms with the reinforcement supplied by representations structured in accordance with the classification. The imposition of a recognized name is an act of recognition of full social existence which transmutes the thing named. It no longer exists merely *de facto*, as a tolerated, illegal or illegitimate practice, but becomes a *social* function, i.e., a mandate, a mission (*Beruf*), a task, a role – all words which express the difference between authorized activity, which is assigned to an individual or group by tacit or explicit delegation, and mere usurpation, which creates a ‘state of affairs’ awaiting institutionalization. But the specific effect of ‘collective representations’, which, contrary to what the Durkheimian connotations might suggest, may be the product of the application of the same scheme of perception or a common system of classification while still being subject to antagonistic social uses, is most clearly seen when the word precedes the thing, as with voluntary associations that turn into recognized professions or corporate defence groups (such as the trade union of the ‘cadres’), which progressively impose the representation of their existence and their unity, both on their own members and on other groups.

A group’s presence or absence in the official classification depends on its capacity to get itself recognized, to get itself noticed and admitted, and so to win a place in the social order. It thus escapes from the shadowy existence of the ‘nameless crafts’ of which Emile Benveniste speaks: business in antiquity and the Middle Ages, or illegitimate activities, such as those of the modern healer (formerly called an ‘empiric’), bone-setter or prostitute. The fate of groups is bound up with the words that designate them: the power to impose recognition depends on the capacity to mobilize around a name, ‘proletariat’, ‘working class’, ‘cadres’ etc., to appropriate a common name and to commune in a proper name, and so to mobilize the union that makes them strong, around the unifying power of a word.<sup>22</sup>

In fact, the order of words never exactly reproduces the order of things. It is the relative independence of the structure of the system of classifying, classified words (within which the distinct value of each particular label is defined) in relation to the structure of the distribution of capital, and more precisely, it is the time-lag (partly resulting from the inertia inherent in classification systems as quasi-legal institutions sanctioning a state of a power relation) between changes in jobs, linked to changes in the productive apparatus, and changes in titles, which creates the space for symbolic strategies aimed at exploiting the discrepancies between the nominal and the real, appropriating words so as to get the things they designate, or appropriating things while waiting to get the words that sanction them; exercising responsibilities without having entitlement to do so, in order to acquire the right to claim the legitimate titles, or, conversely, declining the material advantages associated with devalued titles so as to avoid losing the symbolic advantages bestowed by more prestigious labels or, at least, vaguer and more manipulable ones; donning the

most flattering of the available insignia, verging on imposture if need be – like the potters who call themselves ‘art craftsmen’, or technicians who claim to be engineers – or inventing new labels, like physiotherapists (*kinésithérapeutes*) who count on this new title to separate them from mere masseurs and bring them closer to doctors. All these strategies, like all processes of competition, a paper-chase aimed at ensuring constant distinctive gaps, tend to produce a steady inflation of titles – restrained by the inertia of the institutionalized taxonomies (collective agreements, salary scales etc.) – to which legal guarantees are attached. The negotiations between antagonistic interest groups, which arise from the establishment of collective agreements and which concern, inseparably, the tasks entailed by a given job, the properties required of its occupants (e.g., diplomas) and the corresponding advantages, both material and symbolic (the name), are an institutionalized, theatrical version of the incessant struggles over the classifications which help to produce the classes, although these classifications are the product of the struggles between the classes and depend on the power relations between them.

## **The Reality of Representation and the Representation of Reality**

The classifying subjects who classify the properties and practices of others, or their own, are also classifiable objects which classify themselves (in the eyes of others) by appropriating practices and properties that are already classified (as vulgar or distinguished, high or low, heavy or light etc. – in other words, in the last analysis, as popular or bourgeois) according to their probable distribution between groups that are themselves classified. The most classifying and best classified of these properties are, of course, those which are overtly designated to function as signs of distinction or marks of infamy, stigmata, especially the names and titles expressing class membership whose intersection defines social identity at any given time – the name of a nation, a region, an ethnic group, a family name, the name of an occupation, an educational qualification, honorific titles and so on. Those who classify themselves or others, by appropriating or classifying practices or properties that are classified and classifying, cannot be unaware that, through distinctive objects or practices in which their ‘powers’ are expressed and which, being appropriated by and appropriate to classes, classify those who appropriate them, they classify themselves in the eyes of other classifying (but also classifiable) subjects, endowed with classificatory schemes analogous to those which enable them more or less adequately to anticipate their own classification.

Social subjects comprehend the social world which comprehends them. This means that they cannot be characterized simply in terms of material properties, starting with the body, which can be counted and measured like any other object in the physical world. In fact, each of these properties, be it the height or volume of the body or the extent of landed property, when perceived and appreciated in relation to other properties of the same class by agents equipped with socially constituted schemes of perception and appreciation, functions as a symbolic property. It is therefore necessary to move beyond the opposition between a ‘social physics’ – which uses statistics in objectivist fashion to establish distributions (in both the statistical and economic senses), quantified expressions of the differential appropriation of a finite quantity of social energy by a large number of competing individuals, identified through ‘objective indicators’ – and a ‘social semiology’ which seeks to decipher meanings and bring to light the cognitive operations whereby agents produce and decipher them. We have to refuse the dichotomy between,

on the one hand, the aim of arriving at an objective ‘reality’, ‘independent of individual consciousnesses and wills’, by breaking with common representations of the social world (Durkheim’s ‘pre-notions’), and of uncovering ‘laws’ – that is, significant (in the sense of non-random) relationships between distributions – and, on the other hand, the aim of grasping, not ‘reality’, but agents’ representations of it, which are the whole ‘reality’ of a social world conceived ‘as will and representation’.

In short, social science does not have to choose between that form of social physics, represented by Durkheim – who agrees with social semiology in acknowledging that one can only know ‘reality’ by applying logical instruments of classification<sup>23</sup> – and the idealist semiology which, undertaking to construct ‘an account of accounts’, as Harold Garfinkel puts it, can do no more than record the recordings of a social world which is ultimately no more than the product of mental, i.e., linguistic, structures. What we have to do is to bring into the science of scarcity, and of competition for scarce goods, the practical knowledge which the agents obtain for themselves by producing – on the basis of their experience of the distributions, itself dependent on their position in the distributions – divisions and classifications which are no less objective than those of the balance-sheets of social physics. In other words, we have to move beyond the opposition between objectivist theories which identify the social classes (but also the sex or age classes) with discrete groups, simple countable populations separated by boundaries objectively drawn in reality, and subjectivist (or marginalist) theories which reduce the ‘social order’ to a sort of collective classification obtained by aggregating the individual classifications or, more precisely, the individual strategies, classified and classifying, through which agents class themselves and others.<sup>24</sup>

One only has to bear in mind that goods are converted into distinctive signs, which may be signs of distinction but also of vulgarity, as soon as they are perceived relationally, to see that the representation which individuals and groups inevitably project through their practices and properties is an integral part of social reality. A class is defined as much by its *being-perceived* as by its *being*, by its consumption – which need not be conspicuous in order to be symbolic – as much as by its position in the relations of production (even if it is true that the latter governs the former). The Berkeleyan – i.e., petit-bourgeois – vision which reduces social being to perceived being, to seeming, and which, forgetting that there is no need to give theatrical performances (*représentations*) in order to be the object of mental representations, reduces the social world to the sum of the (mental) representations which the various groups have of the theatrical performances put on by the other groups, has the virtue of insisting on the relative autonomy of the logic of symbolic representations with respect to the material determinants of socio-economic condition. The individual or collective classification struggles aimed at transforming the categories of perception and appreciation of the social world and, through this, the social world itself, are indeed a forgotten dimension of the class struggle. But one only has to realize that the classificatory schemes which underlie agents’ practical relationship to their condition and the representation they have of it are themselves the product of that condition, in order to see the limits of this autonomy. Position in the classification struggle depends on position in the class structure; and social subjects – including intellectuals, who are not those best placed to grasp that which defines the limits of their thought of the social world, that is, the illusion of the absence of limits – are perhaps never less likely to transcend ‘the limits of their minds’ than in the representation they have and give of their position, which defines those limits.

## Notes

- 1 I. Kant, *Anthropology from a Pragmatic Point of View* (Carbondale and Edwardsville: Southern Illinois University Press, 1978), p. 141.
- 2 G. W. Leibniz, 'Meditationes de cognitione, veritate et ideis' in *Opuscula Philosophica Selecta* (Paris: Boivin, 1939), pp. 1–2 (see also *Discours de Métaphysique*, par. 24). It is remarkable that to illustrate the idea of 'clear but confused' knowledge, Leibniz evokes, in addition to the example of colours, tastes and smells which we can distinguish 'by the simple evidence of the senses and not by statable marks', the example of painters and artists who can recognize a good or bad work but cannot justify their judgement except by invoking the presence or absence of a 'je ne sais quoi.'
- 3 It would be the task of a genetic sociology to establish how this sense of possibilities and impossibilities, proximities and distances is constituted.
- 4 Just as the opposition between the unique and the multiple lies at the heart of the dominant philosophy of history, so the opposition, which is a transfigured form of it, between the brilliant, the visible, the distinct, the distinguished, the 'outstanding', and the obscure, the dull, the greyness of the undifferentiated, indistinct, inglorious mass is one of the fundamental categories of the dominant perception of the social world.
- 5 See G. Duby, *Les trois ordres ou l'imaginaire du féodalisme* (Paris: Gallimard, 1978).
- 6 E. Durkheim, *Elementary Forms of the Religious Life* (London: Allen and Unwin, 1915), p. 17.
- 7 A more detailed account of the theoretical context of these analyses will be found in P. Bourdieu, "Symbolic Power" in *Identity and Structure*, ed. D. Gleeson (Driffield: Nafferton Books, 1977), pp. 112–19; also in *Critique of Anthropology*, 4 (Summer 1979), 77–85.
- 8 Cf. J.-P. Sartre, *Being and Nothingness* (London: Methuen, 1969), pp. 557–65, esp. 562.
- 9 See H. Giles, 'Accent Mobility: A Model and Some Data', *Anthropological Linguistics*, 15 (1973), 87–105.
- 10 See G. Lenski, 'American Social Classes: Statistical Strata or Social Groups?', *American Journal of Sociology*, 8 (September 1952), 139–44.
- 11 These divergences also emerge, in the same survey, when the respondents are first asked to define social classes at the level of their town and then at the level of the whole country; the rate of non-response rises strongly in the latter case, as does the number of classes perceived.
- 12 Ordinary perception, which applies to practices the scheme of the broad and the narrow, or the expansive and the constrained, anticipates the discoveries of the most refined social psychology, which establishes the existence of a correlation between the room one gives oneself in physical space and the place one occupies in social space. On this point, see S. Fisher and C. E. Cleveland, *Body Image and Personality* (New York: Van Nostrand, 1958).
- 13 This is true in the ordinary sense but also in the sense of Kafka [*procès* = 'process' but also 'trial' – cf. Kafka's *Die Prozess*, *The Trial*, *Le Procès* in French – translator], who offers an exemplary image of this desperate striving to regain a social identity that is by definition ungraspable, being the infinite limit of all categoremes, all imputations.
- 14 The sophism of the heap of wheat and all the paradoxes of physical continua mean, as Poincaré observed, that one has simultaneously  $A=B$ ,  $B=C$  and  $A < C$ , or again,  $A_1=A_2$ ,  $A_2=A_3$ , ...  $A_{99}=A_{100}$  and  $A_1 < A_{100}$ . In other words, though it is clear that one grain does not make a heap, nor do two grains, or three, it is not easy to say whether the heap begins at 264 grains or 265; in other words, whether 265 grains make a heap, but not 264.

- 20 See, for example, H. Tajfel, 'Quantitative Judgement in Social Perception', *British Journal of Psychology*, 50 (1959), 16–21, and H. Tajfel and A. L. Wilkes, 'Classification and Quantitative Judgement', *ibid.*, 54 (1963), 101–4; and for an overview of research in this area, W. Doise, *L'articulation psychosociologique et les relations entre groupes* (Brussels: A. de Boeck, 1976), pp. 178–200.
- 21 'Wherever the groups and classes are set in sharp juxtaposition, the values and mores of each are juxtaposed. Out of group opposition there arises an intense opposition of values, which comes to be projected through the social order and serves to solidify social stratification.' L. Copeland, 'The Negro as a Contrast Conception' in E. Thompson (ed.), *Race Relations and the Race Problem* (Durham, NC: Duke University Press, 1959), pp. 152–79.
- 22 '... le pouvoir unificateur du nom, du mot d'ordre' – the unifying power of the name/noun, the rallying cry ('order word'). (Translator's note.)
- 23 One scarcely needs to point out the affinity between social physics and the positivist inclination to see classifications either as arbitrary, 'operational' divisions (such as age groups or income brackets) or as 'objective' cleavages (discontinuities in distributions or bends in curves) which only need to be recorded.
- 24 Here is a particularly revealing expression (even in its metaphor) of this social marginalism: 'Each individual is responsible for the demeanour image of himself and the deference image of others, so that for a complete man to be expressed, individuals must hold hands in a chain of ceremony, each giving deferentially with proper demeanour to the one on the right what will be received deferentially from the one on the left.' E. Goffmann, 'The Nature of Deference and Demeanour', *American Anthropologist*, 58 (June 1956), 473–502. '... routinely the question is that of whose opinion is voiced most frequently and most forcibly, who makes the minor ongoing decisions apparently required for the coordination of any joint activity, and whose passing concerns have been given the most weight. And however trivial some of these *little gains and losses* may appear to be, *by summing them all up* across all the social situations in which they occur, we can see that their total effect is enormous. The expression of subordination and domination through this swarm of situational means is more than a mere tracing or symbol or ritualistic affirmation of the social hierarchy. These expressions *considerably constitute* the hierarchy.' E. Goffmann, 'Gender Display'. (Paper presented at the Third International Symposium, 'Female Hierarchies', Harry Frank Guggenheim Foundation, April 3–5, 1974); italics mine.

# CHAPTER 6

## Ethics and the Face

*Emmanuel Levinas*

Levinas was a major figure in European philosophy in the mid- to late twentieth century. His work derives from phenomenology and focuses on one's awareness of others. One's relation to "the Other" is more important and foundational than any question in philosophy regarding the nature of existence (ontology). The Other person can never fully be known or appropriated. The relation to the Other marks the limits of the self. Responsibility, rather than freedom, is therefore a paramount value in Levinas's ethics. Levinas's major works were *Time and the Other* (1948) and *Totality and Infinity* (1961).

### 1. Infinity and the Face

Inasmuch as the access to beings concerns vision, it dominates those beings, exercises a power over them. A thing is *given*, offers itself to me. In gaining access to it I maintain myself within the same.

The face is present in its refusal to be contained. In this sense it cannot be comprehended, that is, encompassed. It is neither seen nor touched – for in visual or tactile sensation the identity of the I envelops the alterity of the object, which becomes precisely a content.

The Other is not other with a relative alterity as are, in a comparison, even ultimate species, which mutually exclude one another but still have their place within the community of a genus – excluding one another by their definition, but calling for one another by this exclusion, across the community of their genus. The alterity of the Other does not depend on any quality that would distinguish him from me, for a distinction of this nature would precisely imply between us that community of genus which already nullifies alterity.

And yet the Other does not purely and simply negate the I; total negation, of which murder is the temptation and the attempt, refers to an antecedent relation. The relation between the Other and me, which dawns forth in his expression, issues neither in

*Original publication details:* Emmanuel Levinas, "Ethics and the Face" from *Totality and Infinity*, pp. 194–219. Duquesne University Press, 1969. Reproduced with permission from Duquesne University Press.

number nor in concept. The Other remains infinitely transcendent, infinitely foreign; his face in which his epiphany is produced and which appeals to me breaks with the world that can be common to us, whose virtualities are inscribed in our *nature* and developed by our existence. Speech proceeds from absolute difference. Or, more exactly, an absolute difference is not produced in a process of specification descending from genus to species, in which the order of logical relations runs up against the given, which is not reducible to relations. The difference thus encountered remains bound up with the logical hierarchy it contrasts with, and appears against the ground of the common genus.

Absolute difference, inconceivable in terms of formal logic, is established only by language. Language accomplishes a relation between terms that breaks up the unity of a genus. The terms, the interlocutors, absolve themselves from the relation, or remain absolute within relationship. Language is perhaps to be defined as the very power to break the continuity of being or of history.

The incomprehensible nature of the presence of the Other, which we spoke of above, is not to be described negatively. Better than comprehension, *discourse* relates with what remains essentially transcendent. For the moment we must attend to the formal work of language, which consists in presenting the transcendent; a more profound signification will emerge shortly. Language is a relation between separated terms. To the one the other can indeed present himself as a theme, but his presence is not reabsorbed in his status as a theme. The word that bears on the Other as a theme seems to contain the Other. But already it is said to the Other who, as interlocutor, has quit the theme that encompassed him, and upsurges inevitably behind the said. Words are said, be it only by the silence kept, whose weight acknowledges this evasion of the Other. The knowledge that absorbs the Other is forthwith situated within the discourse I address to him. Speaking, rather than “letting be,” solicits the Other. Speech cuts across vision. In knowledge or vision the object seen can indeed determine an act, but it is an act that in some way appropriates the “seen” to itself, integrates it into a world by endowing it with a signification, and, in the last analysis, constitutes it. In discourse the divergence that inevitably opens between the Other as my theme and the Other as my interlocutor, emancipated from the theme that seemed a moment to hold him, forthwith contests the meaning I ascribe to my interlocutor. The formal structure of language thereby announces the ethical inviolability of the Other and, without any odor of the “numinous,” his “holiness.”

The fact that the face maintains a relation with me by discourse does not range him in the same; he remains absolute within the relation. The solipsist dialectic of consciousness always suspicious of being in captivity in the same breaks off. For the ethical relationship which subtends discourse is not a species of consciousness whose ray emanates from the I; it puts the I in question. This putting in question emanates from the other.

The presence of a being not entering into, but overflowing, the sphere of the same determines its “status” as infinite. This overflowing is to be distinguished from the image of liquid overflowing a vessel, because this overflowing presence is effectuated as a position *in face of* the same. The facing position, opposition par excellence, can be only as a moral summons. This movement proceeds from the other. The idea of infinity, the infinitely more contained in the less, is concretely produced in the form of a relation with the face. And the idea of infinity alone maintains the exteriority of the other with respect to the same, despite this relation. Thus a structure analogous to the ontological argument is here produced: the exteriority of a being is inscribed in its essence. But what is produced here is not a reasoning, but the epiphany that occurs as a face. The metaphysical

desire for the absolutely other which animates intellectualism (or the radical empiricism that confides in the teaching of exteriority) deploys its *en-ergy* in the vision of the face [vision du visage], or in the idea of infinity. The idea of infinity exceeds my powers (not quantitatively, but, we will see later, by calling them into question); it does not come from our a priori depths – it is consequently experience par excellence.

The Kantian notion of infinity figures as an ideal of reason, the projection of its exigencies in a beyond, the ideal completion of what is given incomplete – but without the incomplete being confronted with a privileged *experience* of infinity, without it drawing the limits of its finitude from such a confrontation. The finite is here no longer conceived by relation to the infinite; quite the contrary, the infinite presupposes the finite, which it amplifies infinitely (although this passage to the limit or this projection implicates in an unacknowledged form the idea of infinity, with all the consequences Descartes drew from it, and which are presupposed in this idea of projection). The Kantian finitude is described positively by sensibility, as the Heideggerian finitude by the being for death. This infinity referring to the finite marks the most anti-Cartesian point of Kantian philosophy as, later, of Heideggerian philosophy.

Hegel returns to Descartes in maintaining the positivity of the infinite, but excluding all multiplicity from it; he posits the infinite as the exclusion of every “other” that might maintain a relation with the infinite and thereby limit it. The infinite can only encompass all relations. Like the god of Aristotle it refers only to itself, though now at the term of a history. The relation of a particular with infinity would be equivalent to the entry of this particular into the sovereignty of a State. It becomes infinite in negating its own finitude. But this outcome does not succeed in smothering the protestation of the private individual, the apology of the separated being (though it be called empirical and animal), of the individual who experiences as a tyranny the State willed by his reason, but in whose impersonal destiny he no longer recognizes his reason. We recognize in the finitude to which the Hegelian infinite is opposed, and which it encompasses, the finitude of man before the elements, the finitude of man invaded by the *there is*, at each instant traversed by faceless gods against whom labor is pursued in order to realize the security in which the “other” of the elements would be revealed as the same. But the other absolutely other – the Other – does not limit the freedom of the same; calling it to responsibility, it founds it and justifies it. The relation with the other as face heals allergy. It is desire, teaching received, and the pacific opposition of discourse. In returning to the Cartesian notion of infinity, the “idea of infinity” put in the separated being by the infinite, we retain its positivity, its anteriority to every finite thought and every thought of the finite, its exteriority with regard to the finite; here there was the possibility of separated being. The idea of infinity, the overflowing of finite thought by its content, effectuates the relation of thought with what exceeds its capacity, with what at each moment it learns without suffering shock. This is the situation we call welcome of the face. The idea of infinity is produced in the *opposition* of conversation, in sociality. The relation with the face, with the other absolutely other which I can not contain, the other in this sense infinite, is nonetheless my Idea, a commerce. But the relation is maintained without violence, in peace with this absolute alterity. The “resistance” of the other does not do violence to me, does not act negatively; it has a positive structure: ethical. The first revelation of the other, presupposed in all the other relations with him, does not consist in grasping him in his negative resistance and in circumventing him by ruse. I do not struggle with a faceless god, but I respond to his expression, to his revelation.

## 2. Ethics and the Face

The face resists possession, resists my powers. In its epiphany, in expression, the sensible, still graspable, turns into total resistance to the grasp. This mutation can occur only by the opening of a new dimension. For the resistance to the grasp is not produced as an insurmountable resistance, like the hardness of the rock against which the effort of the hand comes to naught, like the remoteness of a star in the immensity of space. The expression the face introduces into the world does not defy the feebleness of my powers, but my ability for power.<sup>1</sup> The face, still a thing among things, breaks through the form that nevertheless delimits it. This means concretely: the face speaks to me and thereby invites me to a relation incommensurate with a power exercised, be it enjoyment or knowledge.

And yet this new dimension opens in the sensible appearance of the face. The permanent openness of the contours of its form in expression imprisons this openness which breaks up form in a caricature. The face at the limit of holiness and caricature is thus still in a sense exposed to powers. In a sense only: the depth that opens in this sensibility modifies the very nature of power, which henceforth can no longer take, but can kill. Murder still aims at a sensible datum, and yet it finds itself before a datum whose being can not be *suspended* by an appropriation. It finds itself before a datum absolutely non-neutralizable. The “negation” effected by appropriation and usage remained always partial. The grasp that contests the independence of the thing preserves it “for me.” Neither the destruction of things, nor the hunt, nor the extermination of living beings aims at the face, which is not of the world. They still belong to labor, have a finality, and answer to a need. Murder alone lays claim to total negation. Negation by labor and usage, like negation by representation, effect a grasp or a comprehension, rest on or aim at affirmation; they can. To kill is not to dominate but to annihilate; it is to renounce comprehension absolutely. Murder exercises a power over what escapes power. It is still a power, for the face expresses itself in the sensible, but already impotency, because the face rends the sensible. The alterity that is expressed in the face provides the unique “matter” possible for total negation. I can wish to kill only an existent absolutely independent, which exceeds my powers infinitely, and therefore does not oppose them but paralyzes the very power of power. The Other is the sole being I can wish to kill.

But how does this disproportion between infinity and my powers differ from that which separates a very great obstacle from a force applied to it? It would be pointless to insist on the banality of murder, which reveals the quasi-null resistance of the obstacle. This most banal incident of human history corresponds to an exceptional possibility – since it claims the total negation of a being. It does not concern the force that this being may possess as a part of the world. The Other who can sovereignly say *no* to me is exposed to the point of the sword or the revolver’s bullet, and the whole unshakeable firmness of his “for itself” with that intransigent *no* he opposes is obliterated because the sword or the bullet has touched the ventricles or auricles of his heart. In the contexture of the world he is a quasi-nothing. But he can oppose to me a struggle, that is, oppose to the force that strikes him not a force of resistance, but the very *unforeseeableness* of his reaction. He thus opposes to me not a greater force, an energy assessable and consequently presenting itself as though it were part of a whole, but the very transcendence of his being by relation to that whole; not some superlative of power, but precisely the infinity of his transcendence. This infinity, stronger than murder, already resists us in his face, is his face, is the primordial *expression*, is the first word: “you shall not commit

murder.” The infinite paralyses power by its infinite resistance to murder, which, firm and insurmountable, gleams in the face of the Other, in the total nudity of his defenceless eyes, in the nudity of the absolute openness of the Transcendent. There is here a relation not with a very great resistance, but with something absolutely *other*: the resistance of what has no resistance – the ethical resistance. The epiphany of the face brings forth the possibility of gauging the infinity of the temptation to murder, not only as a temptation to total destruction, but also as the purely ethical impossibility of this temptation and attempt. If the resistance to murder were not ethical but real, we would have a *perception* of it, with all that reverts to the subjective in perception. We would remain within the idealism of a *consciousness* of struggle, and not in relationship with the Other, a relationship that can turn into struggle, but already overflows the consciousness of struggle. The epiphany of the face is ethical. The struggle this face can threaten presupposes the transcendence of expression. The face threatens the eventuality of a struggle, but this threat does not exhaust the epiphany of infinity, does not formulate its first word. War presupposes peace, the antecedent and non-allergic presence of the Other; it does not represent the first event of the encounter.

The impossibility of killing does not have a simply negative and formal signification; the relation with infinity, the idea of infinity in us, conditions it positively. Infinity presents itself as a face in the ethical resistance that paralyses my powers and from the depths of defenceless eyes rises firm and absolute in its nudity and destitution. The comprehension of this destitution and this hunger establishes the very proximity of the other. But thus the epiphany of infinity is expression and discourse. The primordial essence of expression and discourse does not reside in the information they would supply concerning an interior and hidden world. In expression a being presents itself; the being that manifests itself attends its manifestation and consequently appeals to me. This attendance is not the *neutrality* [*le neutre*] of an image, but a solicitation that concerns me by its destitution and its Height. To speak to me is at each moment to surmount what is necessarily plastic in manifestation. To manifest oneself as a face is to *impose oneself* above and beyond the manifested and purely phenomenal form, to present oneself in a mode irreducible to manifestation, the very straightforwardness of the face to face, without the intermediary of any image, in one’s nudity, that is, in one’s destitution and hunger. In *Desire* are conjoined the movements unto the Height and unto the Humility of the Other.

Expression does not radiate as a splendor that spreads unbeknown to the radiating being – which is perhaps the definition of beauty. To manifest oneself in attending one’s own manifestation is to invoke the interlocutor and expose oneself to his response and his questioning. Expression does not impose itself as a true representation or as an action. The being offered in true representation remains a possibility of appearance. The world which invades me when I engage myself in it is powerless against the “free thought” that suspends that engagement, or even refuses it interiorly, being capable of living hidden. The being that expresses itself imposes itself, but does so precisely by appealing to me with its destitution and nudity – its hunger – without my being able to be deaf to that appeal. Thus in expression the being that imposes itself does not limit but promotes my freedom, by arousing my goodness. The order of responsibility, where the gravity of ineluctable being freezes all laughter, is also the order where freedom is ineluctably invoked. It is thus the irremissible weight of being that gives rise to my freedom. The ineluctable has no longer the inhumanity of the fateful, but the severe seriousness of goodness.

This bond between expression and responsibility, this ethical condition or essence of language, this function of language prior to all disclosure of being and its cold splendor, permits us to extract language from subjection to a preexistent thought, where it would have but the servile function of translating that preexistent thought on the outside, or of universalizing its interior movements. The presentation of the face is not true, for the true refers to the non-true, its eternal contemporary, and ineluctably meets with the smile and silence of the skeptic. The presentation of being in the face does not leave any logical place for its contradictory. Thus I cannot evade by silence the discourse which the epiphany that occurs as a face opens, as Thrasymachus, irritated, tries to do, in the first book of the *Republic* (moreover without succeeding). “To leave men without food is a fault that no circumstance attenuates; the distinction between the voluntary and the involuntary does not apply here,” says Rabbi Yochanan.<sup>2</sup> Before the hunger of men responsibility is measured only “objectively”; it is irrecusable. The face opens the primordial discourse whose first word is obligation, which no “interiority” permits avoiding. It is that discourse that obliges the entering into discourse, the commencement of discourse rationalism prays for, a “force” that convinces even “the people who do not wish to listen”<sup>3</sup> and thus founds the true universality of reason.

Preexisting the disclosure of being in general taken as basis of knowledge and as meaning of being is the relation with the existent that expresses himself; preexisting the plane of ontology is the ethical plane.

### 3. Reason and the Face

Expression is not produced as the manifestation of an intelligible form that would connect terms to one another so as to establish, across distance, the assemblage of parts in a totality, in which the terms joined up already derive their meaning from the situation created by their community, which, in its turn, owes its meaning to the terms combined. This “circle of understanding” is not the primordial event of the logic of being. Expression precedes these coordinating effects visible to a third party.

The event proper to expression consists in bearing witness to oneself, and guaranteeing this witness. This attestation of oneself is possible only as a face, that is, as speech. It produces the commencement of intelligibility, initiality itself, principality, royal sovereignty, which commands unconditionally. The principle is possible only as command. A search for the influence that expression would have undergone or an unconscious source from which it would emanate would presuppose an inquiry that would refer to new testimonies, and consequently to an original sincerity of an expression.

Language as an exchange of ideas about the world, with the mental reservations it involves, across the vicissitudes of sincerity and deceit it delineates, presupposes the originality of the face without which, reduced to an action among actions whose meaning would require an infinite psychoanalysis or sociology, it could not commence. If at the bottom of speech there did not subsist this originality of expression, this break with every influence, this dominant position of the speaker foreign to all compromise and all contamination, this straightforwardness of the face to face, speech would not surpass the plane of activity, of which it is evidently not a species – even though language can be integrated into a system of acts and serve as an instrument. But language is possible only when speaking precisely renounces this function of being action and returns to its essence of being expression.

Expression does not consist in *giving* us the Other's interiority. The Other who expresses himself precisely does not *give* himself, and accordingly retains the freedom to lie. But deceit and veracity already presuppose the absolute authenticity of the face – the privileged case of a presentation of being foreign to the alternative of truth and non-truth, circumventing the ambiguity of the true and the false which every truth risks – an ambiguity, moreover, in which all values move. The presentation of being in the face does not have the status of a value. What we call the face is precisely this exceptional presentation of self by self, incommensurable with the presentation of realities simply given, always suspect of some swindle, always possibly dreamt up. To seek truth I have already established a relationship with a face which can guarantee itself, whose epiphany itself is somehow a word of honor. Every language as an exchange of verbal signs refers already to this primordial word of honor. The verbal sign is placed where someone signifies something to someone else. It therefore already presupposes an authentification of the signifier.

The ethical relation, the face to face, also cuts across every relation one could call mystical, where events other than that of the presentation of the original being come to overwhelm or sublimate the pure sincerity of this presentation, where intoxicating equivocations come to enrich the primordial univocity of expression, where discourse becomes incantation as prayer becomes rite and liturgy, where the interlocutors find themselves playing a role in a drama that has begun outside of them. Here resides the rational character of the ethical relation and of language. No fear, no trembling could alter the straightforwardness of this relationship, which preserves the discontinuity of relationship, resists fusion, and where the response does not evade the question. To poetic activity – where influences arise unbeknown to us out of this nonetheless conscious activity, to envelop it and beguile it as a rhythm, and where action is borne along by the very work it has given rise to, where in a dionysiac mode the artist (according to Nietzsche's expression) becomes a work of art – is opposed the language that at each instant dispels the charm of rhythm and prevents the initiative from becoming a role. Discourse is rupture and commencement, breaking of rhythm which enraptures and transports the interlocutors – prose.

The face in which the other – the absolutely other – presents himself does not negate the same, does not do violence to it as do opinion or authority or the thaumaturgic supernatural. It remains commensurate with him who welcomes; it remains terrestrial. This presentation is preeminently nonviolence, for instead of offending my freedom it calls it to responsibility and founds it. As nonviolence it nonetheless maintains the plurality of the same and the other. It is peace. The relation with the other – the absolutely other – who has no frontier with the same is not exposed to the allergy that afflicts the same in a totality, upon which the Hegelian dialectic rests. The other is not for reason a scandal which launches it into dialectical movement, but the first rational teaching, the condition for all teaching. The alleged scandal of alterity presupposes the tranquil identity of the same, a freedom sure of itself which is exercised without scruples, and to whom the foreigner brings only constraint and limitation. This flawless identity freed from all participation, independent in the I, can nonetheless lose its tranquillity if the other, rather than countering it by upsurging on the same plane as it, speaks to it, that is, shows himself in expression, in the face, and comes from on high. Freedom then is inhibited, not as countered by a resistance, but as arbitrary, guilty, and timid; but in its guilt it rises to responsibility. Contingency, that is, the irrational, appears to it not outside of itself in the other, but within itself. It is not limitation by the other that constitutes

contingency, but egoism, as unjustified of itself. The relation with the Other as a relation with his transcendence – the relation with the Other who puts into question the brutal spontaneity of one's immanent destiny – introduces into me what was not in me. But this “action” upon my freedom precisely puts an end to violence and contingency, and, in this sense also, founds Reason. To affirm that the passage of a content from one mind to the other is produced without violence only if the truth taught by the master is from all eternity in the student is to extrapolate maieutics beyond its legitimate usage. The idea of infinity in me, implying a content overflowing the container, breaks with the prejudice of maieutics without breaking with rationalism, since the idea of infinity, far from violating the mind, conditions nonviolence itself, that is, establishes ethics. The other is not for reason a scandal that puts it in dialectical movement, but the first teaching. A being *receiving* the idea of Infinity, *receiving* since it cannot derive it from itself, is a being taught in a non-maieutic fashion, a being whose very existing consists in this incessant reception of teaching, in this incessant overflowing of self (which is time). To think is to have the idea of infinity, or to be taught. Rational thought refers to this teaching. Even if we confine ourselves to the formal structure of logical thought, which starts from a definition, infinity, relative to which concepts are delimited, can not be defined in its turn. It accordingly refers to a “knowledge” of a new structure. We seek to fix it as a relation with the face and to show the ethical essence of this relation. The face is the evidence that makes evidence possible – like the divine veracity that sustains Cartesian rationalism.

#### 4. Discourse Founds Signification

Language thus conditions the functioning of rational thought: it gives it a commencement in being, a primary identity of signification in the face of him who speaks, that is, who presents himself by ceaselessly undoing the equivocation of his own image, his verbal signs. Language conditions thought – not language in its physical materiality, but language as an attitude of the same with regard to the Other irreducible to the representation of the Other, irreducible to an intention of thought, irreducible to a consciousness of ..., since relating to what no consciousness can contain, relating to the infinity of the Other. Language is not enacted within a consciousness; it comes to me from the Other and reverberates in consciousness by putting it in question. This event is irreducible to consciousness, where everything comes about from within – even the strangeness of suffering. To regard language as an attitude of the mind does not amount to disincarnating it, but is precisely to account for its incarnate essence, its difference from the constitutive, egological nature of the transcendental thought of idealism. The originality of discourse with respect to constitutive intentionality, to pure consciousness, destroys the concept of immanence: the idea of infinity in consciousness is an overflowing of a consciousness whose incarnation offers new powers to a soul no long paralytic – powers of welcome, of gift, of full hands, of hospitality. But to take incarnation as a primary fact of language, without indicating the ontological structure it accomplishes, would be to assimilate language to activity, to that prolongation of thought in corporeity, the *I think* in the *I can*, which has indeed served as a prototype for the category of the lived body [corps propre] or incarnate thought, which dominates one part of contemporary philosophy. The thesis we present here separates radically language and activity, expression and labor, in spite of all the practical side of language, whose importance we may not underestimate.

Until very recently the fundamental function of discourse in the upsurge of reason was not recognized. The function of words was understood in their dependence on reason: words reflected thought. Nominalism was the first to seek in words another function: that of an *instrument* of reason. A symbolic function of the word symbolizing the non-thinkable rather than signifying thought contents, this symbolism amounted to association with a certain number of conscious, intuitive data, an association that would be self-sufficient and would not require thought. The theory had no other purpose than to explain a divergence between thought, incapable of aiming at a general object, and language, which does seem to refer to general objects. Husserl's critique, completely subordinating words to reason, showed this divergency to be only apparent. The word is a window; if it forms a screen it must be rejected. With Heidegger Husserl's esperantist words take on the color and weight of a historical reality. But they remain bound to the process of comprehension.

The mistrust of verbalism leads to the incontestable primacy of rational thought over all the *operations* of expression that insert a thought into a particular language as into a system of signs, or bind it to a system of language presiding over the choice of these signs. Modern investigations in the philosophy of language have made familiar the idea of an underlying solidarity of thought with speech. Merleau-Ponty, among others, and better than others, showed that disincarnate thought thinking speech before speaking it, thought constituting the world of speech, adding a world of speech to the world antecedently constituted out of significations in an always transcendental operation, was a myth. Already thought consists in foraging in the system of signs, in the particular tongue of a people or civilization, and receiving signification from this very operation. It ventures forth at random, inasmuch as it does not start with an antecedent representation, or with those significations, or with phrases to be articulated. Hence one might say thought operates in the "I can" of the body. It operates in it before representing this body to itself or constituting it. Signification surprises the very thought that thought it.

But why is language, the recourse to the system of signs, necessary for thought? Why does the object, and even the perceived object, need a name in order to become a signification? What is it to have a meaning? Signification, though received from this incarnate language, nonetheless remains, throughout this conception, an "intentional object." The structure of constitutive consciousness recovers all its rights after the mediation of the body that speaks or writes. Does not the surplus of signification over representation consist in a new mode of being presented (new with respect to constitutive intentionality), whose secret the analysis of "body intentionality" does not exhaust? Does the mediation of the sign constitute the signification because it would introduce into an objective and static representation the "movement" of symbolic relation? But then language would again be suspected of taking us away from "the thing themselves."...

It is the contrary that must be affirmed; it is not the mediation of the sign that forms signification, but signification (whose primordial event is the face to face) that makes the sign function possible. The primordial essence of language is to be sought not in the corporeal operation that discloses it to me and to others and, in the recourse to language, builds up a thought, but in the presentation of meaning. This does not bring us back to a transcendental consciousness constituting objects, against which the theory of language we have just evoked protests with such just rigor. For significations do not present themselves to theory, that is, to the constitutive freedom of a transcendental consciousness; *the being of signification consists in putting into question in an ethical relation constitutive freedom itself*. Meaning is the face of the Other, and all recourse to words takes place already within the primordial face to face of language. Every recourse to words

presupposes the comprehension of the primary signification, but this comprehension, before being interpreted as a “consciousness of,” is society and obligation. Signification is the Infinite, but infinity does not present itself to a transcendental thought, nor even to meaningful activity, but presents itself in the Other; the Other faces me and puts me in question and *obliges* me by his essence qua infinity. That “something” we call signification arises in being with language because the essence of language is the relation with the Other. This relation is not added to the interior monologue – be it Merleau-Ponty’s “corporeal intentionality” – like an address added to the fabricated object one puts in the mailbox; the welcoming of the being that appears in the face, the ethical event of sociality, already commands inward discourse. And the epiphany that is produced as a face is not constituted as are all other beings, precisely because it “reveals” infinity. Signification is infinity, that is, the Other. The intelligible is not a concept, but an intelligence. Signification precedes *Sinngebung*, and rather than justifying idealism, marks its limit.

In a sense signification is to perception what the symbol is to the object symbolized. The symbol marks the inadequateness of what is given in consciousness with regard to the being it symbolizes, a consciousness needy and hungry for the being it lacks, for the being announced in the very precision with which its absence is lived, a potency that evinces the act. Signification resembles it, as an overflowing of the intention that envisages by the being envisaged. But here the inexhaustible surplus of infinity overflows the actuality of consciousness. The shimmer of infinity, the face, can no longer be stated in terms of consciousness, in metaphors referring to light and the sensible. It is the ethical exigency of the face, which puts into question the consciousness that welcomes it. The consciousness of obligation is no longer a consciousness, since it tears consciousness up from its center, submitting it to the Other.

If the face to face founds language, if the face brings the first signification, establishes signification itself in being, then language does not only serve reason, but is reason. Reason in the sense of an impersonal legality does not permit us to account for discourse, for it absorbs the plurality of the interlocutors. Reason, being unique, cannot speak to another reason. A reason immanent in an individual consciousness is, to be sure, conceivable, in the way of naturalism, as a system of laws that regulate the nature of this consciousness, individuated like all natural beings but in addition individuated also as oneself. The concordance between consciousnesses would then be explained by the resemblance of beings constituted in the same fashion. Language would be reduced to a system of signs awakening, from one consciousness to the other, like thoughts. In that case one must disregard the intentionality of rational thought, which opens upon a universal order, and run all the risks of naturalist psychologism, against which the arguments of the first volume of the *Logische Untersuchungen* are ever valid.

Retreating from these consequences, and in order to conform oneself more to the “phenomenon,” one can call reason the internal coherence of an ideal order realized in being in the measure that the individual consciousness, in which it is learnt or set up, would renounce its particularity as an individual and an ipseity, and either withdraw unto a noumenal sphere, from which it would exercise intemporally its role as absolute subject in the I think, or be reabsorbed in the universal order of the State, which at first it seemed to foresee or constitute. In both cases the role of language would be to dissolve the ipseity of individual consciousness, fundamentally antagonistic to reason, either to transform it into an “I think” which no longer speaks, or to make it disappear into its own discourse, whereupon, having entered into the State, it could only undergo the judgment of history, rather than remain me, that is, judge that history.

In such a rationalism there is no longer any society, that is, no longer any relation whose terms absolve themselves from the relation.

The Hegelians may attribute to human animality the consciousness of tyranny the individual feels before impersonal law, but they have yet to make understandable how a rational animal is possible, how the particularity of oneself can be affected by the simple universality of an idea, how an egoism can abdicate?

If, on the contrary, reason lives in language, if the first rationality gleams forth in the opposition of the face to face, if the first intelligible, the first signification, is the infinity of the intelligence that presents itself (that is, speaks to me) in the face, if reason is defined by signification rather than signification being defined by the impersonal structures of reason, if society precedes the apparition of these impersonal structures, if universality reigns as the presence of humanity in the eyes that look at me, if, finally, we recall that this look appeals to my responsibility and consecrates my freedom as responsibility and gift of self – then the pluralism of society could not disappear in the elevation to reason, but would be its condition. It is not the impersonal in me that Reason would establish, but an I myself capable of society, an I that has arisen in enjoyment as separated, but whose separation would itself be necessary for infinity *to be* – for its infinitude is accomplished as the “facing.”

## 5. Language and Objectivity

A meaningful world is a world in which there is the Other through whom the world of my enjoyment becomes a theme having a signification. Things acquire a rational signification, and not only one of simple usage, because an other is associated with my relations with them. In designating a thing I designate it to the Other. The act of designating modifies my relation of enjoyment and possession with things, places the things in the perspective of the Other. Utilizing a sign is therefore not limited to substituting an indirect relation for the direct relation with a thing, but permits me to render the things offerable, detach them from my own usage, alienate them, render them exterior. The word that designates things attests their apportionment between me and the others. The objectivity of the object does not follow from a suspension of usage and enjoyment, in which I possess things without assuming them. Objectivity results from language, which permits the putting into question of possession. This disengagement has a positive meaning: the entry of the thing into the sphere of the other. The thing becomes a theme. To thematize is to offer the world to the Other in speech. “Distance” with regard to the object thus exceeds its spatial signification.

This objectivity is correlative not of some trait in an isolated subject, but of his relation with the Other. Objectification is produced in the very work of language, where the subject is detached from the things possessed as though it hovered over its own existence, as though it were detached from it, as though the existence it exists had not yet completely reached it. This distance is more radical than every distance in the world. The subject must find itself “at a distance” from its own being, even with regard to that taking distance that is inherent in the home, by which it is still in being. For negation remains within the totality, even when it bears upon the totality of the world. In order that objective distance be hollowed out, it is necessary that while in being the subject be not yet in being, that in a certain sense it be not yet born – that it not be in nature. If the subject capable of objectivity is not yet completely, this “not yet,” this state of potency relative

to act, does not denote a less than being, but denotes time. Consciousness of the object – thematization – rests on distance with regard to oneself, which can only be time; or, if one prefers, it rests on self-consciousness, if we recognize the “distance from self to self” in self-consciousness to be “time.” However, time can designate a “not yet” that nevertheless would not be a “lesser being” – it can remain distant both from being and from death – only as the inexhaustible future of infinity, that is, as what is produced in the very relationship of language. In designating what it possesses to the other, in speaking, the subject hovers over its own existence. But it is from the welcoming of the infinity of the other that it receives the freedom with regard to itself that this dispossession requires. It detains it finally from the Desire which does not arise from a lack or a limitation but from a surplus, from the idea of Infinity.

Language makes possible the objectivity of objects and their thematization. Already Husserl affirmed that the objectivity of thought consists in being valid for everyone. To know objectively would therefore be to constitute my thought in such a way that it already contained a reference to the thought of the others. What I communicate therefore is already constituted in function of others. In speaking I do not transmit to the Other what is objective for me: the objective becomes objective only through communication. But in Husserl the Other who makes this communication possible is first constituted for a monadic thought. The basis of objectivity is constituted in a purely subjective process. In positing the relation with the Other as ethical, one surmounts a difficulty that would be inevitable if, contrary to Descartes, philosophy started from a *cogito* that would posit itself absolutely independently of the Other.

For the Cartesian *cogito* is discovered, at the end of the Third Meditation, to be supported on the certitude of the divine existence qua infinite, by relation to which the finitude of the *cogito*, or the doubt, is posited and conceivable. This finitude could not be determined without recourse to the infinite, as is the case in the moderns, for whom finitude is, for example, determined on the basis of the mortality of the subject. The Cartesian subject is given a point of view exterior to itself from which it can apprehend itself. If, in a first movement, Descartes takes a consciousness to be indubitable of itself by itself, in a second movement – the reflection on reflection – he recognizes conditions for this certitude. This certitude is due to the clarity and distinctness of the *cogito*, but certitude itself is sought because of the presence of infinity in this finite thought, which without this presence would be ignorant of its own finitude: “... manifeste intelligo plus realitatis esse in substantia infinita quam infinita, ac proinde priorem quodammodo in me esse perceptionem infiniti quam finiti, hoc est Dei quam mei ipsius. Qua enim ratione intelligerem me dubitare me cupere, hoc est aliquid mihi deesse, et me non esse omnino perfectum si nulla idea entis perfectionis in me esset, ex cuius comparatione defectus meos cognoscerem?”<sup>4</sup>

Is the position of thought in the midst of the infinite that created it and has given it the idea of infinity discovered by a reasoning or an intuition that can posit only themes? The infinite can not be thematized, and the distinction between reasoning and intuition does not apply to the access to infinity. Is not the relation with infinity, in the twofold structure of infinity present to the finite, but present outside of the finite, foreign to theory? We have seen in it the ethical relation. If Husserl sees in the *cogito* a subjectivity without any support outside of itself, this *cogito* constitutes the idea of infinity itself and gives it to itself as an object. The non-constitution of infinity in Descartes leaves a door open; the reference of the finite *cogito* to the infinity of God does not consist in a simple thematization of God. I of myself account for every object; I contain them. The idea of

infinity is not for me an object. The ontological argument lies in the mutation of this “object” into being, into independence with regard to me; God is the other. If to think consists in referring to an object, we must suppose that the thought of infinity is not a thought. What is it positively? Descartes does not raise the question. It is in any case evident that the intuition of infinity retains a rationalist meaning, and will not become any sort of invasion of God across an inward emotion. Decartes, better than an idealist or a realist, discovers a relation with a total alterity irreducible to interiority, which nevertheless does not do violence to interiority – a receptivity without passivity, a relation between freedoms.

The last paragraph of the Third Meditation brings us to a relation with infinity in thought which overflows thought and becomes a personal relation. Contemplation turns into admiration, adoration, and joy. It is a question no longer of an “infinite object” still known and thematized, but of a majesty: “... placet hic aliquamdiu in ipsius Dei contemplatione immorari, eius attributa apud me expendere et immensi huius luminis pulchritudinem quantum caligantis ingenii mei acies ferre poterit, intueri, admirari, adorare. Ut enim in hac sola divinae majestatis contemplatione summan alterius vitae felicitatem consistere fide credimus, ita etiam jam ex eadem licet multo minus perfecta, maximum cuius in hac vita capaces simus voluptatem percipi posse experimur ...”<sup>5</sup>

To us this paragraph appears to be not a stylistic ornament or a prudent hommage to religion, but the expression of this transformation of the idea of infinity conveyed by knowledge into Majesty approached as a face.

## 6. The Other and the Others

The presentation of the face, expression, does not disclose an inward world previously closed, adding thus a new region to comprehend or to take over.<sup>6</sup> On the contrary, it calls to me above and beyond the given that speech already puts in common among us. What one gives, what one takes reduces itself to the phenomenon, discovered and open to the grasp, carrying on an existence which is suspended in possession – whereas the presentation of the face puts me into relation with being. *The existing of this being*, irreducible to phenomenality understood as a reality without reality, is effectuated in the non-postponable urgency with which he requires a response. This response differs from the “reaction” that the given gives rise to in that it cannot remain “between us,” as is the case with the steps I take with regard to a thing. Everything that takes place here “between us” concerns everyone, the face that looks at it places itself in the full light of the public order, even if I draw back from it to seek with the interlocutor the complicity of a private relation and a clandestinity.

Language as the presence of the face does not invite complicity with the preferred being, the self-sufficient “I-Thou” forgetful of the universe; in its frankness it refuses the clandestinity of love, where it loses its frankness and meaning and turns into laughter or cooing. The third party looks at me in the eyes of the Other – language is justice. It is not that there first would be the face, and then the being it manifests or expresses would concern himself with justice; the epiphany of the face qua face opens humanity. The face in its nakedness as a face presents to me the destitution of the poor one and the stranger; but this poverty and exile which appeal to my powers, address me, do not deliver themselves over to these powers as givens, remain the expression of the face. The poor one, the stranger, presents himself as an equal. His equality within this essential poverty

consists in referring to the *third party*, thus present at the encounter, whom in the midst of his destitution the Other already serves. He comes to *join* me. But he joins me to himself for service; he commands me as a Master. This command can concern me only inasmuch as I am master myself; consequently this command commands me to command. The *thou* is posited in front of a *we*. To be *we* is not to “jostle” one another or get together around a common task. The presence of the face, the infinity of the other, is a destituteness, a presence of the third party (that is, of the whole of humanity which looks at us), and a command that commands commanding. This is why the relation with the Other, discourse, is not only the putting in question of my freedom, the appeal coming from the other to call me to responsibility, is not only the speech by which I divest myself of the possession that encircles me by setting forth an objective and common world, but is also sermon, exhortation, the prophetic word. By essence the prophetic word responds to the epiphany of the face, doubles all discourse not as a discourse about moral themes, but as an irreducible movement of a discourse which by essence is aroused by the epiphany of the face inasmuch as it attests the presence of the third party, the whole of humanity, in the eyes that look at me. Like a shunt every social relation leads back to the presentation of the other to the same without the intermediary of any image or sign, solely by the expression of the face. When taken to be like a genus that unites like individuals the essence of society is lost sight of. There does indeed exist a human race as a biological genus, and the common function men may exercise in the world as a totality permits the applying to them of a common concept. But the human community instituted by language, where the interlocutors remain absolutely separated, does not constitute the unity of genus. It is stated as a kinship of men. That all men are brothers is not explained by their resemblance, nor by a common cause of which they would be the effect, like medals which refer to the same die that struck them. Paternity is not reducible to a causality in which individuals would mysteriously participate, and which would determine, by no less mysterious an effect, a phenomenon of solidarity.

It is my responsibility before a face looking at me as absolutely foreign (and the epiphany of the face coincides with these two moments) that constitutes the original fact of fraternity. Paternity is not a causality, but the establishment of a unicity with which the unicity of the father does and does not coincide.<sup>7</sup> The non-coincidence consists, concretely, in my position as brother; it implies other unicities at my side. Thus my unicity qua I contains both self-sufficiency of being and my partialness, my position before the other as a face. In this welcoming of the face (which is already my responsibility in his regard, and where accordingly he approaches me from a dimension of height and dominates me), equality is founded. Equality is produced where the other commands the same and reveals himself to the same in responsibility; otherwise it is but an abstract idea and a word. It cannot be detached from the welcoming of the face, of which it is a moment.

The very status of the human implies fraternity and the idea of the human race. Fraternity is radically opposed to the conception of a humanity united by resemblance, a multiplicity of diverse families arisen from the stones cast behind by Deucalion, and which, across the struggle of egoisms, results in a human city. Human fraternity has then two aspects: it involves individualities whose logical status is not reducible to the status of ultimate differences in a genus, for their singularity consists in each referring to itself. (An individual having a common genus with another individual would not be removed enough from it.) On the other hand, it involves the commonness of a father, as though the commonness of race would not bring together enough. Society must be a fraternal

community to be commensurate with the straightforwardness, the primary proximity, in which the face presents itself to my welcome. Monotheism signifies this human kinship, this idea of a human race that refers back to the approach of the Other in the face, in a dimension of height, in responsibility for oneself and for the Other.

## 7. The Asymmetry of the Interpersonal

The presence of the face coming from beyond the world, but committing me to human fraternity, does not overwhelm me as a numinous essence arousing fear and trembling. To be in relationship while absolving oneself from this relation is to speak. The Other does not only *appear* in his face, as a phenomenon subject to the action and domination of a freedom; infinitely distant from the very relation he enters, he presents himself there from the first as an absolute. The I disengages itself from the relationship, but does so within relationship with a being absolutely separated. The face with which the Other turns to me is not reabsorbed in a representation of the face. To hear his destitution which cries out for justice is not to represent an image to oneself, but is to posit oneself as responsible, both as more and as less than the being that presents itself in the face. Less, for the face summons me to my obligations and judges me. The being that presents himself in the face comes from a dimension of height, a dimension of transcendence whereby he can present himself as a stranger without opposing me as obstacle or enemy. More, for my position as I consists in being able to respond to this essential destitution of the Other, finding resources for myself. The Other who dominates me in his transcendence is thus the stranger, the widow, and the orphan, to whom I am obligated.

These differences between the Other and me do not depend on different “properties” that would be inherent in the “I,” on the one hand, and, on the other hand, in the Other, nor on different psychological dispositions which their minds would take on from the encounter. They are due to the I-Other conjuncture, to the inevitable *orientation* of being “starting from oneself” toward “the Other.” The priority of this orientation over the terms that are placed in it (and which cannot arise without this orientation) summarizes the theses of the present work.

Being is not *first*, to afterwards, by breaking up, give place to a diversity all of whose terms would maintain reciprocal relations among themselves, exhibiting thus the totality from which they proceed, and in which there would on occasion be produced a being existing for itself, an I, facing another I (incidents that could be accounted for by an impersonal discourse exterior to those incidents). Not even the language that narrates it can depart from the orientation of the I to the Other. Language does not take place *in front of* a correlation from which the I would derive its identity and the Other his alterity. The separation involved in language does not denote the presence of two beings in an ethereal space where union simply echos separation. Separation is first the fact of a being that lives *somewhere*, from *something*, that is, that enjoys. The identity of the I comes to it from its egoism whose insular sufficiency is accomplished by enjoyment, and to which the face teaches the infinity from which this insular sufficiency is separated. This egoism is indeed founded on the infinitude of the other, which can be accomplished only by being produced as the idea of Infinity in a separated being. The other does indeed invoke this separated being, but this invocation is not reducible to calling for a correlative. It leaves room for a process of being that is deduced from itself, that is, remains separated and capable of shutting itself up against the very appeal that has

aroused it, but also capable of welcoming this face of infinity with all the resources of its egoism: economically. Speech is not instituted in a homogeneous or abstract medium, but in a world where it is necessary to aid and to give. It presupposes an I, an existence separated in its enjoyment, which does not welcome empty-handed the face and its voice coming from another shore. Multiplicity in being, which refuses totalization but takes form as fraternity and discourse, is situated in a “space” essentially asymmetrical.

## 8. Will and Reason

Discourse conditions thought, for the first intelligible is not a concept, but an intelligence whose inviolable exteriority the face states in uttering the “you shall not commit murder.” The essence of discourse is ethical. In stating this thesis, idealism is refused.

The idealist intelligible constitutes a system of coherent ideal relations whose presentation before the subject is equivalent to the entry of the subject into this order and its absorption into those ideal relations. The subject has no resource in itself that does not dry up under the intelligible sun. Its will is reason and its separation illusory (even though the possibility of illusion attests the existence of an at least subterranean subjective source which the intelligible cannot dry up).

Idealism completely carried out reduces all ethics to politics. The Other and the I function as elements of an ideal calculus, receive from this calculus their real being, and approach one another under the dominion of ideal necessities which traverse them from all sides. They play the role of moments in a system, and not that of origin. Political society appears as a plurality that expresses the multiplicity of the articulations of a system. In the kingdom of ends, where persons are indeed defined as wills, but where the will is defined as what permits itself to be affected by the universal – where the will wishes to be reason, be it practical reason – multiplicity rests in fact only on the hope of happiness. The so-called animal principle of happiness, ineluctable in the description of the will, even taken as practical reason, maintains pluralism in the society of minds.

In this world without multiplicity language loses all social signification; interlocutors renounce their unicity not in desiring one another but in desiring the universal. Language would be equivalent to the constitution of rational institutions in which an impersonal reason which is already at work in the persons who speak and already sustains their effective reality would become objective and effective: each being is posited apart from all the others, but the will of each, or ipseity, from the start consists in willing the universal or the rational, that is, in negating its very particularity. In accomplishing its essence as discourse, in becoming a discourse universally coherent, language would at the same time realize the universal State, in which multiplicity is reabsorbed and discourse comes to an end, for lack of interlocutors.

To distinguish formally will and understanding, will and reason, nowise serves to maintain plurality in being or the unicity of the person if one forthwith decides to consider only the will that adheres to clear ideas or decides only through respect for the universal to be a good will. If the will can aspire to reason in one way or another, it is reason, reason seeking or forming itself; its true essence is revealed in Spinoza or in Hegel. This identification of will and reason, which is the ultimate intention of idealism, is opposed by the entire pathetic experience of humanity, which the Hegelian or Spinozist idealism relegates to the subjective or the imaginary. The interest of this opposition does not lie in the very protestation of the individual who refuses the system and reason, that

is, in his arbitrariness, which the coherent discourse could hence not silence by persuasion – but in the affirmation that makes this opposition live. For the opposition does not consist in shutting one's eyes to being and thus striking one's head madly against the wall so as to surmount in oneself the consciousness of one's deficiencies of being, one's destitution, and one's exile, and so as to transform a humiliation into desperate pride. This opposition is inspired by the certainty of the surplus which an existence separated from and thus desiring the full or immutable being or being in act involves by relation to that being, *that is, the surplus that is produced by the society of infinity*, an incessant surplus that accomplishes the infinitude of infinity. The protestation against the identification of the will with reason does not indulge in arbitrariness, which, by its absurdity and immorality, would immediately justify this identification. It proceeds from the certitude that the ideal of a being accomplished from all eternity, thinking only itself, can not serve as the ontological touchstone for a life, a becoming, capable of renewal, of Desire, of society. Life is not comprehensible simply as a diminution, a fall, or an embryo or virtuality of being. The individual and the personal count and act independently of the universal, which would mould them. Moreover, the existence of the individual on the basis of the universal, or the fall from which it arises, remains unexplained. *The individual and the personal are necessary for Infinity to be able to be produced as infinite.*<sup>8</sup> The impossibility of treating life in function of being is manifested compellingly in Bergson, where duration no longer imitates, in its fallenness, an immobile eternity, or in Heidegger, where possibility no longer is referred to *ἔργον* as a δύναμις. Heidegger dissociates life from the finality of potency tending toward act. That there could be a more than being or an above being is expressed in the idea of creation which, in God, exceeds a being eternally satisfied with itself. But this notion of the being above being does not come from theology. If it has played no role in the Western philosophy issued from Aristotle, the Platonic idea of the Good ensures it the dignity of a philosophical thought – and it therefore should not be traced back to any oriental wisdom.

If the subjectivity were but a deficient mode of being, the distinguishing between will and reason would indeed result in conceiving the will as arbitrary, as a pure and simple negation of an embryonic or virtual reason dormant in an I, and consequently as a negation of that I and a violence in regard to oneself. If, on the contrary, the subjectivity is fixed as a separated being in relation with an other absolutely other, the Other, if the face brings the first signification, that is, the very upsurge of the rational, then the will is distinguished fundamentally from the intelligible, which it must not comprehend and into which it must not disappear, for the intelligibility of this intelligible resides precisely in ethical behavior, that is, in the responsibility to which it invites the will. The will is free to assume this responsibility in whatever sense it likes; it is not free to refuse this responsibility itself; it is not free to ignore the meaningful world into which the face of the Other has introduced it. *In the welcoming of the face the will opens to reason.* Language is not limited to the maieutic awakening of thoughts common to beings. It does not accelerate the inward maturation of a reason common to all; it teaches and introduces the new into a thought. The introduction of the new into a thought, the idea of infinity, is the very work of reason. The absolutely new is the Other. The rational is not opposed to the experienced; absolute experience, the experience of what is in no way a priori, is reason itself. In discovering, as correlative of experience, the Other, him who, being in himself essentially, can speak, and nowise sets himself up as an object, the *novelty* contributed by experience is reconciled with the ancient Socratic exigency of a mind nothing can force, an exigency Leibniz again answers to in refusing the monads windows.

The ethical presence is both other and imposes itself without violence. As the activity of reason commences with speech, the subject does not abdicate his unicity, but confirms his separation. He does not enter into his own discourse to disappear in it; it remains an apology. The passage to the rational is not a dis-individuation precisely because it is language, that is, a response to the being who in a face speaks to the subject and tolerates only a personal response, that is, an ethical act.

# CHAPTER 7

## Levinas and Literary Interpretation: Facing Baudelaire’s “Eyes of the Poor”

*Kuisma Korhonen*

Kuisma Korhonen is Professor of Literature at the University of Oulu. His books include *Textual Friendship: The Essay as Impossible Encounter* (2004), *Tropes for the Past: Hayden White and the History/Literature Debate* (ed., 2006), *The Event of Encounter in Art and Philosophy* (co-ed., 2010), and *Chiasmatic Encounters* (co-ed., forthcoming). His work has addressed literature as a form of ethical encounter and textual community. Lately he has been working on the ethics of cultural memory.

“Levinasian narratology” may sound like an oxymoron. Indeed, Emmanuel Levinas’s criticism of all artistic representations, including narratives, in his early essay “Reality and its Shadow” should warn us not to apply his work to narrative analysis. There Levinas famously claims that novels, like artistic representations in general, force reality into fixed and frozen, shadowy and statuesque images. Novels turn living temporality into plots, destinies, and meanings, and transform the living interiority of human time into the immobile exteriority of the narrative gaze:

The characters of a novel are beings that are shut up, prisoners. Their history is never finished, it still goes on, but makes no headway. A novel shuts beings up in a fate despite their freedom. Life solicits the novelist when it seems to him as if it were already something out of the book. Something somehow completed arises in it, as though a whole set of facts were immobilized and formed a series. They are described between two well-determined moments, in the space of a time existence had traversed as through a tunnel. The events related form a *situation* – akin to a plastic ideal. (1989b [1948]: 139)

In his later work, Levinas makes constant references to literary texts, but as Colin Davis (81–102) or Hanna Meretoja (forthcoming) note, his reservations on narrative forms like the novel remain strong. In the vocabulary of the late Levinas, the form of the novel

*Original publication details:* Kuisma Korhonen, “Towards a Post-Levinasian Approach to Narrativity,” from *Partial Answers – Journal of Literature and the History of Ideas* 6.2 (June 2008), pp. 459–480. Reproduced with permission from Johns Hopkins University Press.

turns the Saying into the Said, the act of addressing and welcoming the Other into an act of comprehending and appropriating the Other.<sup>1</sup> When he describes the fiction of his close friend Maurice Blanchot, *narrative* is seen as the inevitable but violent moment where poetic saying betrays itself and becomes enveloped “in the totality of the said” (Levinas 1989d [1966]: 157).

So, what kind of “narratology” could we possibly construct around Levinasian ethics if its basic approach to narratives is highly critical? Indeed, the very notion of *logos* in “narratology” – the very idea of “narrative science” as a theory and method of mapping, describing, and analyzing textual structures – is already incompatible with the Levinasian thinking which concentrates on those elements that, in ethical experience, escape our cognitive attempts to grasp otherness.

My purpose in this essay is not to construct any Levinasian or post-Levinasian narratological method (or any post-Levinasian literary theory, for that matter). To do so would require taking into account the dual background of Levinas’s *œuvre* in both the phenomenological (Husserl and Heidegger) and Judaic (Buber and Rosenzweig) traditions, as well as the philosophical context in which it has been read and discussed: Derrida (1978 [1964], 1991 [1980], 1999 [1997]), Blanchot, Irigaray, Ricoeur, and the work of at least the most important commentators of Levinas, such as Critchley, Peperzak (1993, 1999), Llewelyn (1995, 2002), or Bailhache. Against this general background of Levinasian and post-Levinasian philosophical discourse it would then be necessary to describe the attempts that have been made to apply the Levinasian approach to ethical literary criticism – by Robert Eaglestone and Jill Robbins, who have discussed Levinas’s own comments on literature and art, and by Adam Z. Newton, who, combining his Levinasian influences with the dialogism of Bakhtin and with Cavellian skepticism, argues that narrative is the original form of ethical thought. And we certainly would have to enter into dialogue with Geoffrey Galt Harpham, whose views on the relationship between ethics and morality build heavily on Levinas; Andrew Gibson, who has introduced several Levinasian themes in his account of the post-modern English novel; and Derek Attridge, whose *Singularity of Literature* is inspired by Levinasian insights on the primacy of otherness.

The task would be enormous. What I can do here is to take one central Levinasian theme – facing the Other – and see how it resonates with one short narrative, Baudelaire’s “Eyes of the Poor.” Even this attempt to bridge the distance between Levinasian ethics and narrative analysis may contain a rupture, as I move from Levinasian ethics and his notion of the “face” – often used as a highly figurative term – to more traditional narratological terms and the reading of concrete faces in Baudelaire’s text.

First, however, I must explain why one of the most important themes in the work of Levinas is also the reason why we should turn to Levinas in reading narratives despite his seemingly hostile attitude towards them – and why we should, in the end, combine the purely Levinasian approach with more textually, historically, and politically oriented insights on narratives in order to move towards a post-Levinasian ethical approach.

## I

The central element in Levinasian ethics is the encounter. Truly ethical thinking begins not from the experience of a single consciousness thrown into existence but from the event of encountering otherness. For Levinas, this encounter is never symmetric: the Other is vulnerable, at one’s mercy, and this is exactly why he or she is, in one’s ethical

experience, above one, commanding one, holding one “hostage.” This encounter cannot be reversed: one’s responsibility before the Other is not dependent on the way the Other sees one. One is responsible not only *to* the Other but *for* the other, to the point where one (but oneself alone) is a “substitute” for every other – the other being not someone one could identify with, but precisely someone who remains irreducibly other (1974: 200).

Consequently, a Levinasian approach to narratives should be attentive not to the text in and of itself, as a completed work of art, but rather to the asymmetric and irreversible space of textual encounter that the text opens up between the author and the reader. The focus is shifted from the textual object to what Buber called *Zwischen* – to a relational space that is always *in between* and is never identifiable with any given object, theme, or value. In this space, the textual otherness (the vision of the author, the voice of the narrator, the beings that we encounter in the fictional world) is both at our mercy and above us – in its vulnerability it commands us, makes us responsible for it before we have even begun to read. I am, in a way, a hostage of the text, called not to identify with the narrator or characters, but to substitute for them, to carry responsibility (but a totally singular responsibility that cannot be generalized) *to* and *for* every being in the text. I do not have to feel any sympathy for or resemblance with Raskolnikov, but as a substitute for all beings in *Crime and Punishment* it is still I, not Dostoevsky or the fictional characters that he has invented, who kills the women.<sup>2</sup>

The encounter is, for Levinas, the event of *facing* the Other. The figure of the *face* (*visage*) is perhaps the central and most controversial feature of his first major work, *Totalité et infini* (1961). The *face* for Levinas resists our attempts to comprehend and appropriate the Other. It is the element in the Other that precedes our knowledge, that calls us to respond to and welcome the Other before we have started to process the encounter with our cognitive skills. If we analyze the color of the hair or eyes of the Other, we have already moved into cognitive appropriation and do not welcome the *face* in the Levinasian sense. The face is vulnerable, but in its very vulnerability it commands us: thou shall not kill. In other words, the face is a metonymy for something that cannot be reduced to mere visibility. It is a figure – or rather a *counter-figure*<sup>3</sup> – that reveals the limits of figuration.

More than in vision, in fact, the *face* is figured in discourse. In the vocabulary of the second major work of Levinas, *Otherwise Than Being or Beyond Essence*, the *face* is heard in the event of Saying (the vocative act of addressing the Other) that precedes all the Said (language as a system of referential relations, significations, etc.) (1974: 16–20). Saying is the original possibility of encounter that founds the possibility of response and thus of responsibility. This possibility does not have to be conscious; it is a structural necessity of language. However, when we formulate our vocative act in words and sentences, every Saying is inevitably turned into something Said, into those conceptual structures that a subject uses in order to define and master the world. Only the Said is visible to the analytic gaze, whereas Saying can be perceived only through those ruptures – or traces of those ruptures – that it has left to the order of the Said.<sup>4</sup>

In literature, what counts is not the Said – the thesis, theme, or cognitive meaning of a book – but Saying, or the event of encounter where we welcome the *face* of the Other. In *Ethics and Infinity: Conversations with Philippe Nemo*, Levinas describes literature as follows:

What one calls written in souls is at first written in books. Their status has always been too quickly made commonplace among the tools or cultural products of Nature or History. Even though their literature effects a rupture in being and does not come down to some

unknown intimate voice, or to the normative abstraction of “values” that the world itself where we are cannot reduce to the objectivity of objects. I think that across all literature the human face speaks – or stammers, or gives itself a countenance, or struggles with its caricature. (1985: 116–17)

We may note at least two important points. First, here Levinas, unlike in some of his early essays, treats writing not as natural but as a secondary continuation of living speech or inner monologues: writing is a technique that, as a technique, marks a rupture in being. Books are not just tools or products but a singular mode of being that we should not take for granted. Second, in literature, indeed, “the human face speaks,” but speaks in a way that cannot be objectified or reduced to any traditional “inner voice” or abstract “values” that would guarantee a stable and recognizable identity. Rather than just speak, as Levinas specifies, the human face “stammers, or gives itself a countenance, or struggles with its caricature.” In order to hear how the human face tries to manifest itself in books, we should, it seems, take into account the technology that forms the specific mode of being of literary texts – for example, narrative techniques.<sup>5</sup>

The ultimate target of Levinas in “Reality and its Shadow” is not art in itself, but rather a certain aestheticist and fetishistic approach to art that remains content to analyze and enjoy the artistic techniques as ends in themselves. His criticism of this approach is informed by the Bergsonian notion of *duration*, which Bergson contrasts with objectifications of the lived, continuous experience of time. Instead of the aesthetic contemplation of completed artworks Levinas calls for criticism that feels the “need to enter into a relation with someone” (1989c [1949]: 147), for interpretation as a version of *prosopopoeia*: “the immobile statue has to be put in movement and made to speak” (1989b [1948]: 142). The “duration in the interval,” art as a frozen image of death, must be transformed by critical reading to lived, continuous *duration* in the Bergsonian sense (and to the recognition of the irreducible otherness of the duration of the Other). In fact, modern literature has already moved in that direction: “Modern literature, disparaged for its intellectualism (which none the less goes back to Shakespeare, the Molière of *Don Juan*, Goethe, Dostoevsky), certainly manifests an increasingly clear awareness of this fundamental insufficiency of artistic idolatry” (1989b [1948]: 143).<sup>6</sup>

We may now see that the objections of Levinas against novels as rhetorical artifacts does not necessarily mean that he condemns the *act of narration* as an event of addressing the Other. Indeed, Levinas tends to see the act of narration (as a mode of *Saying*) in a more positive light than the narrative as a final product (the *Said*). In order to illustrate this, I shall briefly discuss three occasions where Levinas reads narrative texts.

In his once highly influential work *The Rhetoric of Fiction* (1961), Wayne C. Booth presents Céline’s *Journey to the End of the Night* as an example of a novel that fails to build a coherent image of the implied author, and consequently fails to offer the reader any reliable, comprehensive, and ethically valuable interpretation. For Booth, Céline’s narrator Bardamu is, in his simultaneous nihilism and verbal energy, neither reliable nor unreliable enough. The reader cannot accept the narrator’s moral values, but does not get enough hints for the alternative vision of the “implied author” behind them.

For Levinas, in “Everyday Language and Rhetoric without Eloquence” (1993 [1981]), the importance of Céline’s narration in *Journey* does not lie in the final product, in the novel itself, or in the image that it offers of the world or of its implied author, but in its break with the calculative and eloquent rhetoric that had governed French literature, and in its introduction of new modes, vocabularies, and rhythmic energies. If we take

Levinas's stance a bit further than he himself does in his short reading, Bardamu's uncertain reliability might be seen as a virtue: by provoking us into asking ourselves why he still bothers to communicate if he is so completely a nihilist, Bardamu turns our attention to the difference between the Said and the act of Saying. There is, beneath all semantic meanings of his text, a vocative act, an urgent plea: hear my voice, feel the body that cries these words. It is true that Céline's novel actively resists all coherent interpretations, and it is certainly not easy to define the true moral values of the "implied author" behind the text (especially since the political stance of Céline himself was very ambiguous, changing from the leftist anarchism of *Journey* to his violently anti-Semitic pamphlets in the 1930's). However, in *Journey*, our attention is drawn to the most crucial element of all communication, to the act of Saying, even in the middle of the most outrageous bursts of anger and nihilism. Yet even Céline's narrative energy can become a mode of the Said, and Levinas admits that this author's anti-eloquence has gelled into a new rhetoric, a replicable style.

In an early essay "The Transcendence of Words" (1989c [1949]), Levinas reads *Bifffures*, the first part of the autobiographical narrative (or metanarrative) *La Règle du jeu* by Michel Leiris. At the end of his book, Leiris puns on the words *bifffures* (bifurcations) and *biffures* (erasures): his writing proceeds both as bifurcations (by unexpected associations and turns) and erasures (by continual corrections and alterations). According to Levinas, "in these bifurcations and erasures Leiris is less concerned to go down the new paths opened up or to latch onto the corrected meaning than he is to capture thought at that special moment when it turns into something other than itself" (146). It seems that Levinas values in Leiris exactly those elements that break and disturb the appropriation of life as a narrative, as a temporally and causally organized series of events. Rather than looking for a completed life story, Levinas (like Leiris) is interested in the act of writing as *de-narration*, as the continuous multiplication and erasure of narrative gestures. The childhood past and the sense of the self are seen as ever-changing constructions of the writing self. This erasing and associative method of writing represents for Levinas "a thought that lies beyond the classical categories of representation and identity" (146). At the end Levinas expresses a minor critical reservation about the primacy that Leiris still gives to the visual and spatial elements: the Said – "the thought content," – over the Saying – "the living word" (149).

It is in Proust that Levinas seems to find his narrative ideal. In another early essay on literature, "The Other in Proust," Levinas sees that Proust situates "reality in a relation with something which for ever remains other, with the Other as absence and mystery" (1989a [1947]: 165). Things, characters, and events that Proust describes remain, in spite of endless precision and details, multiple and indeterminate: "acts are shadowed by unpredictable 'counter-acts,' and things by 'counter-things' that reveal unsuspected perspectives and dimensions" (162). The world, the people, and the self remain mysterious, other. The events are important only as the subject encounters them and finds, through them, its own otherness: "It is not the inner event that counts, but the way in which the self seizes it and is bowled by it, as though it were encountered in another. It is this way of grasping an event that constitutes the very event" (163). Proust's respect for the mystery of the indeterminate other culminates, for Levinas, in Marcel's relationship with Albertine. Her death leaves Marcel alone, but it is precisely this solitude – the ever-present possibility of death as the death of the Other – that alone can create proximity, friendship, and love. Communication that seeks a fusion of identities under some external term (like a common ideal, a common enemy, or love as "a fusion with the Other") fails, since it tries to reduce the otherness of the Other to the unity of a common

identity. Proximity can, for Levinas, take place only in the incommunicable solitude, where one is ready to welcome the mystery of the Other (164–65).

It seems, then, that only when narration somehow *fails* or *refuses* to produce a coherent narrative can it open up the horizon of otherness for Levinas. We may argue that this kind of *de-narration* is, for Levinas, one way of “unsaying the Said” so that the original Saying as “nudity of the face” before all linguistic acts can be welcome. Colin Davis has argued that Levinas endorses literary works “only in as far as they echo his own ethics of alterity,” and that he fails to read narratives because he is, in the end, afraid that the radical otherness in narratives might challenge his own ethics (93). It is true that Levinas’s readings are always tied to his larger philosophical project; nevertheless I disagree, at least partly, with Davis. The texts Levinas reads do not necessarily have to echo his views, at least on the thematic level – Céline, for example, can hardly be said to echo the “ethics of alterity.” It seems that Davis does not pay enough attention to the difference between the act of narrating (as Saying) and the narrative form (as the Said) in Levinas.

However – and now we come to our need to move beyond Levinas – the counter-figure of the face does raise, in the case of writing, problems that we cannot avoid. I am not thinking here so much about the criticism of Slavoj Žižek (2006), who from his Lacanian viewpoint has argued that justice and ethics can exist only as “a choice AGAINST the face, for the THIRD” – in other words, that one should put the faceless multitude of others before the face of the privileged Other. Rather, I find Levinas’s emphasis on the immediacy of the face problematic. For Levinas, “the face is signification, and signification without context” (1985: 86). All meanings, while inevitably tied to their context, share one ultimate signification “without context”: the primacy of the Other’s face. But one can well ask if this ethical purity leaves us numb before all narratives: without context, there is no narrative and no narrative meanings that one could talk about. Without context, there is no language – and without language as the Said, there is no Saying either.<sup>7</sup>

Moreover, much as I appreciate Céline’s primal scream in *Journey*, I would like to suggest that in narration the act of Saying should not be reduced to the narrative voice – or to the “bifurcations and erasures” of Leiris, or even to some general respect for mystery in Proust. Rather, if we take seriously the suggestion that the late Levinas makes in his conversation with Philippe Nemo – that we should treat books not merely as tools or products but as a mode of being that has its own specific status and its own technology – then we could take into account also the nature of literary communication as communication in the second degree. In other words, we should not follow those moments in early Levinas (and sometimes in the late Levinas) where he shows hostility to images or figures as such, or falls prey to what Derrida calls “phonocentrism.” As Robbins notes, we should “face the figure otherwise, as language’s own most figurative potential, as that which is most distinctive to language, that is, … face language as ethical possibility” (54). Literary writing is not so much an act of uttering words in a written form, a linguistic act in the first degree, as it is an act of creating and distributing representations of linguistic acts to the reader. Writing is not *only* communication but *also* meta-communication, and the true ethical event that Levinas calls Saying is thus not necessarily the moment when the author holds the pen, but the virtual space of the book where the event of writing is represented and staged. The event of literature (as all events of reproduced art) is not a moment: it is an event that has taken place, is taking place, and will take place as long as the text exists, an event and a meta-event. When I read, Dostoevsky is still writing in me; when I watch movies, Charlie Chaplin is still

eating his shoes; when I listen to a CD, I can hear how Jimi Hendrix is still bending the metal strings of his Stratocaster. But none of these reproductions gives me access to any original act of writing, eating, or playing: all reproduced and represented images obey the rule of “arche-writing” that is, according to Derrida, governed by *iterability*, by a possibility of repetition and modification of marks. This “duration in the interval” is not necessarily the “death of the other, death for the survivor” (Levinas 1989b [1948]: 140), but an opportunity to encounter the Other *otherwise*.

We cannot discern the event of Saying – hear the face of the Other speak – in narratives unless we pay attention to those narrative techniques that open up the space for textual encounter. This means reading narratives on several different levels: on the level of the story world, at the level of narration, and in the space between the author and the reader. For example, we can – as I shall soon do – analyze how characters in a narrative encounter each other, how the narrator encounters the characters and the reader, and how this narrative act as a whole creates the space for the encounter and coming-to-being of the author and the reader. And we could try to see how these different levels act together, reflect each other, sometimes struggle with each other. For this, narratological theory, developed, for example, by Genette, Rimmon-Kenan, Herman (2004), or Phelan, offers helpful insights and a workable vocabulary. The narrative techniques it refers to should be treated not as ends in themselves, or as tools to comprehend and appropriate narrative otherness, but as ethical terms, as terms that help us to discern the mode of being that is specific to literature and that may therefore help us in encountering the face of the Other.

Moreover, before we can encounter the face without context – as pure ethical plea – we must see it in its context. Levinas has often been accused (e.g., in Badiou 2001, Žižek 2006) – quite rightly – of eliding historical and political contexts. A face-to-face encounter takes place in a non-historical non-space, where the realities of existence are, for a moment, bracketed. Although he does admit the importance of *the third* that introduces moral choices, justice, and politics, in practice Levinas’s analyses concentrate on the moment of pure face-to-face encounter. However, I would suggest that in order to hear and see how the human face speaks – or how it “stammers, or gives itself a countenance, or struggles with its caricature” – we should first see the historical and political background that has formed those “caricatures” and is trying to struggle with them, and only then turn to examine how the narrative is challenging those caricatures in order to reveal the face beneath all the discourses of power that try to appropriate it. In Jacques Rancière’s terms, before the possibility of ethical encounter there is always a certain political “sharing of the sensible” – certain historical institutions that both allow people to share sensible spaces with each other and leave some people out of those spaces.

## II

Let us read a short narrative on encountering and facing, Charles Baudelaire’s “Les Yeux des pauvres” (“Eyes of the Poor”).<sup>8</sup> As many of his prose poems in *Le Spleen de Paris*, this one is a short story or an anecdote rather than a poem.<sup>9</sup> For my generation, the text is also known as the source of inspiration for The Cure’s hit song, “How Beautiful You Are,” written (or rather adapted from Baudelaire) by Robert Smith (1987).

The narrator of Baudelaire’s prose poem tells how he and his lover spent a wonderful day together and, in the end, sat down on a terrace in front of a splendid new café. The man then sees a poor father with his children standing on the pavement, looking at

the café, and “hears” their eyes speak. The man turns to his lover, but instead of sharing his pity and compassion for the family, she asks him to get rid of them. This is, as the narrator adds at the end of the story, proof of how difficult it is, even for people who are in love, to understand each other.

The opening sentences of the story describe the narrative situation: “Oh! You want to know why I hate you today. It will undoubtedly be less easy for you to understand than it will be for me to explain, for you are, I believe, the most beautiful example of feminine impermeability one could ever encounter.” We can discern what Genette calls a “homodiegetic narrator” or Phelan a “character narrator” – a narrator who tells, in the first person, a tale where he is himself also a character. There is also a narratee, a person directly addressed by the narrator. The narrative act is apparently motivated by the narratee’s wish to know why the narrator hates her on that particular day. There is, thus, from the beginning, an open antagonism and distrust between the narrator and the narratee. This distrust, as well as the passive expression “qui se puisse rencontrer,” translated here “one could ever encounter,” already suggests that there is also another audience, an ideal narrative audience, for whom this “you” is meant to serve as “the most beautiful example of feminine impermeability,” and who may understand him better than the narratee does. I shall return to this narrative situation.

The storyline can be divided into three stages: (1) the illusory state of communion between lovers; (2) the introduction of a third party, a poor family; and (3) the breakdown of the illusion of communion.

(1) At the beginning, the narrator and his lover have spent a wonderful day together. (For the sake of clarity, I will distinguish between “the narrator” who is performing the narrative act and “the man” as a protagonist in the story.) The way the narrator describes the encounter is, as he is ready to admit at the moment of narration, “not the least bit original”: the lovers had promised to “share all thoughts with one another” so that their “souls would henceforth be one.” We can already ask whether this is the perfect face-to-face encounter, where two subjects share an infinite responsibility towards each other, an infinite promise to share all thoughts, an infinite will to respond to each other. Is this the perfect love that all human beings desire? Or is this, as the narrator hints, only a dream that “has been realized by none”? Or could it be what Levinas calls “fusion,” a non-authentic love that tries to reduce the Other to the Same?

The glory of the new café with its sparkling gaslight, shining mirrors, and overflowing pastoral décor – “les Hébés et les Ganymèdes” – reflects the lovers’ happiness, but the narrator adds an ironic twist: “all of history and all of mythology at the service of gluttony.” This comment is felt to pertain to the relationship between the lovers: they are dreaming about perfect communion in terms that are perhaps more indebted to a cultural tradition of romantic, pastoral love than to the real conditions of their encounter. All the same, the obvious delight that the narrator takes in describing the sensual pleasures suggests that he cannot maintain his ironic distance – that the scene also caters to the *narrator’s* verbal gluttony.

(2) Everything changes when the man sees a poor father in his forties with two small children, “all in rags,” staring at the splendor of the café. The father has taken his sons for a walk, “playing the role of nanny,” as the narrator states from his condescending viewpoint. It seems that this situation was somewhat ridiculous in nineteenth-century Paris – at least, it distinguishes this ragged family from those of the wealthy bourgeoisie, who delegated such activities to specially paid professionals. But where is the mother? Is she tired, sick, or dead? Perhaps the father is a widower and his sons are half-orphans?

The faces of the poor gain more resolution than the words that the man had earlier shared with his lover (of which we have only a very general description): the narrator “hears” the eyes of the poor talk and translates their gazes into articulated sentences. The father’s eyes say “How beautiful it is! You’d think all the gold in this poor world was on its walls”; the boy’s eyes say “How beautiful it is! But it’s a house only people who aren’t like us can enter.” The eyes of the youngest child are not given voice; they just express “stupid and profound joy.” The face speaks, almost literally.

The *prosopopoeia* used to describe the faces of the poor may hint that this face-to-face encounter is, in fact, deeper and more significant to the man than his earlier encounter with his lover. And, indeed, the second encounter suits Levinas’s definition of the ethical encounter to a greater extent than does the first one: the poor are, at the same time, lower than the man – for Levinas, the prototype of the Other is “the poor, the stranger, the widow, and the orphan” (1961: 281) – and higher, thanks to the moral glory achieved by the father’s care for his sons even in poverty. The relationship between the man and the family is asymmetric and non-reciprocal – and thus, one could claim, more ethical than any romantic love – as reciprocity, equality, and communion – could ever be.

In Levinasian terms, the father and his sons introduce “the third”: the demand for justice, the demand for moral decisions. The self and the Other are never alone in the world: there is always a third who is also one’s Other (and an Other to one’s Other); an Other who also demands understanding, to and for whom one is also responsible. This creates the necessity of moral decisions, laws, and political action, and leads us from the pre-original but, as such, empty ethical experience of face-to-face encounter to actual moral thinking in society.

Admittedly, Levinasian ethical, non-political terms alone do not reveal the whole irony of this situation. To understand the significance of the “third,” we also need historical and political analysis. As Walter Benjamin attempts to show in his unfinished *Arcades Project*, the boulevards and cafés of nineteenth-century Paris were the birthplace of a new, bourgeois metropolitan capitalism.<sup>10</sup> Their architecture was designed to display a consumerist spectacle that both invited people to enjoy the “gluttony” of all sensible pleasures that money could buy and divided people into actors and spectators, those who had money and those who did not. This simultaneous seduction and division can be seen in terms of what Rancière has called *partage du sensible*, the “distribution of the sensible.” The dividing line between the boulevard and the café seems to be quite open and porous – the couple is not inside the café, but in front of it. The poor and the couple share the same visual space; they see the same splendor of the café, but the poor are kept out of that space and are not allowed to share in its true pleasures. The logic of this sharing, this simultaneous seduction and exclusion, can be seen in the way the poor, from the youngest to the oldest, react to the vision of abundance in front of them. Like Althusserian “interpellation,” sharing offers the subject the position of a consumer, and denies the status of the subject to those who lack the means to consume. We can see how this exclusion is refracted in the eyes of the poor: the youngest child senses only the seduction and feels a “stupid and profound joy,” whereas the older son, full of admiration, already knows that they are debarred from the pleasures that this seduction promises. The father’s “words” could be interpreted not only as admiration but also as recognition of the larger context of the capitalist economy: the world, or the people in the world (*le monde*) is poor because all the gold in it is on the walls of that café.

(3) The introduction of the third, the presence of the social reality of nineteenth-century capitalism, interrupts the original encounter between the man and his lover.

The man still tries to keep the illusion of perfect communion alive: as the narrator notes, he turns his gaze towards her eyes, “inhabited by Caprice and inspired by the Moon,” to read “[his] thoughts there.” Note: not *her* thoughts, but *his*. He still believes in the love of the same, which, in practice, is never a union of two but a reduction of the Other to the Same, a fusion.<sup>11</sup>

However, the woman shatters the illusion of perfect communion by saying coldly: “I can’t stand those people over there, with their eyes wide open like carriage gates! Can’t you tell the head-waiter to send them away?” The eyes of the poor are compared to carriage gates (*portes cochères*) – they are ready to take in those pleasures that are not their lot. In this situation, the head-waiter can be seen as a local representative of the “police” – in charge of the distribution and sharing of the sensible. The narrative ends with a brief return to the initial narrative situation, as the narrator concludes: “So difficult is it to understand one another, my dear angel, and so incommunicable is thought, even between people in love!”<sup>12</sup>

Is the woman just a perfect example of “feminine impermeability”? Someone who does not let any empathic thought seep into her mind, who stays insensitive both to the needs of the poor and to the thoughts of the man? Is she just a willing actor in the consumerist spectacle of the rising capitalism? Before we pass judgment, let us reexamine the narrative situation.

Apparently, the narrator’s words are an answer to a question, explicit or implicit, that the woman has posed to him, something like “why do you hate me today?” However, we can infer her question only from the narrator’s answer. Their common history, the things they said to each other during their perfect day, is revealed to us only through his diegetic plane, although before the appearance of the poor he speaks in the first person plural: “We had spent together. . . . We had indeed promised . . . we wanted to sit down.” However, this “we” is, in fact, a singular voice who speaks *in the name* of the first person plural, a voice of one who sees it as his right to speak on behalf of “we.” It is the man who says “we,” not the woman. The woman’s voice is represented directly only once and even then it is framed by the narrator. The narrative situation really does not give her any chance to defend herself against the caricature that the narrator has made, to see her face without his interpretation.<sup>13</sup>

What *would* she say if she were given the possibility to tell *her* tale? Perhaps she would say that she was just trying to stay loyal to their love and did not want anything in the world to disturb their encounter. She has her rights, too, her rights to love. She may have money, but she has not yet met her true love, as the poor father with his children perhaps has, in spite of his poverty. Perhaps she felt hurt when she realized that the man no longer concentrated on her, that he had turned away and responded to other gazes. Perhaps she even suspected that his feelings of shame were, as in fact the narrator also hints by referring to a “song-writer’s saying,” caused rather by pleasure that had “softened” (*amollit*) his heart than by real ethical empathy. Perhaps she sensed that the love between them was, from the very beginning, ruled by his romantic imagination rather than by his will to welcome and understand her in her otherness.<sup>14</sup>

Just before the narrator quotes her words, he speaks about her eyes: “I plunged into your so beautiful and so bizarrely gentle eyes, into your green eyes, inhabited by Caprice and inspired by the Moon.” The contrast between her gentle and mystic eyes and her harsh words is striking – but, as the look in her eyes is focalized only through the man’s eyes, interpreted only through the narrator’s vocabulary, one can see the contrast also as a calculated effect, arranged by the narrator. Anyway, it was not *her* fault that *he* had

discerned “Caprice” and “Moon” in her eyes – although those figures of feminine instability could have prepared him for her unexpected words. The appropriation of her eyes by reading allegory and myth into them is, in the context of the story, just as ridiculous as the tasteless use of mythological imagery in the décor of the café.

Moreover, the apparent misreading of her eyes casts doubt on his reading of the expression in the eyes of the poor. From this point of view, his act of giving voice to the silent eyes of the poor is rather a gesture of violent appropriation than of real empathy: by “translating” their silence into words that are under *his* control he deprives them of their dignity, their right to stay silent. How could he know, any better than the woman, what the poor family was really thinking?<sup>15</sup> If thought is “so incomunicable, even between people in love,” as the narrator says in the end, how can he claim to know what the eyes of the poor really said? And it is here, of course, that we can return to Levinas: for him, the “face” is the *topos* of not comprehending, not thematizing, not turning the other into something said. The face should remain as such, as the Other, and should not be turned into a *logos*. By formulating the look on their faces into well-defined sentences, the narrator becomes blind to their faces as faces.

Perhaps there is some reason for the narrator’s hatred besides the one he suggests throughout his story. Perhaps the whole narrative is an act of revenge wrought on the woman for shattering his illusions rather than an act of justice on behalf of the poor. Moreover, as the double bind between the hatred in the beginning and the expressions “my dear angel” and “people in love” in the end suggest, the whole narrative act may be part of some bigger, sadomasochistic game – a game that, for most readers, is only too familiar from Baudelaire’s other writings. The open hostility of the narrator towards the woman should make him unreliable also in the reader’s eyes. Perhaps the narrator has arranged the whole narrative scene only in order to humiliate the woman in the eyes of the implied narrative audience that is watching the one-sided dialogue from outside? Perhaps we can discern also the face of the author (behind all his obsessions, perhaps against his own will) who calls us to see the violent narrative situation not only from the point of view of the male narrator but also from the point of view of the woman who is, most of the time, denied her own voice?

Or are there, after all, some hints that the narrator not only hates the woman, but also truly loves her, or at least understands her, at the moment of narration, better than he did at the café? We may compare Baudelaire’s text with Smith’s adaptation in “How Beautiful You Are.” The song ends: “And this is why I hate you / And how I understand / that no-one ever knows or loves another // Or loves another.” But this is not what the narrator says in the original “The Eyes of the Poor.” Baudelaire’s narrator ends his tale as follows: “So difficult is it to understand one another, my dear angel, and so incomunicable is thought, even between people in love!” Smith sees the story as that of the destruction of love, but Baudelaire’s narrator does not, in fact, deny the possibility of love even though mutual understanding between lovers is hardly attainable. We can perhaps read “my dear angel” as still ironic, but not necessarily the expression “people in love” (*gens qui s’aiment*). Perhaps it is meant literally: yes, we love each other, deeply, even though we cannot know or understand each other’s thoughts. Perhaps the narrator, in the end, is more willing to understand love in terms of “love of the Other” instead of “love of the Same.” Perhaps the “feminine impermeability” in the beginning should be read not only as a hint at the lack of empathy in the woman but as a general affirmation of her irreducible otherness – we can love each other even if the gaze of each cannot penetrate the other, even if man and woman remain mysteries to each other, separate from each other.

We can note, then, several interpretations of the story: the first one we could call “Marxist,” and it follows, more or less, the point of view of the male narrator and his shock at his companion’s alleged lack of empathy, stressing the structural violence between the classes in capitalist society; the second one we could call “feminist,” and it tries to reveal the viewpoint of the woman, stressing the violence of the male point of view in the narrative situation. Arguably, both interpretations are violent and fail to do justice to all the participants in the story. In the Marxist interpretation, the reader is in alliance with the man and the poor family, against the woman, the head-waiter, and the capitalist society that distributes material resources in an unjust way. However, in this interpretation, the woman’s point of view is not respected; she has been left to the mercy of the male narrator. In the feminist interpretation, the reader is in alliance with the woman, against the man – but, alas, perhaps also against the poor family, thereby doing violence to their poverty, their need to share in a portion of sensual pleasures. (We may ask whether the story would be different if the poor family were, for example, a mother and two daughters. Does the male gender of the poor make it easier for the man to feel empathy with them?)

And then we can perhaps suggest a third interpretation that takes the narrator not as a chauvinist but as a “Levinasian” who does understand the violence of his own gestures and hints that love precedes understanding.

There can be several plausible “politically correct” readings, but there can be no single “ethically correct” reading, because any ethical reading draws us into endless negotiation between infinite responsibilities rather than offering us a clear solution to the situation. Whether I like it or not, I, as a reader, am responsible *to* and *for* the narrator, and as he, I am torn between infinite responsibilities: I am called to respond to the rights of his beloved and to the rights of the poor. I become, when reading the text, a substitute not only for the narrator, but for the woman, the poor family, the author – but this responsibility or substitution cannot be generalized.

Perhaps the first “you” in the story refers not only to the narratee, the woman in the story, but implicitly also to the narrative audience, to me, the reader. David Herman has called this kind of reference “double deixis”: a move from a fairly unambiguous “you” as a fictional character in the story to a more ambiguous “you” that may refer either to the fictive character or to the reader (1994; 2004: 364). As Kara Rabbitt notes, the gender of “you” is grammatically expressed only in the feminine *fatiguée*, but is curiously erased in the expressions *cher amour* or *mon cher ange* (359). The last words may be saying, “so difficult is it to understand one another, my dear reader (whatever your gender), and so incomunicable is thought, even between people who are bound together by that textual friendship we call reading.” Even the beginning, the “Oh! You want to know why I hate you today,” may be directed not only toward the woman, but also, implicitly, to me, the reader – the reader to whom the author is bound not only by his desire to be heard and understood, but also by the fear that he will never be heard and understood, and by the hatred that this fear entails. Perhaps there is always a certain *philopolemology* (simultaneous friendship and struggle, *philia* and *polemos*) in the narrator’s relationship to his narratee, or in the author’s relationship to his readers, a simultaneous desire and fear between the speaker and addressee that precedes all genuine textual encounters (Derrida 1997 [1994]). The narrative act as Saying that precedes the Said, the final story, does not yet know if the response it encounters is marked by love or hate, but it is still ready to take all the risks that addressing and revealing oneself to the Other may bring along. All narrative acts welcome – they cannot but welcome – that “dangerous perhaps” that

all future readings and interpretations carry with them. And this is, indeed, the gift that Baudelaire gives to us: we are constantly reminded that we cannot stay passive in front of these texts, that we cannot just read them, but that we also have to encounter them. Baudelaire's texts thus act "more like the interlocutors they portray than as third-person objects for us to study, unsettling us by their persistent refusal to provide a stable mirror for a reading of the self" (Rabbitt 367).

### III

As I cautioned in the beginning, there has been a rupture in my approach, a gap between Levinasian transcendentalism and my (post-classical) narratological analysis of Baudelaire's prose poem. This rupture is both unavoidable and revealing. It would be misleading to claim that we can simply apply Levinas to concrete moral dilemmas that we encounter in real life or in reading literary narratives. Levinas does not offer practical solutions but insists on the radical infinity of ethical responsibility. However, it would be just as misleading to claim that his ethics has *no* connection to practice at all. After all, its roots are in the phenomenological analysis of ethical experiences. Notions like "face" or "hostage," which Levinas seems to use in a highly figurative way, actually trail in traces of their concrete origins with them. They should be read not as abstractions or simple metaphors (in the traditional Aristotelian sense of the word) but rather as metonymies, as figures that still have ties to their original use. The figure of the face, often extended from real life encounters to texts, is not just an abstraction: it carries with it the memory of some rare moments when we have faced the Other, eye to eye. However, there is no way of representing the face as such, and this failure creates the gap between the transcendental ethical imperative of the face and the moral compromises that we make when we face other people in real life or in literature.

In Baudelaire's "Eyes of the Poor," the narrator calls the reader to encounter the faces of the poor and the face of his beloved. However, it seems that all the faces in the story escape the narrator's attempts to appropriate them. Face-to-face encounter is seen both as a necessary and an impossible condition for love and understanding. Our attempts to encounter the face of the Other turn the Saying in the face into something Said, into an object. Nevertheless, it is exactly from this inevitable failure of reading the face of the Other that we can perhaps hear the singular way in which "across all literature the human face speaks – or stammers, or gives itself a countenance, or struggles with its caricature" (Levinas 1985: 117).

### Notes

- 1 I shall return to the distinction between Saying and the Said. In the meantime, it should be noted that in French there are two words for the "other": *autre* can refer to any kind of otherness, whereas *autrui* only to a singular and human other. I follow the standard translations of Levinas and use "other" for *autre* and "Other" (with a capital O) for *autrui*.
- 2 The reference to Dostoevsky here is not accidental. In developing the theme of substitution, Levinas often refers to a famous sentence in *The Brothers Karamazov*: "We are all guilty of all and for all men before all, and I more than the others" (1985: 98).
- 3 For the notion of "counter-figure," see Räsänen (2007: 14–25), who uses this term to refer, in particular, to all figures that paradoxically deny their own figurality, like the legend below Magritte's painting *Trahison des images*: "Ceci n'est pas une pipe."

- 4 The distinction between Saying and the Said cannot, then, be reduced to the formalist/structuralist distinction between “discourse” and “story time.”
- 5 Here the attitude of Levinas towards speech and writing is, as mentioned above, different from some of his earlier texts, where he still speaks about the “privilege of the living word, which is destined to be heard, in contrast to the word that is an image and already a picturesque sign” (1989c [1949]: 148). This change of attitude may be due in part to Derrida’s insistence that writing cannot be reduced to speech.
- 6 Here I have slightly modified the translation of Alphonso Lingis.
- 7 This is, of course, just another way to express the criticism that Derrida levels as early as 1964 at the idea of “non-violent language” in “Violence and Metaphysics: An Essay on the Thought of Emmanuel Levinas.”
- 8 “Les Yeux des pauvres” was first published in 1864 in *La Vie Parisienne*. The whole volume *Spleen de Paris* or *Petits poèmes en prose* was published posthumously in 1869.
- 9 On the mixed genre of the texts in *Le Spleen de Paris*, see Evans.
- 10 For Benjamin’s reading of Baudelaire, see also McLaughlin.
- 11 Following Luce Irigaray, Eva Korsgaard distinguishes between two forms of love: love for the Same that seeks communion where “souls would henceforth be one,” and love of the Other that seeks the recognition of the irreducible otherness of the Other (50–56).
- 12 On the failure of their communication, see Scott 93–98.
- 13 “Throughout the collection, women’s utterances are generally reduced to sighs (‘La Femme sauvage et la petite maîtresse’), or to self-centered, thoughtless exclamations and often censored insults (‘Les Yeux des pauvres,’ ‘La Soupe et les nuages,’ and ‘Laquelle est la vraie?’)” (Krueger 294).
- 14 Cf. Rabbitt: “The beloved’s assertion of her own difference, indeed erases the speaker’s desire, suggesting that his quest for ‘identification’ is one not of relationship but of idealized self-reflection” (361).
- 15 The man is, of course, doing what we all do in our everyday life: exercising “folk psychology” or “intermental cognition,” trying to read other people’s minds through their gestures – sometimes succeeding, but often failing at it.

# CHAPTER 8

## Cultivating Humanity: The Narrative Imagination

*Martha Nussbaum*

Martha Nussbaum, who teaches at Brown University, is a leading advocate of ethical criticism. Essential to ethics, she argues, is compassion, the ability to feel for others and especially for their suffering. That ability is the basis of the urge towards the achievement of social justice. Literature plays an important role in cultivating a potential for compassion because it invites us to identify with characters and with their concerns, as if they were real people. Her books include *The Fragility of Goodness* (1986), *Love's Knowledge* (1990), and *Cultivating Humanity* (1997).

*[There] are many forms of thought and expression within the range of human communications from which the voter derives the knowledge, intelligence, sensitivity to human values: the capacity for sane and objective judgement which, so far as possible, a ballot should express. [The] people do need novels and dramas and paintings and poems, “because they will be called upon to vote.”*

Alexander Meiklejohn, “The First Amendment Is an Absolute”

The world citizen needs knowledge of history and social fact.<sup>1</sup> We have begun to see how those requirements can be met by curricula of different types. But people who know many facts about lives other than their own are still not fully equipped for citizenship. As Heraclitus said 2,500 years ago, “Learning about many things does not produce understanding.” Marcus Aurelius insisted that to become world citizens we must not simply amass knowledge; we must also cultivate in ourselves a capacity for sympathetic imagination that will enable us to comprehend the motives and choices of people different from ourselves, seeing them not as forbiddingly alien and other, but as sharing many problems and possibilities with us. Differences of religion, gender, race, class, and national origin make the task of understanding harder, since these differences shape not only the practical choices people face but also their “insides,” their desires, thoughts, and ways of looking at the world.

*Original publication details:* Martha Nussbaum, “The Narrative Imagination” from *Cultivating Humanity*, pp. 85–112. Harvard University Press, 1997. Reproduced with permission from Harvard University Press.

Here the arts play a vital role, cultivating powers of imagination that are essential to citizenship. As Alexander Meiklejohn, the distinguished constitutional scholar and theorist of “deliberative democracy,” put it fifty years ago, arguing against an opponent who had denied the political relevance of art, the people of the United States need the arts precisely because they will be called upon to vote. That is not the only reason why the arts are important, but it is one significant reason. The arts cultivate capacities of judgment and sensitivity that can and should be expressed in the choices a citizen makes. To some extent this is true of all the arts. Music, dance, painting and sculpture, architecture – all have a role in shaping our understanding of the people around us. But in a curriculum for world citizenship, literature, with its ability to represent the specific circumstances and problems of people of many different sorts, makes an especially rich contribution. As Aristotle said in chapter 9 of *The Poetics*, literature shows us “not something that has happened, but the kind of thing that might happen.” This knowledge of possibilities is an especially valuable resource in the political life.

To begin to understand how literature can develop a citizen’s imagination, let us consider two literary works widely separated in place and time. In both cases, the literary work refers to its own distinctive capacity to promote adequate civic perception.

Sophocles’ *Philoctetes*, produced in 409 B.C., during a crisis in the Athenian democracy, concerns the proper treatment of a citizen who has become an outcast, crippled by a disfiguring illness. On his way to Troy to fight with the Greeks in the Trojan War, Philoctetes stepped by mistake into a sacred shrine. His foot, bitten by the serpent who guards the shrine, began to ooze with an ulcerous sore, and his cries of pain disrupted the army’s religious festivals. So the commanders abandoned him on the deserted island of Lemnos, with no companions and no resources but his bow and arrows. Ten years later, learning that they cannot win the war without his magical bow, they return, determined to ensnare him by a series of lies into participating in the war. The commander Odysseus shows no interest in Philoctetes as a person; he speaks of him only as a tool of public ends. The chorus of common soldiers has a different response (lines 169–176):

For my part, I have compassion for him. Think how  
with no human company or care,  
no sight of a friendly face,  
wretched, always alone,  
he wastes away with that savage disease,  
with no way of meeting his daily needs.  
How, how in the world, does the poor man survive?

Unlike their leader, the men of the chorus vividly and sympathetically imagine the life of a man whom they have never seen, picturing his loneliness, his pain, his struggle for survival. In the process they stand in for, and allude to, the imaginative work of the audience, who are invited by the play as a whole to imagine the sort of needy, homeless life to which prosperous people rarely direct their attention. The drama as a whole, then, cultivates the type of sympathetic vision of which its characters speak. In the play, this kind of vivid imagining prompts a political decision against using Philoctetes as a means, and the audience is led to believe this to be a politically and morally valuable result. In this way, by showing the public benefits of the very sort of sympathy it is currently awakening in its spectators, the drama commends its own resources as valuable for the formation of

decent citizenship and informed public choice. Although the good of the whole should not be neglected, that good will not be well served if human beings are seen simply as instruments of one another's purposes.

Ralph Ellison's *Invisible Man* (1952) develops this tradition of reflection about our failures of perception and recognition. Its hero describes himself as "invisible" because throughout the novel he is seen by those he encounters as a vehicle for various race-inflected stereotypes: the poor, humiliated black boy who snatches like an animal at the coins that lie on an electrified mat; the good student trusted to chauffeur a wealthy patron; the listening ear to whom this same patron unburdens his guilt and anxiety; the rabble-rousing activist who energizes an urban revolutionary movement; the violent rapist who gratifies the sexual imagination of a woman brought up on racially charged sexual images – always he is cast in a drama of someone else's making, "never more loved and appreciated" than when he plays his assigned role. The "others," meanwhile, are all "lost in a dream world" – in which they see only what their own minds have created, never the reality of the person who stands before them. "You go along for years knowing something is wrong, then suddenly you discover that you're as transparent as air." Invisibility is "a matter of the construction of their *inner* eyes, those eyes with which they look through their physical eyes upon reality."<sup>22</sup>

Ellison's grotesque, surreal world is very unlike the classical world of Sophocles' play. Its concerns, however, are closely linked: social stratification and injustice, manipulation and use, and above all invisibility and the condition of being transparent to and for one's fellow citizens. Like Sophocles' drama, it explores and savagely excoriates these refusals to see. Like that drama, it invites its readers to know and see more than the unseeing characters. "Being invisible and without substance, a disembodied voice, as it were, what else could I do? What else but try to tell you what was really happening when your eyes were looking through?"<sup>23</sup> In this way, it works upon the inner eyes of the very readers whose moral failures it castigates, although it refuses the easy notion that mutual visibility can be achieved in one heartfelt leap of brotherhood.

Ellison explicitly linked the novelist's art to the possibility of democracy. By representing both visibility and its evasions, both equality and its refusal, a novel, he wrote in an introduction, "could be fashioned as a raft of hope, perception and entertainment that might help keep us afloat as we tried to negotiate the snags and whirlpools that mark our nation's vacillating course toward and away from the democratic idea." This is not, he continued, the only goal for fiction; but it is one proper and urgent goal. For a democracy requires not only institutions and procedures; it also requires a particular quality of vision, in order "to defeat this national tendency to deny the common humanity shared by my character and those who might happen to read of his experience."<sup>24</sup> The novel's mordantly satirical treatment of stereotypes, its fantastic use of image and symbol (in, for example, the bizarre dreamlike sequence in the white-paint factory), and its poignant moments of disappointed hope, all contribute to this end.

As Ellison says, forming the civic imagination is not the only role for literature, but it is one salient role. Narrative art has the power to make us see the lives of the different with more than a casual tourist's interest – with involvement and sympathetic understanding, with anger at our society's refusals of visibility. We come to see how circumstances shape the lives of those who share with us some general goals and projects; and we see that circumstances shape not only people's possibilities for action, but also their aspirations and desires, hopes and fears. All of this seems highly pertinent to decisions we must make as citizens. Understanding, for example, how a history of

racial stereotyping can affect self-esteem, achievement, and love enables us to make more informed judgments on issues relating to affirmative action and education.

Higher education should develop students' awareness of literature in many different ways. But literature does play a vital role in educating citizens of the world. It makes sense, then, to ask how it can perform this function as well as possible – what sorts of literary works, and what sort of teaching of those works, our academic institutions should promote in order to foster an informed and compassionate vision of the different. When we ask this question, we find that the goals of world citizenship are best promoted by a literary education that both adds new works to the well-known “canon” of Western literature and considers standard texts in a deliberative and critical spirit.

It is frequently claimed that it is inappropriate to approach literature with a “political agenda.” Yet it is hard to justify such a claim without embracing an extreme kind of aesthetic formalism that is sterile and unappealing. The Western aesthetic tradition has had throughout its history an intense concern with character and community. The defense of that tradition in the contemporary “culture wars” should enlist our support.

## Fancy and Wonder

When a child and a parent begin to tell stories together, the child is acquiring essential moral capacities. Even a simple nursery rhyme such as “Twinkle, twinkle little star, how I wonder what you are” leads children to feel wonder – a sense of mystery that mingles curiosity with awe.<sup>5</sup> Children wonder about the little star. In so doing they learn to imagine that a mere shape in the heavens has an inner world, in some ways mysterious, in some ways like their own. They learn to attribute life, emotion, and thought to a form whose insides are hidden. As time goes on, they do this in an increasingly sophisticated way, learning to hear and tell stories about animals and humans. These stories interact with their own attempts to explain the world and their own actions in it. A child deprived of stories is deprived, as well, of certain ways of viewing other people. For the insides of people, like the insides of stars, are not open to view. They must be wondered about. And the conclusion that this set of limbs in front of me has emotions and feelings and thoughts of the sort I attribute to myself will not be reached without the training of the imagination that storytelling promotes.

Narrative play does teach children to view a personlike shape as a house for hope and fear and love and anger, all of which they have known themselves. But the wonder involved in storytelling also makes evident the limits of each person's access to every other. “How I wonder what you are,” goes the rhyme. In that simple expression is an acknowledgment of the lack of completeness in one's own grasp of the fear, the love, the sympathy, the anger, of the little star, or of any other creature or person. In fact the child adept at storytelling soon learns that people in stories are frequently easier to know than people in real life, who, as Proust puts it in *The Past Recaptured*, frequently offer “a dead weight that our sensitivity cannot remove,” a closed exterior that cannot be penetrated even by a sensitive imagination. The child, wondering about its parents, soon learns about these obstacles, just as it also learns that its parents need not know everything that goes on in its own mind. The habits of wonder promoted by storytelling thus define the other person as spacious and deep, with qualitative differences from oneself and hidden places worthy of respect.

In these various ways, narrative imagination is an essential preparation for moral interaction. Habits of empathy and conjecture conduce to a certain type of citizenship and a certain form of community: one that cultivates a sympathetic responsiveness to another's needs, and understands the way circumstances shape those needs, while respecting separateness and privacy. This is so because of the way in which literary imagining both inspires intense concern with the fate of characters and defines those characters as containing a rich inner life, not all of which is open to view; in the process, the reader learns to have respect for the hidden contents of that inner world, seeing its importance in defining a creature as fully human. It is this respect for the inner life of consciousness that literary theorist Lionel Trilling describes when he calls the imagination of the novel-reader a "liberal imagination"<sup>6</sup> – meaning by this that the novel-reader is led to attribute importance to the material conditions of happiness while respecting human freedom.

As children grow older, the moral and social aspects of these literary scenarios become increasingly complex and full of distinctions, so that they gradually learn how to ascribe to others, and recognize in themselves, not only hope and fear, happiness and distress – attitudes that are ubiquitous, and comprehensible without extensive experience – but also more complex traits such as courage, self-restraint, dignity, perseverance, and fairness. These notions might be defined for the child in an abstract way; but to grasp their full meaning in one's own self-development and in social interactions with others requires learning their dynamics in narrative settings.

As children grasp such complex facts in imagination, they become capable of compassion. Compassion involves the recognition that another person, in some ways similar to oneself, has suffered some significant pain or misfortune in a way for which that person is not, or not fully, to blame. As many moral traditions emphasize – the analysis of compassion is remarkably constant in both Western and non-Western philosophy – it requires estimating the significance of the misfortune as accurately as one can – usually in agreement with the sufferer, but sometimes in ways that depart from that person's own judgment. Adam Smith points out that people who lose their mental faculties are the objects of our compassion even though they themselves are not aware of this loss: what is significant is the magnitude of the loss, as the onlooker estimates its role in the life of the loser. This requires, in turn, a highly complex set of moral abilities, including the ability to imagine what it is like to be in that person's place (what we usually call *empathy*), and also the ability to stand back and ask whether the person's own judgment has taken the full measure of what has happened.

Compassion requires one thing more: a sense of one's own vulnerability to misfortune. To respond with compassion, I must be willing to entertain the thought that this suffering person might be me. And this I will be unlikely to do if I am convinced that I am above the ordinary lot and no ill can befall me. There are exceptions to this, in some religious traditions' portrayals of the compassion of God; but philosophers such as Aristotle and Rousseau have plausibly claimed that imperfect human beings need the belief that their own possibilities are similar to those of the suffering person, if they are to respond with compassion to another's plight. This recognition, as they see it, helps explain why compassion so frequently leads to generous support for the needs of others: one thinks, "That might have been me, and that is how I should want to be treated."

Compassion, so understood, promotes an accurate awareness of our common vulnerability. It is true that human beings are needy, incomplete creatures who are in many ways dependent on circumstances beyond their control for the possibility of well-being.

As Rousseau argues in *Emile*, people do not fully grasp that fact until they can imagine suffering vividly to themselves, and feel pain at the imagining. In a compassionate response to the suffering of another, one comprehends that being prosperous or powerful does not remove one from the ranks of needy humanity. Such reminders, the tradition argues, are likely to lead to a more beneficent treatment of the weak. Philoctetes, in Sophocles' play, asks for aid by reminding the soldiers that they themselves might suffer what he has suffered. They accept because they are able to imagine his predicament.

It seems, then, to be beneficial for members of a society to see themselves as bound to one another by similar weaknesses and needs, as well as by similar capacities for achievement. As Aristotle argues in chapter 9 of *The Poetics*, literature is “more philosophical than history” – by which he means more conducive to general human understanding – precisely because it acquaints us with “the kind of thing that might happen,” general forms of possibility and their impact on human lives.

Compassion requires demarcations: which creatures am I to count as my fellow creatures, sharing possibilities with me? One may be a person of refined feeling and still treat many people in one's world as invisible, their prospects as unrelated to one's own. Rousseau argues that a good education, which acquaints one with all the usual vicissitudes of fortune, will make it difficult to refuse acknowledgment to the poor or the sick, or slaves, or members of lower classes. It is easy to see that any one of those might really have been me, given a change of circumstances. Boundaries of nationality can similarly be transcended in thought, for example by the recognition that one of the frequent hazards of wartime is to lose one's nation. Boundaries of race, of gender, and of sexual orientation prove, historically, more recalcitrant: for there might appear to be little real-life possibility of a man's becoming a woman, a white person's becoming black, or even (*pace* earlier psychiatry) a straight person's becoming gay or lesbian. In these cases, then, it is all the more urgent to cultivate the basis for compassion through the fictional exercise of imagination – for if one cannot in fact change one's race, one can imagine what it is like to inhabit a race different from one's own, and by becoming close to a person of different race or sexual orientation, one can imagine what it would be like for someone one loves to have such a life.

Rousseau thought that people differed only in circumstances: underneath, their desires, aims, and emotions were the same. But in fact one of the things imagining reveals to us is that we are not all brothers under the skin, that circumstances of oppression form desire and emotion and aspiration. Some characters feel like us, and some repel easy identification. But such failures to identify can also be sources of understanding. Both by identification and by its absence, we learn what life has done to people. A society that wants to foster the just treatment of all its members has strong reasons to foster an exercise of the compassionate imagination that crosses social boundaries, or tries to. And this means caring about literature.

## Literature and the Compassionate Imagination

The basis for civic imagining must be laid in early life. As children explore stories, rhymes, and songs – especially in the company of the adults they love – they are led to notice the sufferings of other living creatures with a new keenness. At this point, stories can then begin to confront children more plainly with the uneven fortunes of life, convincing them emotionally of their urgency and importance. “Let him see, let him

feel the human calamities,” Rousseau writes of his imaginary pupil. “Unsettle and frighten his imagination with the perils by which every human being is constantly surrounded. Let him see around him all these abysses, and, hearing you describe them, hold on to you for fear of falling into them.”<sup>7</sup>

For older children and young adults, more complex literary works now should be added. It was in connection with the moral education of young adults that ancient Athenian culture ascribed enormous importance to tragic drama. Going to a tragedy was not understood to be an “aesthetic experience,” if that means an experience detached from civic and political concerns. The tragic festivals of the fifth century B.C. were civic festivals during which every other civic function stopped, and all citizens gathered together. Dramas were routinely assessed as much for their moral and political content as for their other characteristics. Indeed, as the literary criticism preserved in Aristophanes’ *Frogs* makes plain, it was well understood that formal devices of meter, vocabulary, and verse form conveyed, themselves, a moral content. What, then, was the civic education that tragedies were intended to promote?

Tragedies acquaint the young citizen with the bad things that may happen in a human life, long before life itself does so. In the process they make the significance of suffering, and the losses that inspire it, unmistakably plain to the spectator; this is one way in which the poetic and visual resources of the drama have moral weight. By inviting the spectators to identify with the tragic hero, at the same time portraying the hero as a relatively good person, whose distress does not stem from deliberate wickedness, the drama makes compassion for suffering seize the imagination. This emotion is built into the dramatic form.

The sympathies of the spectator are broadened in the process, through the notion of risks that are common to all human beings. Tragedies are obsessed with the possibilities and weaknesses of human life as such, and with the contrast between human life and other, less limited lives, belonging to gods and demigods. In the process they move their spectator, in imagination, from the male world of war to the female world of the household. They ask the future male citizen of ancient Athens to identify himself not only with those he might in actual fact become – beggars, exiles, generals, slaves – but also with many who in some sense he can never be, such as Trojans and Persians and Africans, such as wives and daughters and mothers.

Through such devices the drama explores both similarity and difference. Identifying with a woman in a drama, a young male spectator would find that he can in some sense remain himself, that is to say, a reasoning human being with moral virtues and commitments. On the other hand, he discovers through this identification much that is not his own lot: the possibility, for example, of being raped and being forced to bear the enemy’s child; the possibility of witnessing the deaths of children whom one has nursed oneself; the possibility of being abandoned by one’s husband and in consequence totally without social support. He is brought up against the fact that people as articulate and able as he face disaster and shame in some ways that males do not; and he is asked to think about that as something relevant to himself. So far from being “great books” without a political agenda, these dramas were directly pertinent to democratic debates about the treatment of captured peoples in wartime. With their efforts to overcome socially shaped invisibilities, they participated actively in those debates.

Literature does not transform society single-handed; we know that these powerful and in some sense radical dramatic experiences took place in a society that was highly repressive of women, even by the standards of its own era. Certain ideas about others

may be grasped for a time and yet not be acted upon, so powerful are the forces of habit and the entrenched structures of privilege and convention. Nonetheless, the artistic form makes its spectator perceive, for a time, the invisible people of their world – at least a beginning of social justice.

The tragic form asks its spectators to cross cultural and national boundaries. On the other hand, in its universality and abstractness it omits much of the fabric of daily civic life, with its concrete distinctions of rank and power and wealth and the associated ways of thinking and speaking. For such reasons, later democratic thinkers interested in literature as a vehicle of citizenship came to take a particular interest in the novel – a genre whose rise coincided with, and supported, the rise of modern democracy.<sup>8</sup> In reading a realist novel with active participation, readers do all that tragic spectators do – and something more. They embrace the ordinary. They care not only about kings and children of kings, but about David Copperfield, painfully working in a factory, or walking the twenty-six miles from London to Canterbury without food. Such concrete realities of a life of poverty are brought home to them with a textured vividness unavailable in tragic poetry.

Again, the reader's learning involves both sameness and difference. Reading a novel of class difference (for example, a novel of Dickens), one is aware, on the one hand, of many links to the lives of the characters and their aspirations, hopes, and sufferings. There are many ways, however, in which circumstances have made the lives of the poorer characters very different from those of middle-class readers. Such readers assess those differences, thinking of their consequence for aspirations to a rich and fulfilling life. They also notice differences in the inner world, seeing the delicate interplay between common human goals and the foreignness that can be created by circumstances. Differences of class, race, ethnicity, gender, and national origin all shape people's possibilities, and their psychology with them. Ellison's "invisible man," for example, repels the easy and facile sympathy that says "we are all brothers" because his inner world strikes the reader as dark and frightening, as the secure child of a loving home gradually takes on more savage and pessimistic sentiments. In this way we start to see how deeply racism penetrates the mind and emotions. Consider, for example, the scene in which the narrator buys a Yam from a Harlem street vendor. His emotions of homesickness, delight, and recognition are in one sense familiar; but the struggle with shame, as he decides not to hide his pleasure in something he has been taught to see as a sign of negritude, will be unfamiliar to the white middle-class reader, who probably will not be able to identify with such an experience. Such a failure of sympathy, however, prompts a deeper and more pertinent kind of sympathy, as one sees that a human being who initially might have grown up free from the deforming experience of racism has been irrevocably shaped by that experience; and one does come to see that experience of being formed by oppression as a thing "such as might happen" to oneself or someone one loves.

This complex interpretive art is what the Stoics required when they asked the world citizen to gain empathic understanding of people who are different.<sup>9</sup> This idea, however, needs to be developed in a specifically democratic way, as an essential part of thinking and judging well in a pluralistic democratic society that is part of an even more complex world. One literary figure from our own tradition who gives us particular help in this task is Walt Whitman, who saw the literary artist as an irreplaceably valuable educator of democratic citizens. "Their Presidents," he wrote, "shall not be their common referee so much as their poets shall."<sup>10</sup> He went on to argue that literary art develops capacities for perception and judgment that are at the very heart of democracy, prominently including

the ability to “see eternity in men and women,” understanding their aspirations and the complexity of their inner world, rather than to “see men and women as dreams or dots,” as mere statistics or numbers. Whitman makes it clear that his idea of a democratic poetry is his own translation of the ancient Athenian idea to the situation of modern America: in “Song of the Exposition” he imagines the Muse of ancient Greek poetry migrating to the New World and inspiring his poetry, “undeterr’d” by America’s mixture of peoples and its surprising love of machinery.

The poet’s ability to “see eternity,” Whitman holds, is especially important when we are dealing with groups whose humanity has not always been respected in our society: women and racial minorities, homosexuals, the poor and the powerless. A major part of the social role of the literary artist, as he saw it, was to promote our sympathetic understanding of all outcast or oppressed people, by giving their strivings voice. “I am he attesting sympathy,” the poet announces (*Song of Myself* 22.461–24.5):

Through me many long dumb voices,  
Voices of the interminable generations of prisoners and slaves,  
Voices of the diseas’d and despairing and of thieves and dwarfs,

...

Through me forbidden voices,  
Voices of sexes and lusts, voices veil’d and I remove the veil,  
Voices indecent by me clarified and transfigur’d ...

Dazzling and tremendous how quick the sun-rise would kill me,  
If I could not now and always send sun-rise out of me.

The poet in effect becomes the voice of silenced people, sending their speech out of himself as a kind of light for the democracy. Like Ellison much later, Whitman focuses on our failures to see the flesh and blood of those with whom we live; his poems, like Ellison’s novel, portray themselves as devices of recognition and inclusion. The imagining he demands promotes a respect for the voices and the rights of others, reminding us that the other has both agency and complexity, is neither a mere object nor a passive recipient of benefits and satisfactions. At the same time, it promotes a vivid awareness of need and disadvantage, and in that sense gives substance to the abstract desire for justice.

As in Athens, so in America: the fact that sympathy inspired by literary imagining does not immediately effect political change should not make us deny its moral worth. If we follow Whitman’s idea, we will conclude that it is essential to put the study of literature at the heart of a curriculum for citizenship, because it develops arts of interpretation that are essential for civic participation and awareness.

Marcus Aurelius made a further claim on behalf of the narrative imagination: he argued that it contributes to undoing retributive anger. He means that when we are able to imagine why someone has come to act in a way that might generally provoke an angry response, we will be less inclined to demonize the person, to think of him or her as purely evil and alien. Even if we never fully understand the action, the very activity of asking the question and trying to depict the person’s psychology to ourselves in the manner of a good novelist is an antidote to self-centered rage. It is easy to see how this psychological mechanism operates in our personal lives, where the ability to tell ourselves the story of a parent or a lover or a child who has angered us can often help us

avoid selfish vindictiveness. In our political lives, this ability has an equally prominent role – especially when we are dealing with people different from ourselves, whom it would be all too easy to treat as alien objects without the sort of psychological and historical complexity we habitually impute to ourselves.

This point is itself repeatedly dramatized in literary works dealing with characters against whom society has directed its anger. The reader of Richard Wright's *Native Son* contrasts the demonized version of criminal defendant Bigger Thomas, in the novel's account of the press coverage of his trial, with the complicated person she has come to know. The reader of E. M. Forster's posthumously published *Maurice* in a similar way contrasts the demonizing stereotypes of the homosexual purveyed by most characters in the novel with the inner world of Maurice himself, as the reader has come to know it, his dreams of companionship and his intense longing for love. As Whitman insists, literary understanding is a form of imaginative and emotional receptivity that can seem profoundly threatening to the sort of person who would demonize a group. To allow inside one's mind people who seem alien and frightening is to show a capacity for openness and responsiveness that goes against the grain of many cultural stereotypes of self-sufficiency.

Whitman's insistence on receiving the voices of the excluded suggests a further point: that for literature to play its civic function it must be permitted, and indeed invited, to disturb us. If we can easily sympathize with a character, the invitation to do so has relatively little moral value; the experience can too easily deteriorate into a self-congratulatory wallowing in our own compassionate tendencies. The challenge of Sophocles' *Philoctetes* to its audience was to see without flinching what the characters found disgusting and vile: pus, blasphemous cries, Philoctetes' body covered with sores. The challenge of Wright's *Native Son* was and is to look into the life of a violent criminal who kills his lover Bessie more casually than he kills a rat. Similarly, the challenge of *Invisible Man* is to see what it is like to be seen through, or seen in terms of various demeaning fantasies – again, a difficult experience for the novel's likely audience.

These works are all written in a conventional literary language, a fact that explains their relatively easy acceptance into the realm of "literature" despite the radical character of their subject matter. It can also be argued, however, that literary art most fully fulfills its Whitmanesque mission of acknowledging the excluded when it allows the excluded to talk as they really talk, to use a daily language that is nonliterary and that may shock our sensibilities. The 1994 Booker Prize for Fiction, Britain's most distinguished literary award, was given to James Kelman's *How Late It Was How Late*, a novel of working-class life in Glasgow, Scotland. The novel, which is set in the mind of its protagonist, uses throughout the working-class Scots dialect that such a character would actually speak, and includes all the words that such a character would be likely to use in thought and speech. The award created a minor furor, since many cultural critics objected strenuously to giving such a prestigious artistic prize to a work that, by one count, uses the word *fuck* over four thousand times. In interviews given during the controversy, Kelman defended his project in Whitmanesque terms. The voices of working-class people, he claimed, have generally been excluded from "English literature" in his still highly class-conscious society. For generations, at least since Dickens, there have been gestures of inclusion, in which working-class characters figure in a literary novel; but their voices first had to be assimilated to a middle-class norm of literary discourse. This was a way of rendering real working people invisible.

A central role of art is to challenge conventional wisdom and values. One way works engage in this Socratic enterprise is by asking us to confront – and for a time to be – those

whom we do not usually like to meet. Offensiveness is not all by itself a sign of literary merit; but the offensiveness of a work may be part of its civic value. The inclusion of new and disturbing works in the curriculum should be assessed with these ideas in mind. When we do consider such works we should bear in mind that it is difficult to know in advance, or quickly, which unconventional works, or parts of works, will have a lasting power to illuminate the situation of a group and which are merely shocking. Most of us have fears and blind spots that militate against the acknowledgment of some of our fellow citizens, and we should recognize that our reactions of disturbance may therefore be highly unreliable, leading us to regard as merely shocking what will eventually be seen to have genuine merit. (To give just one example, contemporary sensibilities required the excision of a crucial scene from Wright's *Native Son*, in which Bigger and his friend masturbate in the movie theater while looking at the image of a white woman. This scene, too shocking for publication in 1940 and not included in editions of the novel until 1993, can now be seen as crucial to the narrative development of the work, and to its exploration of the social formation of Bigger's imagination and desires.) We do not need to deny that there are defensible criteria of literary merit in order to recognize that we ourselves are unreliable judges of merit when works touch on our own lives and the controversies of our own time. For this reason we ought to protect the opportunity of the arts to explore new territory with broad latitude, and we should also protect the right of university teachers to explore controversial works in the classroom, whether or not we ourselves have been convinced of their lasting merit.

### **Compassion in the Curriculum: A Political Agenda?**

If the literary imagination develops compassion, and if compassion is essential for civic responsibility, then we have good reason to teach works that promote the types of compassionate understanding we want and need. This means including works that give voice to the experiences of groups in our society that we urgently need to understand, such as members of other cultures, ethnic and racial minorities, women, and lesbians and gay men.

Recall Reno student Eric Chalmers, who, in connection with the readings assigned in his English class, was asked to think about the experience of a gay person and to write a letter to his parents in that persona – to let that person's voice emerge from his mouth. "I probably didn't say anything," he quickly explained; "I just rambled." This otherwise aggressive and crusty young man, extremely confident and even dogmatic, showed a moment of confusion and uncertainty. He acknowledged that the "off-the-wall" assignment had had a point – because "we met, you know, all sorts of people," and fulfilling the assignment is "like an understanding of their belief system." Such Whitmanesque experiences of receptivity and voice should be cultivated. They are closely connected to the Socratic activity of questioning one's own values and to the Stoic norm of becoming a citizen of the whole world, but they cannot be engendered without works that stimulate the imagination in a highly concrete way, including works that unsettle and disturb.

To produce students who are truly Socratic we must encourage them to read critically; not only to empathize and experience, but also to ask critical questions about that experience. And this means cultivating an attitude to familiar texts that is not the detached one that we sometimes associate with the contemplation of fine art. This more critical attitude has its roots, in the West, in the ancient Greek tradition of the tragic festivals,

where watching a work of art was closely connected to argument and deliberation about fundamental civic values. It has been revived and vividly depicted in quite a few critical works of the present day – among them, Wayne Booth’s fine work, *The Company We Keep: An Ethics of Fiction*.<sup>11</sup> Drawing on his own reading of ancient Greek texts, Booth proposes a valuable metaphor for the interaction of reader with a literary work. A literary work, he writes, is, during the time one reads it, a friend with whom one has chosen to spend one’s time. The question now is, what does this friendship do to my mind? What does this new friend ask me to notice, to desire, to care about? How does he or she invite me to view my fellow human beings? Some novels, he argues, promote a cheap cynicism about human beings and lead us to see our fellow citizens with disdain. Some lead us to cultivate cheap sensationalistic forms of pleasure and excitement that debase human dignity. Others, by contrast, show what might be called respect before a soul<sup>12</sup> – in the way the text itself depicts the variety of human goals and motives, and also, it may be, in the interactions among the characters it displays.

Booth makes it clear that this critical attitude is perfectly compatible with immersion in the work; his idea is that immersion and experience precede, and ground, a critical assessment that we should ideally carry on in conversation with others whose perceptions will complement and challenge our own. He calls the process “co-duction” to stress its communal and comparative character. Through this process we attain insight into what we have become while we were enjoying the work. This insight will illuminate the nature of the literary experience and its role in our lives. Booth considers the classroom a paradigmatic scene of such critical activity.

Booth is famous for a distinction that we need to bear in mind: between the narrator or characters and the “implied author,” that is, the sense of life embodied in the text taken as a whole. A work that contains few or no sympathetic, admirable characters may still promote sympathy and respect in the reader through the sort of interaction the work as a whole constructs. (Both of these figures are distinct, in turn, from the real-life author, who may have all sorts of properties that are not realized in the text.)

Thinking about Booth’s metaphor of the literary work as friend shows us a further dimension of the experience of sympathy. When we read a novel with close attention, we frequently will be led by the text to have sympathy with characters of many different kinds; but frequently, too, the text will cultivate sympathy unevenly, directing our attention to some types of human beings and not to others. Literary works are not free of the prejudices and blind spots that are endemic to most of the political life. A novel that sees the experience of middle-class women with great sympathy may (like the novels of Virginia Woolf) render working-class people invisible. A novel that recognizes the struggles of working-class people – as, up to a point, the novels of Dickens do – may have little sensitivity to the lives and experiences of many types of women. If we are reading and teaching such novels with democratic ideals of equal concern and respect in mind, we will probably come to feel that there is something incomplete or even defective in these works. In this sense sympathetic reading and critical reading should go hand in hand, as we ask how our sympathy is being distributed and focused. One learns something about the text when one asks these critical questions: one sees its internal structure with a new sharpness, and one makes one’s own relation to it more precise.

This civic and evaluative approach to reading is both moral and political. It asks how the interaction between reader and text constructs a friendship and/or community, and it invites us to discuss texts by making moral and social assessments of the kinds of communities texts create. Wayne Booth’s version of this approach, like the one defended

here – and like that of Lionel Trilling in the previous generation – is liberal and democratic, informed by a conviction that all citizens are worthy of respect and that certain fundamental freedoms deserve our deepest allegiance.

But conservative critics have recently charged that the whole idea of reading in this way is an illicit and antiliterary activity, alien to the high tradition of the humanities.<sup>13</sup> To take a fairly typical example, in a column titled “Literary Politics,” George Will recently wrote of the “supplanting of esthetic by political responses to literature,” arguing that this approach “aims at delegitimizing Western civilization by discrediting the books and ideas that gave birth to it.”<sup>14</sup>

It is not clear what notion of the aesthetic George Will has in mind when he contrasts the aesthetic with the political. The questions raised here about compassion and community are hardly new, faddish questions. Indeed, they are as old as literary interpretation itself. In ancient Greece alone, one can find them in Aristophanes and Aristotle, Plato and Plutarch. How, all these works ask us, does literature shape the character of the young citizen? What moral weight do its forms and structures have? This, we might say without distortion, is the dominant question asked about literature in the Western aesthetic tradition. And it is asked, when it is asked well, in a manner that does not neglect the literary form of the text. In fact, one of the greatest contributions of both Plato and Aristotle to aesthetics was their subtle account of the ways in which literary forms themselves convey a content, a view of what is worth taking seriously, and what the world is like.

What could someone mean by saying that these questions are not aesthetic? Such a claim can be seriously supported only by defending a picture of the aesthetic that has had a relatively narrow and recent history in the Western tradition, namely the Kantian and post-Kantian formalist tradition, according to which the proper aesthetic attitude is one that abstracts from all practical interests. Kant’s own thought on this topic is complex and susceptible of multiple interpretations. But his claim that beauty gives pleasure without interest has certainly led many people to suppose that he was urging us to look at art without thinking of any practical questions at all, including very general questions, such as what is worth caring for, what is just and good. More recently, formalist aestheticians such as Bloomsbury writers Clive Bell and Roger Fry advocated that sort of detachment as characteristic of a truly aesthetic response.<sup>15</sup> In a famous example supplied by their ally, aesthetician Edward Bullough, people caught in the fog will usually prove unable to look at the fog aesthetically, because they are preoccupied with their safety.<sup>16</sup> They will succeed in doing so only if they can suspend their practical interests in safety and well-being, and attend to the pure color and shape that surround them. George Will needs to defend such a view to make sense of his claims. On other more common views of the aesthetic, political criticism is a central part of aesthetic attention.

Is the formalist view an adequate view of the aesthetic? It has a certain intuitive appeal. It seems true that if I am preoccupied with how to get out of the fog, there are many features of its shape, color, and form to which I am probably not attending. Similarly, if I am reading Ellison’s novel as a set of instructions on how to bring about racial harmony, or Dickens’ *Hard Times* as a blueprint for labor reform, much will elude me. Ellison described his novel as “a raft of hope, perception, and entertainment”; the person who ignores the entertainment loses a crucial dimension of the perception and hope. But this does not mean that the texture of Dickens’ or Ellison’s language is not profoundly moral and political, aimed at creating a community of a certain sort and at acknowledging certain parts of the human world as worthy of our attention and love.

Most great aesthetic theorists in the Western tradition have ultimately rejected the extreme formalist view. The long list includes Plato, Aristotle, the Stoics, Hegel, Nietzsche, Tolstoy, and fine present-day theorists such as Arthur Danto, Nelson Goodman, and Richard Wollheim. Ironically, it includes, as well, the Renaissance humanists who shaped the canon of literary classics that conservative theorists defend: for these thinkers saw their focus on the Greeks and Romans as part of the “political agenda” of reacting against medieval scholasticism and promoting a more human-centered view of the world.

One can at least comprehend how one might look at a Monet canvas in the way Bell and Bullough recommend – although I doubt that it is the most richly rewarding way to look, if it neglects ways in which Monet’s forms express joy, and serenity, and even a certain ideal of community. One can at least comprehend what it might mean to listen to a Mahler symphony that way – though, once again, it seems that one would lose much by refusing the music’s invitation to feel compassion, disgust, despair, and triumphant joy, and one would certainly be doing violence to Mahler’s own self-conception, which seems a remarkably fruitful one. (He repeatedly speaks in letters of the ways in which his works address questions about the meaning of life and seek to create a compassionate, nonhierarchical community.) It is at least possible to look at dances of some modern choreographers in this way – though, once again, one would, I think, be missing a great deal that is both ethical and political, for example Martha Graham’s narrative investigations of myth, sexuality, and ethical conflict.

But it is next to impossible to see what it could mean to read a drama of Sophocles, or a novel of Dickens or George Eliot, in the detached way. It is impossible to care about the characters and their well-being in the way the text invites, without having some very definite political and moral interests awakened in oneself – interests, for example, in the just treatment of workers and in the reform of education. Both Dickens and Eliot frequently address the reader, alluding to such common interests. This commitment to the making of a social world, and of a deliberative community to think critically about it, is what makes the adventure of reading so fascinating, and so urgent.

There was a brief moment in the recent history of literary criticism when it did seem possible and desirable to hold such concerns in abeyance. This was the moment of the flourishing of the so-called New Criticism, which held (to simplify) that when one read a poem one should bring nothing external to that reading – no historical and social context, no questions of one’s own about life and how to live it.<sup>17</sup> Not surprisingly, this movement produced its best work in the area of lyric poetry, and even there only by a degree of inconsistency – for critics did allow themselves to ask what a word could have meant in 1786, say, and did permit themselves the extraneous knowledge that a certain other meaning came into being only in 1925. If they had not done so they would have produced gibberish. Other elements of context crept back in, as did normal human concerns about love and death, meaning and emptiness. Indeed, claims were ultimately made about the political meaning of literary irony and complexity. But even in its more elastic version, this movement had a difficult time doing justice to complex narrative works with a social dimension. For this reason it was resisted all along by some of the finest minds in the field, among them British moral critic F. R. Leavis and American social thinker Lionel Trilling. Both of these men had a political agenda. Trilling’s *The Liberal Imagination* made explicit his own commitment to liberalism and democracy, and argued brilliantly that the novel as genre is committed to liberalism in its very form, in the way in which it shows respect for the individuality and the privacy of each human

mind. He connected his criticism of the fiction of Henry James very closely with his general social criticism. *The Liberal Imagination* juxtaposes essays on James with essays on contemporary social issues.

What Wayne Booth and many other contemporary critics are doing today, feminist critics prominently among them, is to continue such approaches and to render them more sophisticated by asking more subtle questions about the ways in which works construct desire and thought, inviting the imagination to be active in these or those ways. Such a critical stance sometimes leads the critic to be harsh toward famous works of literature. Thus Wayne Booth argues that Rabelais's works display a contemptuous and cruel attitude to women, and that such an attitude is intrinsic not only to certain characters, but also to the works as a whole and their humor. Booth finds Rabelais distasteful because of this lack of empathy, and reports that he can no longer really enjoy the work's humor now that he has come to see it in this critical light, as tinged with cruelty. He is therefore probably somewhat less likely to teach and recommend the works, though in his book he does continue to "teach" them in this critical spirit.

On the other hand, considerations of empathy more frequently lead to an expansion of the traditional list of works read, as critics, searching for accounts of the experience of silenced people, discover powerful accounts of that experience that have previously been overlooked. A representative example of this type of criticism is the article "In the Waiting Room," by the young feminist critic Judith Frank. In the first portion of her article, Frank, a scholar of eighteenth-century English literature who teaches at Amherst College, describes her own teaching of unfamiliar works by women. She notes that these works focused on the vicissitudes of the female body in a way unparalleled, not surprisingly, in male works of that period. Three of them, in fact, dealt with breast cancer – one being Fanny Burney's journal account of her mastectomy, "an operation performed during the eighteenth century with only a wine cordial as anesthesia." Frank's brilliant idea of setting her account of curricular controversies in the context of a vivid, unsentimental, and powerful account of her own radiation treatment for breast cancer – diagnosed the semester after she taught the three nonstandard works alluding to breast cancer – reminds her reader vividly of the fact that this historically and ethically situated kind of criticism responds to an age-old conception of what gives literature its importance in human life. "... isn't that, after all," she asks, "what many people think good literature should do: sustain us when we're weak, deepen our understanding of history, expand our sense of what it's possible to think and feel?" She makes us ask why we might suspect a teacher who assigns the three nonstandard works of having a "political agenda": is it political to acknowledge the bodies of women and the illnesses to which women are subject, and apolitical to deny such recognition? Is criticism political only when it asks us to look and see, acknowledging what we might not have acknowledged before, and apolitical when it does not invite such acknowledgment?

The move to include noncanonical works and to scrutinize the ways in which such works construct desire and recognition does not necessarily lead to "delegitimizing Western civilization," as George Will fears. Says Frank,

Despite the picture Will paints of contemporary academic life, I did not whine to my colleagues that Shakespeare and Milton don't talk about breast cancer; nor did I, deciding that the lack of a poetic treatment of breast cancer in their works makes them bad writers,

demand that my department replace our courses in Shakespeare and Milton with courses on Maria Edgeworth and Audre Lorde. Rather, like many of my colleagues, I taught the noncanonical alongside the canonical: Edgeworth and Burney, for example, alongside Defoe, Richardson, Fielding, Smollett, and Sterne. Will is anxious about the wholesale destruction of Western civilization, I think, because canon revision reveals the canon to be a social institution rather than a self-evidently sublime entity unsoiled by the grime of human interest.

If literature is a representation of human possibilities, the works of literature we choose will inevitably respond to, and further develop, our sense of who we are and might be.

Once we start to think of literature this way, we notice something else: that the New Critics' decision *not* to concern themselves with the social and historical dimensions of literary works was itself a political act, an act of a quietistic type. Turning to the ethical interpretation of a standard text, Frank defends an interpretation of Defoe's *Robinson Crusoe* that links it closely to its own historical context, one in which moral issues involved in colonialism and slavery were hotly debated. As Frank puts it, "You need to do a lot of work to ignore the historical context of *Robinson Crusoe*, no matter how mythically it presents itself." The willful choice to remain ignorant of such issues, and to treat the work as distant myth, betrays a certain stance, a stance of detachment from concrete human problems. The detachment of the Bloomsbury formalists was less innocent of politics than it might at first seem. Indeed, it seems evident, when one studies the writings of Bell, Fry, and other members of the Bloomsbury group, that their stance was closely connected with Bloomsbury's own complicated political stance, radical in matters of sex and aristocratic in matters of taste and education. The idea was that the cultivation and defense of fine-tuned, detached aesthetic responses allowed them to rise above everyday moral judgments (and thus to protect unconventional forms of sexual life), but also to neglect reformist proposals of the day that focused on the education of the masses, concentrating instead on the cultivation of small elite communities of friends. (The Bloomsbury ideal was closely linked not only to disdain for the working classes but also, frequently, to anti-Semitism and other forms of ethnic and racial prejudice. These prejudices also infect much of the New Criticism.) There is of course no reason why the political attitudes of Bloomsbury or the related ideas of the New Criticism should not be found in the literary classroom. We all learn most from a curriculum that contains dissent and difference, an interaction of opposing views. Even in the process of coming to grips with one work in a single class we should seek out a plurality of contrasting judgments. And different classrooms will properly differ greatly, as they foster approaches with political dimensions of many different types. The important thing to recognize is that we don't avoid the political dimension by pretending it isn't there; and insofar as we do, we drain the works, especially narrative works, of much of their meaning and urgency. This sort of frank debate about the moral content of art has been a staple of the Western tradition, in both philosophy and literature. There is no reason why it should not continue to make our teaching of literature more truly Socratic. The addition of new works will enhance our understanding both of history and of human beings. A critical examination of more standard works will yield new insights – frequently (as in the case of *Robinson Crusoe*) by revealing a dimension of unease or criticism in the text that a more morally detached style of criticism might have missed.

## World Citizenship, Relativism, and Identity Politics

What, if anything, should worry us in the current political criticism? It is not a cause for concern that some political critics are more radical than Wayne Booth and Lionel Trilling, just as some are more conservative. It would be dull if all academics were liberals; criticism, like moral and political philosophy, profits from vigorous debate. It is far more healthy for students to hear debates between opposing views than for them to hear only refined talk about a poem's irony, divorced from any historical or ethical considerations.

Nor is it a cause for grave concern, ultimately, that many contemporary critics espouse forms of moral relativism deriving from French postmodernist philosophy, denying the objectivity of value judgments. One may certainly take issue with the conclusions of these critics, and find fault with their arguments. On the whole, philosophers thinking about truth and objectivity have not been very impressed by the arguments of the postmodernist critics, even when they defend versions of relativism on other grounds. The full assessment of these issues requires an arduous engagement with arguments, frequently technical in nature, drawn from the philosophy of physics, the philosophy of mathematics, and the philosophy of language. Any scholar who moves between philosophical debates on these issues and the related debates in literary theory cannot help noticing a difference in sophistication and in complexity of argument. (Literature is not the only field guilty of lapses in conceptual clarity: when economists talk about values, they are equally likely to espouse a naive form of relativism that would not withstand philosophical scrutiny.) We should demand more philosophical rigor in literary discussions of relativism, which otherwise risk superficiality and triviality.

But to ask for more rigor is not to say that relativist positions should be ignored or dismissed. The humanities classroom ought to contain vigorous debate between relativists and antirelativists of many kinds, just as between conservatives and liberals. When carried on at a high level, such a debate about the objectivity of value judgments enriches our understanding of alternatives in a useful way.

Such reflections about the philosophical shortcomings of literary teaching suggest that the teaching of literature can prepare world citizens better if it becomes more truly Socratic, more concerned with self-critical argument and with the contribution of philosophy. Interdisciplinary teaching, such as the work done at St. Lawrence by Grant Cornwell of the Philosophy Department and Eve Stoddard of the English Department, is an especially good way of promoting this rigor, both in the work of faculty and in their undergraduate teaching. Any literature classroom in which views of deconstructionist critics are discussed or exemplified should also contain some basic analysis of the arguments for and against various forms of cultural relativism. This can most easily be done in a climate of interdisciplinary dialogue and debate, in which literature teachers can observe the way these issues are handled by philosophers in courses on issues ranging from ethics to the philosophy of science, and in which the philosophers become aware of the subtle issues involved in discussions of literary interpretation. There is indeed a risk that our newly theory-conscious departments of literature will produce an outpouring of bad philosophy on these issues, both in research and in teaching. Interdisciplinary dialogue is the best way to prevent this from happening more than it already has.

Interdisciplinary dialogue about literature takes a variety of forms on today's campuses. Many introductory courses in "world civilization" or "Western civilization" bring philosophers together with literary scholars for the discussion of central literary texts. Such courses are most successful if they give the faculty support for

course-development time, during which they can talk together and bring the resources of their disciplines to their common readings. Faculty also frequently team-teach courses at a higher level, integrating the perspectives of different disciplines. And finally, faculty may join in interdisciplinary dialogue outside the classroom, in ways that shape their classroom teaching. At St. Lawrence, the interdisciplinary faculty seminar, which focused extensively on theoretical issues of relativism, influenced the design and the methods of each individual faculty member's departmental courses. Such approaches need strong support, since without them the facile relativism that many undergraduates bring to the classroom is likely to remain unexamined and the goals of world citizenship to that extent unfulfilled.

The really grave cause for concern in the current teaching of literature, however, is not the presence of defective arguments, which can easily be criticized. It is, instead, the prevalence of an approach to literature that questions the very possibility of a sympathy that takes one outside one's group, and of common human needs and interests as a basis for that sympathy. The goal of producing world citizens is profoundly opposed to the spirit of identity politics, which holds that one's primary affiliation is with one's local group, whether religious or ethnic or based on sexuality or gender. Much teaching of literature in the current academy is inspired by the spirit of identity politics. Under the label "multiculturalism" – which can refer to the appropriate recognition of human diversity and cultural complexity – a new antihumanist view has sometimes emerged, one that celebrates difference in an uncritical way and denies the very possibility of common interests and understandings, even of dialogue and debate, that take one outside one's own group. In the world-citizen version of multiculturalism, the ethical argument for adding a work such as *Invisible Man* to the curriculum will be Ellison's own argument: that our nation has a history of racial obtuseness and that this work helps all citizens to perceive racial issues with greater clarity. In the identity-politics version of multiculturalism, by contrast, the argument in favor of *Invisible Man* will be that it affirms the experience of African-American students. This view denies the possibility of the task Ellison set himself: "of revealing the human universals hidden within the plight of one who was both black and American."

These different defenses of literature are connected with different conceptions of democracy. The world-citizen view insists on the need for all citizens to understand differences with which they need to live; it sees citizens as striving to deliberate and to understand across these divisions. It is connected with a conception of democratic debate as deliberation about the common good. The identity-politics view, by contrast, depicts the citizen body as a marketplace of identity-based interest groups jockeying for power, and views difference as something to be affirmed rather than understood. Indeed, it seems a bit hard to blame literature professionals for the current prevalence of identity politics in the academy, when these scholars simply reflect a cultural view that has other, more powerful sources. Dominant economic views of rationality within the political culture have long powerfully promoted the idea that democracy is merely a marketplace of competing interest groups, without any common goals and ends that can be rationally deliberated. Economics has a far more pervasive and formative influence on our lives than does French literary theory, and it is striking that conservative critics who attack the Modern Language Association are slow to criticize the far more powerful sources of such anticosmopolitan ideas when they are presented by market economists. It was no postmodernist, but Milton Friedman, who said that about matters of value, "men can

ultimately only fight.”<sup>18</sup> This statement is false and pernicious. World citizens should vigorously criticize these ideas wherever they occur, insisting that they lead to an impoverished view of democracy.

An especially damaging consequence of identity politics in the literary academy is the belief, which one encounters in both students and scholars, that only a member of a particular oppressed group can write well or, perhaps, even read well about that group’s experience. Only female writers understand the experience of women; only African-American writers understand black experience. This claim has a superficial air of plausibility, since it is hard to deny that members of oppressed groups frequently do know things about their lives that other people do not know. Neither individuals or groups are perfect in self-knowledge, and a perceptive outsider may sometimes see what a person immersed in an experience fails to see. But in general, if we want to understand the situation of a group, we do well to begin with the best that has been written by members of that group. We must, however, insist that when we do so it may be possible for us to expand our own understanding – the strongest reason for including such works in the curriculum. We could learn nothing from such works if it were impossible to cross group boundaries in imagination.

Literary interpretation is indeed superficial if it preaches the simplistic message that we are all alike under the skin. Experience and culture shape many aspects of what is “under the skin,” as we can easily see if we reflect and read. It is for this reason that literature is so urgently important for the citizen, as an expansion of sympathies that real life cannot cultivate sufficiently. It is the political promise of literature that it can transport us, while remaining ourselves, into the life of another, revealing similarities but also profound differences between the life and thought of that other and myself and making them comprehensible, or at least more nearly comprehensible. Any stance toward criticism that denies that possibility seems to deny the very possibility of literary experience as a human social good. We should energetically oppose these views wherever they are found, insisting on the world-citizen, rather than the identity-politics, form of multiculturalism as the basis for our curricular efforts.

Literature makes many contributions to human life, and the undergraduate curriculum should certainly reflect this plurality. But the great contribution literature has to make to the life of the citizen is its ability to wrest from our frequently obtuse and blunted imaginations an acknowledgment of those who are other than ourselves, both in concrete circumstances and even in thought and emotion. As Ellison put it, a work of fiction may contribute “to defeat this national tendency to deny the common humanity shared by my character and those who might happen to read of his experience.”<sup>19</sup> This contribution makes it a key element in higher education.

We are now trying to build an academy that will overcome defects of vision and receptivity that marred the humanities departments of earlier eras, an academy in which no group will be invisible in Ellison’s sense. That is in its way a radical political agenda; it is always radical, in any society, to insist on the equal worth of all human beings, and people find all sorts of ways to avoid the claim of that ideal, much though they may pay it lip service. The current agenda is radical in the way that Stoic world citizenship was radical in a Rome built on hierarchy and rank, in the way that the Christian idea of love of one’s neighbor was and is radical, in a world anxious to deny our common membership in the kingdom of ends or the kingdom of heaven. We should defend that radical agenda as the only one worthy of our conception of democracy and worthy of guiding its future.

# CHAPTER 9

## Theory in Practice *Relation and Responsibility:* *A Levinasian Reading of King Lear*

*Kent Lehnhofer*

Kent Lehnhofer teaches English at Chapman University and writes on Milton, Shakespeare, Spenser, and Sidney. In this essay, he explores the applicability of the ethical philosophy of Emmanuel Levinas to *King Lear*. He argues that Levinas's idea that self and other are inseparable in the ethical relationship is evident in Lear's actions towards his daughters. The relation to the other defines the tragic situation in which Lear finds himself, and the play, according to Lehnhofer, does not resolve the problem that the relation to the other inserts into human life.

*To escape the “there is,” one must not be posed but deposed; to make an act of deposition, in the sense one speaks of deposed kings. This deposition of sovereignty by the ego is the social relationship with the Other, the dis-inter-ested relation.*

(Emmanuel Levinas)<sup>1</sup>

The late philosopher Emmanuel Levinas (1905–95) is frequently celebrated as one of the twentieth century's most astute and insightful readers of Husserl and Heidegger. Yet Levinas was also an attentive reader of Shakespeare. He specifically mentions Shakespeare when talking of his early influences, and he includes the English playwright in a list of authors whose art he admires.<sup>2</sup> Levinas's great work *Otherwise than Being* (1974) alludes to both *Hamlet* and *Macbeth* on its very first page, and his collected works contain more references to Shakespeare than to any other author, save Dostoyevsky. Indeed, Levinas refers to Shakespeare so frequently in the lectures from 1946 and 1947 published under the title *Time and the Other* that he feels compelled at one point to pause and beg pardon for having “overindulged” himself. The self-deprecating gesture,

*Original publication details:* Kent Lehnhofer, “A Levinasian Reading of *King Lear*.” *Modern Philology* 111.3, pp. 485–509. University of Chicago Press, 2014.

of course, does not prevent him from going on to say more about Shakespeare, nor does it really apologize for anything. Less an apology than a justification, Levinas excuses his literary allusiveness by provocatively suggesting that Shakespeare is at the center of all philosophical activity. “It sometimes seems to me,” Levinas says, “that the whole of philosophy is only a meditation of Shakespeare.”<sup>3</sup>

Although Levinas is not alone in ascribing a philosophical thickness to Shakespeare’s oeuvre, what makes his claim especially intriguing (aside from its arresting hyperbole) is the kind of philosophizing it takes the plays to be performing. For by way of his recurrent allusions, Levinas would make Shakespeare proximate to his own philosophical position that the “I” cannot exist apart from the other, that the self comes into being only in and through the interpersonal relation. At first glance, this might seem an easy thing to say of an early modern author, since it is commonplace to describe identity in the early modern era as a relational construct, arising from any number of social networks or situations. But Levinas’s claims about subjectivity and Shakespeare go well beyond our work on the self-constituting effects of kinship, ethnicity, sex, rank, and profession. As Alphonso Lingis notes, Levinas’s ideas about intersubjectivity are nothing short of “anarchic.”<sup>4</sup> They have profoundly changed our reading of philosophy, and they can change our reading of Shakespeare as well. To demonstrate what I mean, I propose to use Levinas to put philosophical pressure on Shakespeare’s dramatization of human relatedness in *The Tragedy of King Lear* (1607–8). Even though Levinas does not discuss *Lear* at length in any of his published work, this difficult philosopher and this difficult play have much to say to one another.<sup>5</sup> As I will show, Levinas can be fruitfully brought to bear on Shakespeare’s great tragedy, generating fresh and productive ideas about its most pivotal moments, its most perplexing questions, and its most popular interpretations. In addition, Levinas can provide a useful frame for discussing the nature of the response the stage play requires of us, both as audience members and literary critics. Levinas, I suggest, goes some distance toward helping us think what it might mean to “speak what we feel, not what we ought to say” (5.3.299).<sup>6</sup>

The difficult relation between self and other that lies at the heart of Shakespeare’s stagecraft is both the core and crux of Levinas’s phenomenology. Its primacy is expressed in Levinas’s oft-repeated assertion that ethics – not ontology – is “first philosophy.” Ethics must come first, Levinas explains, because the “I” does not emerge as an existent until after the arrival of *autrui* (the other person, someone other than myself). Were it not for the other, nothing would oppose the notion that all is an extension of the self. *Autrui*, however, explodes this egoistic delusion by confronting me with that which cannot be reduced or assimilated to myself. At every moment, the other overflows and destroys all thoughts I can think of him. Or, as Levinas puts it, “He escapes my grasp by an essential dimension, even if I have him at my disposal.”<sup>7</sup> In his absolute alterity, the other reveals to me the boundaries of my being and in this manner constitutes me as a subject. I become an ego inasmuch as I am demarcated or delimited as such by the presence of the other.

But the self that is so constituted is also (and immediately) called into question. I cannot freely pursue my own interests in the face of the other, for the nudity and neediness I see in the face of the other lays claim to all that I would consume, control, or possess in such a pursuit. Arresting all egoism, the encounter with the other makes me responsible – not because I accept responsibility – but because the mere existence of the other makes this responsibility incumbent upon me. For Levinas, the essence of this responsibility is

service. The face of the other commands me to give all that I have, to not merely be, but be for the other. Though I can try to ignore this summons, I can never “unhear” or silence it. According to Levinas, responsibility is the inexorable condition of human subjectivity. “To be” is always already to be “ordained,” to be called to a long and difficult life of service.

Paradoxically, this inexhaustible ordination does not diminish my subjectivity but actually invests it. Because I am the only one who can fulfill my obligation to the other, my obligation endows me with absolute individuality – what Levinas terms the “supreme dignity of the unique.” As Levinas writes, “I am I in the sole measure that I am responsible, a non-interchangeable I. I can substitute myself for everyone, but no one can substitute himself for me. Such is my inalienable identity of subject.”<sup>8</sup> Moreover, the other person who gives me my identity also gives me my world, affording it a reality it could not otherwise possess. As Levinas explains, the exteriority of the world depends upon there being more to it than just me. Because the other provides me with the category of “not-me” that is the essence of exteriority, the other makes my world real. I know it to be actual rather than illusory exactly to the extent that I have it in common with the other.

All told, these ideas about exteriority, intersubjectivity, and infinite responsibility are quite difficult and carry with them some disturbing implications. However, I concur with Levinas that they are central to much of Shakespeare. Especially in *King Lear* – with its unflinching focus on interpersonal bonds “which are too intrince t’unloose” (2.2.69) – Shakespeare explores what it means to be in relation to the other and to be responsible for the other. The stage for this examination is set in the very first scene, for the starting point for *Lear*, as for Levinas, is the traumatic encounter with one who cannot be made same-as-me.

When the drama begins, Lear is blithely doing what being does: seeking its own interests, maintaining its own existence, apprehending and assimilating the world unto itself. And for the purposes of personal enrichment, Goneril and Regan elect to play along. Venally performing the obsequious parts to which they have been assigned, they dissemble their otherness and present themselves as obedient extensions of Lear’s self. Their hypocrisy enables the king’s fantasies of self-sovereignty, and things move along smoothly enough. But with her bare “nothing,” Cordelia abruptly brings to an end this inauthentic play of the same. As Gayatri Spivak observes, Cordelia’s answer to the question, “What can you say to draw / A third more opulent than your sisters?” derails everything – the meter as well as the moment.

CORDELIA.	Nothing my lord. [six syllables of silence]
LEAR.	Nothing? [eight syllables of silence]
CORDELIA.	Nothing. [eight syllables of silence]
LEAR.	Nothing will come of nothing. Speak again. (1.1.83–88) <sup>9</sup>

As an answer to Lear’s question, Cordelia’s reply is incomprehensible, irrecuperable. The king cannot bend it to his will. To borrow from Levinas, we might say that Cordelia here exceeds her father’s grasp by an essential dimension, even when he has her at his disposal.

Of course, Lear is not alone in his perplexity. For the better part of four hundred years, audiences, actors, and critics have struggled to make sense of Cordelia’s comportment

in the love contest, worrying over her words and wondering about her motives. Some have suggested that she acts as she does because she is confused, either too innocent or too naïve to know what is expected of her. Others have regarded her as obstinate or passive-aggressive, refusing to play her father's game because it demeans her and devalues love. Still others have seen her as intentionally hurtful, provoking her father so as to expose his arrogance and pride.<sup>10</sup> What makes it so hard to settle upon a single interpretation is the strange way in which all seem to apply. As oxymoronic as it might be, Cordelia is humble, high-minded, and hostile – all at the same time. Yet this contradictory condition is precisely what Levinas identifies as the principal modality of the other. To look upon the other is to see both mastery and abjection – or, rather, mastery in abjection, since what gives the other power over me is precisely his nudity, destitution, and poverty. Such is Cordelia's situation in the play's opening scene. Standing before her father in the place of the inassimilable other, Cordelia confronts the king with a dispossessing defenselessness and a commanding vulnerability. She overwhelms him with what Levinas calls “the resistance of what has no resistance – the ethical resistance.”<sup>11</sup>

Whereas Goneril and Regan use rhetorical figures and theatrical masks to conceal themselves, Cordelia does not suppress her alterity. Instead of offering her father empty words, she offers him herself. For, whatever else Cordelia's bare “nothing” might mean, it is first and foremost an exposure: an opening of herself to the examination, indignation, and authority of the king. By way of her one-word answer, Cordelia as much as says: “You have asked me to declare my love, but I can say nothing beyond what I am. My answer is myself. Behold me here.” This is not rhetoric but revelation.

But if Cordelia's response is a revelation, it is an unwelcome one, for it interrupts the egotistical exercise the king is attempting to oversee. Her plainness upends everything by inverting in an instant the power relations that structure his contest. Having expended all his political capital to make himself the center of attention, Lear finds himself supplanted by a daughter whose powerlessness comprises a more compelling claim to that place. Her vulnerability speaks more loudly than his majesty, obliging him to attend to her. And in that moment of attention, Lear instantly knows himself to be a usurper, responsible to the one before him.<sup>12</sup> Rather than respond with care, however, Lear responds with rage. His anger is quite obviously an evasion, an attempt to duck his responsibility by casting blame on Cordelia. As Sears Jayne remarks, Lear reacts with “that violence which characterizes the actions of people who are stung by the consciousness of their own guilt.”<sup>13</sup> The perverse logic of Lear's passion goes something like this: “You have made me angry, so you must be in the wrong. Were I the offender, I would be feeling contrition. Instead, I am feeling outrage, which is the natural response to unjust treatment. Thus, the emotions you have made me feel prove that I am the victim here, the one to whom redress must be made.” In the palpable force of his anger, the king would validate his neglect of Cordelia, and the intensity of his ire is the measure of his self-betrayal, showing the lengths to which he must go to ignore the accountability he feels. Lear must crowd out his sense of responsibility with all-consuming anger if he is to persist on his selfish path.

And persist he does. From one moment to the next, Lear disowns his daughter and leaves her without a dowry, as if he could relinquish his responsibility by renouncing his paternity. Even when stripped of her filial status, though, Cordelia continues to stand before her father in the primary ethical relation of the-one-before-the-other. Her upright and exposed face is a perpetual reproof, a vision so searing that Lear cannot stand to look

upon it. “Hence, and avoid my sight!” he roars (1.1.122). To elude the obligations otherness imposes upon him, Lear turns away from the face in which he has seen it:

Thou hast her, France. Let her be thine, for we  
Have no such daughter, nor shall ever see,  
That face of hers again.

(1.1.260–62)

Rather than heed Kent’s call to “See better, Lear,” the king forswears forever the sight of his youngest daughter (1.1.156). While it is common for critics to parley these repeated references to sight into an overarching trope about eyesight and insight, Paul Alpers is right to remind us that looking in this play is primarily a form of connection, not perception. To look upon someone is to enter into relation with him or her. Thus, when Lear turns away from Cordelia what he rejects is not abstract moral truth but “actual human relationships that give rise to moral obligations.”<sup>14</sup> The king does not want to look on his daughter because he perceives in her naked face a naked command.

The pattern established with Cordelia repeats itself throughout the opening acts. Each time the king encounters alterity, he tries to escape the claim it makes on him, first by raging against the other, and then by demanding that he or she be removed from his field of vision. When Kent, for example, presents himself as “the true blank of thine eye,” Lear tries not to look (1.1.157). He orders Kent to absent himself (“Out of my sight!” [1.1.155]) and then banishes him under penalty of death. Later, when Goneril and Regan cast off their false faces and reveal themselves as they really are, Lear showers them with curses. He cannot countenance his daughters the second they stop pretending to be the same as him. By this time, though, the king has surrendered his scepter and can no longer banish them as he has done Kent and Cordelia. Consequently, he exiles himself. Rather than submit to others, Lear takes to the heath, vainly seeking what Levinas terms “the salvation of a hermit.”<sup>15</sup> Before Lear will be for the other, he will try to be without the other, as if he could return – through sheer force of will – to an imaginary state prior to the arrival of the other and the claims he makes.

It is a fool’s errand, destined to fail. There can be no “I” without the other, and Shakespeare suggests as much when the king, in his isolation, increasingly loses hold of himself and his world. Try as he might, Lear cannot keep it together. His sides come unbound. His tears pour forth. His sorrows rise up. His heart breaks into a hundred thousand flaws. For a materialist critic like Margreta de Grazia, this dissolution demonstrates the degree to which early modern personhood is tied to property, such that “what *one* is depends on what *one owns*.<sup>16</sup> Thus, the sovereign who surrenders his crown and kingdom becomes a nobody or nothing: what the fool witheringly calls “an O without a figure” (1.4.158). Though this reading is both insightful and compelling, our appreciation for the identity effects of the objective relation in *Lear* should not overshadow the importance of the intersubjective one, especially since Lear’s self-stability is so closely connected to his proximity to others. It is when Lear tries to live outside of all interrelation that he feels his sanity slipping away, giving theatrical expression to Levinas’s statement that “the self cannot survive by itself alone, cannot find meaning within its own being-in-the-world, within the ontology of sameness.”<sup>17</sup> As Lear flees from the answerability that is uniquely his own, he retreats from the one thing that both dignifies and defines him. He declines from the “supreme dignity” and “inalienable identity” of the one who is answerable to the ignominy and anonymity of

one who is but “Lear’s shadow” (1.4.196). Moreover, as Lear recoils from the alterity that is the condition of his exteriority, he causes his world to collapse upon itself. Out on the heath, the tempest without merges with the tempest within, for Lear has turned away from the human other who divides the interior from the exterior, giving shape and meaning to each. The tenuous reality of Lear’s world out on the heath is a direct consequence of his refusal to occupy it with another.

Of course, Lear cannot really regress to a state prior to the other. (The other always already precedes the ego.) But inasmuch as *Lear* imagines this possibility, it suggestively ties identity and exteriority to interrelation, indicating that both self and world would slip away without the other. In his self-imposed solipsism, Lear is stripped of subjectivity and set adrift in a formless, faceless universe that threatens to swallow him up. If he is to be brought back, the stage play intimates, it must be by way of the other person – the shivering fool, the naked beggar, the blinded father, the suffering servant, the downcast daughter – each of whom summons Lear back to himself by summoning him back to his obligation.

Many are the points of contact with Levinas’s work, where interrelation is said to deliver the self from the horrors of impersonal existence. Levinas refers to this state of being-less being as the “*il y a*” (the “there is”) and associates it with panic and dread. He maintains, however, that one does not escape “the anonymous and senseless rumbling of being” by asserting one’s self but by depositing one’s self, “in the sense one speaks of deposed kings.”<sup>18</sup> This idea of deposition has obvious significance for Shakespeare’s play. Indeed, *Lear* can be seen to revolve around two types of deposition: one political and one ethical. The political deposition takes place early on, when Lear abdicates his throne and Goneril and Regan conspire to seize even the limited authority he would retain. Lear’s ethical deposition, however, is another matter altogether. Nevertheless, this is the one toward which the play presses, pushing us to consider what it might mean to depose the ego and enter into disinterested relation with the other.

A number of critics have addressed the play’s searching exploration of interrelation. Among the most insightful is Stanley Cavell, who seeks to understand why Lear turns away from characters like Kent and Cordelia, who quite plainly love him. Cavell ultimately concludes that the old man does not want to be loved – cannot bear to be loved – because love presents itself to him as a demand. Were he to acknowledge the affection of others, the king would be bound to deserve and reciprocate it. But this burden seems too large to bear, so Lear endeavors to avoid loving interrelation and all who offer it.<sup>19</sup> This argument is elegant, and much of it can be harmonized with my own interpretation. Nevertheless, I hesitate to accede to the principle of reciprocity that Cavell uses to explain the relations of love and responsibility in *Lear*. By tying interpersonal obligation to the offer and acceptance of love, Cavell effectively makes the answerability of the king contingent upon the actions of the other. Lear is bound to love where he is loved, but where he is not loved, his obligations are much less clear. Cavell’s reading, in other words, circumscribes personal responsibility within a network of symmetrical and mutually reinforcing demands, implicitly limiting Lear’s obligation only to those who love him. The king must care for Cordelia, but he owes little (if anything) to Regan, Edmund, and Cornwall.

I find Shakespeare’s play to be more exacting than this. If we apply a strictly reciprocal logic to the tragic action, it is difficult to fault Lear for hating the daughters who have betrayed him. Yet it seems clear to me that we are meant to wince when Lear savagely curses Goneril and then Regan. Their mistreatment of him does not condone

his mistreatment of them. And truly, if the actions of the most virtuous characters in the play are to teach us anything, it is that commitment can have nothing to do with calculation or conditionality. The Fool, Kent, and Cordelia all give themselves to one who cannot be said to deserve their devotion, and their actions are approved for this very reason. If we are to give proper value to the play's most meaningful characters and moments, we must acknowledge that what they have in common is an unqualified altruism quite apart from all thoughts of reciprocity and all systems of exchange. This, I believe, is the ethical standard to which the play holds us.

Such extreme selflessness perhaps runs counter to our notions of justice and fairness, but for Levinas it is the only ethical response. He is adamant that my relation to the other is not a quid pro quo.<sup>20</sup> According to Levinas, my obligation to *autrui* has nothing to do with his behavior toward me. It is our relation that commands me, anterior to and irrespective of all action he might undertake. And since this summons inheres as long as I am in relation to the other, my obligation to him is endless. At no point can I limit it by saying "I have done enough" or "I have done my part" or "I am more sinned against than sinning."

To be clear, Levinas does not rule out justice and fairness. Quite the contrary, Levinas asserts that my obligation to all others (and not just the other currently before me) compels me to arbitrate between competing interests and pursue a course of justice. Similarly, there are considerations that intervene and require justice even for me. But the "I" who is obliged to seek justice for others can never do so for itself, for it is impossible for the self to give weight to its own interests over and against the interests of the other. While it might be reasonable to expect that my face commands the other just as his face commands me, or to assume that the claims he makes on me are counterbalanced by the claims I make on him, Levinas insists that the "I" cannot experience its interrelatedness from the outside, as a symmetry or reciprocity. The face of the other, Levinas frequently says, addresses me from an insuperable "height" or "elevation." He and I are never on equal footing. Before the other, I can know nothing but my own obligation.

According to Levinas, this radically asymmetrical relation brings the self into being. But some have objected that it must also bring the self unto destruction. Paul Ricoeur, for example, contends that the claim that the "I" can never be equal to the other leads inevitably to self-loathing, while the corollary claim that the "I" must give all to the other leads just as surely to self-annihilation.<sup>21</sup> Significantly, a number of literary critics have seen Shakespeare's play as moving in the same direction. According to Richard Halpern, the tragedy imposes such impossible interpersonal demands upon its characters that self-destruction is the only viable response. In his view, the characters of *Lear* live and move in a zero-sum economy that does not allow for rational conservation. Consequently, what is ultimately "chosen" by the play as the most adequate response to its world of scarcity and struggle is aristocratic *dépense* or "self-destructive expenditure." If we are to credit Halpern's interpretation, we must conclude that all signs in *Lear* point toward aggressive self-annihilation.<sup>22</sup>

Yet Levinas insists that suicide is no answer to answerability and advises, more generally, that "my responsibility for all can and has to manifest itself also in limiting itself."<sup>23</sup> Paradoxically, the basis for this self-limiting is the limitlessness of my responsibility. If the "I" is to support a responsibility that extends uninterruptedly into eternity and embraces an infinity of others, it must have a care for itself. The self must preserve and maintain itself if it is to have anything to give (in the first place) and if it is to continue

being able to give (in the second place). Or as Jamie Ferreira puts it, we can speak of self-surrender without requiring self-annihilation because “the counter-weight to GIVING ALL is ALWAYS GIVING.”<sup>24</sup> If responsibility is understood to be infinite, then it cannot be discharged in the matter of a moment, no matter how spectacular that moment might be.

There are, to be sure, a number of spectacular moments of self-sacrifice in Shakespeare’s play. And it is true that Lear turns to “self-destructive expenditure” when his initial attempts to browbeat, banish, and turn his back on the other fail to give him the relief he seeks. In spite of his act 1 evasions, the king simply cannot escape the neighbor whose nudity and neediness overmaster him. Even in the wilderness, Lear is unmistakably summoned. Edgar runs onstage, and Lear must confess: “Thou art the thing itself. Unaccommodated man is no more but such a poor, bare, forked animal as thou art” (3.4.95–97).<sup>25</sup> So piercing is Poor Tom’s poverty that Lear is compelled to respond. This time, however, he does not resort to anger or exile. Rather, he starts ripping off his raiment, literally exposing himself to feel what wretches feel. “Off, off, you lendings!” he bellows, “Come, unbutton here” (3.4.97–98). Lear’s desperate disrobing seems to be of a different order than his anger and self-estrangement. Yet Lear’s self-exposure is no less of an evasion, for it is clear that the king is not undressing to relieve Edgar (to whom he does not offer the cast-off clothing) but to relieve himself. As was the case with Lear’s wrath, his divestment turns out to be just another dodge, an attempt to put melodrama in the place of meaningful service. It is as if the king believes he can escape his obligation by making himself just as destitute (and therefore just as commanding) as the beggar before him. Or as if he can acquit himself of a lifetime of responsibility by performing one grand, self-destructive gesture. Instead of submitting himself, Lear magnificently attempts to undo himself.<sup>26</sup>

Gloucester tries to escape his ordination in analogous fashion. Upon finally owning up to the enormity of his individual responsibility, Gloucester despairs of ever being equal to it and resolves to cast off his burden – as Lear has cast off his clothing – in one extravagant, self-consuming act. Bestowing his wealth upon a beggar, he hurls himself (as he supposes) off a cliff. Though Gloucester presents this intended suicide as a protest on the part of all humanity, such a sacrifice would benefit nobody but him. Taking his cue from Hamlet, who would “his quietus make / With a bare bodkin” (3.1.77–78), Gloucester embraces self-slaughter as a strategy for paying off or canceling his account.<sup>27</sup> By leaping into oblivion, Gloucester hopes to end not only his life but also his answerability.

If we attend to these scenes, however, we can see that Shakespeare’s play does not permit self-sacrifice to take the place of true surrender any more than Levinas does. When Lear undresses and Gloucester falls face-first, the futility and absurdity of their actions is apparent. It cannot be the case that these self-destructive acts are “chosen” by the play when they have put so many in mind of the temper tantrums of young children and the buffoonery of circus clowns.<sup>28</sup> Even if Gloucester and Lear want to bow out in a blaze of glory, the play will not let them. Self-sacrifice, or *dépense*, is not allowed as a final answer. Each of these suffering selves must pick himself up and keep going.<sup>29</sup> Indeed, it is this relentless drive that makes the play so poignant and so powerful. The summons to be otherwise works ceaselessly on Gloucester and Lear, such that they cannot ignore their ordination, even if they will not altogether assume it. Pricked again and again by their encounters with the other, the play’s protagonists are pitched relentlessly forward, lurching toward transcendence.

This ragged trajectory has often been plotted along an axis of empathy or fellow feeling. Christian and humanist readings alike have long held that Shakespeare's Lear achieves redemption insofar as his torments teach him to feel what others feel.<sup>30</sup> In these interpretations, the king is said to take his first stumbling steps toward self-knowledge and salvation in 3.2, when he conceives a compassionate concern for the fool. The tender scene certainly seems like a turning point. We are out on the heath. The king is contending with the elements in self-righteous fury. The apocalyptic annihilation for which he has been calling appears imminent. But then his glance falls on the fool. The sight of the boy, skin-soaked and shivering, cuts Lear to the quick. He stops his shouting and says, "My wits begin to turn." Though many have taken these lines to announce a turn for the worse (Lear is really losing it now!), what follows is not the stuff of madness. For the first time in the play, Lear sets aside his obsessive interest in his own injuries and attends to the needs of another: "Come on, my boy. How dost, my boy? Art cold?" (3.2.66–67). As he addresses himself to the plight of the fool, Lear speaks with more reason and moderation than he has for some time. He also regains enough understanding to seek shelter from the storm. He conducts the fool to an outbuilding and invites him to enter, even offering him priority of place: "In, boy; go first" (3.4.26). Then, before taking shelter himself, Lear pauses to pray. Kneeling in the mud, the king pours out his heart to the houseless and the unfed, exhorting himself to "to take physic" and "expose thyself to feel what wretches feel" (3.4.26–34). It is a poignant moment, and many have taken it to express the overarching message of the play: namely, that compassion can cure us.

Levinas, however, is adamant that empathy is no achievement, and his critique of fellow feeling gives us reason to think twice about interpretations applauding Lear's emergent desire to identify with others. In Levinas's view, to see one's neighbor as one's self is not to respond to him but to totalize him, to make him an instance of one's own categories. Empathy in this respect is but "egology": an approach that reduces the other to an analogue of the self. This tiresome play of the same, Levinas maintains, cannot emancipate anyone – which is what we see when Shakespeare's king seizes upon Tom o' Bedlam as a second self, or partner in sorrows.

When Poor Tom rushes onstage, his wildness and weirdness are utterly astonishing. Lear, however, strives to close the gap between the stranger and himself by asserting an essential similarity. As if to blunt the force of Edgar's alterity, Lear equates the beggar's condition with his own.

Didst thou give all to thy two daughters,  
And art thou come to this?  
.....  
Has his daughters brought him to this pass?  
Couldst thou save nothing? Wouldst thou give 'em all?  
(3.4.47–48, 59–60)

Though Kent objects that Poor Tom has no daughters, Lear is undeterred in his identification. He will not allow that Edgar's situation might exceed his own: "Death, traitor! Nothing could have subdued nature / To such a lowness but his unkind daughters" (3.4.65–66). Lear's approach is all wrong, and not just on points of fact. By comprehending Edgar's suffering within the circumference of his own, Lear effectively denies Edgar's difference and makes himself the model for all misfortune. Staged like this, Lear's empathy looks a lot like narcissism.<sup>31</sup> It is unseemly, and it does nothing to deliver

Lear from the solitude of being that manifests itself in this play as madness. When Lear cozies up to Poor Tom as to a known quantity, his mental state precipitously declines. Before long, he is removing all his clothes – a sure sign of madness in Shakespeare's day.<sup>32</sup> As a corrective, then, to the conventional view that *Lear* is all about empathy, we ought to acknowledge that though the king comes to think of others as of himself, this is not enough to heal him. Indeed, it is in a fit of fellow feeling that Lear strips himself naked and provides conclusive proof that he is mad.

This is not to say that empathy is given no value in Shakespeare's play. (As egocentric as it may be, Lear's empathy is at least an attempt at relation.) It is to say, however, that empathy's limitations are everywhere implied. As Jonathan Dollimore remarks, the king who commits himself to the cause of "windowless poverty" after coming to "feel what wretches feel," draws attention to the difficulty of seeking social justice in fellow feeling: the majority is bound to remain poor, naked, and wretched if a king must share the suffering of his subjects in order to "care."<sup>33</sup> In the end, empathy cannot produce an ethical society – or even prevent an unethical one. As Levinas explains, empathy is incapable of preventing bad acts because its ethical effects diminish as soon as we tell ourselves that some people are not "really" the same as us, that some people are not as fully human as are we.<sup>34</sup> This is what the Nazis claimed of the Jews, and this is what Lear claims of his "pelican daughters" (3.4.70). Lear feels justified in offering violence to Regan and Goneril because he has determined that they are not persons but predators (wolves, foxes, serpents, curs). As is evident in the king's chilling "Then kill, kill, kill, kill, kill, kill!" (4.5.177), empathy is an inadequate ground for ethics because it is too easily qualified or set aside. If Lear is to be brought more fully into the realm of the ethical, something more will be required. Instead of encountering the neighbor as an alter ego (to be given equal consideration), Lear must encounter him as an other (to be given all). What is needed is not empathy but awe.<sup>35</sup>

If we look at the moments wherein Lear is most authentically connected to other people, what we see is not empathy or understanding but profound embarrassment, even shame. The king is furthest from the mark when he feels "at home" with others: when he experiences the other as familiar, accommodating, or companionable. However, he comes closest to the play's ideal when he feels overwhelmed or at a loss – when his interactions are so disturbing, disarming, and dispossessing that he knows not what to do or say. This ethical discomfiture is most evident in his act 4 encounter with Cordelia, and it is for this reason that their reunion is rightly regarded as *Lear*'s highest moment.

Suffused as it is with gentle tones and soft music, the scene is unlike any other in the play.<sup>36</sup> Some of its elements, however, are familiar. When Lear rouses from sleep, Cordelia offers herself to him as she previously did in the love contest, inviting his gaze and subjecting herself to it. "Sir, do you know me?" (4.6.41), and "O look upon me, sir" (4.6.50). Lear shrinks back, confessing that Cordelia has ample cause to hate him. Her gentle reply is no more than a murmur: "No cause, no cause" (4.6.68). Like the "nothing" of act 1 that it echoes, Cordelia's "no cause" performs the literal operation of negation or denial. Yet the meaning of her words surpasses their linguistic function.<sup>37</sup> Analysis always feels inadequate to Cordelia's utterance because its meaning, as Levinas would say, lies not in the said (*le dit*) but in the saying (*le dire*). What gives "no cause" its significance is not only the content it communicates but also the approach it enacts. Her words will always be in excess of interpretation because Cordelia is not using signs so much as she is making herself a sign, delivering herself to her father in that discursive attitude of sustained exposure and incessant offer that Levinas calls "the very signifyingness of signification."<sup>38</sup>

Where Cordelia's self-exposure pitched Lear into a fiery passion in act 1, it works differently on him in act 4. What we see now is not rage but responsiveness. When Cordelia bows her head to receive his blessing, Lear does not hold his hand over her in the gesture of authority but kneels before her in a posture of humility. This action, as Richard McCoy points out, revisits an earlier instance in which Lear has kneeled sarcastically to beg a daughter for food, bed, and raiment. There, the action was cruelly derisive and was rebuked as such ("Good sir, no more. These are unsightly tricks" [2.2.321–22]). But when Lear takes to his knees in act 4, the gesture seems genuine.<sup>39</sup> His submissiveness is so stirring, so sublime, that A. C. Bradley finds the scene "almost a profanity to touch."<sup>40</sup>

When Margreta de Grazia looks upon this scene, she sees a man whose misfortunes have stripped him of selfhood. In his "*not having*," de Grazia writes, Lear is reduced to "*non-being*."<sup>41</sup> Levinas, however, would see things differently. For Levinas, the king who kneels before Cordelia has not been plunged into "*non-being*" but has been moved "*beyond being*." He has not ceased to be so much as he has begun to "*be-otherwise*." This state of self-surrender is what Lear – and his play – has been groping toward from the very beginning. It is more than empathy, more than self-sacrifice, more than loving reciprocity. Edgar refers to it as "*ripeness*" (5.2.11), but Levinas calls it "*passivity*" – by which he does not mean inertia or apathy but rather a readiness to be moved by the other, to be called by him without anticipating or presuming to know what is required.<sup>42</sup> This passivity, Adriaan Peperzak writes, "is lived in the humility of a devotion that is not planned but undergone." It is the way of transcendence, but it is also the way of suffering. "To live for others is to suffer, and even to suffer gratuitously, without meaning, for nothing, because only such a passion unquestioningly realizes the unchosen, entirely disinterested character of transcendent passivity."<sup>43</sup>

Kent, Cordelia, and the Fool appear to inhabit this exhausting ethical space from the outset. They are, in Levinasian terms, hostage to the other: obsessed, afflicted, wounded, burdened. But what about Lear? The trajectory of the tragedy is shaped by his struggle to enter into the ethical. But does this arc eventually complete itself? The question is vexing, for the transcendent encounter of act 4 is followed by the cruel crosses of act 5, sorely testing the passivity Lear appeared to assume. At times, the king seems to relapse into his old evasions. When Cordelia, for example, wants to go see these daughters and these sisters, Lear's anxious "No, no, no, no" calls to mind his earlier attempts to turn away from the face of the other (5.3.8). At other times, his responsiveness seems too tied to Cordelia. Though Lear will stop at nothing to succor his youngest, he can treat others, such as Kent and Gloucester, with apparent apathy and insensitivity. And even his intense devotion to Cordelia is alarming, since Lear's bearing toward her oscillates uncomfortably between submissiveness and possessiveness. The final act forces us to wonder whether Lear has truly given himself to the ethical relation or whether he has merely adopted more subtle means to monopolize Cordelia's affection and attention.<sup>44</sup>

In the instant before his heart breaks, Lear gives us reason to believe he is sincerely answering his ordination, and our hope that this is so attests to the play's success in impressing upon us its exacting ethical vision. The king's attentiveness to Cordelia's inert form, as Michael Holahan has shown, is an exquisite example of ethical perception and responsiveness.<sup>45</sup> And it is true, as Maynard Mack affirms, that Lear dies with no regard for himself. He draws his last breath "with his whole being launched toward another."<sup>46</sup> Yet this altruistic posture is undermined by several of Lear's last lines, some of which signal delusion ("This feather stirs. She lives" [5.3.239]), others indifference ("Prithee, away" [5.3.242]), and others wrath ("A plague upon you, murderers, traitors

all” [5.3.243]). The play drives toward an ideal of ethical interrelation and absolute responsibility, but how close does the king come? After all is said and done, what we have witnessed remains enigmatic. Like the irreducible other, the tragedy resists our efforts to thematize its content or comprehend its meaning.<sup>47</sup>

But even as the play frustrates our understanding, it requires our response. This requirement is especially acute in the case of Cordelia, for the king is not the only one caught up in the face-to-face encounter with her. As the drama draws to a close, Lear exhorts every person in the theater to cast eyes on his daughter: “Do you see this? Look on her. Look, her lips, / Look there, look there” (5.3.285–86).<sup>48</sup> In performance, it is not uncommon for the actor playing Lear to turn his body and speak these lines directly to the audience, rotating and elevating Cordelia’s inert form so as to present it to the seated spectators. The staging feels right, for in his last lines the king offers to each of us the daughter who has repeatedly offered herself to him. Yet what do we see if we obey Lear’s injunction and look? We see, to be sure, a beloved daughter who is dead, but we also see an actor who is dressed up and dissimulating. “Beholders are asked to see what may not exist,” Holahan writes, “for this is and is not Cordelia. Her character now appears only in an actor’s body’s mimicry of a past life – a striking union of death and theatrical illusion.”<sup>49</sup> The “Cordelia” we are asked to consider is a theatrical construct: a person masked in a dramatic character. To what degree, then, can we live up to Lear’s final command and look on, lament, and love this virtuous girl? Is it even possible for us to submit ourselves to a simulation?

Cavell believes that it is. Even as he concedes that our acknowledgment of Cordelia cannot be completed, Cavell downplays the difference between acknowledging a theatrical character and acknowledging an actual person. In both instances, he says, the difficulty lies in presenting ourselves to others to be recognized and commanded by them. Since dramatic characters do not and cannot take cognizance of us, this self-presentation seems especially difficult in the theater. But Cavell maintains that the problem inheres in every interrelation. Bound up within our own egos, you and I never occupy the same site. Thus, what is the case inside the theater is also the case outside of it. It is true that we cannot put ourselves in the presence of a theatrical character, but we cannot put ourselves in the presence of a real person, either. But though I cannot put myself in your presence, I can put myself in your present – and I do so by making your present mine. By suspending my egocentric perspective and surrendering the moment to you, I can make the present yours and put myself in it. This is how we acknowledge another person, and this is how we acknowledge Cordelia.<sup>50</sup>

Cavell’s argument makes sense, but it depends on the elision of the actor. If we are to talk about surrendering ourselves to Cordelia’s present, we must use the plural, for when Cordelia is before us there are two “presents” present. There is the present of the girl who is trying to help her father, and there is the present of the actor who is trying to enact the assigned role. Can we make one present without the other? Can we concentrate on Cordelia to the exclusion of the actor? The actor’s “present” would seem to persist, no matter how enthusiastically we embrace the illusion. Were the actor to stumble, or sneeze, or say something surprising, we would instantly be aware of her “present,” not Cordelia’s. The actor in this scene is invisible to us only to the extent that she conforms to the expectations we are constantly applying to her. But if she should surpass, disappoint, or alter our idea of who Cordelia is and how Cordelia should act, the actor and her agency are immediately on our minds. How can the actor not exist in this scenario, if we are perpetually overseeing her and her actions?

As audience members, we may want to give ourselves entirely to Cordelia, but a part of us will always be attentive to the actor: to her skill in simulating loss (How believable this is!), to her success in evoking our wonder (What a remarkable performance!) – even to her safety in the final scene (Is the actor playing Lear going to be able to carry her safely?). The artificiality of the event intrudes. It divides our attention and makes us see double. Knowing that this is a simulation, we cannot fully commit ourselves to the characters on the stage. We may feel their grief and pain, but our experience of it is diminished by the knowledge that it is dissembled. Thus, at the same time that *King Lear* demands our response, it also constrains it. The play preaches the importance of an ethical openness it does not altogether allow.

Lear calls attention to the inadequacy of our response when he staggers onstage with Cordelia's lifeless body. His rebuke indicts the audience as well as the actors/characters at his side:

Howl, howl, howl, howl! O, you are men of stones.  
Had I your tongues and eyes, I'd use them so  
That heaven's vault should crack.

(5.3.231–33)

As Marianne Novy observes, no spectator can respond accordingly, and our inability is profoundly embarrassing. For Novy, this unsettling insufficiency instills within each of us a keen sense of isolation. As we watch on in silence while Lear bursts his lungs and then his heart, we come to feel a sharp separation not only from the characters onstage but also from our fellow spectators. Nevertheless, Novy insists that this feeling of isolation ultimately gives way to a sense of solidarity. I cannot know if you and I are feeling the same thing, and I cannot deny that neither of us is feeling enough, but the simple fact that we are both feeling something (whatever it is) attests to a basic connectedness that, finally, fashions us into a community of care. “The one consolation that [Shakespeare] offers – and in a theater it is a significant one – is that we feel each other’s loss because of our basic connection.” Although our emotional response to Lear’s tragedy will never rise to the height it deserves, it is – at least for Novy – enough to knit us together.<sup>51</sup>

The connectedness that Novy envisions, however, is hard to see onstage. At the close of the play, the surviving characters remain painfully and awkwardly apart. Albany tries to establish some form of sociality, but his proposal to reconstitute the realm under the joint rule of Kent and Edgar falls flat. Kent is intent on suicide, while Edgar makes no answer at all. Who will rule the kingdom and what will become of it are left as open questions, muddled even more by the fact that the play’s final speech, which would customarily spoken by the royal successor, is inconsistently assigned to Albany in the Quarto and to Edgar in the Folio.<sup>52</sup> In a certain sense, this incertitude is apt: the nomination of a new king is hardly relevant, for the kingdom he would inherit has disintegrated. No longer a society, Albion is now a number of atomistic individuals, aloof and embarrassed. Their dissociation is distressing, and it prods us to consider a number of difficult questions concerning ethics, sociality, and politics. Among other things, we are brought to wonder whether the ethical relation can coalesce into – or even coexist with – the political relation. In a play world that places such weight on intersubjectivity and individual responsibility, is politics even possible?

*Lear* appears to answer in the negative, seemingly because politics – as imagined in the play – would put limits on responsibilities that are limitless. Even though Lear’s regime

instills within its subjects a sense of exorbitant duty, the expression of this duty (whether sincere or not) is too narrow. All devotion is directed at the king, who is officially enthroned as the singular other, the one whose plenipotent voice drowns out every other summons. By restricting responsiveness to the royal court, the monarchial structure of *Lear* would elide the existence and ignore the neediness of the non-regal other. Moreover, by channeling altruism into the well-defined and well-worn conventions of courtly service, the play's political system would distance its subjects from the unpredictable passivity that is the essence of the ethical. Court forms are too rigid, insisting upon choreographed behaviors and chivalric displays instead of openness and sincerity.

Even the king is too constrained by the monarchial model, inasmuch as his royal office subsumes his self in such a way as to inure him to the "elevation" of *autrui* and impedes him from responding as a flesh-and-blood individual to the other before him. The king is not an "I" but a "we," and the metaphysical plurality of his person inhibits him from assuming the ethical stance of the one-for-the-other. This difficulty is evident in the very first scene, as Lear slips in and out of the third person, recurrently using the royal "we" to make personal demands.<sup>53</sup> His erratic usage is indicative of his inability to separate his self from his scepter, an inability that confuses his conversation and complicates his approach to the other. To truly address himself to the other, a king would have to extract himself from his office: he would have to speak in the first person. Henry V attempts something of the sort on the eve of the battle at Agincourt, but he butts up against political impossibility. To enter into relation, a king must do more than borrow a cloak. He must truly depose himself before the other, which would seem to leave us – at least in the case of *Lear* – without a prince and without a polity.

Simon Critchley denies that ethics and politics are incommensurable, claiming to the contrary that an ethics of individual responsibility exists "for the sake of politics."<sup>54</sup> This may well be true, but Shakespeare's tragedy is silent on how it could be so. Aside from the evils of anarchy, the play does not present an alternative to monarchy. There is no purer ethico-political system waiting in the wings, ready to step in and save the gored state. Instead of trying to sketch out a political situation in which individual responsibility could be actualized and honored, *Lear* simply abandons politics altogether. The drama that begins with royal edicts and courtly ceremony concludes with stateless sincerity and direct address. At play's end, there is neither king nor kingdom – only responsibility. The relentless pursuit of the ethical pulls the play away from its political underpinnings, perhaps positing politics as antiethical.

But if *Lear*'s emphasis on individual responsibility leaves us without a recognizable political system, it also leaves us without a recognizable ethical system. Though the play thrusts us into the realm of the ethical (*l'éthique*), this realm does not resolve into an ethics (*une éthique*).<sup>55</sup> Or, to put it another way, the drama does not yield up or yield to a set of general rules capable of determining the proper course of action anterior to or outside of the event. Categorical imperatives cannot tell us what Cordelia ought to do when asked to profess her love, or what Lear ought to do when betrayed by his eldest daughters, or what Edgar ought to do when solicited by his suicidal father. Clearly, these characters must respond to the other, but the quality of their response remains rooted in the moment, deeply infixated in "ripeness" and "feeling" rather than in precepts and rules. With a few notable exceptions (e.g., the treachery of Edmund, the cruelty of Cornwall and Regan), the challenging emotional landscape of this play is not to be navigated by a priori ethical precepts – which is one of the many reasons it feels so Levinasian to me. Whereas someone like Kant envisions ethics as a matter of principle, such that uprightness

consists of accepting and enacting impersonal, rational rules, Levinas believes it is unconscionably reductive to regard the other or my relation to him as universal instances or generic abstractions. The other is neither an instance nor an abstraction: he is who he is. Consequently, the ethical experience must be personal and particular, not principled.<sup>56</sup> Levinas argues – and I think *Lear* is in broad agreement – that one cannot resort to preconceived imperatives if one is to respond authentically. Rather, what one must do is resign oneself to a thoroughgoing passivity in which responsiveness is determined wholly in the moment, entirely by the other.

After all, this is exactly what the play calls for at the close. As Edgar (or is it Albany?) speaks the last lines of the play, he affirms the necessity of an exhaustively personal response that goes far beyond our sense of what “should” be said in such a situation.

The weight of this sad time we must obey,  
 Speak what we feel, not what we ought to say.  
 The oldest hath borne most. We that are young  
 Shall never see so much, nor live so long.

(5.3.298–302)

Platitudes are too paltry for what we have witnessed. If we are to do justice to the suffering and exposedness of those before us, we must offer more than our conventional expressions of consolation. We must bravely enter that unscripted, self-delivering realm of discourse that Levinas calls “conversation” and that Shakespeare calls “speaking what we feel.”<sup>57</sup>

But perhaps I go too far in giving such ethical weight to a stage play written and presented primarily as an entertainment. In spite of the early moderns’ enthusiasm for poetry’s ability to delight and to instruct, art and ethics are not identical. In fact, the distance between them can be such that we might wonder whether they are ever in alignment, whether art can ever bring about an ethical end. If the ethical is imagined as an encounter with radical alterity, what can be the value of the simulation? On this question, Levinas is equivocal, if not contradictory. On the one hand, he distrusts art as an escape or an evasion. Art can give us selfish pleasure and enable our flight from the real world, thereby offering us false transcendence. In this respect, art is an idol: a lifeless object put in place of the other. On the other hand, Levinas openly acknowledges his philosophical debts to the great authors of Russia and western Europe and frequently refers to their literary works in his own writings. (The most obvious example is the line from *The Brothers Karamazov* that Levinas adopts as his motto, quoting it no less than twelve times in his published work.)<sup>58</sup> The best authors, Levinas will say, not only recognize and resist art’s idolatrous potential but also wrestle with core philosophical questions, such as the meaning of life and the meaning of the human. In this way, the best art can prepare one for authors like Plato and Kant. What is more, it can also model the way out of being. According to Levinas, good art can imitate a form of ethical discourse by continually interrupting itself and calling itself into question.<sup>59</sup>

*King Lear*, it would seem, does this in spades. The tragedy assails us in our unknowing. At play’s end, we are baffled and bewildered – and compelled to speak even so. But what can we say? Or, to put a finer point on the question, what can we say that will not violate the terms of our speaking? Can we speak in a way that does not reduce or thematize? If it is true that great literature, like *Lear*, can imitate a form of ethical discourse, is it possible for literary criticism to do the same? As I draw this essay to a close, I would like to touch briefly on this question by considering how a Levinasian perspective might

influence not only our experience of the drama but also our critical reception of it. In doing so, I make what is admittedly a perilous leap from stage plays to scripture, proposing to think about Levinas's approach to the Talmud as both a mode and model of literary criticism.<sup>60</sup>

Though Levinas took pains to separate his Talmudic writings from his philosophical writings (e.g., publishing each with different publishers), both endeavors are characterized by an antipathy toward totalization. With regard to scripture, Levinas unsurprisingly insists that the commentator's task is not to solve, settle, or decipher the text. He speaks instead of "renewal." "The life of the Talmudist," Levinas writes, "is nothing but the permanent renewal of the letter through the intelligence."<sup>61</sup> No amount of erudition or historical contextualization or critical knowledge can substitute for the unceasing work of asking questions of the text, since anything other than this has the effect of turning the text into a dead letter, an academic artifact containing obscurities without interest. For Levinas, the truth of the Talmud is inextricable from the light each individual sheds upon it; consequently, Talmudic thought must needs foster a dynamic pluralism – not to delight in relativism but to honor the infinite density of the Word, which requires the multiplicity of persons to express itself and unfold in the course of time.<sup>62</sup>

While it might seem like the worst kind of bardolatry to say that Shakespearean criticism could or should follow Levinas's Talmudic pattern, I am nonetheless attracted to a hermeneutic that favors renewal over resolution. Such an approach would oppose an analytic order that tries to contract a plenitude of responses into a handful of "right" readings and that tramples individuality underfoot in its expectation that all informed readers and audience members respond alike. Such an approach would recognize that agreement and unicity can dry up the wellsprings of meaning and significance and would embrace instead the unsettling effects of multiplicity and plurality, which do not appease us with a self-satisfying sense of knowledge but send us back to the text, obsessed and enthralled. Such an approach would begin to resemble what Simon Critchley, in a slightly different context, calls "dissensual emancipatory praxis": a relentless disturbing of the idyll of consensus, not to do away with consensus (or criticism) but to bring about its endless betterment.<sup>63</sup> The ethical possibilities toward which Levinas directs us (if only indirectly) are to be realized in a literary criticism that does not thematize but throws open, upsetting our apprehension in such a way as to reaffirm the richness of the text and the range and depth of responses it can draw forth. This kind of criticism would not be defined by dogmatism but would depend instead upon the incessant questioning of all: the disciple as well as the master. This criticism would strive to keep our responsiveness from rigidifying into a stultifying totality. It would aim at something akin to "the permanent renewal of the text through the intelligence."

And perhaps no stage play lends itself to this type of criticism as readily as Shakespeare's *King Lear*. With its challenging portrayal of our intersubjective situation and the infinite responsibility to which this puts us, the play text ushers us into a distressed and difficult realm of relation. To experience this tragedy is to be called into question: to be both traumatized and summoned. It is difficult to ignore this state of ordination, even though it most certainly exceeds us. We think and talk and write about the play with particular energy because it is in and through our responsiveness that we begin to uphold our noninterchangeable obligation and in this manner approximate the ethical ideal at the heart of the play.

Literary criticism as an act of ethical responsiveness? Speak what we feel, indeed.

## Notes

The origins of this essay trace back to an undergraduate honors thesis written in 1994 at Brigham Young University under the direction of Richard Duerden and Bruce Young. It was presented in revised form at the 2007 meeting of the Shakespeare Association of America in a seminar organized by Douglas Trevor and Kristen Poole. Its current state owes a great deal to the generosity and insight of several anonymous readers.

- 10 It is impossible to cite all the relevant readings, so a few representatives will have to suffice. Stanley Cavell is among those who see Cordelia’s reply as an expression of confusion. Richard Halpern is less forgiving, emphasizing the cruelty of Cordelia’s words and relating them to the more vicious revenges of Goneril and Regan. Eugene England tries to recuperate the painfulness of Cordelia’s response by portraying her as a therapist/savior who only hurts her father to heal him. See Stanley Cavell, *Disowning Knowledge in Seven Plays of Shakespeare*, updated ed. (Cambridge University Press, 2003), 62–64; Richard Halpern, *The Poetics of Primitive Accumulation: English Renaissance Culture and the Genealogy of Capital* (Ithaca, NY: Cornell University Press, 1991), 248–49; and Eugene England, “Cordelia and Paulina: Shakespeare’s Healing Dramatists,” *Literature and Belief* 2 (1982): 69–82.
- 11 Levinas, *Totality and Infinity*, 199.
- 12 “What is … a solitary individual,” Levinas asks, “if not a growing tree without regard for all that it cuts off and destroys, absorbing the nourishment, the air and the sun, a being which is fully justified in its nature and its being? What is an individual if not a usurper? What does the advent

- of conscience mean ... , if not the discovery of cadavers at my side and my horror of existing as a murderer?" (Levinas, quoted in Adriaan T. Peperzak, "Judaism and Philosophy in Levinas," *International Journal for Philosophy of Religion* 40 [1996]: 135).

  - 14 Paul J. Alpers, "King Lear and the Theory of the 'Sight Pattern,'" in *In Defense of Reading: A Reader's Approach to Literary Criticism*, ed. Reuben A. Brower and Richard Poirier (New York: Dutton, 1962), 135.
  - 15 Levinas, quoted in Peperzak, "Judaism and Philosophy in Levinas," 135.
  - 16 Margreta de Grazia, "The Ideology of Superfluous Things: *King Lear* as Period Piece," in *Subject and Object in Renaissance Culture*, ed. Margreta de Grazia, Maureen Quilligan, and Peter Stallybrass (Cambridge University Press, 1996), 34.
  - 17 Levinas, quoted in M. Jamie Ferreira, "'Total Altruism' in Levinas's 'Ethics of the Welcome,'" *Journal of Religious Ethics* 29 (2001): 462.
  - 18 See the epigraph to this essay, and n. 1 above.
  - 19 Cavell, *Disowning Knowledge*, 57–62.
  - 20 We gain a sense of Levinas's commitments here by noting that he distrusts and distances himself from the word "love" that is central to Cavell's analysis precisely because it implies reciprocity and familiarity. Levinas prefers instead "the harsh name for what we call love of one's neighbor," namely, "responsibility for my neighbor" (Emmanuel Levinas, *Entre Nous: On Thinking-of-the-Other*, trans. Michael B. Smith and Barbara Harshav [New York: Columbia University Press, 1998], 103).
  - 21 Paul Ricoeur, *Oneself as Another*, trans. Kathleen Blamey (University of Chicago Press, 1992). For a concise summary of Ricoeur's critique, see Ferreira, "'Total Altruism,'" 451–52.
  - 22 Halpern, *Poetics of Primitive Accumulation*, 264.
  - 23 Levinas, *Ethics and Infinity*, 121–22, and *Otherwise than Being*, 128.
  - 24 Ferreira, "'Total Altruism,'" 454.
  - 25 In these lines, we might find the rudiments of an early modern rationale for Levinas's claim that *autrui* is always and only human. Perplexed by his anthropocentric stance, several of Levinas's critics have asked why the "I" is not also ordained by the alterity of animals, or even plants. Though Levinas answers religiously (the human other bears "the trace of God," whereas plants and animals do not), the human exceptionalism established in Lear's speech is different. As Laurie Shannon has shown, it is a negative exceptionalism, predicated upon the underprovisioned condition of humankind. Whereas nonhuman animals are naturally "coated," the human creature Lear considers is uniquely naked, compelled to case himself in secondhand skins, or "lendings." Given Levinas's insistence on the essential nudity of *autrui*, Lear's vision of "unaccommodated man" seems relevant. As Shannon remarks, the "poor, bare, forked animal" we are made to see in the play raises the question of whether any animal other than the human may fairly be deemed "naked." See Laurie Shannon, "Poor, Bare, Forked: Animal Sovereignty, Human Negative Exceptionalism, and the Natural History of *King Lear*," *Shakespeare Quarterly* 60 (2009): 168–96.
  - 26 Act 3's "Off, off, you lendings! Come, unbutton here" is revisited in act 5 when Lear asks of an attendant, "Pray you, undo this button. Thank you, sir" (5.2.84). Making the same basic request, but in a much calmer register, the king signals a shift in his character. This shift is even more significant if we take Lear to be making the request for Cordelia, rather than himself. In most productions, the king tugs at his own constricting collar when he speaks these lines, but he could be fumbling with Cordelia's. He is, after all, trying to resuscitate her, and undoing a button at her neckline would be commensurate with this. If staged like this, the scene would show a subtle yet striking reversal. The man who once tried to "unbutton" to escape his answerability now unbuttons to administer aid to another.
  - 27 In the early modern period, a paid-off account was marked *Quietus est* ("laid to rest"), as the Norton edition states in a footnote to *Hamlet* (1706 n. 9).
  - 28 Janet Adelman sees in Lear's actions "the rage of an abandoned infant." G. Wilson Knight remarks that the king's "tremendous soul" is "incongruously geared to a puerile intellect." According to Knight, "Lear is mentally a child; in passion, a Titan." For Jan Kott, both Lear and Gloucester are "too ridiculous" to be tragic: they are "clowns who do not yet know they are clowns." Nowhere is this more apparent than in Gloucester's attempt to end his life. The attempted suicide, Kott

- writes, "is merely a circus somersault on an empty stage ... the classic expression of buffoonery." See Janet Adelman, *Suffocating Mothers: Fantasies of Maternal Origin in Shakespeare's Plays, "Hamlet" to "The Tempest"* (New York: Routledge, 1992), 118; G. Wilson Knight, *The Wheel of Fire: Essays in Interpretation of Shakespeare's Sombre Tragedies* (London: Oxford University Press, 1930), 177, 179; and Jan Kott, *Shakespeare Our Contemporary*, trans. Boleslaw Tatarski (Garden City, NY: Doubleday, 1964), 90, 177, 117.
- 29 On this point, see also Lawrence, "Difficulty of Dying in *King Lear*."
- 30 Paul Siegel epitomizes the Christian approach, while Wendell Berry exemplifies the humanist approach. Jonathan Dollimore provides a useful overview of both Christian and humanist readings in *Radical Tragedy* before rejecting each for misguidedly mystifying the suffering of Lear and others. See Paul N. Siegel, "Adversity and the Miracle of Love in *King Lear*," *Shakespeare Quarterly* 6 (1955): 325–36; Wendell Berry, "The Uses of Adversity," *Sewanee Review* 115 (2007): 211–38; and Jonathan Dollimore, *Radical Tragedy: Religion, Ideology and Power in the Drama of Shakespeare and His Contemporaries* (University of Chicago Press, 1984), 189–95.
- 31 On this point, see also Kearney, "This Is Above All Strangeness," 458–59.
- 32 See Michael MacDonald, *Mystical Bedlam: Madness, Anxiety, and Healing in Seventeenth-Century England* (Cambridge University Press, 1981), 130.
- 33 Dollimore, *Radical Tragedy*, 191.
- 34 See Hilary Putnam, "Levinas and Judaism," in *The Cambridge Companion to Levinas*, ed. Simon Critchley and Robert Bernasconi (Cambridge University Press, 2002), 35.
- 35 On the subject of sympathy versus awe, Jean Marsden's work is suggestive. She observes that an English obsession with sympathy in the second half of the eighteenth century led to extensive revisions of *Lear*. "Here we can find," Marsden writes, "an attempt to bring Shakespeare into the realm of sympathy, to recast his tragedies in a form that inspired not awe but 'fellow-feeling'" (Jean Marsden, "Shakespeare and Sympathy," in *Shakespeare and the Eighteenth Century*, ed. Peter Sabor and Paul Yachnin [Aldershot: Ashgate, 2008], 29).
- 36 Music is explicitly indicated in Q, where the Doctor says: "Louder the music there!" (Q.4.21.23).
- 37 Alpers eloquently describes Cordelia's words as "almost speechless gestures – the verbal equivalents of simple physical contact" ("King Lear and the Theory of the 'Sight Pattern,'" 150).

- 51 Marianne Novy, *Love's Argument: Gender Relations in Shakespeare* (Chapel Hill: University of North Carolina Press, 1984), 163.
- 52 Contemporary critics tend to see Edgar as the more suitable successor (as implied in F), but Richard Dutton and Tom Clayton show that there is a case to be made for Albany as well. See

- Richard Dutton, “*King Lear, The Triumphs of Reunited Britannia* and ‘The Matter of Britain,’” *Literature and History* 12 (1986): 146–47; and Tom Clayton, “‘The Injuries That They Themselves Procure’: Justice Poetic and Pragmatic, and Aspects of the Endplay, in *King Lear*,” in “*King Lear*”: *New Critical Essays*, ed. Jeffrey Kahan (New York: Routledge, 2008), 198–203.
- 53 See Jerry Wasserman, “‘And Every One Have Need of Other’: Bond and Relationship in *King Lear*,” *Mosaic* 9 (1976): 22.
- 54 Simon Critchley, “Five Problems in Levinas’s View of Politics and the Sketch of a Solution to Them,” *Political Theory* 32 (2004): 182.
- 55 I am indebted to John Llewelyn for the distinction between *l'éthique* and *une éthique*. See John Llewelyn, “In the Name of Philosophy,” *Research in Phenomenology* 28 (1998): 39.
- 56 In contrasting Kant and Levinas, I lean heavily on the ideas and phrasing of Hilary Putnam. See Putnam, “Levinas and Judaism,” 54–55.
- 57 “To approach the Other in conversation is to welcome his expression, in which at each instant he overflows the idea a thought would carry away from it. It is therefore to *receive* from the Other beyond the capacity of the I.... The relation with the Other, or Conversation, is a non-allergic relation, an ethical relation” (Levinas, *Totality and Infinity*, 51).
- 58 “We are all guilty of all and for all men before all, and I more than the others” (Fyodor Dostoyevsky, *The Brothers Karamazov*, trans. Constance Garnett [New York: New American Library, 1957], 264).
- 59 For useful summaries of Levinas’s statements on art, see C. Fred Alford, “The Opposite of Totality: Levinas and the Frankfurt School,” *Theory and Society* 31 (2002): 238–39; and Gerald L. Bruns, “The Concepts of Art and Poetry in Emmanuel Levinas’s Writings,” in Critchley and Bernasconi, *Cambridge Companion to Levinas*, 206–33.
- 60 As Jill Robbins demonstrates in her admirable study of Levinas and literature, it is virtually impossible to cull a coherent theory of literary criticism from Levinas’s thought and practice. By turning to his Talmudic writings, I oversimplify the situation and draw what might be unpardonable parallels. Nevertheless, I hope that the suggestiveness of the maneuver will make up for its recklessness. See Jill Robbins, *Altered Realities: Levinas and Literature* (University of Chicago Press, 1999).
- 61 Emmanuel Levinas, *Nine Talmudic Readings*, trans. Annette Aronowicz (Bloomington: Indiana University Press, 1990), 79.
- 62 This paragraph is drawn from Catherine Chalier, “Levinas and the Talmud,” trans. Annette Aronowicz, in Critchley and Bernasconi, *Cambridge Companion to Levinas*, 103–4.
- 63 Critchley uses the term in a discussion of Levinas and politics. Noting that government tends to become tyrannical when left to itself, Critchley commends the way Levinas’s ethical ideas can cultivate forms of “dissensual emancipatory praxis” that “work against the consensual idyll of the state, not in order to do away with the state or consensus, but to bring about its endless betterment” (“Five Problems in Levinas’s View of Politics,” 183).

# CHAPTER 10

## Theory in Practice

### *The Baby or the Violin: Ethics and Femininity in the Fiction of Alice Munro*

*Naomi Morgenstern*

Naomi Morgenstern is an Assistant Professor in the Department of English at the University of Toronto. She has published essays on Willa Cather, Toni Morrison, E. L. Doctorow, and feminist and psychoanalytic theory.

*Doing this in the name of the good, and even more in the name of the good of the other, is something that is far from protecting us not only from guilt but also from all kinds of inner catastrophes.*

— Jacques Lacan

*Ahhhh! No Lessons. No lessons ever!*

— Alice Munro

When asked in a 1982 interview whether or not she “embed[s] lessons in [her] stories,” Alice Munro objected in no uncertain terms (Hancock 223). And surely no one would want to call Alice Munro a “moral” writer. Her narrators and central characters provocatively resist final acts of judgment, leaving readers confronted by the complexities and impossibilities that characterize the ethical.<sup>1</sup> The name *morality*, Derek Attridge has recently suggested, is often given to “specific obligations governing concrete situations in a social context, which require the greatest possible control of outcomes,” whereas ethical demands involve “responsibility” and “obligation,” but also “unpredictability and risk” (28).<sup>2</sup> Munro’s stories represent the risks of the ethical (the possibility that the call from the other has been misidentified; the possibility that the other’s otherness has been compromised in the work of responding; the risk that the subject of

*Original publication details:* Naomi Morgenstern, “The Baby or the Violin: Ethics and Femininity in the Fiction of Alice Munro.” *Lit: Literature Interpretation Theory*, 14.2, pp. 69–97. Reproduced with permission from Taylor & Francis.

an ethical intervention will never recover herself) even as they insist on giving us nothing but “specific obligations” and “concrete situations.”

Take, for example, the recent “Post and Beam.” Lorna, a young married woman with two children, is visited by her needy cousin Polly. Already weighed down with responsibility and fantasizing of escape, Lorna wants to be able to think of Polly and her other relatives back home as “some people she knew and liked but was not responsible for” (103). “You should live your own life,” Lorna tells her older cousin with exasperation (100). But when Lorna and her husband and children go away for the weekend, leaving the houseguest behind, Lorna is tormented by the thought – the very definitive image – of a Polly who will have committed suicide in their absence. Lorna will have failed Polly; she will not have responded to her call. For Lorna, it is as if others are at risk if one refuses to take responsibility for them (which is, of course – just to complicate matters – sometimes the case). In the car on the way home Lorna tries to reason her way out of responsibility for Polly. After all, Polly is an adult; Lorna has children of her own to care for. But “No sooner had she put the argument in place than she felt the body knock against the door as they tried to push it open. The deadweight, the gray body. The body of Polly who had been given nothing at all” (105).

Lorna’s attempt to reason her way out of concern for her cousin is disrupted by something which has the feel of exteriority: “No sooner had she put the argument in place than she felt the body knock against the door as they tried to push it open” (105). Munro’s words here demand careful attention: Lorna’s call to responsibility is experienced as the uncannily intentional “knock” on the door given by a corpse. This corpse, moreover, has been put into motion by the subject’s attempt to respond (by opening the door). Lorna’s image (for it is, after all, *her* corpse – *her* conjuration) figures the call of responsibility as a call from beyond; the dead body of Polly knocks against Lorna’s reasoning, even as it is Lorna’s concerned pushing that sets the body in motion. Lorna is more than aware of the “neurotic,” “primitive,” childish nature of her fears and their tendency to discount the otherness of others even as they overcome her with concern. Nevertheless, she cannot shake the knocking of the corpse and so decides to make a “bargain” on the drive home (109). What will she, Lorna, have to sacrifice, so that Polly will survive her betrayal? When Lorna returns home, Polly is more than all right. She stands strongly independent and may even have taken up with the “friend of the family,” Lionel, who had represented Lorna’s own fantastic possibilities of escape, a possible shadowy affair (106). What Lorna realizes is that others exist independently of her fantasy life and psychic economy. She looks out on the backyard at her husband, Brendan, at Polly, at Lionel, at her daughter Elizabeth, at their mundanely pleasant interactions, their otherness, their separateness, the fact that they are all temporarily happy without her. It is both something of a miracle and the simplest of truths: “How had that happened? [...] A scene so ordinary and amazing come about as if by magic. Everybody happy” (108).

The end of “Post and Beam” tells us, with a jolt, that this all happened long ago (something we both know and do not know as we read the story) and that Lorna will continue to make bargains. In other words, she will repeatedly confuse herself with others: “It was a long time ago that this happened. In North Vancouver, when they lived in the post-and-beam house. When she was twenty-four years old and new to bargaining” (109). Why, then, Munro’s story leads us to ask, does the ethical insight – that the other exists beyond the self – need to be repeated? Why does it fail to sustain itself? Munro’s stories, I will argue, offer us more than one answer. First of all, they suggest that we

cannot but live in the stories we tell ourselves; if confusing life with literary narrative is a mistake, it is also an inevitable one (Munro's stories insist on this again and again).<sup>3</sup> The unmaking and remaking of a subject and the world she inhabits are a repeated process in Munro's fiction. But the stories do not allow us to stop here; the ethical insight is also impossible to maintain because this simple truth – that the other is radically exterior – is simultaneously false. And this is why many have contended that ethics are “impossible” or “paradoxical.” (“It is on the basis of the thinking of a certain impossibility,” writes Jill Robbins, “that the ethical becomes legible” [xv].) How can one reach out to the other without doing violence to their otherness in the very attempt to fold them into the self’s understanding? How can an encounter with alterity not do violence to the encountering subject (ethical responsibility, writes Emmanuel Levinas, “requires subjectivity as an irreplaceable hostage [...] my being that belongs to me and not to another is undone” [qtd. in Keenan 20])?<sup>4</sup> Would the subject be capable of ethical response if he or she were not already the subject of a constitutive alterity? “If the settled patterns of my mental world,” writes Derek Attridge, “have been so freed up that the truly other finds a welcome, my subjectivity will have been altered in some degree, and thus – especially if the cumulative effect of such events is taken into account – the self too can be said to be a creation of the other” (21). In “Post and Beam” Lorna realizes that her life itself is already the bargain, a compromise, a giving up, not discrete in itself; she is inhabited by otherness. Where in one’s life story could one hope to locate a time or space outside of dependence and responsibility?

Lorna’s back and forth between a registration of the absolute exteriority of the call to responsibility and a refusal to recognize the other’s radical exteriority (the reduction of all others to characters in the drama of the subject’s responsibility) defines a compelling engagement with the complexities of the ethical. “Can there be something,” Levinas asks, “as strange as an experience of the absolutely exterior, as contradictory in its terms as a heteronomous experience [...] whose movement unto the other is not recuperated in identification, does not return to its point of departure [?]” (“Trace of the Other” 348). Munro’s characters experience ethical crisis as an encounter with demands that cannot be comfortably located or coherently translated, and this is part of their appeal and their sophistication. It is not easy to describe who or what one responds to in the ethical moment (“Exactly *to* whom we are responsible or answerable in this situation is one of the questions I shall have to leave unaddressed,” writes Attridge [27]; “A fragility at the limit of non-being,” is one of the ways Levinas finds to describe that which calls one to responsibility [*Totality* 258]), but in Munro’s fiction the relationship established by ethical responsibility resists the banality of an economic exchange – of needs and their satisfaction; of knowledge and understanding – between two intentionalities figured as equal partners. The call of the other in “Post and Beam” is indissociable from the force exerted by the same; the call is as much Lorna’s as is her attempt to reason a way out of responsibility. In this respect the story suggests that the possibility of an ethical response is linked to the violence of an attempt to contain the other’s otherness within an economy of the same. But as Jacques Derrida writes in his commentary on Levinas, “the irreducible violence of the relation to the other, is at the same time nonviolence, since it opens the relation to the other” (“Violence” 128–29).

Alice Munro’s stories of ethical crisis, then, depict characters responding – or failing to respond – to calls defined by their ambiguous intentionality and potential meaninglessness. Hesitating on the border between the mechanical and the human, the physiological and the intentional, or the outside and the inside of the psyche, these calls put

language, and hence being, into question. In what follows, I want to elaborate on the relationship between ethics and intersubjectivity in Munro's fiction by focusing on two stories in which a dreaming woman is called, quite literally, to responsibility by cries that verge on the inhuman: that of a yowling, nameless woman in "Meneseteung," and a screaming infant, who also happens to be the narrator, in "My Mother's Dream." While dreams are usually taken to be the "royal road" to the individual's unconscious, in Munro's narratives, I claim, dreams fleetingly register the other's otherness. In reading "Meneseteung" and "My Mother's Dream" together, then, I am insisting on their specific registration of an ethical dilemma. These stories explore the impossibility of the ethical and the crises of responsibility generated by ethical relations, and they address the question of why it is that the ethical insight – that the other exists beyond the self – needs to be repeated. In addition, I want to pay particular attention to the ways in which these stories inflect ethical encounters with crises of gendered subjectivity. In Munro's stories, sexual difference is never left behind, but neither is it simply mapped onto the opposition between self and other. "Meneseteung" presents us with what I will call an ethical "primal scene" that threatens conventional femininity and its accompanying limited and calculable acts of generosity, while "My Mother's Dream" explores the relationship between object loss, lack, and gendered subjecthood. Re-reading the classical psychoanalytic account, Munro provocatively suggests that "femininity" reconsidered may coincide with the relational itself. These are feminist stories, I argue, that repeatedly refuse to think of ethical questions as separable from embodied life (although, of course, this does not mean that involving the body provides any simple answers). Munro's stories, I suggest, can be read to expose the mystical and somewhat desperate fiction (woman and man as "opposite" sexes) that has been crucial to notions of alterity promised by the metaphysics of presence.

Recently critics have argued that while Munro herself is no theorist, her writing speaks powerfully to feminism and to literary theory.<sup>5</sup> While concurring with this assessment, I add that Munro's stories have much to contribute to contemporary efforts to think about literariness and ethics.<sup>6</sup> Intriguingly, Magdalene Redekop's study of Munro's fiction ends (except for the postscript) with an insistent repetition of the word "responsibility." "Meneseteung," she argues, defines "an explicit *responsibility* – that of the contemporary woman writer to the voices of the past. It is a *responsibility*, however, that is linked to the writer's *responsibility* to her craft [...] The writer's *responsibility*, in turn, is linked by Munro to our *responsibilities* in the real world that contains a river called the 'Meneseteung'" (228; italics mine). This insistence, then, is my starting point for a consideration of gender and ethics in the fiction of Alice Munro.<sup>7</sup>

### "Meneseteung"

In "Meneseteung" an unnamed narrator tells the story of a nineteenth-century Canadian woman poet, Almeda Roth, who is the author of a single conventional book of poems entitled *Offerings*. Five years after the publication of her book, Almeda is contemplating the possibility of marriage to her neighbor, the widower Jarvis Poulter. But Almeda awakens from a dream one night to hear a horrible racket: a fight between a drunken man and woman and what might be a call for help. Knowing that she must do something, Almeda only goes back to sleep. She is re-awakened by the "sorrowful" voice of a crow (505). There is a woman's body lying up against her back gate. Almeda assumes that the

woman is dead, and that she, Almeda, has failed to take responsibility for her. She goes to Jarvis Poulter for help. The woman, it turns out, is not dead at all. She heaves herself up onto all fours and calls out inarticulately. Ultimately, she is shooed off the premises by Mr. Poulter, who would preclude, or at least contain, Almeda's encounter with otherness. He is a proper and "productive" subject, possessed of a "lively commercial spirit"; "Stop it. Gwan home, now. Gwan home, where you belong," he says to the woman (513, 507). But if the woman retreats to where she "belongs" (even in this almost allegorical story one only glimpses otherness), where Almeda "belongs" is forever unsettled.

Far from welcoming, then, what another nineteenth-century poet called the "merge" (Walt Whitman's "Who need be afraid of the merge?" 31) and the interchangeability of "you" and "I" ("And what I assume, you shall assume" 25), Almeda's daily life in what was once the "wilds of Canada West" reproduces rigid structures of distinction:

Almeda Roth's house faces on Dufferin Street, which is a street of considerable respectability. On this street, merchants, a mill owner, an operator of salt wells have their houses. But Pearl Street, which her back windows overlook and back gate opens onto, is another story. Workmen's houses are adjacent to hers. Small but decent row houses – that is all right. Things deteriorate toward the end of the block, and the next, last one becomes dismal. Nobody but the poorest people, the unrespectable and undeserving poor, would live there at the edge of a boghole (drained since then), called the Pearl Street Swamp. Bushy and luxuriant weeds grow there, makeshift shacks have been put up, there are piles of refuse and debris and crowds of runty children, slops are slung from doorways. The town tries to compel these people to build privies, but they would just as soon go in the bushes [...] It is said that even the town constable won't go down Pearl Street on a Saturday night. (497)

This passage describes the face of respectability set in opposition to the abject body with its functions, needs, and desires ("boghole," "Swamp," "Bushy and luxuriant weeds," "runty children," "slops"). Munro forges a connection, here, between denying one's own embodiment and dehumanizing others (a familiar and convenient psychopolitical maneuver according to which only others have bodies that are messy, reproduce, decay, and die). But this does not mean that the entire world beyond Almeda's psyche is only the projection of Almeda's psyche. And, I would contend, "Meneseteung" is most compelling insofar as it is *not* a psychological tale, or rather insofar as it allegorizes the necessary limitations of such a narration. Instead, the narrator tells us that Almeda Roth's back gate opens onto "another story": not "reality" but a potentially new center; not incoherence and unviability itself, but rather what might throw one version of coherence into crisis. It is when this crisis occurs, when the closed system is interrupted, that we can locate an ethical moment in the text.<sup>8</sup>

It is the encounter between Almeda and the nameless woman that constitutes the primary ethical scene in "Meneseteung." Moreover, this primary scene is also a *primal* scene, both because it is propped on the familiar psychoanalytic primal scene (Almeda witnesses and fantasizes an enigmatic encounter between a man and woman that is both puzzlingly erotic and perceived as violent), and because it so clearly delineates a structure – the subject's glimpse of the other's otherness – that can serve as an "origin" for exploring ethics in Munro's fiction. If the psychoanalytic primal scene is classically a "solution" to explain away a childhood enigma, this ethical primal scene is a crisis that disturbs language, identity, and recognizable social relations. The nameless woman appears on the threshold of Almeda's world and "asks" for something, demands something, beyond what Almeda knows and is accustomed to giving. If Almeda only

glimpses the other's otherness, she is simultaneously overexposed. The "call" is strangely impersonal, verging on the inhuman (Levinas writes of the "wild barbarian character of alterity" ["Trace" 345]), and Almeda's subjecthood is taken "hostage" in the encounter. Almeda will never be the same again.<sup>9</sup>

"Meneseteung" narrates the request for a radical "gift": Almeda Roth is asked to give something more, something that exceeds those conventionally feminine offerings she is accustomed to giving. Almeda writes in the preface to her book, *Offerings*, that her poems stand in the place of embroidery; we are told she suffers a "tendency toward fancy iced cakes and decorated tarts" (500), and on a certain hot Saturday in August she makes "little jars of grape jelly" for they "will make fine Christmas presents, or *offerings* to the sick" (503). "Meneseteung," that is to say, presents us with an ethical demand (what I am calling the *gift* as opposed to the *offering*) that disrupts and exceeds the gendered economy of daily life in nineteenth-century Ontario. Almeda is called on to be responsible for another, and this initiates a crisis in her very being and arguably in the very coherence of the linguistic/symbolic order as such (Blanchot writes: "My responsibility for the Other presupposes an overturning such that it can only be marked by a change in the status of 'me,' a change in time and perhaps in language. Responsibility, which withdraws me from my order – perhaps from all orders and from order itself – responsibility, which separates me from myself [...]" [25]). Almeda begins to write a masterwork that will never – *could* never – assume form, and she simultaneously goes over to the "other" side, becoming indistinguishable from the other she failed to help. Almeda is ultimately relegated to the margins of social coherence and viability.<sup>10</sup>

What distinguishes the call to responsibility in this story (and recalls similar structures in other stories by Munro) is the liminal state in which the subject of ethical crisis experiences the call to responsibility. Thus it is in between waking and sleeping, and in a semi-drugged condition, that Almeda Roth experiences her encounter with the other woman. Almeda still sleeps in her childhood bedroom in the back of the house. Her window opens out onto Pearl Street. One hot August night, after having begun the preparations for making grape jelly, Almeda goes to sleep with her window open: "When she wakes up, the night seems fiery hot and full of threats. She lies sweating on her bed, and she has the impression that the noises she hears are knives and saws and axes – all angry implements chopping and jabbing and boring within her head. But it isn't true" (504).<sup>11</sup> The noises are not *just* in Almeda's head. The unconscious is outside. The scene gradually shapes itself into a more and more recognizable primal encounter that "confuses" sexuality and violence: "just the two figures come on and grapple, and break loose again and finally fall down against Almeda's fence. The sound they make becomes very confused – gagging, vomiting, grunting, pounding. Then a long, vibrating, choking sound of pain and self-abasement, self-abandonment, which could come from either or both of them" (505).

In addition to being a primal scene, however, this scene is both a fantastic beating scene and a scene of real sexual violence: "Two voices gradually distinguish themselves – a rising and falling howling cry and a steady throbbing low-pitched stream of abuse that contains all those words which Almeda associates with danger and depravity and foul smells and disgusting sights. Someone – the person crying out 'Kill me! Kill me now!' – is being beaten. A woman is being beaten [...] Yet there is something taunting and triumphant about her cry. There is something theatrical about it" (504).<sup>12</sup> Here then is Almeda's dilemma: "Is that the sound of murder she has heard? What is to be done, what is she to do? She must light a lantern, she must go downstairs and light a lantern – she

must go out into the yard, she must go downstairs. Into the yard. The lantern” (505). Almeda knows what she “must” do – and in this sense there is no dilemma – and then she falls asleep.

Almeda wakes the next morning to the sound of a “big crow” talking in a “disapproving but unsurprised way [...] ‘Wake up and move the wheelbarrow!’ it says to her scolding, and she understands that it means something else by ‘wheelbarrow’ – something foul and sorrowful. Then she is awake and sees that there is no such bird” (505).<sup>13</sup> “Meneseteung,” in other words, suggests that the call of another can only be heard by something other than consciousness, by something “beyond” one’s self-sufficient fictions, even as a return to sleep also constitutes a flight (“*What is it that wakes the sleeper?*” writes Lacan, “Is it not, *in the dream, another reality?*” [58]). Almeda looks out the window and sees “a body.” Significantly, Almeda cannot see the body’s face. The other woman will not emerge as another subject, instead this body is all body, all animal; it is grotesque (“Smelling of vomit. Urine, drink, vomit” [506]), and yet unsettlingly aestheticizable (“the haunch showing a bruise as big as a sunflower” [506]). Almeda “runs away” to Poulter’s house for help. “There is the body of a woman,” she says (506). Poulter and Almeda enter the Roth yard to encounter the body. Its existence exceeds any fantastic need Almeda might have had to conjure it up. “Of course the body is still there. Hunched up, half bare, the same as before” (507). While Almeda feels compelled to express that the unconscious or possibly even dead woman lying against her fence is in some way her responsibility, Poulter shows no qualms about treating the anonymous woman like an animal and with absolute disgust and disdain. But then the woman “speaks” for herself:

Now a startling thing happens. The body heaves itself onto all fours, the head is lifted – the hair all matted with blood and vomit – and the woman begins to bang this head, hard and rhythmically, against Almeda Roth’s picket fence. As she bangs her head, she finds her voice and lets out an openmouthed yowl, full of strength and what sounds like an anguished pleasure. (507)

One might read this moment (“she bangs her head, she finds her voice”) as a parody of feminist aspiration, or perhaps as a dark version of Whitman’s “barbaric yawp.” One witnesses here a scandalous moment of masochistic pleasure lodged in a speaking and insistent body that Almeda cannot claim and “celebrate” (as in Whitman’s “I celebrate myself”). The woman who “bangs her head” and “finds her voice,” I would argue, represents a crisis in the symbolic order. The yowling woman represents a plenitude that exists on the periphery; she is literally banging her head on that which divides. And this plenitude includes the body, the specifically female body (this encounter also marks the onset of Almeda’s menstruation), the lives that might feature in other stories that would be differently centered, and that scandalous sexuality which does not know pleasure from pain. It also includes the call of an other, the call to be responsible for an other, to recognize what disrupts one’s singular economy.

In 1929 V. N. Volosinov argued that there was only one use of the human voice that could be said to be asocial, prior to signification: “The animal cry, the pure response to pain in the organism, is bereft of accent; it is a purely natural phenomenon. For such a cry, the social atmosphere is irrelevant, and therefore it does not contain even the germ of sign formation” (21–22). Otherwise, Volosinov held, all signs were ideological and the “individual consciousness” was “ideological through and through” (22). But

“Meneseteung” encourages us to hesitate before making such binary distinctions: the cry of pain on one side, the entirety of human signification on the other. For Volosinov’s cry, like the voice in Munro’s story, destabilizes the symbolic, revealing that its apparent closure is merely contingent. If bodies speak, language also must be said to have a body, and this is why there can be no absolutely unique voice (so much for the idealized rendering of finding one’s own voice: everything begins with reproduction). Furthermore, it is because of this irreducible destabilization that there is always something new to be said, something not yet signified, a cry from beyond.<sup>14</sup> If Munro’s stories explore the potential collapse of language into sheer materiality (a collapse that takes place on the border of the human and the animal, the human and the machine, the living and the dead), they also recognize this space as generative and ethical. The cry from beyond is simultaneously a cry from the internal border of language, from that in language which, without precedent or preparation, is nevertheless at home in language (“an at home that is given, or, rather, loaned, allotted, advanced before every contract, in the ‘anachronism of a debt preceding the loan’” [Derrida, *Adieu* 99]).

After the woman stumbles off, Almeda will retreat into her house, consume several drops of “nerve medicine” in her tea, and, in an account resembling “The Yellow Wallpaper” (another story about madness, freedom, and responsibility for others who are also the self), she will begin to hallucinate: “A lot of things to watch. For every one of these patterns, decorations seems charged with life, ready to move and flow and alter. Or possibly to explode. Almeda Roth’s occupation throughout the day is to keep an eye on them” (510). What was once decorous, decorative, and feminine is in danger of exploding (we are reminded earlier in the story that single men never decorate their houses). Almeda now imagines “one very great poem that will contain everything [...] Stars and flowers and birds and trees and angels in the snow and dead children at twilight – that is not the half of it. You have to get in the obscene racket on Pearl Street and the polished toes of Jarvis Poulter’s boot and the plucked chicken haunch with its blue-black flower” (510–11). Her *Leaves of Grass* would be “Meneseteung”: “All this can be borne only if it is channeled into a poem, and the word *channeled* is appropriate, because the name of the poem will be – it *is* – ‘The Meneseteung.’ The name of the poem is the name of the river. No, in fact it is the river, the Meneseteung, that is the poem – ” (511). Almeda no longer thinks of “what could be done for that woman” (and the wording and perspective here are crucial), nor does she imagine herself as Jarvis Poulter’s wife “keeping [his] dinner warm and hanging his long underwear on the line” (511). That she no longer thinks of either of these relations suggests that the order and divisions that delimit and give form to Almeda’s world have been suspended. We are beyond the home economics of cooking and laundry and traditional self-sacrificing femininity and even beyond a calculable model of responsibility (doing for others). Almeda could be said to inhabit the space of “a dissident and inventive rupture with respect to tradition, authority, orthodoxy, rule, or doctrine”; the space, in other words, in which responsibility can be found.<sup>15</sup>

In fact, Almeda would already seem to have *become* the overembodied other. “On her way through the kitchen, she walks through the pool of grape juice. She knows that she will have to mop it up, but not yet, and she walks upstairs leaving purple footprints and smelling her escaping blood and the sweat of her body that has sat all day in the closed room” (511). But neither this, nor her hallucinatory state, alarms her. “For she hasn’t thought that crocheted roses could float away or that tombstones could hurry down the street. She doesn’t mistake that for reality, and neither does she mistake anything else for reality, and that is how she knows that she is sane” (512). But to be sane, of course, *is* to

mistake a familiar order for reality, and in this sense insanity is intimately bound up with the possibility of ethical relations. Even as Almeda fails the other woman, her crisis must be said to be an ethical one. There has been a suspension of the closed story, a suspension of cultural coherence, without which an ethical encounter cannot be said to have taken place. Ethics, in “Meneseteung,” is indistinguishable from insanity, from being out of one’s (own) mind.<sup>16</sup>

In the wake of their abortive courtship, Almeda Roth and Jarvis Poulter go on to lead separate lives and die separate deaths. The local newspaper, the *Vidette*, describes Almeda’s end:

She had become, in the eyes of those unmindful of her former pride and daintiness, a familiar eccentric, or even, sadly, a figure of fun [...] Her last illness was of mercifully short duration. She caught cold, after having become thoroughly wet from a ramble in the Pearl Street bog. (It has been said that some urchins chased her into the water, and such is the boldness and cruelty of some of our youth, and their observed persecution of this lady, that the tale cannot be entirely discounted.) (512)

One must note here how completely Almeda has become the other, one of those not quite distinguishable characters of Pearl Street. Almeda has gone out her back door never to return, recalling, in the end, both the old, drunken “Queen Aggie” and, of course, the nameless, faceless, yowling figure. Instead of refusing the other, failing to hear the other, constructing a coherence based on his or her exclusion, Almeda opts for a more Whitmanesque “solution” (“I am the man, I suffered, I was there”). While to *become* the other is certainly not what anyone would want to call ethical, Munro’s story insists on marking the ethical as a crisis for language, for social structures, and for the individual being’s coherence.

Almeda is called to responsibility more than once: “Wake up and move the wheelbarrow!” says the crow. But as the reader schooled in dreams and close reading will notice, this discordant signifier that calls Almeda does not come from her own psychic store of the day’s fragments. It comes instead from a story in the *Vidette* and/or from the narrator’s reconstructed history. We are told at the very beginning of the story of “Queen Aggie”: “They get her into a wheelbarrow and trundle her all over town, then dump her into a ditch to sober her up” (496). The “wheelbarrow” stands metonymically for the other woman in her otherness and in her abject embodiment. Perhaps this is one more “clue” as to the unreliability of the narrator; she gives herself away in making the other’s “dream” (Almeda’s) her own. But more intriguingly, I would suggest, since the wheelbarrow is “beyond” Almeda, it also disrupts our illusion that she is a discrete individual. “The responsibility with which I am charged is not mine,” writes Blanchot, “and makes me no longer myself” (13). “Wheelbarrow” (the word itself) conveys, within Munro’s story, the very interruption of the sovereign subject that constitutes a call to ethics.<sup>17</sup>

### “My Mother’s Dream”

“Meneseteung” is not the only Alice Munro story in which a character is called to responsibility from within a dream. “My Mother’s Dream,” which stages a conflict between two who would presume to be sovereign subjects (they are referred to as “monsters”), also includes such a call. In the dream a very young baby has been left out

overnight by its mother ("and perhaps it was not last night but a week or month ago that she had done this" [294]), and the call comes, strikingly, as a silence (prior to the dream, the baby has done nothing but scream – the baby could even be said to have been holding its mother hostage to this scream). In reading the ethical encounter that takes place in "My Mother's Dream," however, I also want to pay particular attention to this story's explicit suggestion that the encounter coincides with an origin for sexual difference. Munro's story succeeds, I suggest, in combining an enquiry into the ethical relation with a feminist critique of the modern sex/gender system.

In Freud's myth of the origin of sexual difference, both the boy and the girl must address the crisis of lack. For the boy, time is the way out. He cannot have his pleasure now, but he can defer it: someday he will be like his father and have a love object like his mother. So the story goes. The girl, on the other hand, has no way out. She can deny "reality" and insist on her own masculinity ("The hope of some day obtaining a penis in spite of everything and so of becoming like a man may persist to an incredibly late age and may become a motive for strange and otherwise unaccountable actions" [Freud, "Some Psychical Consequences" 337]); she can suffer in woundedness, or she can take up a masculine identification that allows her to regard other women with scorn and contempt. There is certainly no "authentic" feminine position to be found here, and this, of course, is what feminists have both despised Freud for and precisely what they have found most insightful in his work. (Freud was recuperated for feminism with Juliet Mitchell's influential claim and productive misreading: psychoanalysis is not a prescription for, but rather a description of, the patriarchal unconscious.) How, then, do we take a loss? After all, Freud insists, we are profoundly conservative creatures. Our very development as subjects paradoxically consists in a series of "vigorous attempts" to recreate the past ("On Narcissism" 95). We never give up a pleasure, a satisfaction, an object, without the most tremendous resistance. "The opposition [to loss] can be so intense," Freud claims, "that a turning away from reality takes place and a clinging to the object through the medium of a hallucinatory wishful psychosis" ("Mourning and Melancholia" 253). The enigma of femininity for Freud is thus, I would claim, the enigma of lack. How do women put up with it? And what do they really want anyway? While there is a certain slippage in my account (between loss-of-the-other and self-loss or loss-of-wholeness), it is precisely the interrelatedness of object loss and lack, I argue, that Alice Munro addresses so profoundly in "My Mother's Dream."

Recent feminist and queer explorations of psychoanalytic theory have reread Freud's account by pointing to a peculiar and culturally dominant equation: the opposition between self and other is understood as being equivalent to the opposition between the sexes. Judith Butler asks, "But why is sexual difference the primary guarantor of loss in our psychic lives? And can all separation and loss be traced back to that structuring loss of the other sex by which we emerge as this sexed being in the world?" (164–65). Similarly, Michael Warner wonders, "why is gender assumed to be our only access to alterity?" (200). He asserts: "the assumption that gender is the phenomenology of difference itself [...] is a staggeringly primitive confusion" (200). In "My Mother's Dream," Munro, too, retells Freud's story of assuming a sexed identity. But while continuing to associate femaleness with loss, "My Mother's Dream" also suggests that the "feminine" "choice" of loss or lack is a choice akin to a life drive, a will to survive. Annihilation, on the one hand, and triumph, on the other, are by implication the more "masculine" options.<sup>18</sup> The oldest of misogynist associations of women with death may actually be an intolerance of the other's ability to *survive* precisely as a subject of lack.

It is not incidental, I would add, that “My Mother’s Dream” is narrated from an impossible position. The narrator narrates from, or at least knows of, “her” intrauterine existence, and “her” life as a pre-verbal non-subject. Indeed, the story is haunted by the possibility that its narrator may very well be a *dead* baby. But it is precisely by speaking in fiction from this impossible place, as I hope to show, that Munro can restage both the birth of the (sexed) subject and the origin of human relatedness (the ethical).

We begin the story in the dream. The dreamer, Jill, looks out from a high spacious house onto a snowy world (“snow had settled overnight on the luxury of summer” [293]). The dreamer has the sense that there is something she has forgotten. She goes outside and remembers: “She had left a baby out there somewhere, before the snow had fallen” (294). She is overcome with horror. And it is “as if” she is awakening from a dream within the dream. She awakens “to a knowledge of her responsibility and mistake” (294). She awakens within the dream a second time (in fact, the states of waking and sleeping are decidedly uncertain from the very start) and discovers that the baby is alive and asleep in its crib. The baby becomes “her” baby: “Red hair like her own on her perfectly safe and unmistakable baby” (295). The dream is simultaneously a wish fulfilled (to have no demand made of her, to have no responsibility, no relation to the baby) and a realization of Jill’s most intense fear: she has killed the baby, and is thus utterly and forever responsible for its being. Freud writes at length on dreaming about the death of those we love, but in Munro’s story it is the death wish that makes “love” possible. It is by encountering the loss of her child that the mother claims the child, becomes its mother, for the *first* time. Freud writes of childhood development and object love that “the finding of an object is in fact a refinding of it” (*Three Essays* 145). Munro could be said to explore this paradox non-developmentally and from the other side: the only object one can “have” is a “lost” one.<sup>19</sup> In fact, in a provocative way the story contains an alternative trajectory in which the baby *does* die, and the story is narrated by this dead baby. This is an illusion (and a radical figuration of the call from beyond) that the completion of the tale both dismisses and sustains: in the end the narrator refers to herself as a “ghost.” In this alternative version the mother’s first “awakening” within the dream would be the true one. And this mother, who comes to pass as the most normal of mothers, would then be a murderer. Thus in Munro, dreams *can* concern responsibility for another (which needs to be contemplated since, as Freud tells us, there is no such thing as an altruistic dream; dreams, like children, are entirely egoistic), and this is in part because they explore the unconscious that is “outside.” While Almeda Roth is “awakened” by the “racket on Pearl Street,” Jill will later refer to her sister-in-law as having “got[ten] into the wrong part of the dream” (329). Munro’s dreams, in other words, rehearse the paradoxes of the ethical: the egoistic closure of the dream may simultaneously open up a space in which otherness can be encountered.

“My Mother’s Dream” concerns a battle between mother and newborn; the dream itself is the culmination of the battle. The narrator of Munro’s story asserts, “We were monsters to each other. Jill and I” (321). In “My Monster/My Self,” Barbara Johnson comments, “The idea that a mother can loathe, fear, and reject her baby has until recently been one of the most repressed of psychoanalytical insights, although it is of course already implicit in the story of Oedipus, whose parents cast him out as an infant to die” (149–50). In Munro’s story, the mother and baby must each give up a fantastic omnipotence to find the other; death (paradoxically a more radical interrelatedness – absolute responsibility for the other) is the only other option. Thus if Freud finds it necessary to provide us with an origin for sexual difference, Munro offers us an origin for what is

“only natural”: motherhood. “My Mother’s Dream” is one of the stories in which Munro empties out and questions the naturalness of maternal desire.<sup>20</sup> But what kind of mother or non-mother or pre-mother is Jill? She certainly has her desires and they are not (in a traditional patriarchal heterosexualizing trajectory of a woman’s life) what they are supposed to be. While getting married, Jill fantasizes about pancakes and bacon, and at her husband’s wake she is dreaming of a burger and mayonnaise. Munro codes orality as female and often presents food as the currency of eroticized exchange between mother and daughter (one could look, for example, at the oral seduction that takes place in an earlier story, “Royal Beatings”). But Munro, I would suggest, is also playing with and re-materializing that idealizing question: “what does a woman want?” If woman is classically an enigma (“throughout history people have banged their heads against the riddle of the nature of femininity,” writes Freud [*Three Essays* 146]), Munro assures us that Jill is merely a “puzzle,” and to anybody who would bother to be concerned she is a “dull” one. Jill’s other desire is her violin. It is with the violin, not the baby, that she has a seemingly natural rapport (“She was sure that she and some violin were naturally, fatefully connected, and would have come together without human help” [310]). While it is suggested that it is the baby who first rejects the mother (“I refused to take my mother’s breast. I screamed blue murder. The big stiff breast might just as well have been a snouted beast rummaging in my face” [314]), the mother does not seem to mind. In fact, she experiences her relationship to her violin, as opposed to the baby, as the “responsibility” that she has taken on in life.

Not surprisingly, the baby, while consistently rejecting her mother, also has an incredibly antagonistic relationship to her mother’s instrument (the sign, or sound, of her mother’s desire and self-possession). This baby wants to have her cake and eat it too: she wants both to reject her mother and make an absolute claim on her. After the baby’s birth, Jill tries to play the violin again: “I woke without a whimper of discontent. No warning, no buildup. Just a shriek, a waterfall of shrieks descended on the house a cry unlike any cry I’d managed before. The letting loose of a new flood of unsuspected anguish, a grief that punished the world with its waves full of stones, the volley of woe sent down from the windows of the torture chamber” (317–18). The impossible baby narrator thus verbalizes her prelinguistic intentions: “My crying is a knife to cut out of her life all that isn’t useful. To me” (319). And although the daughter narrates, it is hard not to identify with Jill. The baby’s demands are absolute (as babies’ demands are); they constitute an “assault” with the power to “annihilate” (“Responsibility,” writes Jill Robbins, “feels like persecution, if it is not ethics” [16]). With absolutely no exaggeration one can make the claim that the baby in this text is figured as an axe-wielding psychopathic murderer, as well as a pale, sweet, fuzzy-headed darling wearing plastic pants with a pattern of butterflies.<sup>21</sup>

The end of the story finds the baby and the violin quite literally in the same place: shoved under the couch. Jill significantly rescues the baby first; although she will go on to play the violin again, professionally and quite successfully. Jill, as I have argued, claims her baby and thus becomes a mother only after suffering the baby’s loss in the dream. Whereas the loss of Jill’s husband (who is killed in World War II, almost immediately after their marriage) is described as the loss of an “extension [with] lighted rooms showing up full of a bewildering sort of splendor,” the loss of the baby threatens to eliminate Jill’s internal constitutive space: “There would never be any room in her for anything else. No room for anything” (306, 295).<sup>22</sup> Moreover, the mother curiously feels all the more sorrow for the baby as a pre-desiring, pre-subject, who does not even know that it

is her, its mother, that it lacks: “The sorrow that came to my mother was the sorrow of the baby’s waiting and not knowing it waited for her, its only hope, when she had forgotten all about it. So small and new a baby that could not even turn away from the snow. She could hardly breathe for her sorrow” (293–94). The baby is a subject on the edge, both tyrant and victim. This is not, however, because the baby has not yet established a self/other distinction, but rather because the distinction is dangerously absolute. Thus her cry, or lack thereof, is strangely impersonal. Blanchot’s articulation of Levinasian responsibility calls out for application to the maternal and specifically to “My Mother’s Dream”: “There is a cry for help, addressed not to me in particular, not to anyone in particular, but to me as anyone – anyone can help – and my anonymity in the situation, far from offering an excuse to ignore the plea, implicates me directly” (22). With this implication comes, in Munro’s story, a crucial identification: While the mother feels overwhelming guilt, it is also hard to distinguish her from her infant (thus complicating, precisely as it establishes, responsibility for the other). Who, for example, is it that can “hardly breathe for her sorrow”?

Munro thus suggests that motherhood has to *happen* – or has to be imagined as happening. Maternal subjectivity cannot merely be assigned to the “natural” and taken for granted. For as we know, what gets assigned to the “natural” tends to return and haunt us as monstrous. There is a crucial sense, then, in which Jill is “Everymother” who must negotiate between her self and that other who is both other and self. Yet, as I have suggested, there is an alternative trajectory here, and there is also a significant third player (and it is not the father). With this other trajectory the normal (good enough?) mother and the murderer come ominously close to being interchangeable.<sup>23</sup>

When the baby is born she does not choose her mother. Instead, it is the powerless, “nervous wreck” of an aunt, Iona, who becomes the baby’s “chosen home” (314). Iona, as honorary mother, goes from being “the most negligible to being the most important person in the house” (315). She is the only one who can save the others from the baby’s potentially annihilating cries: “Touched or spoken to by a non-Iona, I cried. Put down to sleep, not rocked by Iona, I cried myself into exhaustion and slept for ten minutes and woke ready to go at it again. I had no good times or fussy times. I had the Iona-times and the Iona-desertion-times, which might become – oh, worse and worse – the other-people times, mostly Jill-times” (315). Jill, the “real” mother, reads baby books. Iona, the substitute, performs effective mothering. This structure, which is repeated in other Munro stories, challenges the unquestioned primacy of the maternal: here the substitute comes first.

But eventually the dreaded day comes, and, as a result of the other sister-in-law’s manipulations, Iona is whisked off for an overnight trip. Jill is left alone with the baby. Exhausted and unable to escape the baby’s cries, Jill eventually takes out her violin: “In a way she does me honor. No more counterfeit soothing, no more pretend lullabies or concern for tummy-ache, no petsy-wetsy whatsamatter. Instead she will play Mendelssohn’s Violin Concerto” (323). It is after midnight. Jill is nearly mad and definitively exhausted. She goes rummaging for some strong headache medicine and finds a prescription drug: “my cries coming down at her like the clamor of birds of prey over a gurgling river [...] and she thinks, Yes” (327). In addition to dosing herself, Jill shaves a tiny bit of the pill off and sprinkles it over the milk. In the drugged sleep that follows, Jill dreams the dream of the story’s title, the dream of her dead and then not dead baby. The white snow is the pill dust.

If Jill almost kills her baby (and it is by chance or accident that she does not), Iona will return home to discover a baby who is “dead.” Munro brilliantly depicts a psychic

coincidence, a mutual crisis at the site of motherhood. Iona returns home early. She is worried that she has “lost” the baby (which she has – from now on Jill will be its mother). And her fear about her own traumatic loss takes the form of accusing Jill of murder. Meanwhile, of course, Jill has come terribly close to being a murderer:

Iona ducked past her and ran up the stairs. Now she’s screaming. *Dead. Dead. Murderer.* She knows nothing about the pills. So why does she scream “Murderer”? It’s the blanket. She sees the blanket pulled up right over my head [...] It has not taken her any time, not half a second, to get from “dead” to “murderer.” It’s an immediate flying leap [...] “You’ve killed my baby,” Iona is screaming at her. Jill doesn’t correct her – she doesn’t say, *Mine.* (328)

A structure like this one in which Jill’s and Iona’s fantasies, their fears and desires, collide (Jill wants to “lose” a baby and finds one, while Iona suffers precisely the loss she dreads) certainly destabilizes an easy distinction between sleep (fantasy) and awakening (reality). And indeed, when Jill finds the baby that Iona, in her hysteria, literally hides, it is “just as in the dream she comes upon a live baby, not a little desiccated nutmeg-headed corpse” (333). Iona is depicted at the end of the story in all her mad desperation, whereas Jill has “awakened” to motherhood, responsibility, and a living baby. Pointedly, however, Munro does not discredit what Iona perceived:

She said I felt stiff. Then she said not stiff but heavy. So heavy, she said, she instantly thought I could not be alive. A lump, a dead weight. I think there is something to this. I don’t believe that I was dead, or that I came back from the dead, but I do think that I was at a distance, from which I might or might not have come back. I think that the outcome was not certain and that *will* was involved. *It was up to me,* I mean, to go one way or the other. (337; italics mine)

This is the curious “choice” that I referred to at the beginning of this discussion. The baby “chooses” survival; she chooses the “half a loaf ” of love and maternal competence that she will receive from Jill over Iona’s wholeness. In fact, the narrator goes farther and asserts that it was at this moment, when she gave up the battle with her mother, that she assumed her sexed identity:

To me it seems that it was only then that I became female. I know that the matter was decided long before I was born and was plain to everybody else since the beginning of my life, but I believe that it was only at the moment when I decided to come back, when I gave up the fight against my mother (which must have been a fight for something like her total surrender) and when in fact I chose survival over victory (death would have been victory), that I took on my female nature. And to some extent Jill took on hers. Sobered and grateful, not even able to risk thinking about what she’d just escaped, she took on loving me, because the alternative to loving was disaster. (337–38)

In Munro’s primal scene of sexed identity the assumption of femininity takes place without a man in sight! This shouldn’t surprise us, as Freud was of course able to conceptualize sexual difference only from within a fantasy of sameness, working, as many have, from the assumption that the subject is primarily male. But, more seriously, Munro’s scene intriguingly suggests that sexed identity is taken on *between* mother and daughter. Mother and daughter mutually become female in their choice to give up, to

lose out, which is also the choice of survival. They both accept the lack, which means that they will have a relationship (“this being-together as separation precedes or exceeds society, collectivity, community” writes Derrida [“Violence” 95]). Indeed, it is the irreducibility of this mutual lack that makes relationship possible, and this is why I would insist that even here, between mother and daughter, Munro gives us access to the complexities of an ethical encounter.

There is, however, another figuration of lack in “My Mother’s Dream,” one that belongs (if one can speak of a lack as belonging) neither to Jill nor to her daughter. It belongs to Iona. We are told early in the story that Iona has been subjected to shock treatments that “have blown a hole in her discretion” (presumably accomplishing precisely what they were not supposed to accomplish, leaving her less regulatable, less controllable than before) (314). And we encounter this lack again when Iona loses the baby: “she seems to be trying to squeeze the bundle of me into a new terrifying hole in the middle of her body” (328). With this “hole” Munro suggests that if femaleness is associated with lack or loss, there is more than one version of this story. If self-loss is the price some women have paid in exchange for a place in the social order (and one might think here of the “hole” in the middle of Iona’s name), another loss names the only access that there is to (inter)subjectivity.

## Conclusion

“My Mother’s Dream” presents one with almost too much theoretical weight. It is the story of a mother becoming a mother (and of the very substitutive nature of what we think of as primary), of a sexed identity being taken on, and of choosing life over death.<sup>24</sup> Much more might also be said about the specificity of ethics and the mother-child relation in Alice Munro’s fiction (the “unnatural” mother, it could be argued, is Munro’s paradigmatic ethical subject). One could also explore her interest in the writer’s responsibility to those whom he or she represents (by considering, for example, the markedly irresponsible ex-husband writer in “Material” who manages arguably ethical feats of representation). One could even interrogate the ethics of intertextuality (by looking at, among other instances, Munro’s reimagining of “The Grandmother” from O’Connor’s “A Good Man is Hard to Find”). I have tried in this essay, however, to focus on the representation of a specific ethical crisis in which the coherence of the subject is called into question from beyond. In “Meneseteung” and “My Mother’s Dream” (as well as in “Post and Beam” and others), an ethical encounter is inseparable from an encounter with the frayed edge of meaning (an edge that we might refer to as being “beyond” the social contract of intelligible communication but which we could also describe as coming before or always at work *within* such intelligibility). This inseparability in Munro’s stories recalls what Jill Robbins refers to as “thinking responsibility as a relation to the trace” (31). The enigma that these stories help us to articulate is that of a subject for whom the failure to respond to these violently absolute and uncertain cries would be experienced as an irrecoverable loss.

If Munro’s stories insist upon difficult ethical readings, however, it must be added that their humor and particularity just as insistently deflate any overly ambitious design or account. In “Lichen,” for example, Stella’s desperate ex-husband David finds younger and younger women in an attempt to deny his own aging. He invents others in order to preclude his relationship to mortality, which he manages to read as a

personal insult. Sexual difference, for this character, displaces or prevents the possibility of an ethical relation. But rather inconveniently for David, the person at the very end of life in this story is not a woman, but Stella's ninety-three-year-old father. Stella's father is the source of yet another call from beyond, from a place that borders on the inhuman:

Her father said, “David?” The sound seemed to come from a wet cave deep inside him, to be unshaped by lips or jaws or tongue [...] Up through this neck came further sounds, a conversational offering. It was the core of each syllable that was presented, a damp vowel barely held in shape by surrounding consonants. (380–81)

But for all he knows and does not know (“David knows what he’s doing. This is the interesting part of it, he thinks, and has said” [379]), David will not give up. He flees to a phone booth to call his latest obsession. Unable to get through to her, he tries her ex-boyfriend and even imagines disguising his voice on the phone. David is shaking, sweating, praying, and still there is no answer. David is ultimately addressed by an impersonal voice from beyond in the familiar guise of the telephone operator: “Sir? Do you want to keep on trying?” (380). Munro’s achievement at moments like this is to represent the pathos and comedy of language hesitating on the border between meaningless, mechanical repetition, and forceful poignancy. The call to responsibility here (or the call to depart from irresponsibility: “Do you want to keep on trying?”) comes from a voice whose materiality disrupts its presence; the “accidental” significance of the operator’s rote phrase generates the humor and the gravity of an inner catastrophe without which there is no chance for ethics.<sup>25</sup>

## Notes

- 1 In “The Children Stay,” for example, Pauline reflects on her decision to leave her young daughters to run away with her lover. “Her children have grown up. They don’t hate her. For going away or staying away. They don’t forgive her, either. Perhaps they wouldn’t have forgiven her anyway, but it would have been for something different” (213). In other words, there may well have been permanent consequences for the very personhood of the young daughters (they don’t, after all, forgive their mother), but quite possibly (even inevitably) she would have failed them otherwise. Such refusals to judge are further complicated, however, by the fact that we cannot simply attribute their insight or blindness either to the narrator or to the ostensible subject herself. (Does Pauline’s reflection offer us a reliable resistance to moralizing, or is it a guilty mother’s attempt at rationalization?)
- 2 See also Buell, Newton, and Robbins.
- 3 “It would be unfortunate [...] to confuse the materiality of the signifier with the materiality of what it signifies,” writes Paul De Man, but “it is very difficult not to conceive of the pattern of one’s past and future existence in accordance with temporal and spatial schemes that belong to fictional narratives and not to the world. This does not mean that fictional narratives are not part of the world and of reality; their impact may well be all too strong for comfort” (11).
- 4 Robbins offers a valuable account of the evolving concept of ethics in Levinas’ work:

Whereas *Totality and Infinity* described the putting into question of the self in the presence of the other, *Otherwise than Being* describes the self as always already worked over, traumatized and dispossessed by the other. In the later work, ethics does not happen to a self or a subject. The conception of responsibility and ethics that emerges is nonvoluntaristic and nonvolitional. It chooses me before I choose it. (xv)

- 5 For theoretical readings of Munro's stories as well as for more general commentary on the relationship between Munro's fiction and literary theory see Heble, Howells, Houston, and Redekop. Redekop claims that "Munro has no overt feminist agenda [and] she cannot speak the language of literary theory, [still], Munro's stories have a lot to teach theorists writing today" (xii); Heble remarks that while he would "not suggest that Munro is on the cutting edge of literary theory [...] In one way or another, her stories *themselves* signal to us that they are moving away from the myth of the transparency of linguistic representation" (13). Houston reads "Meneseteung" as a Lacanian story about language compensating for and covering over lack, and Howells appeals to a Derridean account of the supplement in her overview of Munro's fiction: "instead of placing the supplement at the end [Howells is writing of a shift she claims takes place in Munro's style in the collections of the 1980s], supplementarity pervades the whole narrative [...] unsettling the story at every stage of its telling" (11).
- 6 For general accounts of the relationship between literature and ethics in contemporary criticism and theory see Buell and Harpham. Buell has argued that ethics may "become the paradigm-defining concept that textuality was for the 1970s and historicism for the 1980s" (7), and Harpham claims "if the battles of literary theory are won on the playing fields of ethics, this is because literary theory, as a kind of oxymoron, has always already accepted the responsibility of otherness, just as literature itself bears the burden of managing the encounter between language and the world" (404).
- 7 Critics have begun to explore how Munro's apparently realist fiction repeatedly and characteristically disrupts itself; and it is precisely these interruptions, I would suggest, that could be said to constitute the ethical dimension of her work. See particularly Heble and Howells on the "disruption" that characterizes Munro's fiction. Heble offers an overview of those critics who explore Munro's "departure from traditional mimetic realism" (15–17).
- 8 Another such "interruption" occurs at the end of "Simon's Luck" where Rose is shocked to learn of Simon's death. She has run away from her love affair with Simon – run away from the possibility of being deserted – only to discover belatedly that she has, in a sense, been the deserter. Starring in a television show in which nothing awful ever happens, Rose, the actress, is also starring in the story of her own life. Playing the role of one who has used up her power, she must vigilantly defend herself against the powerlessness of the relational:

People watching trusted that they would be protected from predictable disasters, also from those shifts of emphasis that throw the story line open to question, the disarrangements which demand new judgements and solutions, and throw the windows open on inappropriate unforgettable scenery.

Simon's dying struck Rose as that kind of disarrangement. It was preposterous, it was unfair, that such a chunk of information should have been left out, and that Rose even at this late date could have thought herself the only person who could seriously lack power. (212–13)

- 9 "Meneseteung" reads as an account of why there could not have been a female Walt Whitman, "hankering, gross, mystical, nude," poet of the body as well as of the soul, who could claim "The scent of these arm-pits is aroma finer than prayer [...] If I worship any particular thing it shall be some of the spread of my body" (Whitman 43, 49). Almeda Joynt Roth, unlike Walt Whitman, cannot write of a radical democracy that includes silenced peoples and silenced parts of the self (the body and its appetites). Roth cannot do this and survive as a coherent (feminine) subject. Among other things, she is presumably lacking in Whitman's highly gendered self-promotional capacities.
- 10 "Meneseteung" cites so-called "Anglo-American" feminist criticism in recovering a "lost" woman writer, but it also engages with "French" feminist theorists and the connection between writing and embodiment. In fact this doubleness is encoded in the story's very title, which is the name of a lost text (Almeda Roth's presumably never written, never-published masterpiece) but which also translates as something like "embodied voice" or "blood speech": menesetueng = menses + tongue.

- 11 One might recall here the similarity to “The Dream and the Primal Scene,” the text in which Freud most extensively explores the primal scene, although not, of course, a primal scene of ethics. The Wolfman’s notorious dream is also a dream of suddenly waking and being arrested by what is just outside the window.
- 12 For more on fantastic beating scenes that are also scenes of real (and potentially sexual) violence see Munro’s earlier “Royal Beatings,” in which both a child and a father are beaten, the female child in a perpetual or habitual present tense, the father in the past of a told and re-told narration.
- 13 Redekop has noted the allusion to “The Raven” in “Meneseteung” (225), and we might also want to consider the relevance of Poe’s “The Philosophy of Composition,” for Munro’s story pointedly and ironically rewrites the infamous death of the “beautiful” woman: “‘There goes your dead body!’” exclaims Jarvis Poulter, our “hero,” as the drunken, disheveled, abject, “other” woman stumbles off. I would like to suggest, however, that “Meneseteung”’s most significant nineteenth-century American intertext is Melville’s “Bartleby, the Scrivener.” For in Melville’s story, as in Munro’s, an enigmatic other poses an impossible ethical demand that throws the sovereign subjecthood of the organizing consciousness, and ultimately of every individual (“Ah, Bartleby! Ah, humanity!) into question. Bartleby’s “call,” like that of “Meneseteung”’s nameless woman, verges disconcertingly on the meaningless. Both stories also resonate with Levinas’ discussion of the ethical “moment”: “A face is imposed on me without my being able to be deaf to its appeal nor to forget it, that is, without my being able to cease to be held responsible for its wretchedness. Consciousness loses its first place” (Levinas, “Trace” 352).
- 14 “By definition, if the other is the other, and if all speech is for the other, no logos as absolute knowledge can *comprehend* dialogue and the trajectory toward the other. This incomprehensibility, this rupture of logos is not the beginning of irrationalism but the wound or inspiration which opens speech and then makes possible every logos or every rationalism” (“Violence” 98).
- 15 See Derrida, *The Gift of Death* 27.
- 16 Coral Ann Howells suggests that the scene Almeda witnesses (the “fight” that goes on just outside her back window) is a sexual primal scene that the innocent, childlike Victorian heroine cannot read: “in her innocence [Almeda] interprets as murder [...] the sounds of sex” (109–10). But to read the story this way is to leave out the other woman in her otherness. As an ethical story “Meneseteung” is neither “merely” psychological nor concerned solely with sexuality. Almeda feels that she is responsible, feels ashamed that she had not even realized that the woman was alive.
- 17 The same Old English word (*beran*) gives us, suggestively, the words “barrow,” “bear,” “born,” and “bier.” There is something unbearable, “Meneseteung” seems to know, about the call to ethical responsibility.
- 18 The appeal of death in this scenario is an appeal with a recognizable history. Addressing the specifically masculine crises of Mary Shelley’s *Frankenstein*, Francis Ferguson writes: “While the sublime raises the specter of the annihilation of the self, even such annihilation looks like a consolidation beside the constant stretching necessary to any self that attempts to honor the various claims on its attention and affection” (111).
- 19 “Who loves the *stranger*? Whom else is there to love?” (Derrida, *Adieu* 105).
- 20 See Redekop on the “multiplication of surrogate maternal figures” in Munro’s fiction (4).
- 21 “A work conceived in its ultimate nature requires a radical generosity of the same who in the work goes unto the other. It then requires an *ingratitude* of the other. Gratitude would in fact be the *return* of the movement to its origin” (Levinas, “Trace” 349).
- 22 The suggestion that losing the baby, failing to respond to its [silent] cry, would leave the mother with no more room gives us another way to understand Levinas’ suggestion that “the relationship with another puts me into question, empties me of myself, and does not let off emptying me – uncovering for me ever new resources” (“Trace” 350). Loss would leave Munro’s mother with no more room (the loss of lack).
- 23 In fact, Munro proposes that it may only be chance that separates the two. See also “Miles City, Montana”: “‘What I can’t get over,’ said Andrew, ‘is how you got the signal. It’s got to be some kind of extra sense that mothers have.’ Partly I wanted to believe that, to bask in my extra sense. Partly I wanted to warn him – to warn everybody – never to count on it” (407). Munro’s fiction challenges us to think about responsibility *and* radical contingency.

- 24 It is also a story about dreams. In fact, “My Mother’s Dream” would seem both to refer to and rewrite Freud’s famous dream of the “burning child” (which concerns a father’s responsibility for his dead son and the relationship between external stimuli and fantasy life) and analyses of this “simple” dream (really, says Freud, there is not much to say about it) by Lacan, Zizek, Shengold, Felman, Caruth, and others. His son has died and an exhausted father finally goes to sleep. He leaves an older man to watch over his dead child, but the watchman himself dozes off, knocking a candle onto the child’s body. Instead of waking immediately (seeing the light, hearing the noise), as one might expect him to do, the father sleeps on momentarily and dreams that his son has come to his side reproachfully: “Father, don’t you see I’m burning?” (“The Psychology of Dream Processes” 653). The father dreams of a responsibility in the form of his son’s reproach (“Father, don’t you see I’m burning?”) that would simultaneously restore to him the son he has so painfully lost. Munro’s mother is luckier. She awakens to a loss, femininity, that allows her to claim her child. Cathy Caruth writes: “the dream reveals how the very consciousness of the father as father, as the one who wishes to see his child alive again so much that he sleeps in spite of the burning corpse, is linked inextricably to the impossibility of adequately responding to the plea of the child in its death. The bond to the child, the sense of responsibility, is in its essence tied to the impossibility of recognizing the child in its potential death” (103).
- 25 In her most recently published story, Munro once again utilizes liminal voices which could be said to hesitate between the human and the inhuman, the intentional and the mechanical, and she does so in an exploration of the relationship between ethics and the craft of fiction writing. The young writer/narrator figure in “Family Furnishings” listens to the story of her father’s cousin’s mother’s death and hears something new: “And the minute that I heard it, something happened. It was as if a trap had snapped shut to hold these words in my head. I did not exactly understand what use I would have for them. I knew only how they jolted me and released me, right away, to breathe a different kind of air, available only to myself” (74). Even as the narrator cannot process the message she receives (which is crucially the story of both a missed and an experienced ethical insight), in a sense, it is with this message that she becomes a writer for the first time. We hear another liminal voice at the very end of the story. The sounds of a baseball game on the radio at the back of a shop: “I did not think of the story that I would write about Alfrida – not of that in particular – but of the work I wanted to do, which seemed more like grabbing something out of the air than like constructing stories. The cries of the crowd came to me like big heartbeats, full of sorrows, lovely, formal-sounding waves, with their distant, almost inhuman assent and lamentation” (77). In this story, then, irresponsibility and responsibility cross paths (absolute indifference to the other can become indistinguishable from the very ability to register the other’s voice). The ethical and the liminal voice clearly remain a preoccupation in Munro’s work.

# PART FOUR

## Post-Structuralism

---

# CHAPTER 1

## Introduction

### *The Class of 1968 – Post-Structuralism par lui-même*

*Julie Rivkin and Michael Ryan*

*Opposition ceases its labor and difference begins its play.*

Gilles Deleuze, *Nietzsche and Philosophy*

*The moment of transgression is the key moment of practice: we can speak of practice wherever there is a transgression of systematicity.*

Julia Kristeva, “The System and the Speaking Subject”

*The March 22nd Movement<sup>1</sup> is engaged in three sorts of disturbance; it belongs to the crisis of the university and to the social crisis; but its proper arena ... is the transformation of the relationship between what is desired and what is given, between potential energy and the machinery of society. Its location in relation to the first two kinds of disturbance and its attempt to respond to them situates it like any other group within the order of politics, an institution which has as its function (like the others though more particularly) the regulation of the flow of energy within the system. But in as much as the March 22nd Movement increases the third kind of disturbance, its work was that of undoing, an anti-political kind of work, carrying out not the reinforcement but the dissolution of the system.*

Jean-François Lyotard, *Adrift After Marx and Freud*

*The French Communist Party has often played the role of a kind of bourgeois superego: it stands for the moral principles which it accuses the ruling class of respecting in theory, only to betray them in practice.*

Guy Hocquenghem, *Homosexual Desire*

*Hence there is a major role for students, youth who are disqualified [from capitalist production] in advance, voluntarily or not, as well as all types of social groups, of regional communities, ethnic or linguistic, because, by the process of the centralization and technocratic pyramidization of the system, they fall into marginality, into the periphery, into the zone of disaffection and irresponsibility. Excluded from the game, their revolt henceforth aims at the rules of the game....*

*It is no longer then a question of an internal, dialectical negativity in the mode of production, but a refusal, pure and simple, of production as the general axiomatic of social*

*relations. Without any doubt, the refusal is hidden in wage and union demands; in mid-stream it is transposed into a carefully asphyxiated and channeled radical negation by the Parties and the Unions, for whom, just as for the system itself, economic demands are the ideal means of control and manipulation. This is what gives the new left or hippie movement its meaning. Not the open revolt of a few, but the immense, latent defection, the endemic, masked resistance of a silent majority, but one nostalgic for the spoken word and for violence. Something in all men profoundly rejoices in seeing a car burn.*

Jean Baudrillard, *The Mirror of Production*

*Even signs must burn.... The catastrophic situation opened up by May '68 is not over.*

Jean Baudrillard, *The Political Economy of the Sign*

Structuralism, which is best represented by the work of anthropologist Claude Lévi-Strauss, literary critic Roland Barthes, and Marxist philosopher Louis Althusser, uses linguistics to find order everywhere, from kinship systems to fashion. Its successor, Post-Structuralism, uses linguistics to argue that all such orders are founded on an essential endemic disorder in language and in the world that can never be mastered by any structure or semantic code that might assign it a meaning. Structuralism dominated French intellectual life in the late 1950s and early 1960s, but even as it reigned, a counter-movement was in the making from the early 1960s onward, one that was less interested in knowing how systems worked than in finding out how they might be undone, so that the energies and potentials that they held in place might be liberated and used to construct an altogether different kind of society. If Structuralism, despite the left political credentials of its most noteworthy practitioners, was methodologically conservative, a description of stable structures which seemed an argument on behalf of their universality or eternity, Post-Structuralism would be self-consciously radical, a putting in question or play of the methods rational thought traditionally uses to describe the world. If Structuralists saw signs as windows to a trans-empirical world of crystalline order, of identities of form that maintained themselves over time and outside history, of codes of meaning that seemed exempt from the differences entailed by the contingencies of living examples, Post-Structuralists claim all such orders are strategies of power and social control, ways of ignoring reality rather than understanding it. It was time, they argued, to burn down the signs and with the signs, all the orders of meaning and/or reality that signs help maintain.

The first works of what would eventually be called Post-Structuralism began to appear in the early 1960s, and they reflected the growing influence on French thought of Friedrich Nietzsche (whose works had been recently translated into French), a thinker whose value for younger French philosophers had to do with his rejection of both the rationalist tradition of objective description and the idealist tradition which dissolved empirical world events into non-empirical or hidden meanings or truths. Another major counter-Structuralist influence was Martin Heidegger, a German thinker whose work had been highly influential in France since the 1940s (especially in the work of Jean-Paul Sartre, whose *Being and Nothingness* is in many ways a pre-text of Post-Structuralism in that it elaborates on themes – such as the foundationlessness of foundations – that would become major assumptions of such Post-Structuralist thinkers as Jacques Derrida). Michel Foucault's *Madness and Unreasonableness (Folie et déraison*, translated as *Madness and Civilization*, 1961)<sup>2</sup> set the tone for the new tendency in French thought by noting how classical reason constructed itself by banishing alternative “nonsensical” modes of thought and labeling them as “madness.” People previously considered mystics were suddenly in need of incarceration, and that switch was due to

the invention of Reason as a guiding category for the Enlightenment. Reason assisted nascent capitalism by permitting utility or usefulness to be calculated and objects and people to be identified, assigned categories, and controlled.

Another major early Post-Structuralist book, Gilles Deleuze's *Nietzsche and Philosophy* (1962), brought attention to Nietzsche's subversion of the rationalist ideal of knowledge and his caustic critique of Christian civilization's habit of locating spiritual meaning in everything. The material world is a play of forces in contention, not something that conceals spirit or meaning. It cannot be understood using rational categories like "subject," or "object," or "will," or "truth," because all categories necessarily "lie." By grasping the world of forces in differential flux, categories translate flux into stable identities, things that have nothing to do with the world. All our thinking is fiction making, making metaphors that substitute stability for the inherent instability of existence, meaning for the eternally returning sameness of a material world that conceals no spiritual sense and that ultimately resists being translated into ideas or ideals like justice or truth or sin and redemption. Nietzsche's ideal philosopher–artist learns to accept this state of affairs, to refuse to assign meaning to things, to avoid categorization, to accept the groundlessness of all our ways of thinking, to throw himself into the play of the world and dance with it.

Deleuze's book was pathbreaking because it presented Nietzsche's hitherto ignored critique of three of the major assumptions of Structuralism: the notion that knowable structures underlie empirical events, the assumption that knowledge operates according to procedures that are axiomatic or not open to question, and the belief that reality is not radically contingent, not a play of forces without order or a series of accidents or events without meaning or logical sequence. It was as if a new door had been opened. The Structuralist desire to find knowable orders everywhere, to break down the flow of the world into unities that could be understood as so many languages or orders of meaning, found itself faced with a disturbing alternative. For the moment, however, that alternative could be ignored. Deleuze's book was a marginal philosophical monograph, not a scandal, and Foucault's book was written in a Heideggerian style that placed it on the margins of then mainstream French debate, which was consumed with the study of signs and structures. Structuralism continued to hold sway and to speak in the voice and style of high reason. Order, meaning, categorization, grammars, logic, et cetera – all continued to circulate as the dominant themes in French intellectual debates.

Everything changed in 1966 with the publication of another book by Foucault – *Words and Things* (*Les Mots et les Choses*, translated as *The Order of Things*). Foucault's style is now more within the Structuralist mainstream, and rather than speak about the expelled others of rationalism, he examines rationalism itself historically and shows how it comes into being and changes over time. Reason could no longer claim to be a light switched on at one go somewhere in the seventeenth century that continues to illuminate everything we do and think in the same consistent manner, locating an objective order in empirical events. The very notion of such an order, Foucault argues, was itself an historical invention, one that required the systematic displacement of earlier ways of knowing that did not make classificatory cuts in the world and that thought and spoke of the world as an order of resemblances and interconnected parts one of which was language itself. The invention of Reason in the "Classical Age," from the seventeenth to the eighteenth centuries, institutes a separation between words and things, language and the world, and turns language into a means of representation of a world now conceived as a world apart, as identifiable objects that differ from other separate objects and can be assigned proper names. From this point on, reason consists, Foucault argues, of historically evolving discursive procedures, from the classificatory divisions of the eighteenth century to the

nineteenth century's emphasis on utility or usefulness or functionality. It is a set of representational techniques or languages, of discursive practices which form rules of consistency amongst themselves in historically evolving regimes of knowledge, what Foucault calls "epistemes." The known world characterized by legible signs of embodied meaning and resemblances between parts that was in existence until the seventeenth century gives way over time to a rationally analyzed and mastered object world of separated parts in functional subordination to each other. And that order becomes a way of justifying society's system of exchange, the way it allows goods and money or money and human labor to be differentiated and equated, made into profitable orders. Strategies of knowledge and strategies of capitalization are complicit.

Foucault's book establishes themes that will reemerge in the work of other Post-Structuralist thinkers, from Jacques Derrida to Jean Baudrillard. Perhaps the idea that is most crucial to their common endeavors is that there is a prior realm (either in history or in language or outside rationalist Western society) where language and world are not yet separated, where the cut that separates knower from world, word from thing, signifier from signified in order to establish rational knowledge in the form of an equivalence of meaning (word = thing, signifier = signified), has not yet occurred. There the play of ambivalence in language, its uncut potential for creating a multiplicity of possible lateral or transverse meanings that exceed all rational binary orders (identity/non-identity, etc.), is still available, still not separated from the material world of which language is a part. Words and things are still the same, as yet not ordered into a classificatory difference between signifier and signified within the order of reason. The act of reason that turns language into a representation of a world apart and the knowing subject into someone separate from the field of vision he masters with representation has yet to occur. After the cut, what reason creates (representation, meaning, knowledge as knowable order, equivalence of signifier and signified, etc.) will necessarily be surrounded by what it banishes. And within reason there will be as a result a murmur of disturbance, the sound of what reason would call nonsense and unreason but that might also simply be called the intertwining of language and world that is the ground of reason: "If language exists, it is because below the level of identities and differences, there is the foundation provided by continuities, resemblances, repetitions, and natural criss-crossings. Resemblance, excluded from knowledge since the early seventeenth century, still constitutes the outer edge of language: the ring surrounding the domain of that which can be analyzed, reduced to order, and known. Discourse dissipates the murmur, but without it it could not speak." After *Words and Things*, French thinkers began to see signification not as a gateway to structure but as a way of constructing repressive orders of knowledge and meaning as well as an apparatus for repressing anti-structuring forces. Signification was not a path to knowledge but a servant of cultural regimes that imposed repressive categorical orders on the world.<sup>3</sup>

Foucault's pathbreaking work intersected with parallel changes that were underway in French psychoanalysis, literature, and politics. Psychoanalysis had been present in French intellectual life long before the 1960s, but it took on an especially crucial role in the development of Post-Structuralism in 1966, when Jacques Lacan published his magisterial *Ecrits (Writings)*. Language was no longer to be considered a representation of psychology; rather, language was, for Lacan, what made psychology or self-identity possible. We become human subjects or selves through our entry into the Symbolic Order of our culture, that language of norms and roles that assigns us a sense of who we are by telling us what we cannot be. Around the same time in the mid-1960s, alternative

theories of madness from the Anglophone world (the work of David Cooper and R. D. Laing) began to have an impact on French thinking. Cooper and Laing's anti-psychiatry reconceived schizophrenia positively as providing access to potentially higher or more complex modes of cognition, and they argued that normality is itself pathological. An alternative tradition regarding schizophrenia was already present in French intellectual life since the Surrealist movement of the 1930s. The work of Georges Bataille and Antonin Artaud, writers of the 1930s and 1940s, in the mid-1960s began to enjoy a revival. Outside civilized structure, according to Bataille, lay not what rationalism calls madness but rather something else entirely, a realm of symbolic exchange that puts the orders of Reason in question. So-called civilized life, Bataille argues, is no different from primitive life; it is founded on sacrifice, the expulsion of the "accursed share," or cursed portion of ourselves that is bodily and material. The accursed share takes the form of forbidden eroticism (incest), excrement, and death (the return to material nature of human life). All are the object of taboos that constitute Western civilization under the sign of rational utility, repression of matter, a cut that separates culture from nature, and the reign of religions of transcendence. The structures of meaning in primitive societies are no different from those in modern society (a point also made by Lévi-Strauss in *The Savage Mind*); symbolic exchange is premised on a reciprocity of gifts rather than the equivalence of commodity exchange, and it permits the waste of surplus to preserve social cohesion rather than allowing the unequal division and accumulation of the surplus as in capitalism. The way primitive societies arrange their economies around a point of "sovereignty," someone who owns so much that he can have everyone to lunch and give away too much, thus initiating a round of reciprocal gift-giving, represents a positive kind of "general expenditure" that stands at odds with the "restricted expenditure" that emerges as capitalism, one that requires that all acquiesce to a norm of usefulness or utility in place of play, rational meaning in place of gay nonsense.<sup>4</sup>

Bataille and others such as Pierre Klossowski were fascinated by figures of excess and criminality like the Marquis de Sade, who drew attention to the violence at the heart of Western rational normality, the sacrifices everyone must make (of themselves and of their "excess" desires) in order to become good citizens. One can see how this line of thinking linked up with that of Foucault to provide the basis for a critique of the way modern societies rationalize or normalize the world. Such societies come into being historically by constructing an ideal of Reason that licenses the definition of alternatives to the societies as "madness." The madman, the criminal, and the experimental writer, the very types whose idiosyncrasy a rationalist procedure like Structuralism could not take into account because they are the anomaly whose expulsion defines the order sought in the Structuralist method, the unexplainably different counter-example or outside that could never be inside because its negativity allowed the positivity of the inside to define itself, began to attract new attention. That Nietzsche defined himself as such a poet-philosopher began suddenly to make sense to a variety of thinkers. Perhaps rationalism and art were merely different ways of using language?

It was in the experimental literature of writers like Mallarmé, Lautréamont, and Artaud especially that the new French thinkers began to see an alternative current to the rationalism and repression that characterized both Structuralism and modern culture in general. If Structuralism harnessed signifiers to signifieds, the differential play of empirical signs to consistent unities, latent structures, and codified orders, and if that buttoning down of language onto structure and meaning was part and parcel of the way rational capitalism maintained a repressive social regime which depended on a particular

signification (construction) of reality and a particular subjection (both as becoming a self and becoming subject to a regime of self-sacrifice), then the new thinking would instead try to find out how all those unities and structures might be undone, come unraveled as principles of cognitive and social order, by unharnessing the signifying potential of the signifier itself and with it all the heterogeneous elements that capitalist signification worked to restrain in the world signified. A new politics of the signifier began to emerge in the journal *Tel Quel* (literally, “Just As It Is”)<sup>5</sup> especially, which devoted many pages to the new generation of Post-Structuralist thinkers like Julia Kristeva and Jacques Derrida.

The publication in 1967 of Derrida’s three books, *Of Grammatology*, *Writing and Difference*, and *Speech and Phenomenon*, marks another major turn in the evolution of Post-Structuralism. Derrida’s critique of Western rationalism includes Lévi-Strauss’s Structuralism, and Derrida finds an alternative to that tradition in the very artist/renegades, such as Bataille and Artaud, who were being championed by the *telquellistes*.

Derrida’s principal quarrel is with the metaphysical tradition in philosophy, which he calls “logocentrism,” because it takes for granted the founding authority of reason or the *logos* (mind). *Logos* in Greek can also mean speech as well as meaning, so when Derrida criticizes logocentrism, he has in mind something more complicated than simple rational thought. He notices that in philosophy from Plato down to Husserl, speech, meaning, and thought are conceived as almost a natural weld, a continuum without joints or articulation. They are seen as being one full and complete substance amongst whose parts there is almost no difference, no spaces of articulation between parts. The mind’s awareness of meaning or ideas in its own internal voice of consciousness is, according to Derrida, a repeatedly referred to norm of authenticity, authority, and truthfulness in metaphysics. We know what truth is because our mind tells us what it is, and we can trust that voice of reason because it is closer than any other form of signification to ideas as they occur in the mind. Such other forms of signification as writing are mere substitutions, repetitions of a more original substance of truth, ideation, mental speech, and meaning. Throughout the history of philosophy, writing is banished from the realm of truth into a pure exterior. But, Derrida asks (and this question is the essence of his critical strategy called “deconstruction”), what justifies the distinction between inside and outside, intelligible and physical, speech and writing? Doesn’t there have to be a prior act of expulsion, setting in opposition, and differentiation in order for the supposed ground and absolute foundation of truth in the voice of the mind thinking the presence of truth to itself to come into being? If philosophy is about intelligibility, doesn’t that require a prior distinction between what is intelligible and what is sensible or material or physical or graphical? Isn’t the ground of truth, which should have no further ground, itself derived, an effect of something more primordial? And if that is the case, what is that more primordial thing?

The *logos* speaks not only truth but authority. It is always a command. And it is so, Derrida claims, because it is founded on an instability and a deficiency that it must control and conceal at all costs. It is not, according to Derrida, what it claims to be – a self-sufficient and complete identity of thought or meaning or idea in the internal voice of consciousness. At work underneath that supposed identity is a process of difference that makes identity possible but which itself can never assume the form of a knowable identity. To understand what Derrida means by this, recall Saussure’s claim that in language there are no full terms, only differences. There are no self-identical terms in language that stand on their own; language consists of differences, not identities. Derrida applies this “diacritical” principle to everything. All being and all thought is similarly differential,

he claims. Everything that exists as an object or a thing, that can be present to our minds and known, is so only in so much as it is different from something else, and to think its identity as what it is (one of the tasks that philosophy sets for itself), one must suppress and ignore the differentiating process that constitutes it. Similarly, when we think or reason philosophically, we try to grasp an idea or a concept of something, but since we exist in time, such a concept or idea can exist only in a kind of movement of temporalization, moving from past to present to future. It is always split apart by difference, always requires a process of self-repetition to maintain the illusion of permanent presence, and such repetition insinuates difference into the heart of the presence of the idea in the mind.

We can never arrest that movement of difference and have a stable, self-identical moment of thought that would hold onto something, grasp both its presence to the mind and its present-ness or here-and-now-ness, outside of that movement. That movement is itself a constant and irreducible differing that does not lend itself to self-identity. What is present in the mind is derived from something else that cannot be known as such, as a graspable presence or identity, a category that does not spill over into other differences that are infinite. Difference between things and difference or deferment in time, according to Derrida, precedes and makes possible the momentary ever movable identities and present experiences, the seemingly stable categories, concepts, and ideas we are able to have in our minds.

In order to be able to begin with a ground of identity and authority that establishes a criterion of what is true, philosophy must always have a second beginning that precedes the first, an act of opposition and differentiation that expels such things as artifice, representation, metaphor, empty substitutes, non-identity, difference, and writing into an outside that then allows an inside to be established. The outside is then subordinated in opposition to the inside. As a result, identity, truth, meaning, the voice of consciousness, et cetera, are seen by philosophy as the superior and original terms, and artifice, writing, substitution, difference, non-identity, and the rest are seen as inferior, secondary, derived, added on, merely supplementary in relation to a prior truth. Philosophy, in other words, relies on a sleight of hand, a maneuver of substitution that places its real origin in difference outside its desired origin in identity (of truth, of reason, of ideas welded to the mind in the *logos*, etc.). It says that substitution is secondary to an original, more authentic moment of truth, but in order to found that moment, it must substitute truth for the more original act of differentiation that constitutes philosophy's supposedly original identity (of meaning to the mind, of truth to reason, etc.). If substitution is how metaphysics defines writing, then it must begin in writing, not in the speech of the mind and the awareness of truth.

Derrida persistently asks the following question of philosophy: if philosophy must begin in this way, with an act of differentiation, then isn't what it begins by declaring secondary and additional already at work in its foundation, at its point of origin? Isn't difference more original than identity? And doesn't this mean that all the values established by that initial differentiation or setting in opposition are questionable? Is substitution really outside and below authenticity if authenticity comes into being through an act of substitution? Is the non-truth of mere representation really secondary to the substance of truth in the voice of consciousness if a certain "re-," a certain doubling or turning is required in order for the substance of truth to establish itself precisely as not being representation, as something which is immediately and always also "the expulsion of representation"? Is signification and the differential processes that make it work really

entirely opposite to a “nature” or a “reality” that is sufficient unto itself and not in need of signification or of the differential process that articulates terms and creates meaning, reference, and a world signified if our knowledge of reality, thought, being, and meaning can only occur within the differential movement that we normally attribute to external signification, to a signification that is supposedly external and additive to thought, truth, ideas, reality, meaning, and the rest?

One cannot, Derrida contends, speak of truth without signification, without those processes of substitution (of a signifier for a signified) and differentiation (of the signifier from the signified and from other signifiers) and repetition (of the original differentiation in an opposition that situates it as the subordinate and devalued term) and non-identity (of the original truth with itself because its “self” is entirely other than itself, being difference) that are “essential” to the making of meaning in language. And if this is so, then there is no more truth as logocentrism has conceived or thought of it: something whose essence is defined precisely by its exemption from a relationship of differentiation to something else that originally defines what it “is,” or that is prior to repetition, being the ground that gives rise to repetition in representation and is itself a cause prior to all acts of repetition, or that is outside of substitution, the replacement of something original and authentic by a mere stand-in, or that is entirely self-sufficient and one with itself, not needing supplementary assistance to be what it is from something outside its orbit, an opposed term which might have to be there for it to be what it (supposedly) is. No truth without falsity, Nietzsche said, for similar reasons. The supposed essential unity and self-sufficient completeness of thought, meaning, or idea welded to the voice of consciousness in the internal realm of the mind which served as the gold standard for metaphysics suddenly looks like what it claimed to be exempt from – a myth, a story, a fiction, a metaphor, an act of differential signification, a piece of writing without any real referent that is not itself differential.

Derrida examines how writing especially is conceived in Western thought as a threat to the *logos*/speech/truth ideal. Writing is a substitute for speech, a repetition of the voice of the mind. Writing is an external addition or supplement to a truth that could just as easily do without its assistance. At stake here in the opposition between mind and the graphic of the written sign are, according to Derrida, all the oppositions that dominate Western thought – mind and matter, spirit and world, intelligibility and sensibility, interior and exterior, culture and nature, the true and the false, good and evil, the authentic and the artificial, et cetera. Derrida argues that such oppositional thinking is only possible on the basis of what it banishes as secondary to all of its values. Writing, which for Derrida is another name for *differance*, is more primordial than speech, truth, presence, et cetera. Its movement makes all of these ideals possible. Without difference and repetition, there could be no truth and no opposition between truth and falsity as such. Something external must be declared external, and that something is precisely what can never possess the qualities of truth (presence, self-identity, immediate intelligibility, etc.). Yet without it, without the exteriority of the signifier that allows a mythic internal realm of intelligibility to be constituted, there would be no concept of truth.

With other Post-Structuralist philosophers like Deleuze, Derrida writes a death sentence for two of the more durable philosophic traditions of the European West – Platonism and Hegelianism. Hegelianism was rampant in France since the late 1930s, and it allowed Sartre and Lacan to define their undertakings. Both Platonism and Hegelianism absorb the material or empirical world into ideal meanings or truths that stand outside history and the contingencies of specific social locations. For Derrida (as for Deleuze), critical

philosophy reverses and displaces this hierarchy. From now on, the contingencies and indeterminacies of the empirical world (and for the French “empirical” means more the play of sensible or material existence than the mental experience of objects), would be seen as primary. Ideas are merely effects of operations such as repetition and difference that do not possess an ontological status as “things” or as “events.” They make all such things and events possible while never being able to assume thingly or eventual form. Like the most basic forces of physics, they can be known only through the effects they generate, and they never appear to our minds (little Kodak cameras that they are) as picturable presences easily known and understood. They are beyond the kind of mastery both Hegel and Plato so easily assumed was possible.

Deleuze, in *Difference and Repetition* (1968) and *The Logic of Meaning* (1969), elaborates on his own earlier work on Nietzsche’s concepts of play and the differences of force that constitute reality. The first book evolves a counter-ontology to the Platonic tradition. Whereas Plato privileges Ideas (universal rational concepts such as Beauty and Justice) over their mode of appearance, their surfaces in the material world (what Plato called “Simulacra”), Deleuze gives privilege to the surfaces, the depth-less appearances. There are no universal ideas, only appearances, but even these can no longer be called appearances, since they do not make anything appear; they are all that is. A scholar of Bergson, the philosopher of the *durée* or duration, Deleuze promotes becoming, the processes of material life, over being, the ideal of a static, unitary ontological substance that stands outside history and representation. *The Logic of Meaning* is about how sense or meaning (the French word for meaning is *sens*) depends on non-sense. Below the unities of language (what makes sense) are asemantic or nonsensical processes that do not permit a differentiation (opposition) between the world of matter and the world of language or between the realm of signifiers (appearance, simulacra) and that of meaning (depth). The two are threaded together, and making sense of the world is belied by a counter-movement that moves meaning towards non-meaning, sense towards non-sense. Like other Post-Structuralists, Deleuze takes heed of the work of Louis Hjelmslev, which provides an alternative to Saussure in that it argues that form and expression, the matter to be stated and the way it is stated, constitute a continuum. One cannot divide language into an intelligible realm of signifieds and a material realm of signifiers; they are all one thing, though shaped differently in different places. There is in other words no “metalanguage,” a language that stands outside of and in opposition to the rest of language, a clearing where reason can operate without getting entangled immediately in semiotic thorns. And clearly also, there are no structures or depths that exist outside or beyond surface manifestations, providing meaning to what is otherwise merely simulacral. There are only simulacra, only surface manifestations. And structure, like meaning, is one of them. When one supposedly moves from signifier to signified, sign to meaning, one merely moves from one surface to another, one part of the world to another. There is no outside. (Arguably, this is what Derrida meant when he announced that “*il n’y a pas de hors texte*,” or “there is no outside to the text,” if by text we mean world, by which we mean language, at least any world we might know or inhabit).

Kristeva is probably the thinker who most clearly embodies the radical spirit of *Tel Quel*. In *Semeiotike: Towards a Semanalysis* (1969) and *Revolution in Poetic Language* (1974), she joins aesthetic to political radicalism. In the first, she links Marx’s notion of production to semiotics and presents the work of Mikhail Bakhtin, especially his concept of dialogic ambivalence, to French readers for the first time. In *Poetic Language*, she argues that writers like Lautréamont, by undermining the orders of signification

(which she associates with thetic statements that assume a separation of subject and predicate in a thesis statement such as “I know *x*”), tap into a well of as yet unordered language processes and unarticulated sounds to generate new possibilities for thought and for society, greater freedom to signify and greater liberation from the capitalist regime of utility, functionality, and work. Every literary text is a phenotext that orders the unruly and potentially infinitely multiple elements of language (the genotext) into discrete, bounded identities of meaning and signification. But that well or *chora* (which is also a locus of libidinal energy) always threatens to erupt and disturb the orders made from it. Experimental literature engages in deliberate disturbances of those orders. It is therefore revolutionary in that it questions the stability of capitalist reality and subjectivity in so much as both are discursively created events, separate identities fabricated thematically. Such literature draws attention to the excesses, the heterogeneous elements, that must be cut off and curtailed if civilization is to found itself (as a regime of necessary repression through forms of representation).

The theorists and writers of *Tel Quel* were not alone in their radicalism. Across the world, a “New Left” critical of capitalism and a “counter-culture” critical of Western rationalism was emerging throughout the 1960s. The new radical politics of the mid- to late 1960s stood opposed to such long-standing institutions of the more orthodox left as the Communist Party of France (PCF), a powerful institution which regularly earned the vote of a quarter of the electorate, and the unions (which the leftists argued were instruments of domination because they limited worker claims to a share of the pie rather than extending those demands to a more fundamental transformation of the social system). The new style of radical politics favored the Nietzschean play of Situationist “happenings” over the dour seriousness of the Communist Party officialdom, contested a multiplicity of repressions (of women, of sexual energy, of desire in general, of ethnic and national minorities, etc.), and were skeptical of the single economic repression decreed as “determining in the last instance” by the “scientific analysis” of the Party philosophers such as Louis Althusser. Althusser’s work, from *For Marx* (1965) to *Reading Capital* (1968), despite its allegiance to a materialism that was in the process of being displaced by Post-Structuralism, could itself in certain respects be considered part of the new movement. Although he locates himself within “Structuralist” parameters, he is deeply influenced by Lacan, especially in his anti-humanist theory of how human subjectivity is formed and shaped by institutions and by discursive practices. We live in ideology, blinded by an “imaginary” consciousness that prevents us from gaining access to objective truth about our historical and class situation. (For a selection from Althusser and more on his theory of ideology, see Part Six.) If in his allegiance to such objectivist notions of science he remains Structuralist, in his theory of how different points in the social system “overdetermine” each other in an unstable and decentered manner, such that each has some autonomy from the others, Althusser moves over towards Post-Structuralism and helps enable the new movement’s focus on the way “superstructure” can play a determining role on “infrastructure.” Perhaps more importantly for the student movement, his thinking helped insert a studious and non-sloganeering reconsideration of Marx’s texts into everyday intellectual discussions of the mid-1960s and helped shape the general radical climate that made the student revolt of 1968 possible.

The new radicals critiqued the politics of representation, the idea that anyone, any party especially, can speak for and represent or stand in for the mass of people and the multiplicity of their desires, needs, and aspirations. There began to emerge a counter-political ideal of “autonomy” that took root in Italy particularly (in such writers as

Antonio Negri – from *Marx Beyond Marx* to *The Savage Anomaly* – and in such organizations as *Autonomia*). According to this new political model, the material energies and creative potentials of people take precedence over the dictates of the traditional Communist Party. Those energies and potentials, not the Party leaders, should guide political change. This democratic critique of political representation intersected crucially with two major historical events in the spring of 1968 – the Soviet invasion of Czechoslovakia to suppress the “Prague Spring,” a movement of democratization that was a precursor of the democratic revolutions of 1989 that swept Stalinism out of power in Eastern Europe and the former Soviet Republics, and the student uprisings in Paris (and around the world) that same spring, uprisings usually referred to as “May ’68.” May ’68 really began on March 22, when students at the University of Paris at Nanterre rose up against the authority of the university. That uprising soon spread to the streets and attracted the participation of workers, who went on wildcat strikes in support of the students. But the movement was ultimately repressed by the government, which was supported by the unions and the PCF. That move by the Party had a profound effect on a generation of student radicals, most of whom would from that point on be either anti-Marxist or post-Marxist.<sup>6</sup>

If they were not already, of course, they would also be Post-Structuralist, since the death of Structuralism as an intellectual movement with any real claim on the allegiance of the most important new thinkers in French thought might be located at or around 1968. The new movement found one of its most eloquent political voices in one of its eldest members – Gilles Deleuze. With his collaborator of the 1970s, Felix Guattari, Deleuze becomes one of the most interesting and creative political Post-Structuralists. While the weld of Marx, Freud, and poetic Modernism in *Tel Quel* in some respects inaugurates Post-Structuralism understood as a form of cultural politics, it remained for Deleuze and Guattari to take the additional step of going beyond Marx and Freud. With Guy Hocquenghem’s *Homosexual Desire* (1972), Jean-François Lyotard’s *Adrift After Marx and Freud* (1973), Jean Baudrillard’s *The Mirror of Production* (1973), Julia Kristeva’s *Revolution in Poetic Language* (1974), Luce Irigaray’s *Speculum of the Other Woman* (1974), Hélène Cixous’s *The Newly Born Woman* (1975), and Michel Foucault’s *Discipline and Punish* (1975), their *The Anti-Oedipus: Capitalism and Schizophrenia* (1972) marks the beginning (in writing at least) of political Post-Structuralism. We will discuss it in conjunction with their later *A Thousand Plateaus: Capitalism and Schizophrenia* (1980).

Against the then-prevalent psychoanalytic myth of Oedipus, which describes desire as originating in absence or lack (of access to the forbidden mother), Deleuze and Guattari instead propose a positive concept of desire as a productive activity. But Deleuze and Guattari go much further than a critique of orthodox Freudian psychoanalysis. They also announce a new set of concepts for understanding the world and our place within it. We are all machines, they argue, and the institutions we make for ourselves such as the family and the state are also machines that take the desiring-production of humanity and process it in useful ways for a particular social regime. The Oedipal family is useful for capitalism because it represses desires that might be in excess of the limits the utilitarian capitalist system requires. In order to work functionally, we have to desire efficiently. But desire is innately reckless and inefficient, an energistics without bounds, and it should be understood as just one segment in larger flows of energy and matter that constitute the world as a mobile, varying, multiple flux with different strata that make up planes of consistency. We exist within such planes as lines of flight that can either escape or be

captured and pinned down by signifying regimes, semantic orders that assign us meanings and identities as “boy” or “girl” or “businessman” or “wife.” All such stabilizations or codings constitute territorializations in that they establish boundaries of identity that restrain temporarily the movement of the flows and the lines of flight. They hold them in place (a territory), but deterritorialization is a more powerful force, and everything eventually breaks apart and flows anew, only once again to be recaptured and reterritorialized by another social regime of signification, made useful and meaningful at the same time. Capitalism represents a supreme form of deterritorialization in regard to the molar (large-scale) institutions of feudalism; it set free energies and desires that had been overcoded and restrained by the Catholic Church and the feudal economy. But capitalism itself is a form of territorialization, and it is always threatened by even more molecular or small-scale movements of energy, matter, and desire, flows that threaten to overwhelm its temporary codifications and territorializations. Schizophrenia represents the repressed underside of capitalist normality, the energy and productive potential that it must constrain in order to fabricate useful citizens and productive workers.

What Deleuze and Guattari propose is a radical new materialism. Thought no longer stands outside matter and understands it as an object of cognition. Thought is a move within matter itself. Rather than have a mind and a body, we are all bodies that are part of the general “body without organs” that is what used previously to be called “the world” or “nature” or “matter.” We are all part of this primordial substance that is unarticulated into identities or objects or selves, but that can be cut up in various ways by signification, which must be understood as a practical material action in/on the world. Indeed, rather than think of history as a succession of modes of economic production, Deleuze and Guattari suggest that we think of it as a succession of signifying regimes, ways of ordering the flows of matter and of desiring-production using “*mots d'ordre*,” or command words. Representation as philosophy has traditionally conceived of it – as something outside matter that embodies rational meaning – does not exist. Representation is itself a body, a line of flight, an act of territorialization or deterritorialization depending on its use or result. There is no difference then between signifier and signified; both are on the same material plane; both flow and are transformed multiply and endlessly. The way signifying orders and the world of desiring production interact is entirely contingent and unpredictable. Deleuze and Guattari frequently rely on analogies to contemporary mathematical theory, especially the theory of catastrophe or chaos, and describe flows as approaching “boundaries” or “thresholds” or “limits” that they either stay within, maintaining a temporary and mobile consistency, or move beyond, destroying that consistency and mutating to form another. Those thresholds are also the points of contact between things or between lines of flight; things are not so much outside each other and in contact, as in perpetual horizontal linkage with other things. No maps can be drawn of such a world; the map would merely be one more linkage, and its mastery merely one more hooking up laterally with things it can never master from a superior position of vertical mastery.

The politics Deleuze and Guattari espouse is perfectly in keeping with the spirit of the students in May '68. It is at once personal and public, micrological and macrological. And it is unabashedly utopian. Of the many social movements unleashed by 1968, feminism and gay liberation were probably among the most significant. Workers had a voice already in the unions and parties, but gays and women had no such organizations and no legitimate route of access to public debate. Nineteen-sixty-eight changed all of that, and two of the most important books of the post-1968 era are Hocquenghem's *Homosexual*

*Desire* and Irigaray's *Speculum*. Hocquenghem's book is exemplary of Post-Structuralism in that it begins with what is expelled or marginalized by civilization, in this case, homosexuality, and resituates it at the heart of civilization itself. Civilization is phallocentric and Oedipal, a heterosexual codification that expels non-heterosexual practices and identities. Essentially paranoiac, civilization founds itself by locating its enemies, its others that must be banished if its own categories are to be stable and grounded. In a Foucauldian manner, Hocquenghem notices how science pathologizes homosexuality and thereby licenses the penal subordination of gay sexuality to heterosexual norms. The homosexual person is seen as deficient or ill in this light. But it is only by engaging in such violent expulsion that civilized heterosexual normality can come into being. Drawing on Deleuze and Guattari's gay manifesto *Anti-Oedipus*, Hocquenghem argues that this fear of homosexuality is simply a way of dealing with the subversive transversality of desire, the way all sexuality exists on a continuum of possibilities, none of which is more valuable or natural than another. He cites *The Anti-Oedipus* at the close of his book: "We are heterosexual statistically or in a molar sense, homosexual personally (whether we are aware of it or not), and finally transsexual in an elementary or molecular sense."<sup>7</sup>

Both in *Speculum* and in *This Sex Which Is Not One* (1977), Irigaray elaborates a Post-Structuralist theory of feminist separatism. In Western philosophy, women have been portrayed as matter, body, physicality, fluidity, boundarylessness, irrationality, artificiality, and the like. Women are the other or opposite, the mirror image, of all the positive values male-dominated Western philosophy privileges, from reason and truth to identity and authenticity. Irigaray plays on the word "speculation," which in philosophy refers to the process of reasoning, especially the metaphysical process of going "beyond" empirical appearances to talk about concepts like "being" and "becoming," or "truth" and "infinity." Such abstraction from concrete particularity and bodily materiality is, according to Irigaray, quintessentially male. Man must separate from the bloody origin in the mother and elevate himself above such matter if he is to attain a psychological identity predicated on masculine principles and ideals. By constructing their own subjective identity, man also projects matter, the matter that includes him, into a position of objectivity, entirely separate and apart from him. This is a gesture of power and control, and the other, Irigaray notes, becomes his "speculum" or mirror, that which confirms his self-identity. That other is woman in general, which Irigaray construes as linked essentially to bodily and material life. *Mater* is like *matrix*, the ground of philosophical speculation, because they are the same matter. Man seeks to extract himself from matter and to dominate it using concepts. All Western philosophy, including Freud's psychoanalysis, thus positions woman in a subordinate place in relation to the male subject (of knowledge and of mastery of matter). There can be no theory of the subject, as she puts it, that is not masculine.

We must elude the opposition, Irigaray suggests, especially in *This Sex*. She proposes that women step outside the system of male equivalence (which is the system of philosophic equivalence – between sign and thing, subject and object, truth and matter, etc. – as such). They must fall back on themselves, value their own bodies instead of despising them as the male tradition has urged. Female bodies amongst themselves, clitoral lips touching each other in an aphallic caress – this is the sexual model Irigaray proposes as an alternative to the male one of penetration, which is as much cognitive or philosophic as phallic. Stop being the mirror of men, she urges; stop pretending to be "feminine."

Hélène Cixous in *The Newly Born Woman* offers a similar argument. Women must abandon the male phallocentric tradition of thinking of the world in oppositions between active and passive, nature and culture, father and mother, *logos* and *pathos*, form and matter, man and woman. We must instead think (or write, since we are now outside traditional thinking) the transverse ambivalence that underlies all of these oppositions. Cixous argues that only a particular kind of experimental writing, what she calls *écriture féminine* or feminine writing, can achieve this end. Feminine writing is not the exclusive domain of women; “male” writers like Joyce also practice it. Cixous’s writing is itself an embodiment of such a new practice in that it crosses the line between the public or thetic and the personal or autobiographical. She writes philosophically of her own life experience, and of philosophy in a personal manner. The purpose of such writing practice is to reconnect with the world of matter that male speculation projected into a realm of intelligible objectivity: “Let us simultaneously imagine a general change in all the structures of training, education, and supervision – hence in the structures of reproduction of ideological results. And let us imagine a real liberation of sexuality, that is to say, a transformation of each one’s relationship to his or her body (and to the other body), an approximation to the vast, material, organic, sensuous universe that we are.”<sup>8</sup>

While one strand of Post-Structuralists reconfigured Western assumptions regarding gender identity and sexuality, another set about pursuing the radical implications of the new theories of representation and signification. If the orders of society were fabricated by signs (rather than being the hidden meanings signs embodied), how did such signs work and how did they accomplish their goals? In a long line of books, from *The System of Objects* (1968) to *The Transparency of Evil* (1990), Jean Baudrillard examines the way in which capitalism has shifted from being a mode of production to being a mode of signification. The real is no longer a matter of production or of productive forces and relations; rather, it has been replaced by simulation models that tell us who we are and shape what will pass for reality. Baudrillard espouses an immediatist politics appropriate to the student movement of 1968, which demanded an immediate total revolution of society, in place of the deferred change or gradual amelioration sought by the unions and the left parties. As a professor at Nanterre, Baudrillard was, as it were, at the heart of the uprising, and his thinking was profoundly shaped by it. As our epigraphs from his work indicate, that work is unique in that it self-consciously adopts the pose of the aesthetic *provocateur*, the poet-cum-outsider-cum-criminal that had become the ideal of at least one part of his generation. He is alone among them in speaking, as it were, with cobblestones. No other thinker of the “class of 1968” would say how nice it is to see a car burn. Or say that signs must also be burned. And then set about developing a burning style that leaves most of the assumptions, platitudes, certainties, and values of his and of any other generation for that matter in ruins. Baudrillard is the closest to Nietzsche’s later style of provocative polemic of all the writers we discuss here.

Baudrillard’s first book, *The System of Objects*, appeared, appropriately, in 1968. It lays out one of his central themes: modes of signification have taken the place of reality. About the shaping of desire and identity by advertising, *System* describes a world in which material needs have given way to codified equivalences between commodities and personal identity. Capitalist production has ceded primacy to the process of reproduction through the marketing of goods, and that marketing is entirely semiotic. The code dominates our lives and tells us who we are. There is no reality apart from it. Baudrillard would extend this argument in *Consumer Society* (1970) and *For a Critique of the Political Economy of the Sign* (1972), but his most scandalous book of this early period is *The*

*Mirror of Production* (1973), an extended critique of Marx and of Marxism. Marx, he argues, merely holds up a mirror to capitalism by adopting its categories, such as “production.” By doing so, Marx mortgages everyone’s lives to the capitalist-rationalist ideals of deferred gratification and functional usefulness. Reform socialists (to this day) argue that the goal of social revolution is a shorter working day; Baudrillard argues that it should be the abolition of work as capitalism knows and imposes it – a system of equivalence that equates human lives with monetary signs and exchange values. No contradiction at the heart of production of the kind Marx adduced (between workers and owners, or between productive forces and productive relations) will end this system; only dismantling the code of signification itself (which is what defines capitalist production itself as a set of equations between money, time, and human life) will bring about change. Against the subsumption of all the radical energies opposed to this rationalist social system into parties or unions that as much control and restrain as direct them, Baudrillard proposes a negative strategy of disaffection, a withdrawal of support, a revolt against the code of valuation as such:

All the institutions of “advanced democracy,” all “social achievements” in regard to personal growth, culture, individual and collective creativity, all of this is, as it has always been, simply the privilege of those with private property, the true right of the few. And for everyone else there are day-care centers and nurseries, institutions of social control in which productive forces are deliberately neutralized. For the system no longer needs universal productivity; it requires only that everyone play the game. This leads to the paradox of social groups who are compelled to fight for a place in the circuit of work and of productivity, the paradox of generations who are left out or placed off limits by the very development of the productive forces.... Revolt emerged against the integration of labor power as a factor of production. The new social groups, de facto dropouts, on the contrary, proved the incapacity of the system to “socialize the society” in its traditionally strategic level, to dynamically integrate them, even by violent contradiction at the level of production. And it is on the basis of their *total irresponsibility* that these marginal generations carry on the revolt.

It is in this book as well that Baudrillard provides a capsule portrait of the artist radical:

The cursed poet, non-official art, and utopian writings in general, by giving a current and immediate content to man’s liberation, should be the very speech of communism, its direct prophecy. They are only its bad conscience precisely because in them something of man is *immediately* realized, because they object without pity to the “political” dimension of the revolution, which is merely the dimension of its final postponement. They are the equivalent, at the level of discourse, of the wild [*sauvage*, wild or uncontrolled] social movements [of May ’68] that were born in a symbolic situation of rupture (symbolic – which means non-universalized, non-dialectical, non-rationalized in the mirror of an imaginary objective history).

*The Mirror of Production* describes society in a manner that will influence Foucault’s theory of the carceral or disciplinary society. For Baudrillard, society consists of very little else than institutions of social control and discipline. Like the Italian radical thinkers of his generation, especially Negri, he argues that the discipline of the factory floor has merely spread to all of society.

The work of Jean-François Lyotard very quickly after 1968 acquired the political tone established that year (what might be called “revolutionary optimism”). In *Discourse/Figures*

(1971) he argues for a deconstructive understanding of figuration or rhetoricity as the spatial representation which makes the discursive ordering of objects possible while simultaneously undermining and precluding all rational intelligibility. Figuration can never be incorporated into a discursive order of oppositions that pose signifiers as standing opposite to meanings. That would itself be an act of figuration, a display in space. Discourse can thus never internalize figuration to its system of order, yet without figuration, no discursive order would be possible. Lyotard is also concerned in this book with noting how the world of objects usually thought to be “grasped” by concepts somehow remains outside rational conceptuality and can never be reduced to it. As Bill Readings puts it: “The object resists being reduced to the state of mere equivalence to its meaning within a system of signification, and the figural marks this resistance, the sense that we cannot ‘say’ everything about an object, that an object always in some sense remains ‘other’ to any discourse we may maintain about it, has a singularity in excess of any meanings we may assign to it.”<sup>9</sup> Finally, art, Lyotard claims with Nietzsche, makes knowledge possible. True knowers are supreme fabricators; the aesthetic cannot be separated from the epistemic.

Lyotard’s *Dérive à partir de Marx et Freud (Adrift After Marx and Freud)* (1973) gives voice to the post- or anti-Marxism that would become a commonplace of French Post-Structuralist thought in the 1970s. Already in *Discourse/Figures*, Lyotard had linked figuration to desire and to the operations of the unconscious, what he would in a later book call a “libidinal economy.”<sup>10</sup> In this book, social and political institutions like capitalism or the Party are described as mechanisms for restraining desires potentially in excess of socially acceptable limits. The task of radical politics is to liberate those desires. Lyotard accords priority to experimental art, which works radically with visual figuration itself rather than making it subordinate to meaning, over the traditional sloganizing of the Left, which gives primacy to meaning over the artifice of figuration.

Already one can begin to glimpse the outlines of what might be called a “general program” of Post-Structuralism: against meaning, figuration, against rigid structure, free play, against conceptuality, the resistance of the object, against identity, endless difference, against identity again, the relation to the other in general,<sup>11</sup> against making sense, the making sense of sense by non-sense, against universality, the irreducible singularity of the event, against signification, significatory multiplicity and excess, against representation conceived as the embodiment of meaning, the same representation conceived as a perpetual leftover which can never become the other within a binary oppositional order of meaning without generating one more representation (forever outside the semantic order), against rationality, the differential flux of life that is a-rational and beyond reason (and which contains reason), against the dialectic, the endless mediation of everything by everything else, against normality and good citizenship, the good madman or the positive criminal, against the repression required for civilized life, liberation, against the Party, the people, against authority, the authorship of authority by dictatorial rhetorics and regimes of discipline that lack all justification other than force and power, against the mind and ideas, the body and the matter that encompass both the mind and ideas, against transcendence, irreducible immanence or here and now within-the-world-ness, against the social system, all the forces of desire that the system must either expel or curtail in order to be itself. And so on.

Michel Foucault in the 1970s and 1980s broadened his historical critique of Western regimes of knowledge and Western social institutions such as the hospital to include what he called the general disciplinary power that saturates society as a whole and shapes our lives. Foucault’s master work of 1975, *Oversee and Punish: The Birth of the Prison*

(*Surveiller et punir: naissance de la prison*, translated as *Discipline and Punish*), is a history of the emergence in modern times of a “carceral” or disciplinary society in which overt forms of public punishment of the kind that characterized the eighteenth century have given way to practices of self-discipline learned in institutions such as schools. Anxiety over behaving well has replaced fear of being publicly dismembered or burned. We have become our own prison guards, according to Foucault, and have learned to mold our behavior in accordance with the needs of modern capitalism. The bourgeois ideal of individual freedom, he argues, is an illusion, a way of loosening the tethers so that we can run faster and better, like useful social machines. Moreover, the modern knowledge disciplines that seem the embodiment of scientific reason are merely, Foucault argues, exercises in social power, ways to impose order on society by constructing personal or social identities and decreeing or normalizing “appropriate” behavior. If the heterosexual family is needed to produce useful citizens, then homosexuality, which had not been previously identified as a “pathology,” will be so identified, and it along with other alternative forms of non-reproductive sexuality will be scientifically branded as “perversions” and banished from normality. The three volumes of Foucault’s *History of Sexuality* (1976, 1984) dislocate how gender has been traditionally conceived as a stable, ontologically grounded cluster of acceptable identities by arguing that sexuality and sexual practices have been the objects of disciplinary power/knowledge that have “scientifically” constructed ideals of propriety by excising and rendering unwelcome sexual practices that earlier ages had no trouble accommodating. Foucault’s most provocative example is sexual love between men in ancient Greece, a practice celebrated by none other than Plato, the philosopher most fondly turned to by many contemporary social conservatives who oppose equal rights for gays and lesbians.

Baudrillard’s work of the late 1970s and 1980s, especially *Symbolic Exchange and Death* (1976), portrays signification as having so replaced reality that now one can say that the world is entirely simulational, entirely generated by semiotic models that have no referent in a supposedly “real world.” All of our desires are codified and manipulated as fashion; all of our thought is saturated with semiotic equations that make critique (the pose of standing outside the system and opposing it) futile; detached from any referent in the world, capitalist signs refer only to other signs within a closed system. Baudrillard’s later work, especially *Seduction* (1979), *Simulacra and Simulations* (1981), *The Fatal Strategies* (1983), and *The Gulf War Did Not Happen* (1991),<sup>12</sup> has attracted a great deal of attention amongst philosophers, cultural critics, and artists (who perhaps have come to recognize in his deliberately provocative style a version of their own aesthetic radicalism). Baudrillard’s work is the most resiliently leftist and political of his “class.” Indeed, thirty years later, it is difficult to imagine that someone still manages to write so ably and accurately in the style of 1968.

In 1979, Post-Structuralism changed names, but, as any Post-Structuralist will tell you, when names change, things change. Post-Structuralism (a term used mostly in the Anglophone academy) found itself being replaced by a new word (actually an old word transplanted from America to France and back again). That word was “Post-Modernism.” Lyotard published a book that year entitled *The Post-Modern Condition: A Report on Knowledge* in which he calls the contemporary historical situation in which the old West European master narratives of progressive subjective enlightenment and rational liberation (Liberal Humanism and Marxism especially) no longer apply to a world of micronarratives that could not be dominated by any single legitimating metanarrative. Instead, a criterion of scientific and economic performativity or usefulness and technical/economic

effectiveness has replaced the old rationalist ideal of a legitimating metalanguage, and it is linked to the growing power of corporations. By controlling scientific research, they are setting the terms of what would be construed as useful knowledge (and by implication, of what would be construed as true). Truth is no longer the possession of a rational subject, nor is it a property of a reality that would be described objectively using objective scientific methods. Rather it is determined by the effectivity of knowledge within a particular economic situation dominated by corporations that have the power both to shape the world and to say what counts as scientific truth regarding that world. What will count as true is what is useful from their point of view. For example, tests on drugs that provide justification for marketability will be deemed true; tests that provide contrary results will be avoided. So long as people continue to smoke and buy cigarettes, it will be true that they are not banishable; which is to say, only tests proving their non-banishability will be deemed true.

“Modernity” is a term common more in Germany than in France or the Anglophone intellectual world as a name for the post-feudal era, which German thinkers like Jürgen Habermas think of as one of progressive enlightenment or rationalization. Our world has come increasingly under the sway of reason in the form of rational laws and procedures, although defects remain that might be corrected if we were able to rationally discuss the issues together and achieve a consensus about remedying them. By choosing the word “Post-Modernism” or “Post-Modernity” to name the contemporary era, Lyotard was implicitly criticizing Habermas. Throughout the 1970s, while Habermas had been arguing in favor of the priority of Reason over discourse, Lyotard had been arguing in books like *Pagan Lessons* (1977) that all we have is discourse or narratives. Reason or rationality might be one language game, one narrative among others, but it is no more than that. In typical Post-Structuralist fashion, Lyotard branded “consensus” the ultimate form of totalitarianism, an attempt to cut off the play of discursive interaction by monologically and authoritatively imposing a model of undifferentiated unity on a field of discussion that can never be closed off or bound in. Discursive linkages are not amenable to domination by ideals of rational meaning. To determine that meaning would simply create one more discursive linkage, another narrative, and so on. Litigations settle disputes between discussants, but according to Lyotard, we live in what he calls “differends,” situations of discussion that are irresolvable. No conclusion or simple judgment that terminates discussion and argument can be achieved.

The books in which Lyotard makes these arguments are *Just Gaming (Au Fusté*, 1979) and *The Differend* (1984). Lyotard takes up the obvious questions an anti-Post-Structuralist would propose: what about justice and ethics? How do you deal with these issues in a world that is nothing but narratives and language games? Lyotard’s answer is “you don’t.” Let them be. Decide by not deciding, and by not deciding, you leave the questions open and you continue talking. Injustice is the closing off of debate and the subordination of the other. It is the imposition on an object, even a horrifying object like Auschwitz, of a meaning or of a category. The category and the meaning necessarily, by virtue of their preponderance and their presence in our minds and in our discourse, make the object disappear. Auschwitz loses its horror even as we attempt to do honor to the horror, to name it as such. There are things, Lyotard contends, that cannot be named, and they are the things most deserving of being honored by non-presentation and silence. Post-Modernism in art, Lyotard contends, consists of trying to present the non-presentable, but that places it outside the habitual regimes of representation that we take for granted in our everyday lives and our everyday rationality.

By a very circuitous route, we are back to the initial issue between Structuralism and Post-Structuralism, that of words and things, names and objects, categories and the world categorized. The problem with Structuralism in general, Lyotard would contend, is that it is an act of violence against an object such as Auschwitz, a reduction of complexity to simplicity, of something differential and problematic to a simple identity of structure that may have nothing to do with what the objects themselves are about or have to say. Why not instead acknowledge that one is always within narrative and pursue the narratives, ask for more stories, fill out the blanks on the same horizontal plane as the event or object itself? Might that not be more a way of “doing it justice”? One might be tempted to add that a law against such things as Auschwitz is always also a helpful additional piece of narrative, but Lyotard would reply that such laws existed before the event and they made no difference; what matters is creating a general discourse or web of arguments that becomes so strong in all cultures that such things simply become practical (which is to say, narrative) impossibilities, stories which can no longer be told because they no longer convince. Laws are just one discursive tool for shaping the world; persuasive narration is another, perhaps more effective, one. Trust in the ability of narratives to persuade and to generate new beliefs, Lyotard would argue, rather than falling back on the bad rationalist habit of authoritatively and violently declaring what a supposedly separate reality is or should be, without taking any decisive, which is to say, convincingly argued, well-narrated steps to change that reality’s potential for taking such violent forms.

Marxists have made something of a cottage industry out of denouncing Post-Structuralism, and for good reason.<sup>13</sup> It places political Marxism, that of the Leninist parties and the trade unions, on the defensive and lays claim to a more challenging political imperative, the demand of the immediate revolution, as opposed to the deferred reform. It also places theoretical Marxism in jeopardy by noting the resemblance between its categories and those of the rationalist-utilitarian tradition Marxism seeks to displace. Marxism, according to Post-Structuralism, is no longer a critical philosophy, one that can stand apart and offer something new. But then, at least according to Post-Structuralists like Baudrillard, such an external critical position is an impossibility in any event. We are all within, and when we seem without, in a position of critical transcendence where we can speak in a metalanguage of reason, we are simply looking at the world through glass, and the glass prevents us from touching anything. It is a matter of shattering the glass, of reinserting ourselves into the world and then of asking, now what? How do we change the shape of things without laying claim to an external instance of power like the Party or resorting to a world-transcending foundation of rational authority like Reason or Truth. As Derrida notes in *Specters of Marx* (1993), Post-Structuralist deconstruction is in some respects the next logical step in Marxism, but as such and as what it has to be, it is also necessarily a step away from Marxism towards what Derrida calls a “New International,” a program for change that ranges from family dynamics to global institutional politics. It is indeed a “general program,” if a Post-Marxist one.

It consists of putting aside all of our concepts and categories regarding knowledge and being and of starting over, possibly from a number of different places at once. One place would be Derrida: to note that all thought is in identities (discrete categories), but that one needs difference to make such identities. So why not reexamine what it means to talk about the world in terms of identities, such as, say, an individual or a free speech or a meaning or a war or a corporation or a worker (which one?) or a woman or the school or the global economy? Can we reword these categories in terms of difference?

And how might that change our thinking? Another place would be Deleuze and Guattari: to note that we are energy that connects up with, bounces off, and is invested in the things around us, which are parts of grids or schemas that temporarily stabilize the general flows of energy that traverse all of us. How are those energies coded, directed, shaped, et cetera? How does the signifying regime we are within allow an order to come about from all of the potentially explosive energy that is in society? Another place would be Kristeva: to note that the foundation of our being and our knowledge is a thesis, a separation of subject and object. How might we reconfigure that relationship? Is it innate or mandatory? Or can we look to avant-garde literature and find there lessons in how it might provide glimpses of an alternative world, one perhaps beyond work and utility and the kinds of meaning that our founding theses bring about? Another place would be Irigaray: to ask how the most everyday categories of thought and action are imbued with phallogocentric values and ideals. How might we work beyond the phallic model into some other site of sexualized thinking that would bring into play all the values and ideals the phallogocentric tradition represses? Another place would be Lyotard: to note that our moral assumptions exist nowhere outside discursive procedures (memories of lessons in good behavior, sermons, laws, discussions, arguments, confessions, rebukes, bad news, good news, etc.). And if reason is itself such a procedure, how might we discuss and change those moral ideals without granting one party a trump that allows it to claim to be more rational?<sup>14</sup> How do “enlightened” people talk to neo-Nazis without betraying the morality of discussion and laying claim to enlightenment, an extra-discursive point of rationality? Another place would be Foucault or Baudrillard: to note that codes have taken over our lives, that we simulate models of good behavior even when we feel most original. How can we lay claim to the codes, undo the equations between money and human lives or between good behavior and codified social repression that anathematizes and stigmatizes the outsiders, the minorities, the criminals, the poor, those who do not live up to “our” expectations, those of the people on the inside of that simulation model of “the good”?

One might say that a paradigm shift has occurred, but that would itself be to remain within the world that has shifted. We are not in a new paradigm. Rather, there are no paradigms or models of knowledge that stand apart from the world and outside the play of its movements (repetition, difference, spacing, energetics, agonistics or antagonism, aesthetics or figuration, etc.). We are simply in the world we have always been in without knowing it, without being able to know it because we were preoccupied with one move (cognition in language) within that world and because the world somehow, even though we can describe it from within (the planetarium of knowledge), cannot be known (summed up in identitarian categories that stand outside, etc.). It can only be lived in knowingly.

## Notes

- 1 The March 22nd Movement was the student group at the University of Nanterre led by Daniel Cohn-Bendit that ignited the student and worker uprisings in the Spring of 1968 in Paris.
- 2 We will occasionally provide alternative translations of French titles when it seems relevant. Here, for example, the standard English translation misses one meaning of Foucault's original title, his use of the word “*déraison*,” which intimates his sense that madness represents a kind of “unreason,” or even more actively “undoing of reason.” The French title also alludes to the verb “*déraisonner*,” to talk nonsense.

- 3 We could even apply this idea to Post-Structuralism itself. Jacques Derrida, for example, notes a resemblance and makes an analogy between the linguistic notion of difference and another process of differentiation that he sees operating in conceptuality or knowledge as well as in the world of entities. Derrida's project of deconstruction might thus be said to be founded on a "mere" metaphorical comparison, which might at first seem to disprove his argument, if it was not a perfect confirmation of the argument.
- 4 A crucial, much-discussed book in this regard is Marcel Mauss's *The Gift*.
- 5 Tel Quel's collaborative volume *Théorie d'ensemble* (1968) is something of a manifesto for the journal's theory of a revolutionary signifying practice that would disturb existing orders and make possible new worlds of thought and being.
- 6 By the mid-1970s, some of them, who became known as the "New Philosophers," would become polemicists against the possibility that the PCF might become part of a coalition government with the Socialist Party.
- 7 Gilles Deleuze and Felix Guattari, *The Anti-Oedipus* (Minneapolis: University of Minnesota Press, 1983), p. 149.
- 8 Hélène Cixous, *The Newly Born Woman* (Minneapolis: University of Minnesota Press, 1986), p. 83.
- 9 Bill Readings, *Introducing Lyotard: Art and Politics* (London and New York: Routledge, 1991), p. 4.
- 10 *Economie Libidinale* (Paris: Minuit, 1974). Translated as *Libidinal Economy* (Bloomington: Indiana University Press, 1994).
- 11 The "other" is a term that can name other people or other things, but it also implies the idea of a relation beyond oneself (identifiable as a subject) or beyond something (identifiable as an object) to something or someone else. We all appear to be identities, to possess selves, but the mark of "other" people is on us in the form of relations or experiences we have had with them. Similarly, no object stands apart from some relation to a field of perception containing other objects in which it is situated. The relation to the other in general, Post-Structuralists contend, is irreducible.
- 12 This piece, widely condemned by Marxists as rightist, was in fact first published in the French leftist newspaper *Liberation*.
- 13 The Marxist critique is itself something of a lesson in Post-Structuralism in that it operates at the level of signification and subordinates reality to the dictates of its code. Marxists apply the word "postmodernism" to the latest stage of capitalism, and declare that capitalism is postmodernism. Then, they apply the same word "postmodernism" to Post-Structuralism and call it "Post-modernism." Consequently, Post-Structuralism must be the latest stage of capitalism, since they share a name. One has to forget, of course, everything that radical anti-capitalist Post-Structuralist thinkers from Foucault to Baudrillard have written if one is to believe this, which makes it somewhat insubstantial as an argument.

The metaphors Marxists use in their denunciations are somewhat sinister. Eagleton speaks of getting Post-Structuralism in his "sights," Jameson of "tracking" (as in hunting?) it, and Simpson of "shock therapy." One must bear in mind that "reform socialists" of the sort a Marxist like Eagleton celebrates as an alternative to the "ultra-leftism" of Post-Structuralism are in the bad habit (at least in Spain) of literally getting ultra-leftist Basque separatists in the sights of their death squads. As Post-Structuralists suggest, one might want to be more careful about one's metaphors.
- 14 See Michael Ryan, "The Joker's Not Wild: Critical Theory and Social Policing," in *Politics and Culture: Working Hypotheses for a Post-Revolutionary Society* (London: Macmillan, 1989; Baltimore: Johns Hopkins University Press, 1989).

# CHAPTER 2

## The Will to Power

*Friedrich Nietzsche*

Nietzsche died before being able to complete what was to be his major work, *The Will to Power* (1885–6). In it, he argues that the essential drive in all life is a yearning for mastery. Nietzsche links this yearning to knowledge. When we know the world, we master its temporally fluid and spatially diverse reality by fixing identities with words. For Nietzsche, philosophical courage consists of being able to tolerate the nonidentical and meaningless character of existence without having to resort to words that posit identities or meanings in things. The world merely exists (what he calls the “eternal return” of the same), and there is no theological origin or conclusion to history. This skepticism regarding the likelihood of a separate spiritual realm in existence carries over into Post-Structuralism, which also questions the more secular versions of this ideal of transcendence, especially the notion that the realm of meaning is essentially distinct from the realm of signification. When the Post-Structuralists declare that there is no “transcendental signified,” they are echoing Nietzsche’s claim that there is teleology, no theological origin or goal to the world.

499

“Thinking” in primitive conditions (pre-organic) is the crystallization of forms, as in the case of crystal. – In *our* thought, the essential feature is fitting new material into old schemas (“Procrustes” = bed), *making equal* what is new.

500

... The same equalizing and ordering force that rules in the idiosyncrasy, rules also in the incorporation of the outer world: our sense perceptions are already the result of this assimilation and equalization in regard to *all* the past in us; they do not follow directly upon the “impression” –

*Original publication details:* Friedrich Nietzsche, from *The Will to Power*, trans. Walter Kaufmann, sections 449 to 517, 542–543, and 552. Random House, 1967. Reproduced with permission from Random House, Inc.

## 501

All thought, judgment, perception, considered as comparison, has as its precondition a “*positing of equality*,” and earlier still a “*making equal*.” The process of making equal is the same as the process of incorporation of appropriated material in the amoeba.

## 511

Equality and similarity.

1. The coarser organ sees much apparent equality;
2. the mind *wants* equality, i.e., to subsume a sense impression into an existing series: in the same way as the body *assimilates* inorganic matter.

Toward an understanding of logic: *the will to equality is the will to power* – the belief that something is thus and thus (the essence of *judgment*) is the consequence of a will that things as much as possible *shall be equal*.

## 512

Logic is bound to the condition: assume there are identical cases. In fact, to make possible logical thinking and inferences, this condition must first be treated fictitiously as fulfilled. That is: the will to logical truth can be carried through only after a fundamental *falsification* of all events is assumed. From which it follows that a drive rules here that is capable of employing both means, firstly falsification, then the implementation of its own point of view: logic does *not* spring from the will to truth.

## 513

The inventive force that invented categories labored in the service of our needs, namely of our need for security, for quick understanding on the basis of signs and sounds, for means of abbreviation: “substance,” “subject,” “object,” “being,” “becoming” have nothing to do with metaphysical truths. –

It is the powerful who made the names of things into law, and among the powerful it is the greatest artists in abstraction who created the categories.

## 514

A morality, a mode of living tried and *proved* by long experience and testing, at length enters consciousness as a law, as *dominating* – And therewith the entire group of related values and states enters into it: it becomes venerable, unassailable, holy, true; it is part of its development that its origin should be forgotten – That is a sign it has become master –

Exactly the same thing could have happened with the categories of reason: they could have prevailed, after much groping and fumbling, through their relative utility – There came a point when one collected them together, raised them to consciousness as a whole – and when one commanded them, i.e., when they had the effect of a command – From then on, they counted as a priori, as beyond experience, as irrefutable. And yet perhaps they represent nothing more than the expediency of a certain race and species – their utility alone is their “truth” –

## 515

Not “to know” but to schematize – to impose upon chaos as much regularity and form as our practical needs require....

## 516

We are unable to affirm and to deny one and the same thing: this is a subjective empirical law, not the expression of any “necessity” but only of an inability.

If, according to Aristotle, the law of contradiction is the most certain of all principles, if it is the ultimate and most basic, upon which every demonstrative proof rests, if the principle of every axiom lies in it; then one should consider all the more rigorously what *presuppositions* already lie at the bottom of it. Either it asserts something about actuality, about being, as if one already knew this from another source; that is, as if opposite attributes *could* not be ascribed to it. Or the proposition means: opposite attributes *should* not be ascribed to it. In that case, logic would be an imperative, not to know the true, but to posit and arrange a world that shall be called true by us.

In short, the question remains open: are the axioms of logic adequate to reality or are they a means and measure for us to *create* reality, the concept “reality,” for ourselves? – To affirm the former one would, as already said, have to have a previous knowledge of being – which is certainly not the case. The proposition therefore contains no *criterion of truth*, but an *imperative* concerning that which *should* count as true....

## 517

In order to think and infer it is necessary to assume beings: logic handles only formulas for what remains the same. That is why this assumption would not be proof of reality: “beings” are part of our perspective. The “ego” as a being (– not affected by becoming and development).

The fictitious world of subject, substance, “reason,” etc., is needed – : there is in us a power to order, simplify, falsify, artificially distinguish. “Truth” is the will to be master over the multiplicity of sensations: – to classify phenomena into definite categories. In this we start from a belief in the “in-itself” of things (we take phenomena as *real*).

The character of the world in a state of becoming as incapable of formulation, as “false,” as “self-contradictory.” Knowledge and becoming exclude one another. Consequently, “knowledge” must be something else: there must first of all be a will to make knowable, a kind of becoming must itself create the deception of beings ...

## 542

If the character of existence should be false – which would be possible – what would truth, all our truth, be then? – An unconscionable falsification of the false? The false raised to a higher power? –

## 543

In a world that is essentially false, truthfulness would be an antinatural tendency: such a tendency could have meaning only as a means to a higher power of falsehood. In order for a world of the true, of being, to be invented, the truthful man would first have to be created (including the fact that such a man believes himself “truthful”).

Simple, transparent, not in contradiction with himself, durable, remaining always the same, without wrinkle, fold, concealment, form: a man of this kind conceives a world of being as “God” in his own image.

For truthfulness to be possible, the whole sphere of man must be very clean, small, and respectable; advantage in every sense must be with the truthful man. – Lies, deception, dissimulation must arouse astonishment – …

## 552

When one has grasped that the “subject” is not something that creates effects, but only a fiction, much follows.

It is only after the model of the subject that we have invented the reality of things and projected them into the medley of sensations. If we no longer believe in the effective subject, then belief also disappears in effective things, in reciprocation, cause and effect between those phenomena that we call things.

There also disappears, of course, the world of effective atoms: the assumption of which always depended on the supposition that one needed subjects.

At last, the “thing-in-itself” also disappears, because this is fundamentally the conception of a “subject-in-itself.” But we have grasped that the subject is a fiction. The antithesis “thing-in-itself” and “appearance” is untenable; with that, however, the concept “appearance” also disappears.

If we give up the effective subject, we also give up the object upon which effects are produced. Duration, identity with itself, being are inherent neither in that which is called subject nor in that which is called object: they are complexes of events apparently durable in comparison with other complexes – e.g., through the difference in tempo of the event (rest–motion, firm–loose: opposites that do not exist in themselves and that actually express only variations in degree that from a certain perspective appear to be opposites. There are no opposites: only from those of logic do we derive the concept of opposites – and falsely transfer it to things).

If we give up the concept “subject” and “object,” then also the concept “substance” – and as a consequence also the various modifications of it, e.g., “matter,” “spirit,” and other hypothetical entities, “the eternity and immutability of matter,” etc. We have got rid of *materiality*.

From the standpoint of morality, the world is false. But to the extent that morality itself is a part of this world, morality is false.

Will to truth is a making firm, a making true and durable, an abolition of the false character of things, a reinterpretation of it into beings. “Truth” is therefore not something there, that might be found or discovered – but something that must be created and that gives a name to a process, or rather to a will to overcome that has in itself no end – introducing truth, as a *processus in infinitum*, an active determining – not a becoming conscious of something that is in itself firm and determined. It is a word for the “will to power.”

Life is founded upon the premise of a belief in enduring and regularly recurring things; the more powerful life is, the wider must be the knowable world to which we, as it were, attribute being. Logicizing, rationalizing, systematizing as expedients of life.

Man projects his drive to truth, his “goal” in a certain sense, outside himself as a world that has being, as a metaphysical world, as a “thing-in-itself,” as a world already in existence. His needs as creator to invent the world upon which he works, anticipate it; this anticipation (this “belief” in truth) is his support ...

Man seeks “the truth”: a world that is not self-contradictory, not deceptive, does not change, a *true* world – a world in which one does not suffer; contradiction, deception, change – causes of suffering! He does not doubt that a world as it ought to be exists; he would like to seek out the road to it. (Indian critique: even the “ego” as apparent, as not real.)

Whence does man here derive the concept reality? – Why is it that he derives *suffering* from change, deception, contradiction? and why not rather his happiness? –

Contempt, hatred for all that perishes, changes, varies – whence comes this valuation of that which remains constant? Obviously, the will to truth is here merely the desire for a world of the constant.

The senses deceive, reason corrects the errors; consequently, one concluded, reason is the road to the constant; the least sensual ideas must be closest to the “true world.” – It is from the senses that most misfortunes come – they are deceivers, deluders, destroyers. –

Happiness can be guaranteed only by being; change and happiness exclude one another. The highest desire therefore contemplates unity with what has being. This is the formula for: the road to the highest happiness.

*In summa:* the world as it ought to be exists; this world, in which we live, is an error – this world of ours ought not to exist.

Belief in what has being is only a consequence: the real *primum mobile* is disbelief in becoming, mistrust of becoming, the low valuation of all that becomes –

What kind of man reflects in this way? An unproductive, suffering kind, a kind weary of life. If we imagine the opposite kind of man, he would not need to believe in what has being; more, he would despise it as dead, tedious, indifferent –

The belief that the world as it ought to be is, really exists, is a belief of the unproductive who do *not desire to create a world* as it ought to be. They posit it as already available, they seek ways and means of reaching it. “Will to truth” – as the failure of the will to create....

Whoever is incapable of laying his will into things, lacking will and strength, at least lays some *meaning* into them, i.e., the faith that there is a will in them already.

It is a measure of the degree of strength of will to what extent one can do without meaning in things, to what extent one can endure to live in a meaningless world because one organizes a small portion of it oneself....

*Overthrowing of philosophers* through the destruction of the world of being: intermediary period of nihilism: before there is yet present the strength to reverse values and to deify becoming and the apparent world as the only world, and to call them good ...

# CHAPTER 3

## What Is Becoming?

*Gilles Deleuze*

Gilles Deleuze was one of the most prolific and influential French philosophers of the 1960s and 1970s. Like other figures of the time, he emphasized the complexity of thought, of literature, and of the world. He developed new abstract models for the world (the difference between "book" and "rhizome," for example) that sought to capture a sense of the instability in existence – that it consists as much of becoming and change as of being and stability. Conceiving of the world in this way renders our old vocabularies less useful and invites the creation of new terms such as "territory" and "deterritorialization" to account for how human life changes over time (see *A Thousand Plateaus*).

*Alice* and *Through the Looking-Glass* involve a category of very special things: events, pure events. When I say "Alice becomes larger," I mean that she becomes larger than she was. By the same token, however, she becomes smaller than she is now. Certainly, she is not bigger and smaller at the same time. She is larger now; she was smaller before. But it is at the same moment that one becomes larger than one was and smaller than one becomes. This is the simultaneity of a becoming whose characteristic is to elude the present. Insofar as it eludes the present, becoming does not tolerate the separation or the distinction of before and after, or of past and future. It pertains to the essence of becoming to move and to pull in both directions at once: Alice does not grow without shrinking, and vice versa. Good sense affirms that in all things there is a determinable sense or direction [*sens*]; but paradox is the affirmation of both senses or directions at the same time.

Plato invites us to distinguish between two dimensions: (1) that of limited and measured things, of fixed qualities, permanent or temporary which always presuppose pauses and rests, the fixing of presents, and the assignation of subjects (for example, a particular subject having a particular largeness or a particular smallness at a particular moment); and (2) a pure becoming without measure, a veritable becoming-mad, which never rests. It moves in both directions at once. It always eludes the present, causing future and past, more and less, too much and not enough to coincide in the simultaneity of a rebellious

*Original publication details:* Gilles Deleuze, "What Is Becoming?" from *The Logic of Sense*, pp. 1–3. Columbia University Press, 1989. Reproduced with permission from Columbia University Press.

matter. “‘Hotter’ never stops where it is but is always going a point further, and the same applies to ‘colder,’ where as definite quality is something that has stopped going on and is fixed”; “... the younger becoming older than the older, the older becoming younger than the younger – but they can never finally become so; if they did they would no longer be becoming, but would be so.”

We recognize this Platonic dualism. It is not at all the dualism of the intelligible and the sensible, of Idea and matter, or of Ideas and bodies. It is a more profound and secret dualism hidden in sensible and material bodies themselves. It is a subterranean dualism between that which receives the action of the Idea and that which eludes this action. It is not the distinction between the Model and the copy, but rather between copies and simulacra. Pure becoming, the unlimited, is the matter of the simulacrum insofar as it eludes the action of the Idea and insofar as it contests *both* model and copy at once. Limited things lie beneath the Ideas; but even beneath things, is there not still this mad element which subsists and occurs on the other side of the order that Ideas impose and things receive? Sometimes Plato wonders whether this pure becoming might not have a very peculiar relation to language. This seems to be one of the principal meanings of the *Cratylus*. Could this relation be, perhaps, essential to language, as in the case of a “flow” of speech, or a wild discourse which would incessantly slide over its referent, without ever stopping? Or might there not be two languages and two sorts of “names,” one designating the pauses and rests which receive the action of the Idea, the other expressing the movements or rebel becomings? Or further still, is it not possible that there are two distinct dimensions internal to language in general – one always concealed by the other, yet continuously coming to the aid of, or subsisting under, the other?

The paradox of this pure becoming, with its capacity to elude the present, is the paradox of infinite identity (the infinite identity of both directions or senses at the same time – of future and past, of the day before and the day after, of more and less, of too much and not enough, of active and passive, and of cause and effect). It is language which fixes the limits (the moment, for example, at which the excess begins), but it is language as well which transcends the limits and restores them to the infinite equivalence of an unlimited becoming (“A red-hot poker will burn you if you hold it too long; and ... if you cut your finger *very* deeply with a knife, it usually bleeds”). Hence the reversals which constitute Alice’s adventures: the reversal of becoming larger and becoming smaller – “which way, which way?” asks Alice, sensing that it is always in both directions at the same time, so that for once she stays the same, through an optical illusion; the reversal of the day before and the day after, the present always being eluded – “jam tomorrow and jam yesterday – but never jam *to-day*”; the reversal of more and less: five nights are five times hotter than a single one, “but they must be five times as cold for the same reason”; the reversal of active and passive: “do cats eat bats?” is as good as “do bats eat cats?”; the reversal of cause and effect: to be punished before having committed a fault, to cry before having pricked oneself, to serve before having divided up the servings.

All these reversals as they appear in infinite identity have one consequence: the contesting of Alice’s personal identity and the loss of her proper name. The loss of the proper name is the adventure which is repeated throughout all Alice’s adventures. For the proper or singular name is guaranteed by the permanence of *savoir*. The latter is embodied in general names designating pauses and rests, in substantives and adjectives, with which the proper name maintains a constant connection. Thus the personal self requires God and the world in general. But when substantives and adjectives begin to

dissolve, when the names of pause and rest are carried away by the verbs of pure becoming and slide into the language of events, all identity disappears from the self, the world, and God. This is the test of *savoir* and recitation which strips Alice of her identity. In it words may go awry, being obliquely swept away by the verbs. It is as if events enjoyed an irreality which is communicated through language to the *savoir* and to persons. For personal uncertainty is not a doubt foreign to what is happening, but rather an objective structure of the event itself, insofar as it moves in two directions at once, and insofar as it fragments the subject following this double direction. Paradox is initially that which destroys good sense as the only direction, but it is also that which destroys common sense as the assignation of fixed identities.

# CHAPTER 4

## Différance<sup>1</sup>

*Jacques Derrida*

In his 1968 essay, "Différance," Derrida describes the process of spatial and temporal movement that he claims makes all thought and all reality possible. To justify it, he draws on the work of Saussure, Heidegger, and Nietzsche. He also alludes to the work of the pre-Socratic philosophers such as Anaximander.

Saussure argued that there is no substance in language. All language consists of differences. In language there are only forms, not substances, and by that he meant that all apparently substantive units of language are generated by other things that lie outside them, but these external characteristics are actually internal to their make-up. A "form" is something external that shapes material into a particular identity or substance. All elements of language have identity only in so much as they are produced by a network of differences, and each element will itself consist of further differentiations, endlessly.

Derrida contends that thought and our perception of reality are governed by similar processes. Traditional philosophy held that we see actual presences and substances in the world and that our ideas have presence and substance that guarantees their truthfulness. Derrida set about demonstrating that ideas especially are like units of language; they are generated by difference; they have no substance apart from the networks of differences (each bearing the traces of other elements and other differences) that generate them as effects. But of course, as in language, those processes that generate them do not have a palpable or graspable presence of their own. Like forms, they are empty, nonpresent, and nonsubstantive.

In this essay, he uses two axes to talk about the work of difference that produces presence as an effect that the mind then mistakenly assumes is a substance that guarantees truthfulness. The first is time. When we think of anything, we cannot grasp it in the "present moment," because that present moment is always passing away. Presence is shadowed by the death of presence, its shuttling past the mind into the oblivion of the past. Similarly, any current present moment bears in it the future present moments toward

*Original publication details:* Jacques Derrida, "Différance" from *Speech and Phenomena and Other Essays on Husserl's Theory of Signs*, trans. David B. Allison, pp. 142–149. Northwestern University Press, 1973. Reprinted with permission from Northwestern University Press, University of Nebraska Press, and Editions Seuil.

which it is moving. The differences between these "presents" constitute the "present" we attempt to grasp as something substantive before our minds. The second axis is space, and the same process of difference haunts the idea of a spatially determinate identity of presence. Any spatially locatable object of thought or idea has an identity or presence of its own only by differing from other things.

Another term for this operation of difference that shadows presence is "trace." All ideas and all objects of thought and perception bear the trace of other things, other moments, other "presences." To bear the trace of other things is to be shadowed by "alterity," which literally means "otherness."

Derrida concludes this essay by evoking the pre-Socratic notion of the "sumploke" or "confluence of being." What the concept of différence leads to is a sense that everything in existence is relationally connected. We can sort it out into parts, but we should not assume those parts are pure and original or that they are pure identities. They are the effects of other processes of relation and differentiation. Derrida will elsewhere argue that what this means is that all things are signs and that all reality is "textual," in that all parts refer to or signify other parts, which are themselves signifiers of other parts. If we bear in mind the traditional definition of writing as the sign of a sign (the written sign of mental speech), then all reality is in a sense *graphic*, a form of writing. At the origin of thought is not a purely present idea but rather what Derrida calls "archi-writing," and by that he means the process he here describes as the spatio-temporal movement of "difference."

Derrida brings Saussure's notion of difference to bear on philosophical concepts. Like signs in language, he argues, they too are given identity by their differences from one another. He famously notes that philosophical oppositions such as the intelligible and the sensible, nature and culture, the ideal and physical, etc. can be shown to be produced by difference. Many literary critics have mistakenly limited deconstruction to this "undoing of binary opposition," but the questioning of oppositions is only one part of Derrida's undertaking, which aims to put in question the values and assumptions of the metaphysical philosophical tradition.

The verb "to differ" [*différer*] seems to differ from itself. On the one hand, it indicates difference as distinction, inequality, or discernibility; on the other, it expresses the interposition of delay, the interval of a *spacing* and *temporalizing* that puts off until "later" what is presently denied, the possible that is presently impossible. Sometimes the *different* and sometimes the *deferred* correspond [in French] to the verb "to differ." This correlation, however, is not simply one between act and object, cause and effect, or primordial and derived.

In the one case "to differ" signifies nonidentity; in the other case it signifies the order of the *same*. Yet there must be a common, although entirely different<sup>2</sup> [*différante*], root within the sphere that relates the two movements of differing to one another. We provisionally give the name *difference* to this *sameness* which is not *identical*: by the silent writing of its *a*, it has the desired advantage of referring to differing, *both* as spacing/temporalizing and as the movement that structures every dissociation.

As distinct from difference, difference thus points out the irreducibility of temporalizing (which is also temporalization – in transcendental language which is no longer adequate here, this would be called the constitution of primordial temporality – just as

the term “spacing” also includes the constitution of primordial spatiality). Difference is not simply active (any more than it is a subjective accomplishment); it rather indicates the middle voice, it precedes and sets up the opposition between passivity and activity. With its *a*, difference more properly refers to what in classical language would be called the origin or production of differences and the differences between differences, the *play [jeu]* of differences. Its locus and operation will therefore be seen wherever speech appeals to difference.

*Difference* is neither a *word* nor a *concept*. In it, however, we shall see the juncture rather than the summation – of what has been most decisively inscribed in the thought of what is conveniently called our “epoch”: the difference of forces in Nietzsche, Saussure’s principle of semiological difference, differing as the possibility of [neurone] facilitation,<sup>3</sup> impression and delayed effect in Freud, difference as the irreducibility of the trace of the other in Levinas, and the ontic-ontological difference in Heidegger. Reflection on this last determination of difference will lead us to consider difference as the *strategic* note or connection – relatively or provisionally *privileged* – which indicates the closure of presence, together with the closure of the conceptual order and denomination, a closure that is effected in the functioning of traces.

I SHALL SPEAK, THEN, OF A LETTER – the first one, if we are to believe the alphabet and most of the speculations that have concerned themselves with it.

I shall speak then of the letter *a*, this first letter which it seemed necessary to introduce now and then in writing the word “difference.” This seemed necessary in the course of writing about writing, and of writing within a writing whose different strokes all pass, in certain respects, through a gross spelling mistake, through a violation of the rules governing writing, violating the law that governs writing and regulates its conventions of propriety. In fact or theory we can always erase or lessen this spelling mistake, and, in each case, while these are analytically different from one another but for practical purposes the same, find it grave, unseemly, or, indeed, supposing the greatest ingenuousness, amusing. Whether or not we care to quietly overlook this infraction, the attention we give it beforehand will allow us to recognize, as though prescribed by some mute irony, the inaudible but displaced character of this literal permutation. We can always act as though this makes no difference. I must say from the start that my account serves less to justify this silent spelling mistake, or still less to excuse it, than to aggravate its obtrusive character.

On the other hand, I must be excused if I refer, at least implicitly, to one or another of the texts that I have ventured to publish. Precisely what I would like to attempt to some extent (although this is in principle and in its highest degree impossible, due to essential *de jure* reasons) is to bring together an *assemblage* of the different ways I have been able to utilize – or, rather, have allowed to be imposed on me – what I will provisionally call the word or concept of difference in its new spelling. It is literally neither a word nor a concept, as we shall see. I insist on the word “assemblage” here for two reasons: on the one hand, it is not a matter of describing a history, of recounting the steps, text by text, context by context, each time showing which scheme has been able to impose this graphic disorder, although this could have been done as well; rather, we are concerned with the *general system of all these schemata*. On the other hand, the word “assemblage” seems more apt for suggesting that the kind of bringing together proposed here has the structure of an interlacing, a weaving, or a web, which would allow the different threads and different lines of sense or force to separate again, as well as being ready to bind others together.

In a quite preliminary way, we now recall that this particular graphic intervention was conceived in the writing-up of a question about writing; it was not made simply to shock the reader or grammarian. Now, in point of fact, it happens that this graphic difference (the *a* instead of the *e*), this marked difference between two apparently vocalic notations, between vowels, remains purely graphic: it is written or read, but it is not heard. It cannot be heard, and we shall see in what respects it is also beyond the order of understanding. It is put forward by a silent mark, by a tacit monument, or, one might even say, by a pyramid – keeping in mind not only the capital form of the printed letter but also that passage from Hegel's *Encyclopaedia* where he compares the body of the sign to an Egyptian pyramid. The *a* of difference, therefore, is not heard; it remains silent, secret, and discreet, like a tomb.<sup>4</sup>

It is a tomb that (provided one knows how to decipher its legend) is not far from signaling the death of the king.

It is a tomb that cannot even be made to resonate. For I cannot even let you know, by my talk, now being spoken before the Société Française de Philosophie, which difference I am talking about at the very moment I speak of it. I can only talk about this graphic difference by keeping to a very indirect speech about writing, and on the condition that I specify each time that I am referring to difference with an *e* or difference with an *a*. All of which is not going to simplify matters today, and will give us all a great deal of trouble when we want to understand one another. In any event, when I do specify which difference I mean – when I say “with an *e*” or “with an *a*” – this will refer irreducibly to a *written text*, a text governing my talk, a text that I keep in front of me, that I will read, and toward which I shall have to try to lead your hands and eyes. We cannot refrain here from going by way of a written text, from ordering ourselves by the disorder that is produced therein – and this is what matters to me first of all.

Doubtless this pyramidal silence of the graphic difference between the *e* and the *a* can function only within the system of phonetic writing and within a language or grammar historically tied to phonetic writing and to the whole culture which is inseparable from it. But I will say that it is just this – this silence that functions only within what is called phonetic writing – that points out or reminds us in a very opportune way that, contrary to an enormous prejudice, there is no phonetic writing. There is no purely and strictly phonetic writing. What is called phonetic writing can only function – in principle and *de jure*, and not due to some factual and technical inadequacy – by incorporating non-phonetic “signs” (punctuation, spacing, etc.); but when we examine their structure and necessity, we will quickly see that they are ill described by the concept of signs. Saussure had only to remind us that the play of difference was the functional condition, the condition of possibility, for every sign; and it is itself silent. The difference between two phonemes, which enables them to exist and to operate, is inaudible. The inaudible opens the two present phonemes to hearing, as they present themselves. If, then, there is no purely phonetic writing, it is because there is no purely phonetic phone. The difference that brings out phonemes and lets them be heard and understood [*entendre*] itself remains inaudible.

It will perhaps be objected that, for the same reasons, the graphic difference itself sinks into darkness, that it never constitutes the fullness of a sensible term, but draws out an invisible connection, the mark of an inapparent relation between two spectacles. That is no doubt true. Indeed, since from this point of view the difference between the *e* and the *a* marked in “differance” eludes vision and hearing, this happily suggests that we must here let ourselves be referred to an order that no longer refers to sensibility.

But we are not referred to intelligibility either, to an ideality not fortuitously associated with the objectivity of *theorein* or understanding. We must be referred to an order, then, that resists philosophy's founding opposition between the sensible and the intelligible. The order that resists this opposition, that resists it because it sustains it, is designated in a movement of difference (with an *a*) between two differences or between two letters. This difference belongs neither to the voice nor to writing in the ordinary sense, and it takes place, like the strange space that will assemble us here for the course of an hour, *between* speech and writing and beyond the tranquil familiarity that binds us to one and to the other, reassuring us sometimes in the illusion that they are two separate things.

Now, HOW AM I TO SPEAK OF the *a* of difference? It is clear that it cannot be *exposed*. We can expose only what, at a certain moment, can become *present*, manifest; what can be shown, presented as a present, a being-present in its truth, the truth of a present or the presence of a present. However, if difference is (I also cross out the "is") what makes the presentation of being-present possible, it never presents itself as such. It is never given in the present or to anyone. Holding back and not exposing itself, it goes beyond the order of truth on this specific point and in this determined way, yet is not itself concealed, as if it were something, a mysterious being, in the occult zone of a non-knowing. Any exposition would expose it to disappearing as a disappearance. It would risk appearing, thus disappearing.

Thus, the detours, phrases, and syntax that I shall often have to resort to will resemble – will sometimes be practically indiscernible from – those of negative theology. Already we had to note that difference is *not*, does not exist, and is not any sort of being-present (*on*). And we will have to point out everything that it *is not*, and, consequently, that it has neither existence nor essence. It belongs to no category of being, present or absent. And yet what is thus denoted as difference is not theological, not even in the most negative order of negative theology. The latter, as we know, is always occupied with letting a supraessential reality go beyond the finite categories of essence and existence, that is, of presence, and always hastens to remind us that, if we deny the predicate of existence to God, it is in order to recognize him as a superior, inconceivable, and ineffable mode of being. Here there is no question of such a move, as will be confirmed as we go along. Not only is difference irreducible to every ontological or theological – onto-theological – reappropriation, but it opens up the very space in which onto-theology – philosophy – produces its system and its history. It thus encompasses and irrevocably surpasses onto-theology or philosophy.

For the same reason, I do not know where to begin to mark out this assemblage, this graph, of difference. Precisely what is in question here is the requirement that there be a *de jure* commencement, an absolute point of departure, a responsibility arising from a principle. The problem of writing opens by questioning the *arche*. Thus what I put forth here will not be developed simply as a philosophical discourse that operates on the basis of a principle, of postulates, axioms, and definitions and that moves according to the discursive line of a rational order. In marking out difference, everything is a matter of strategy and risk. It is a question of strategy because no transcendent truth present outside the sphere of writing can theologically command the totality of this field. It is hazardous because this strategy is not simply one in the sense that we say that strategy orients the tactics according to a final aim, a *telos* or the theme of a domination, a mastery or an ultimate reappropriation of movement and field. In the end, it is a strategy without finality. We might call it blind tactics or empirical errance, if the value of empiricism

did not itself derive all its meaning from its opposition to philosophical responsibility. If there is a certain errance in the tracing-out of difference, it no longer follows the line of logico-philosophical speech or that of its integral and symmetrical opposite, logico-empirical speech. The concept of *play* [*jeu*] remains beyond this opposition; on the eve and aftermath of philosophy, it designates the unity of chance and necessity in an endless calculus.

By decision and, as it were, by the rules of the game, then, turning this thought around, let us introduce ourselves to the thought of difference by way of the theme of strategy or stratagem. By this merely strategic justification, I want to emphasize that the efficacy of this thematics of difference very well may, and even one day must, be sublated, i.e., lend itself, if not to its own replacement, at least to its involvement in a series of events which in fact it never commanded. This also means that it is not a theological thematics.

I will say, first of all, that difference, which is neither a word nor a concept, seemed to me to be strategically the theme most proper to think out, if not master (thought being here, perhaps, held in a certain necessary relation with the structural limits of mastery), in what is most characteristic of our “epoch.” I start off, then, strategically, from the place and time in which “we” are, even though my opening is not justifiable in the final account, and though it is always on the basis of difference and its “history” that we can claim to know who and where “we” are and what the limits of an “epoch” can be.

Although “difference” is neither a word nor a concept, let us nonetheless attempt a simple and approximative semantic analysis which will bring us in view of what is at stake [*en vue de l'enjeu*]. We do know that the verb “to differ” [*differer*] (the Latin verb *differre*) has two seemingly quite distinct meanings; in the *Littré* dictionary, for example, they are the subject of two separate articles. In this sense, the Latin *differre* is not the simple translation of the Greek *diapherein*; this fact will not be without consequence for us in tying our discussion to a particular language, one that passes for being less philosophical, less primordially philosophical, than the other. For the distribution of sense in the Greek *diapherein* does not carry one of the two themes of the Latin *differre*, namely, the action of postponing until later, of taking into account, the taking-account of time and forces in an operation that implies an economic reckoning, a detour, a respite, a delay, a reserve, a representation – all the concepts that I will sum up here in a word I have never used but which could be added to this series: *temporalizing*. “To differ” in this sense is to temporalize, to resort, consciously or unconsciously, to the temporal and temporalizing mediation of a detour that suspends the accomplishment or fulfillment of “desire” or “will,” or carries desire or will out in a way that annuls or tempers their effect. We shall see, later, in what respects this temporalizing is also a temporalization and spacing, is space’s becoming-temporal and time’s becoming-spatial, is “primordial constitution” of space and time, as metaphysics or transcendental phenomenology would call it in the language that is here criticized and displaced.

The other sense of “to differ” [*differer*] is the most common and most identifiable, the sense of not being identical, of being other, of being discernible, etc. And in “differents,” whether referring to the alterity of dissimilarity or the alterity of allergy or of polemics, it is necessary that interval, distance, *spacing* occur among the different elements and occur actively, dynamically, and with a certain perseverance in repetition.

But the word “difference” (with an *e*) could never refer to differing as temporalizing or to difference as *polemos*. It is this loss of sense that the word difference (with an *a*) will have to schematically compensate for. Difference can refer to the whole complex of its

meanings at once, for it is immediately and irreducibly multivalent, something which will be important for the discourse I am trying to develop. It refers to this whole complex of meanings not only when it is supported by a language or interpretive context (like any signification), but it already does so somehow of itself. Or at least it does so more easily by itself than does any other word: here the *a* comes more immediately from the present participle [*différent*] and brings us closer to the action of “differing” that is in progress, even before it has produced the effect that is constituted as different or resulted in difference (with an *e*). Within a conceptual system and in terms of classical requirements, difference could be said to designate the productive and primordial constituting causality, the process of scission and division whose differings and differences would be the constituted products or effects. But while bringing us closer to the infinitive and active core of differing, “difference” with an *a* neutralizes what the infinitive denotes as simply active, in the same way that “parlance” does not signify the simple fact of speaking, of speaking to or being spoken to. Nor is resonance the act of resonating. Here in the usage of our language we must consider that the ending *-ance* is undecided between active and passive. And we shall see why what is designated by “difference” is neither simply active nor simply passive, that it announces or rather recalls something like the middle voice, that it speaks of an operation which is not an operation, which cannot be thought of either as a passion or as an action of a subject upon an object, as starting from an agent or from a patient, or on the basis of, or in view of, any of these *terms*. But philosophy has perhaps commenced by distributing the middle voice, expressing a certain intransitiveness, into the active and the passive voice, and has itself been constituted in this repression.

How are differance as temporalizing and difference as spacing conjoined?

Let us begin with the problem of signs and writing – since we are already in the midst of it. We ordinarily say that a sign is put in place of the thing itself, the present thing – “thing” holding here for the sense as well as the referent. Signs represent the present in its absence; they take the place of the present. When we cannot take hold of or show the thing, let us say the present, the being-present, when the present does not present itself, then we signify, we go through the detour of signs. We take up or give signs; we make signs. The sign would thus be a deferred presence. Whether it is a question of verbal or written signs, monetary signs, electoral delegates, or political representatives, the movement of signs defers the moment of encountering the thing itself, the moment at which we could lay hold of it, consume or expend it, touch it, see it, have a present intuition of it. What I am describing here is the structure of signs as classically determined, in order to define – through a commonplace characterization of its traits – signification as the difference of temporalizing. Now this classical determination presupposes that the sign (which defers presence) is conceivable only *on the basis of* the presence that it defers and *in view of* the deferred presence one intends to reappropriate. Following this classical semiology, the substitution of the sign for the thing itself is both *secondary* and *provisional*: it is second in order after an original and lost presence, a presence from which the sign would be derived. It is provisional with respect to this final and missing presence, in view of which the sign would serve as a movement of mediation.

In attempting to examine these secondary and provisional aspects of the substitute, we shall no doubt catch sight of something like a primordial difference. Yet we could no longer even call it primordial or final, inasmuch as the characteristics of origin, beginning, *telos*, *eschaton*, etc., have always denoted presence – *ousia*, *parousia*, etc. To question

the secondary and provisional character of the sign, to oppose it to a “primordial” difference, would thus have the following consequences:

- (1) Difference can no longer be understood according to the concept of “sign,” which has always been taken to mean the representation of a presence and has been constituted in a system (of thought or language) determined on the basis of and in view of presence.
- (2) In this way we question the authority of presence or its simple symmetrical contrary, absence or lack. We thus interrogate the limit that has always constrained us, that always constrains us – we who inhabit a language and a system of thought – to form the meaning of being in general as presence or absence, in the categories of being or beingness (*ousia*). It already appears that the kind of questioning we are thus led back to is, let us say, the Heideggerian kind, and that difference *seems* to lead us back to the ontic-ontological difference. But permit me to postpone this reference. I shall only note that between difference as temporalizing-temporalization (which we can no longer conceive within the horizon of the present) and what Heidegger says about temporalization in *Sein und Zeit* (namely, that as the transcendental horizon of the question of being it must be freed from the traditional and metaphysical domination by the present or the now) – between these two there is a close, if not exhaustive and irreducibly necessary, interconnection.

But first of all, let us remain with the semiological aspects of the problem to see how difference as temporalizing is conjoined with difference as spacing. Most of the semiological or linguistic research currently dominating the field of thought (whether due to the results of its own investigations or due to its role as a generally recognized regulative model) traces its genealogy, rightly or wrongly, to Saussure as its common founder. It was Saussure who first of all set forth the *arbitrariness of signs* and the *differential character* of signs as principles of general semiology and particularly of linguistics. And, as we know, these two themes – the arbitrary and the differential – are in his view inseparable. Arbitrariness can occur only because the system of signs is constituted by the differences between the terms, and not by their fullness. The elements of signification function not by virtue of the compact force of their cores but by the network of oppositions that distinguish them and relate them to one another. “Arbitrary and differential” says Saussure “are two correlative qualities.”

As the condition for signification, this principle of difference affects the *whole sign*, that is, both the signified and the signifying aspects. The signified aspect is the concept, the ideal sense. The signifying aspect is what Saussure calls the material or physical (e.g., acoustical) “image.” We do not here have to enter into all the problems these definitions pose. Let us only cite Saussure where it interests us:

The conceptual side of value is made up solely of relations and differences with respect to the other terms of language, and the same can be said of its material side . . . Everything that has been said up to this point boils down to this: in language there are only differences. Even more important: a difference generally implies positive terms between which the difference is set up; but in language there are only differences *without positive terms*. Whether we take the signified or the signifier, language has neither ideas nor sounds that existed before the linguistic system, but only conceptual and phonic differences that have issued from the system. The idea or phonic substance that a sign contains is of less importance than the other signs that surround it.<sup>5</sup>

The first consequence to be drawn from this is that the signified concept is never present in itself, in an adequate presence that would refer only to itself. Every concept is necessarily and essentially inscribed in a chain or a system, within which it refers to another and to other concepts, by the systematic play of differences. Such a play, then – *differance* – is no longer simply a concept, but the possibility of conceptuality, of the conceptual system and process in general. For the same reason, *differance*, which is not a concept, is not a mere word; that is, it is not what we represent to ourselves as the calm and present self-referential unity of a concept and sound [*phonie*]. We shall later discuss the consequences of this for the notion of a word.

The difference that Saussure speaks about, therefore, is neither itself a concept nor one word among others. We can say this *a fortiori* for *differance*. Thus we are brought to make the relation between the one and the other explicit.

Within a language, within the *system* of language, there are only differences. A taxonomic operation can accordingly undertake its systematic, statistical, and classificatory inventory. But, on the one hand, these differences *play a role* in language, in speech as well, and in the exchange between language and speech. On the other hand, these differences are themselves *effects*. They have not fallen from the sky ready made; they are no more inscribed in a *topos noētos* than they are prescribed in the wax of the brain. If the word “History” did not carry with it the theme of a final repression of *differance*, we could say that differences alone could be “historical” through and through and from the start.

What we note as *differance* will thus be the movement of play that “produces” (and not by something that is simply an activity) these differences, these effects of difference. This does not mean that the *differance* which produces differences is before them in a simple and in itself unmodified and indifferent present. *Differance* is the nonfull, non-simple “origin”; it is the structured and differing origin of differences.

Since language (which Saussure says is a classification) has not fallen from the sky, it is clear that the differences have been produced; they are the effects produced, but effects that do not have as their cause a subject or substance, a thing in general, or a being that is somewhere present and itself escapes the play of difference. If such a presence were implied (quite classically) in the general concept of cause, we would therefore have to talk about an effect without a cause, something that would very quickly lead to no longer talking about effects. I have tried to indicate a way out of the closure imposed by this system, namely, by means of the “trace.” No more an effect than a cause, the “trace” cannot of itself, taken outside its context, suffice to bring about the required transgression.

As there is no presence before the semiological difference or outside it, we can extend what Saussure writes about language to signs in general: “Language is necessary in order for speech to be intelligible and to produce all of its effects; but the latter is necessary in order for language to be established; historically, the fact of speech always comes first.”<sup>6</sup>

Retaining at least the schema, if not the content, of the demand formulated by Saussure, we shall designate by the term *differance* the movement by which language, or any code, any system of reference in general, becomes “historically” constituted as a fabric of differences. Here, the terms “constituted,” “produced,” “created,” “movement,” “historically,” etc., with all they imply, are not to be understood only in terms of the language of metaphysics, from which they are taken. It would have to be shown why the concepts of production, like those of constitution and history, remain accessories in this respect to what is here being questioned; this, however, would draw us too far away today, toward the theory of the representation of the “circle” in which we seem to be enclosed. I only use these terms here, like many other concepts, out of strategic convenience

and in order to prepare the deconstruction of the system they form at the point which is now most decisive. In any event, we will have understood, by virtue of the very circle we appear to be caught up in, that differance, as it is written here, is no more static than genetic, no more structural than historical. Nor is it any less so. And it is completely to miss the point of this orthographical improppriety to want to object to it on the basis of the oldest of metaphysical oppositions – for example, by opposing some generative point of view to a structuralist-taxonomic point of view, or conversely. These oppositions do not pertain in the least to difference; and this, no doubt, is what makes thinking about it difficult and uncomfortable.

If we now consider the chain to which “differance” gets subjected, according to the context, to a certain number of nonsynonymic substitutions, one will ask why we resorted to such concepts as “reserve,” “protowriting,” “prototrace,” “spacing,” indeed to “supplement” or “*pharmakon*,” and, before long, to “hymen,” etc.<sup>7</sup>

Let us begin again. Differance is what makes the movement of signification possible only if each element that is said to be “present,” appearing on the stage of presence, is related to something other than itself but retains the mark of a past element and already lets itself be hollowed out by the mark of its relation to a future element. This trace relates no less to what is called the future than to what is called the past, and it constitutes what is called the present by this very relation to what it is not, to what it absolutely is not; that is, not even to a past or future considered as a modified present. In order for it to be, an interval must separate it from what it is not; but the interval that constitutes it in the present must also, and by the same token, divide the present in itself, thus dividing, along with the present, everything that can be conceived on its basis, that is, every being – in particular, for our metaphysical language, the substance or subject. Constituting itself, dynamically dividing itself, this interval is what could be called *spacing*; time’s becoming-spatial or space’s becoming-temporal (*temporalizing*). And it is this constitution of the present as a “primordial” and irreducibly nonsimple, and, therefore, in the strict sense nonprimordial, synthesis of traces, retentions, and protentions (to reproduce here, analogically and provisionally, a phenomenological and transcendental language that will presently be revealed as inadequate) that I propose to call protowriting, prototrace, or differance. The latter (is) (both) spacing (and) temporalizing.<sup>8</sup>

Given this (active) movement of the (production of) difference without origin, could we not, quite simply and without any neographism, call it *differentiation*? Among other confusions, such a word would suggest some organic unity, some primordial and homogeneous unity, that would eventually come to be divided up and take on difference as an event. Above all, formed on the verb “to differentiate,” this word would annul the economic signification of detour, temporalizing delay, “deferring.” I owe a remark in passing to a recent reading of one of Koyré’s texts entitled “Hegel at Jena.”<sup>9</sup> In that text, Koyré cites long passages from the Jena *Logic* in German and gives his own translation. On two occasions in Hegel’s text he encounters the expression “*differente Beziehung*.” This word (*different*), whose root is Latin, is extremely rare in German and also, I believe, in Hegel, who instead uses *verschieden* or *ungleich*, calling difference *Unterschied* and qualitative variety *Verschiedenheit*. In the Jena *Logic*, he uses the word *different* precisely at the point where he deals with time and the present. Before coming to Koyré’s valuable remark, here are some passages from Hegel, as rendered by Koyré:

The infinite, in this simplicity is – as a moment opposed to the self-identical – the negative. In its moments, while the infinite presents the totality to (itself) and in itself, (it is) excluding

in general, the point or limit; but in this, its own (action of) negating, it relates itself immediately to the other and negates itself. The limit or moment of the present (*der Gegenwart*), the absolute “this” of time or the now, is an absolutely negative simplicity absolutely excluding all multiplicity from itself, and by this very fact is absolutely determined; it is not an extended whole or *quantum* within itself (and) which would in itself also have an undetermined aspect or qualitative variety, which of itself would be related, indifferently (*gleichguldig*) or externally to another but on the contrary, this is an absolutely different relation of the simple.<sup>10</sup>

And Koyré specifies in a striking note: “Different relation *differente Beziehung*. We could say: differentiating relation.” And on the following page, from another text of Hegel, we can read: “*Diese Beziehung ist Gegenwart, als eine differente Beziehung*” (This relation is [the] present, as a different relation). There is another note by Koyré: “The term ‘different’ is taken here in an active sense.”

Writing “differing” or “difference” (with an *a*) would have had the utility of making it possible to translate Hegel on precisely this point with no further qualifications – and it is a quite decisive point in his text. The translation would be, as it always should be, the transformation of one language by another. Naturally, I maintain that the word “differance” can be used in other ways, too; first of all, because it denotes not only the activity of primordial difference but also the temporalizing detour of deferring. It has, however, an even more important usage. Despite the very profound affinities that differance thus written has with Hegelian speech (as it should be read), it can, at a certain point, not exactly break with it, but rather work a sort of displacement with regard to it. A definite rupture with Hegelian language would make no sense, nor would it be at all likely; but this displacement is both infinitesimal and radical. I have tried to indicate the extent of this displacement elsewhere; it would be difficult to talk about it with any brevity at this point.

Differences are thus “produced” – differed – by differance. But *what* differs, or *who* differs? In other words, *what is* differance? With this question we attain another stage and another source of the problem.

What differs? Who differs? What is difference?

If we answered these questions even before examining them as questions, even before going back over them and questioning their form (even what seems to be most natural and necessary about them), we would fall below the level we have now reached. For if we accepted the form of the question in its own sense and syntax (“What?,” “What is?,” “Who is?”), we would have to admit that difference is derived, supervenient, controlled, and ordered from the starting point of a being-present, one capable of being something, a force, a state, or power in the world, to which we could give all kinds of names: a *what*, or being-present as a *subject*, a *who*. In the latter case, notably, we would implicitly admit that the being-present (for example, as a self-present being or consciousness) would eventually result in differing: in delaying or in diverting the fulfillment of a “need” or “desire,” or in differing from itself. But in none of these cases would such a being-present be “constituted” by this difference.

Now if we once again refer to the semiological difference, what was it that Saussure in particular reminded us of? That “language [which consists only of differences] is not a function of the speaking subject.” This implies that the subject (self-identical or even conscious of self-identity, self-conscious) is inscribed in the language, that he is a “function” of the language. He becomes a *speaking* subject only by conforming his speech – even

in the aforesaid “creation,” even in the aforesaid “transgression” – to the system of linguistic prescriptions taken as the system of differences, or at least to the general law of difference, by conforming to that law of language which Saussure calls “language without speech.” “Language is necessary for the spoken word to be intelligible and so that it can produce all of its effects.”<sup>11</sup>

If, by hypothesis, we maintain the strict opposition between speech and language, then difference will be not only the play of differences within the language but the relation of speech to language, the detour by which I must also pass in order to speak, the silent token I must give, which holds just as well for linguistics in the strict sense as it does for general semiology; it dictates all the relations between usage and the formal schema, between the message and the particular code, etc. Elsewhere I have tried to suggest that this difference within language, and in the relation between speech and language, forbids the essential dissociation between speech and writing that Saussure, in keeping with tradition, wanted to draw at another level of his presentation. The use of language or the employment of any code which implies a play of forms – with no determined or invariable substratum – also presupposes a retention and protention of differences, a spacing and temporalizing, a play of traces. This play must be a sort of inscription prior to writing, a protowriting without a present origin, without an *arche*. From this comes the systematic crossing-out of the *arche* and the transformation of general semiology into a grammatology, the latter performing a critical work upon everything within semiology – right down to its matrical concept of signs – that retains any metaphysical presuppositions incompatible with the theme of difference.

We might be tempted by an objection: to be sure, the subject becomes a *speaking* subject only by dealing with the system of linguistic differences; or again, he becomes a *signifying* subject (generally by speech or other signs) only by entering into the system of differences. In this sense, certainly, the speaking or signifying subject would not be self-present, insofar as he speaks or signifies, except for the play of linguistic or semiological difference. But can we not conceive of a presence and self-presence of the subject before speech or its signs, a subject’s self-presence in a silent and intuitive consciousness?

Such a question therefore supposes that prior to signs and outside them, and excluding every trace and difference, something such as consciousness is possible. It supposes, moreover, that, even before the distribution of its signs in space and in the world, consciousness can gather itself up in its own presence. What then is consciousness? What does “consciousness” mean? Most often in the very form of “meaning” [“*vouloir dire*”], consciousness in all its modifications is conceivable only as self-presence, a self-perception of presence. And what holds for consciousness also holds here for what is called subjective existence in general. Just as the category of subject is not and never has been conceivable without reference to presence as *hypokeimenon* or *ousia*, etc., so the subject as consciousness has never been able to be evinced otherwise than as self-presence. The privilege accorded to consciousness thus means a privilege accorded to the present; and even if the transcendental temporality of consciousness is described in depth, as Husserl described it, the power of synthesis and of the incessant gathering-up of traces is always accorded to the “living present.”

This privilege is the ether of metaphysics, the very element of our thought insofar as it is caught up in the language of metaphysics. We can only de-limit such a closure today by evoking this import of presence, which Heidegger has shown to be the onto-theological determination of being. Therefore, in evoking this import of presence, by an examination which would have to be of a quite peculiar nature, we question the absolute privilege

of this form or epoch of presence in general, that is, consciousness as meaning [*vouloir dire*] in self-presence.

We thus come to posit presence – and, in particular, consciousness, the being-next-to-itself consciousness – no longer as the absolutely matrical form of being but as a “determination” and an “effect.” Presence is a determination and effect within a system which is no longer that of presence but that of differance; it no more allows the opposition between activity and passivity than that between cause and effect or in-determination and determination, etc. This system is of such a kind that even to designate consciousness as an effect or determination – for strategic reasons, reasons that can be more or less clearly considered and systematically ascertained – is to continue to operate according to the vocabulary of that very thing to be delimited.

Before being so radically and expressly Heideggerian, this was also Nietzsche's and Freud's move, both of whom, as we know, and often in a very similar way, questioned the self-assured certitude of consciousness. And is it not remarkable that both of them did this by starting out with the theme of differance?

This theme appears almost literally in their work, at the most crucial places. I shall not expand on this here; I shall only recall that for Nietzsche “the important main activity is unconscious” and that consciousness is the effect of forces whose essence, ways, and modalities are not peculiar to it. Now force itself is never present; it is only a play of differences and quantities. There would be no force in general without the difference between forces; and here the difference in quantity counts more than the content of quantity, more than the absolute magnitude itself.

Quantity itself therefore is not separable from the difference in quantity. The difference in quantity is the essence of force, the relation of force with force. To fancy two equal forces, even if we grant them opposing directions, is an approximate and crude illusion, a statistical dream in which life is immersed, but which chemistry dispels.<sup>12</sup>

Is not the whole thought of Nietzsche a critique of philosophy as active indifference to difference, as a system of reduction or adiaphoristic repression? Following the same logic – logic itself – this does not exclude the fact that philosophy lives *in* and *from* differance, that it thereby blinds itself to the *same*, which is not the identical. The same is precisely differance (with an *a*), as the diverted and equivocal passage from one difference to another, from one term of the opposition to the other. We could thus take up all the coupled oppositions on which philosophy is constructed, and from which our language lives, not in order to see opposition vanish but to see the emergence of a necessity such that one of the terms appears as the differance of the other, the other as “differed” within the systematic ordering of the same (e.g., the intelligible as differing from the sensible, as sensible differed; the concept as differed-differing intuition, life as differing-differed matter; mind as differed-differing life; culture as differed-differing nature; and all the terms designating what is other than *physis* – *technē*, *nomos*, society, freedom, history, spirit, etc. – as *physis* differed or *physis* differing: *physis in differance*). It is out of the unfolding of this “same” as differance that the sameness of difference and of repetition is presented in the eternal return.

In Nietzsche, these are so many themes that can be related with the kind of symptomatology that always serves to diagnose the evasions and ruses of anything disguised in its difference. Or again, these terms can be related with the entire theatics of active interpretation, which substitutes an incessant deciphering for the disclosure of truth as

a presentation of the thing itself in its presence, etc. What results is a cipher without truth, or at least a system of ciphers that is not dominated by truth value, which only then becomes a function that is understood, inscribed, and circumscribed.

We shall therefore call difference this “active” (in movement) discord of the different forces and of the differences between forces which Nietzsche opposes to the entire system of metaphysical grammar, wherever that system controls culture, philosophy, and science.

It is historically significant that this diaphoristics, understood as an energetics or an economy of forces, set up to question the primacy of presence qua consciousness, is also the major theme of Freud’s thought; in his work we find another diaphoristics, both in the form of a theory of ciphers or traces and an energetics. The questioning of the authority of consciousness is first and always differential.

The two apparently different meanings of difference are tied together in Freudian theory: differing [*le différer*] as discernibility, distinction, deviation, diastem, *spacing*; and deferring [*le différer*] as detour, delay, relay, reserve, *temporalizing*. I shall recall only that:

- (1) The concept of trace (*Spur*), of facilitation (*Bahnung*), of forces of facilitation are, as early as the composition of the *Entwurf*, inseparable from the concept of difference. The origin of memory and of the psyche as a memory in general (conscious or unconscious) can only be described by taking into account the difference between the facilitation thresholds, as Freud says explicitly. There is no facilitation [*Bahnung*] without difference and no difference without a trace.
- (2) All the differences involved in the production of unconscious traces and in the process of inscription (*Niederschrift*) can also be interpreted as moments of difference, in the sense of “placing on reserve.” Following a schema that continually guides Freud’s thinking, the movement of the trace is described as an effort of life to protect itself by *deferring* the dangerous investment, by constituting a reserve (*Vorrat*). And all the conceptual oppositions that furrow Freudian thought relate each concept to the other like movements of a detour, within the economy of difference. The one is only the other deferred, the one differing from the other. The one is the other in difference, the one is the difference from the other. Every apparently rigorous and irreducible opposition (for example that between the secondary and primary) is thus said to be, at one time or another, a “theoretical fiction.” In this way again, for example (but such an example covers everything or communicates with everything), the difference between the pleasure principle and the reality principle is only difference as detour (*Aufschieben, Aufschub*). In *Beyond the Pleasure Principle*, Freud writes

Under the influence of the ego’s instincts of self-preservation, the pleasure principle is replaced by the reality principle. This latter principle does not abandon the intention of ultimately obtaining pleasure, but it nevertheless demands and carries into effect the postponement of satisfaction, the abandonment of a number of possibilities of gaining satisfaction and the temporary toleration of displeasure as a step on the long indirect road (*Aufschub*) to pleasure.<sup>13</sup>

Here we touch on the point of greatest obscurity, on the very enigma of difference, on how the concept we have of it is divided by a strange separation. We must not hasten to

make a decision too quickly. How can we conceive of difference as a systematic detour which, within the element of the same, always aims at either finding again the pleasure or the presence that had been deferred by (conscious or unconscious) calculation, and, *at the same time*, how can we, on the other hand, conceive of difference as the relation to an impossible presence as an expenditure without reserve, as an irreparable loss of presence, an irreversible wearing-down of energy, or indeed as a death instinct and a relation to the absolutely other that apparently breaks up any economy? It is evident – it is evidence itself – that system and nonsystem, the same and the absolutely other, etc., cannot be conceived *together*.

If difference is this inconceivable factor, must we not perhaps hasten to make it evident, to bring it into the philosophical element of evidence, and thus quickly dissipate its mirage character and illogicality, dissipate it with the infallibility of the calculus we know well – since we have recognized its place, necessity, and function within the structure of difference? What would be accounted for philosophically here has already been taken into account in the system of difference as it is here being calculated. I have tried elsewhere, in a reading of Bataille,<sup>14</sup> to indicate what might be the establishment of a rigorous, and in a new sense “scientific,” *relating* of a “restricted economy” – one having nothing to do with an unreserved expenditure, with death, with being exposed to nonsense, etc. – to a “general economy” or system that, so to speak, *takes account of* what is unreserved. It is a relation between a difference that is accounted for and a difference that fails to be accounted for, where the establishment of a pure presence, without loss, is one with the occurrence of absolute loss, with death. By establishing this relation between a restricted and a general system, we shift and recommence the very project of philosophy under the privileged heading of Hegelianism.

The economic character of difference in no way implies that the deferred presence can always be recovered, that it simply amounts to an investment that only temporarily and without loss delays the presentation of presence, that is, the perception of gain or the gain of perception. Contrary to the metaphysical, dialectical, and “Hegelian” interpretation of the economic movement of difference, we must admit a game where whoever loses wins and where one wins and loses each time. If the diverted presentation continues to be somehow definitively and irreducibly withheld, this is not because a particular present remains hidden or absent, but because difference holds us in a relation with what exceeds (though we necessarily fail to recognize this) the alternative of presence or absence. A certain alterity – Freud gives it a metaphysical name, the unconscious – is definitively taken away from every process of presentation in which we would demand for it to be shown forth in person. In this context and under this heading, the unconscious is not, as we know, a hidden, virtual, and potential self-presence. It is differed – which no doubt means that it is woven out of differences, but also that it sends out, that it delegates, representatives or proxies; but there is no chance that the mandating subject “exists” somewhere, that it is present or is “itself,” and still less chance that it will become conscious. In this sense, contrary to the terms of an old debate, strongly symptomatic of the metaphysical investments it has always assumed, the “unconscious” can no more be classed as a “thing” than as anything else; it is no more of a thing than an implicit or masked consciousness. This radical alterity, removed from every possible mode of presence, is characterized by irreducible aftereffects, by delayed effects. In order to describe them, in order to read the traces of the “unconscious” traces (there are no “conscious” traces), the language of presence or absence, the metaphysical speech of phenomenology, is in principle inadequate.

The structure of delay (*retardement: Nachträglichkeit*) that Freud talks about indeed prohibits our taking temporalization (temporalizing) to be a simple dialectical complication of the present; rather, this is the style of transcendental phenomenology. It describes the living present as a primordial and incessant synthesis that is constantly led back upon itself, back upon its assembled and assembling self, by retentional traces and protentional openings. With the alterity of the “unconscious,” we have to deal not with the horizons of modified presents – past or future – but with a “past” that has never been nor will ever be present, whose “future” will never be produced or reproduced in the form of presence. The concept of trace is therefore incommensurate with that of retention, that of the becoming-past of what had been present. The trace cannot be conceived – nor, therefore, can difference – on the basis of either the present or the presence of the present.

A past that has never been present: with this formula Emmanuel Levinas designates (in ways that are, to be sure, not those of psychoanalysis) the trace and the enigma of absolute alterity, that is, the Other [*autrui*]. At least within these limits, and from this point of view, the thought of difference implies the whole critique of classical ontology undertaken by Levinas. And the concept of trace, like that of difference, forms – across these different traces and through these differences between traces, as understood by Nietzsche, Freud, and Levinas (these “authors’ names” serve only as indications) – the network that sums up and permeates our “epoch” as the de-limitation of ontology (of presence).

The ontology of presence is the ontology of beings and beingness. Everywhere, the dominance of beings is solicited by difference – in the sense that *sollicitare* means, in old Latin, to shake all over, to make the whole tremble. What is questioned by the thought of difference, therefore, is the determination of being in presence, or in beingness. Such a question could not arise and be understood without the difference between Being and beings opening up somewhere. The first consequence of this is that difference is not. It is not a being-present, however excellent, unique, principal, or transcendent one makes it. It commands nothing, rules over nothing, and nowhere does it exercise any authority. It is not marked by a capital letter. Not only is there no realm of difference, but difference is even the subversion of every realm. This is obviously what makes it threatening and necessarily dreaded by everything in us that desires a realm, the past or future presence of a realm. And it is always in the name of a realm that, believing one sees it ascend to the capital letter, one can reproach it for wanting to rule.

Does this mean, then, that difference finds its place within the spread of the ontic-ontological difference, as it is conceived, as the “epoch” conceives itself within it, and particularly “across” the Heideggerian meditation, which cannot be gotten around?

There is no simple answer to such a question.

In one particular respect, difference is, to be sure, but the historical and epochal deployment of Being or of the ontological difference. The *a* of difference marks the movement of this deployment.

And yet, is not the thought that conceives the *meaning* or *truth* of Being, the determination of difference as ontic-ontological difference – difference conceived within the horizon of the question of *Being* – still an intrametaphysical effect of difference? Perhaps the deployment of difference is not only the truth or the epochality of Being. Perhaps we must try to think this *unheard-of* thought, this silent tracing, namely, that the history of Being (the thought of which is committed to the Greco-Western logos), as it is itself produced across the ontological difference, is only one epoch of the *diapherein*. Then we

could no longer even call it an “epoch,” for the concept of epochality belongs within history understood as the history of Being. Being has always made “sense,” has always been conceived or spoken of as such, only by dissimulating itself in beings; thus, in a particular and very strange way, differance (is) “older” than the ontological difference or the truth of Being. In this age it can be called the play of traces. It is a trace that no longer belongs to the horizon of Being but one whose sense of Being is borne and bound by this play; it is a play of traces or differance that has no meaning and is not, a play that does not belong. There is no support to be found and no depth to be had for this bottomless chessboard where being is set in play.

It is perhaps in this way that the Heraclitean play of the *hen diapheron heautoi*, of the one differing from itself, of what is in difference with itself, already becomes lost as a trace in determining the *diapherein* as ontological difference.

To think through the ontological difference doubtless remains a difficult task, a task whose statement has remained nearly inaudible. And to prepare ourselves for venturing beyond our own logos, that is, for a differance so violent that it refuses to be stopped and examined as the epochality of Being and ontological difference, is neither to give up this passage through the truth of Being, nor is it in any way to “criticize,” “contest,” or fail to recognize the incessant necessity for it. On the contrary, we must stay within the difficulty of this passage; we must repeat this passage in a rigorous reading of metaphysics, wherever metaphysics serves as the norm of Western speech, and not only in the texts of “the history of philosophy.” Here we must allow the trace of whatever goes beyond the truth of Being to appear/disappear in its fully rigorous way. It is a trace of something that can never present itself; it is itself a trace that can never be presented, that is, can never appear and manifest itself as such in its phenomenon. It is a trace that lies beyond what profoundly ties fundamental ontology to phenomenology. Like difference, the trace is never presented as such. In presenting itself it becomes effaced; in being sounded it dies away, like the writing of the *a*, inscribing its pyramid in differance.

We can always reveal the precursive and secretive traces of this movement in metaphysical speech, especially in the contemporary talk about the closure of ontology, i.e., through the various attempts we have looked at (Nietzsche, Freud, Levinas) – and particularly in Heidegger’s work.

The latter provokes us to question the essence of the present, the presence of the present.

What is the present? What is it to conceive the present in its presence?

Let us consider, for example, the 1946 text entitled “Der Spruch des Anaximander.” Heidegger there recalls that the forgetting of Being forgets about the difference between Being and beings:

But the point of Being (*die Sache des Seins*) is to be the Being of beings. The linguistic form of this enigmatic and multivalent genitive designates a genesis (*Genesis*), a provenance (*Herkunft*) of the *present* from presence (*des Anwesenden aus dem Anwesen*). But with the unfolding of these two, the essence (*Wesen*) of this provenance remains hidden (*verborgen*). Not only is the essence of this provenance not thought out, but neither is the simple relation between presence and present (*Anwesen und Anwesenden*).

Since the dawn, it seems that presence and being-present are each separately something. Imperceptibly, presence becomes itself a present.... The essence of presence (*Das Wesen des Anwesens*), and thus the difference between presence and present, is forgotten. *The forgetting of Being is the forgetting of the difference between Being and beings.*<sup>15</sup>

In recalling the difference between Being and beings (the ontological difference) as the difference between presence and present, Heidegger puts forward a proposition, indeed, a group of propositions; it is not our intention here to idly or hastily “criticize” them but rather to convey them with all their provocative force.

Let us then proceed slowly. What Heidegger wants to point out is that the difference between Being and beings, forgotten by metaphysics, has disappeared without leaving a trace. The very trace of difference has sunk from sight. If we admit that differance (is) (itself) something other than presence and absence, if it *traces*, then we are dealing with the forgetting of the difference (between Being and beings), and we now have to talk about a disappearance of the trace’s trace. This is certainly what this passage from “Der Spruch des Anaximander” seems to imply:

The forgetting of Being is a part of the very essence of Being, and is concealed by it. The forgetting belongs so essentially to the destination of Being that the dawn of this destination begins precisely as an unconcealment of the *present* in its *presence*. This means: the history of Being begins by the forgetting of Being, in that Being retains its essence, its difference from beings. Difference is wanting; it remains forgotten. Only what is differentiated – the present and presence (*das Anwesende und das Anwesen*) – becomes uncovered, but not *insofar as* it is differentiated. On the contrary, the matinal trace (*die frühe Spur*) of difference effaces itself from the moment that presence appears as a being-present (*das Anwesen und ein Anwesendes erscheint*) and finds its provenance in a supreme (being)-present (*in einem höchsten Anwesenden*).<sup>16</sup>

The trace is not a presence but is rather the simulacrum of a presence that dislocates, displaces, and refers beyond itself. The trace has, properly speaking, no place, for effacement belongs to the very structure of the trace. Effacement must always be able to overtake the trace; otherwise it would not be a trace but an indestructible and monumental substance. In addition, and from the start, effacement constitutes it as a trace – effacement establishes the trace in a change of place and makes it disappear in its appearing, makes it issue forth from itself in its very position. The effacing of this early trace (*die frühe Spur*) of difference is therefore “the same” as its tracing within the text of metaphysics. This metaphysical text must have retained a mark of what it lost or put in reserve, set aside. In the language of metaphysics the paradox of such a structure is the inversion of the metaphysical concept which produces the following effect: the present becomes the sign of signs, the trace of traces. It is no longer what every reference refers to in the last instance; it becomes a function in a generalized referential structure. It is a trace, and a trace of the effacement of a trace.

In this way the metaphysical text is *understood*; it is still readable, and remains to be read. It proposes both the monument and the mirage of the trace, the trace as simultaneously traced and effaced, simultaneously alive and dead, alive as always to simulate even life in its preserved inscription; it is a pyramid.

Thus we think through, without contradiction, or at least without granting any pertinence to such contradiction, what is perceptible and imperceptible about the trace. The “matinal trace” of difference is lost in an irretrievable invisibility, and yet even its loss is covered, preserved, regarded, and retarded. This happens in a text, in the form of presence.

Having spoken about the effacement of the matinal trace, Heidegger can thus, in this contradiction without contradiction, consign or countersign the sealing of the trace. We read on a little further:

The difference between Being and beings, however, can in turn be experienced as something forgotten only if it is already discovered with the presence of the present (*mit dem Anwesen des Anwesenden*) and if it is thus sealed in a trace (*so eine Spur geprägt hat*) that remains preserved (*gewahrt bleibt*) in the language which Being appropriates.<sup>17</sup>

Further on still, while meditating upon Anaximander's *τόχρεών*, translated as *Brauch* (sustaining use), Heidegger writes the following:

Dispensing accord and deference (*Fug und Ruch verfügend*), our sustaining use frees the present (*das Anwesende*) in its sojourn and sets it free every time for its sojourn. But by the same token the present is equally seen to be exposed to the constant danger of hardening in the insistence (*in das blosse Beharren verhärtet*) out of its sojourning duration. In this way sustaining use (*Brauch*) remains itself and at the same time an abandonment (*Aushändigung*: handing-over) of presence (*des Anwesens*) *in den Un-fug*, to discord (disjointedness). Sustaining use joins together the dis- (*Der Brauch fügt das Un-*).<sup>18</sup>

And it is at the point where Heidegger determines *sustaining use* as *trace* that the question must be asked: can we, and how far can we, think of this trace and the *dis-* of difference as *Wesen des Seins*? Doesn't the *dis* of difference refer us beyond the history of Being, beyond our language as well, and beyond everything that can be named by it? Doesn't it call for – in the language of being – the necessarily violent transformation of this language by an entirely different language?

Let us be more precise here. In order to dislodge the “trace” from its cover (and whoever believes that one tracks down some *thing*; one tracks down tracks), let us continue reading this passage:

The translation of *τόχρεών*, “sustaining use” (*Brauch*) does not derive from cogitations of an etymologico-lexical nature. The choice of the word “sustaining use” derives from an antecedent translation (*Übersetzen*) of the thought that attempts to conceive difference in the deployment of Being (*im Wesen des Seins*) toward the historical beginning of the forgetting of Being. The word “sustaining use” is dictated to thought in the apprehension (*Erfahrung*) of the forgetting of Being. *τόχρεών* properly names a trace (*Spur*) of what remains to be conceived in the word “sustaining use,” a trace that quickly disappears (*alsbald verschwindet*) into the history of Being, in its world-historical unfolding as Western metaphysics.<sup>19</sup>

How do we conceive of the outside of a text? How, for example, do we conceive of what stands opposed to the text of Western metaphysics? To be sure, the “trace that quickly disappears into the history of Being, ... as Western metaphysics,” escapes all the determinations, all the names it might receive in the metaphysical text. The trace is sheltered and thus dissimulated in these names; it does not appear in the text as the trace “itself.” But this is because the trace itself could never itself appear as such. Heidegger also says that difference can never appear *as such*: “Lichtung des Unterschiedes kann deshalb auch nicht bedeuten, dass der Unterschied als der Unterschied erscheint.” There is no essence of difference; not only can it not allow itself to be taken up into the *as such* of its name or its appearing, but it threatens the authority of the *as such* in general, the thing’s presence in its essence. That there is no essence of difference at this point also implies that there is neither Being nor truth to the play of writing, *insofar as* it involves difference.

For us, difference remains a metaphysical name; and all the names that it receives from our language are still, so far as they are names, metaphysical. This is particularly so when they speak of determining difference as the difference between presence and present (*Anwesen/Anwesend*), but already and especially so when, in the most general way, they speak of determining difference as the difference between Being and beings. “Older” than Being itself, our language has no name for such a difference. But we “already know” that if it is unnameable, this is not simply provisional; it is not because our language has still not found or received this *name*, or because we would have to look for it in another language, outside the finite system of our language. It is because there is no *name* for this, not even essence or Being – not even the name “difference,” which is not a name, which is not a pure nominal unity, and continually breaks up in a chain of different substitutions.

“There is no name for this”: we read this as a truism. What is unnameable here is not some ineffable being that cannot be approached by a name; like God, for example. What is unnameable is the play that brings about the nominal effects, the relatively unitary or atomic structures we call names, or chains of substitutions for names. In these, for example, the nominal effect of “difference” is itself involved, carried off, and reinscribed, just as the false beginning or end of a game is still part of the game, a function of the system.

What we do know, what we could know if it were simply a question of knowing, is that there never has been and never will be a unique word, a master name. This is why thinking about the letter *a* of difference is not the primary prescription, nor is it the prophetic announcement of some imminent and still unheard-of designation. There is nothing kerygmatic about this “word” so long as we can perceive its reduction to a lower-case letter.

There will be no unique name, not even the name of Being. It must be conceived without *nostalgia*; that is, it must be conceived outside the myth of the purely maternal or paternal language belonging to the lost fatherland of thought. On the contrary, we must *affirm* it – in the sense that Nietzsche brings affirmation into play – with a certain laughter and with a certain dance.

After this laughter and dance, after this affirmation that is foreign to any dialectic, the question arises as to the other side of nostalgia, which I will call Heideggerian *hope*. I am not unaware that this term may be somewhat shocking. I venture it all the same, without excluding any of its implications, and shall relate it to what seems to me to be retained of metaphysics in “Der Spruch des Anaximander,” namely, the quest for the proper word and the unique name. In talking about the “first word of Being” (*das frühe Wort des Seins: τό χρεών*), Heidegger writes,

The relation to the present, unfolding its order in the very essence of *presence*, is unique (*ist eine einzige*). It is pre-eminently incomparable to any other relation; it belongs to the uniqueness of Being itself (*Sie gehört zur Einzigkeit des Seins selbst*). Thus, in order to name what is deployed in Being (*das Wesende des Seins*), language will have to find a single word, the unique word (*ein einziges, das einzige Wort*). There we see how hazardous is every word of thought (every thoughtful word: *denkende Wort*) that addresses itself to Being (*das dem Sein zugesprochen wird*). What is hazarded here, however, is not something impossible, because Being speaks through every language; everywhere and always.<sup>20</sup>

Such is the question: the marriage between speech and Being in the unique word, in the finally proper name. Such is the question that enters into the affirmation put into play

by difference. The question bears (upon) each of the words in this sentence: “Being / speaks / through every language; / everywhere and always ./.”

## Notes

- 1 This essay appeared originally in the *Bulletin de la Société française de philosophie*, LXII, No. 3 (July–September, 1968), pp. 73–101. Derrida's remarks were delivered as a lecture at a meeting of the Société at the Sorbonne, in the Amphithéâtre Michelet, on January 27, 1968, with Jean Wahl presiding. Professor Wahl's introductory and closing remarks have not been translated. The essay was reprinted in *Théorie d'ensemble*, a collection of essays by Derrida and others, published by Editions Seuil in 1968. It is reproduced here by permission of Editions Seuil.
- 2 [The reader should bear in mind that “difference,” or difference with an *a*, incorporates two significations: “to differ” and “to defer.” – Trans.]
- 3 [For the term “facilitation” (*frayage*) in Freud, cf. “Project for a Scientific Psychology” in *The Complete Psychological Works of Sigmund Freud*, 24 vols (New York and London: Macmillan, 1964) I, p. 300, n. 4 by the translator, James Strachey: “The word ‘facilitation’ as a rendering of the German ‘Bahnung’ seems to have been introduced by Sherrington a few years after the *Project* was written. The German word, however, was already in use.” The sense that Derrida draws upon here is stronger in the French or German, that is, the opening-up or clearing-out of a pathway. In the context of the “Project for a Scientific Psychology I,” facilitation denotes the conduction capability that results from a difference in resistance levels in the memory and perception circuits of the nervous system. Thus, lowering the resistance threshold of a contact barrier serves to “open up” a nerve pathway and “facilitates” the excitatory process for the circuit. Cf. also J. Derrida, *L'Écriture et la différence*, ch. VII, “Freud et la scène de l'écriture” (Paris: Seuil, 1967), esp. pp. 29–305. – Trans.]

# CHAPTER 5

## That Dangerous Supplement

*Jacques Derrida*

In *Of Grammatology* (1967), Derrida evoked the metaphor of "writing" to characterize the primordial process of differentiation he saw interrupting the categories of the metaphysical tradition in philosophy – identity, essence, presence, being, et cetera. The metaphysical tradition usually operated as a hierarchy of terms. One set of terms was designated as more original, morally superior, conceptually prior, axiomatic, et cetera, while the other was characterized by terms suggesting loss, a falling away, depletion, derivation, imitation, et cetera. On the one side was presence, life, wholeness, identity, nature, et cetera; on the other absence, death, dissolution, non-identity, artifice, technology, representation. Writing was always characterized as inauthentic, not the real thing, a mere substitute, while speech conveyed the immediate presence of the living mind; it was therefore more likely to be associated with authenticity, nature, and truth. For Jean-Jacques Rousseau, therefore, the most original form of language is speech; writing for him is a degradation that corrupts the purity of speech. Only speech can convey pure truth that is not prey to deviation or falseness.

Derrida sees the distinction between speech and writing as a template for metaphysics. Metaphysics differentiated between values and ideas associated with truth (identity, presence, nature, immediacy, originality, etc.) and those associated with non-truth (difference, absence, artifice, mediation, repetition, imitation, etc.). But according to Derrida, difference is in fact primary and gives rise to identity. Therefore, all the hierarchies of value that found metaphysics fall apart. Bringing about such a collapse of hierarchical values through a close textual analysis is called deconstruction, the term Derrida used to characterize his method of reading. In the case of Rousseau, it consists of demonstrating that the speech Rousseau thought to be at the origin of language must, in fact, be characterized in terms associated in Rousseau's own text with writing such as articulation (which assumes the difference between terms that are articulated or related through connection). Rousseau's ideal speech cannot exist without articulation; no speech is

*Original publication details:* Jacques Derrida, "That Dangerous Supplement" from *Of Grammatology*, trans. G.C. Spivak, pp. 141–164. Johns Hopkins University Press, 1977. Reproduced with permission from Johns Hopkins University Press.

possible without a distinction between vowels and consonants. Difference is therefore more primordial than the presence Rousseau imagined at the origin of language as a pure speech devoid of all the characteristics of writing. To an extent, speaking metaphorically, writing precedes speech (if by "writing," we mean "différance"). What this means is that one cannot do as metaphysics does and divide the world categorically into nature and technique, origin and imitation, identity and alterity, et cetera. Differentiation is more prior than all of these categories, and there is no identity, origin, nature, or truth of differentiation. To try to locate an origin, a presence, a nature, or a truth that would serve as a solid ground for constructing a metaphysical hierarchy of values is a bit like tossing a buoy overboard from a rowboat in the middle of the ocean and declaring "There is the center of the ocean."

In this selection from *Of Grammatology*, Derrida examines the use of the term "supplement" in Rousseau. Rousseau characterizes writing as a supplement to speech. It is added on to speech in order to make it more widely useful, but in doing so, it suggests there is a fault or lack in speech. It is not as complete or full in itself as Rousseau imagines. Language can cover greater distances in the form of writing; it no longer requires the immediate presence of the speaker. But for Rousseau, such presence is the gold standard of truth. A mere supplement that is added on as an artificial technological representation in the form of dead letters on the page cannot really convey such truth. Yet without the help of this addition, speech-as-truth would be limited in range and usefulness. Speech needs writing, but by adding writing, it depletes the superior value of truth. This strange logic (whereby a helpful addition points out a lack or deficiency in the supposedly superior original) attracts Derrida's attention because it points to the fault in all of metaphysics—that it proclaims things like speech to be superior (because they are more present, more natural, more immediate, more self-identical, etc.) but it simultaneously points out a deficiency in the superior value. It is not self-sufficient; it requires an other; it is therefore caught up in differentiation. Derrida sees this shuttling between original-that-requires-supplementation and supplement-that-is-non-original as a version of the *différance* or differentiation that disturbs metaphysics' founding values of presence, identity, and authenticity. In Rousseau, original speech is never intact in itself, a pure identity. In a primordial sense, it requires something different from itself to supplement it. It is primordially dependent on something other. Writing is chosen as a metaphor for this shuttling of difference between the supposedly self-identical and the other it needs in order to be self-identical because each part of a written sentence has identity only in relation to all the other parts.

*How people will cry out against me! I hear from afar the shouts of that false wisdom which is ever dragging us onwards, counting the present as nothing, and pursuing without a pause a future which flies as we pursue, that false wisdom which removes us from our place and never brings us to any other.*

— Emile

*All the papers which I have collected to fill the gaps in my memory and to guide me in my undertaking, have passed into other hands, and will never return to mine.*

— Confessions

I have implied it repeatedly: the praise of living speech, as it *preoccupies* Lévi-Strauss's discourse, is faithful to only one particular motif in Rousseau. This motif comes to terms with and is organized by its contrary: a perpetually reanimated mistrust with regard to the so-called full speech. In the spoken address, presence is at once promised and refused. The speech that Rousseau raised above writing is speech as it should be or rather as it *should have been*. And we must pay attention to that mode, to that tense which relates us to presence within living colloquy. *In fact*, Rousseau had tested the concealment within speech itself, in the mirage of its immediacy. He had recognized and analyzed it with incomparable acumen. We are dispossessed of the longed-for presence in the gesture of language by which we attempt to seize it. To the experience of the "robber robbed" that Starobinski admirably describes in *L'oeil vivant* [Paris, 1961], Jean Jacques is subjected not only in the play of the mirror image which "captures his reflection and exposes his presence" (p. 109). It lies in wait for us from the first word. The specular dispossession which at the same time institutes and deconstitutes me is also a law of language. It operates as a power of death in the heart of living speech: a power all the more redoubtable because it opens as much as it threatens the possibility of the spoken word.

Having in a certain way recognized this power which, inaugurating speech, dislocates the subject that it constructs, prevents it from being present to its signs, torments its language with a complete writing, Rousseau is nevertheless more pressed to exorcise it than to assume its necessity. That is why, straining toward the reconstruction of presence, he valorizes and disqualifies writing at the same time. At the same time; that is to say, in one divided but coherent movement. We must try not to lose sight of its strange unity. Rousseau condemns writing as destruction of presence and as disease of speech. He rehabilitates it to the extent that it promises the reappropriation of that of which speech allowed itself to be dispossessed. But by what, if not already a writing older than speech and already installed in that place?

The first movement of this desire is formulated as a theory of language. The other governs the experience of the writer. In the *Confessions*, when Jean-Jacques tries to explain how he became a writer, he describes the passage to writing as the restoration, by a certain absence and by a sort of calculated effacement, of presence disappointed of itself in speech. To write is indeed the only way of keeping or recapturing speech since speech denies itself as it gives itself. Thus an *economy of signs* is organized. It will be equally disappointing, closer yet to the very essence and to the necessity of disappointment. One cannot help wishing to master absence and yet we must always let go. Starobinski describes the profound law that commands the space within which Rousseau must move:

How will he overcome the misunderstanding that prevents him from expressing himself according to his true value? How escape the risks of improvised speech? To what other mode of communication can he turn? By what other means manifest himself? Jean-Jacques chooses to be *absent* and to *write*. Paradoxically, he will hide himself to show himself better, and he will confide in written speech: "I would love society like others, if I were not sure of showing myself not only at a disadvantage, but as completely different from what I am. The part that I have taken of *writing and hiding myself* is precisely the one that suits me. If I were present, one would never know what I was worth" (*Confessions*). The admission is singular and merits emphasis: Jean-Jacques breaks with others, only to present himself to them in written speech. Protected by solitude, he will turn and re-turn his sentences at leisure.<sup>1</sup>

Let us note that the economy is perhaps indicated in the following: the operation that substitutes writing for speech also replaces presence by value: to the *I am* or to the *I am*

*present* thus sacrificed, a *what I am* or a *what I am worth* is preferred. “If I were present, one would never know what I was worth.” I renounce my present life, my present and concrete existence in order to make myself known in the ideality of truth and value. A well-known schema. The battle by which I wish to raise myself above my life even while I retain it, in order to enjoy recognition, is in this case within myself, and writing is indeed the phenomenon of this battle.

Such would be the writing lesson in Jean-Jacques’ existence. The act of writing would be essentially – and here in an exemplary fashion – the greatest sacrifice aiming at the greatest symbolic reappropriation of presence. From this point of view, Rousseau knew that death is not the simple outside of life. Death by writing also inaugurates life. “I can certainly say that I never began to live, until I looked upon myself as a dead man” (*Confessions*, Book 6 [p. 236]). As soon as one determines it within the system of this economy, is not the sacrifice – the “literary suicide” – dissipated in the *appearance*? Is it anything but a symbolic reappropriation? Does it not renounce the *present* and the *proper* in order to master them better in their meaning, in the ideal form of truth, of the presence of the present and of the proximity or property of the proper? We would be obliged to decide that a ruse and an appearance are necessary if in fact we were to abide by these concepts (sacrifice, expenditure, renunciation, symbol, appearance, truth, etc.) which determine what we here call economy in terms of truth and appearance, starting from the opposition presence/absence.

But the work of writing and the economy of difference will not be dominated by this classical conceptuality, this ontology, or this epistemology. On the contrary, these furnish its hidden premises. Difference does not *resist* appropriation, it does not impose an exterior limit upon it. Difference began by *broaching* alienation and it ends by leaving reappropriation *breached*. Until death. Death is the movement of difference to the extent that that movement is necessarily finite. This means that difference makes the opposition of presence and absence possible. Without the possibility of difference, the desire of presence as such would not find its breathing-space. That means by the same token that this desire carries in itself the destiny of its non-satisfaction. Difference produces what it forbids, makes possible the very thing that it makes impossible.

If difference is recognized as the obliterated origin of absence and presence, major forms of the disappearing and the appearing of the entity, it would still remain to be known if being, before its determination into absence or presence, is already implicated in the thought of difference. And if difference as the project of the mastery of the entity should be understood with reference to the sense of being. Can one not think the converse? Since the sense of being is never produced as history outside of its determination as presence, has it not always already been caught within the history of metaphysics as the epoch of presence? This is perhaps what Nietzsche wanted to write and what resists the Heideggerian reading of Nietzsche; *difference* in its *active* movement – *what* is comprehended in the concept of *difference* without exhausting it – is what not only precedes metaphysics but also extends beyond the thought of being. The latter speaks *nothing other than* metaphysics, even if it exceeds it and thinks it as what it is within its closure.

## From/Of Blindness to the Supplement

In terms of this problematical scheme, we must therefore think Rousseau’s experience and his theory of writing together, the accord and the discord that, under the name of writing, relate Jean-Jacques to Rousseau, uniting and dividing his proper name. On the

side of experience, a recourse to literature as reappropriation of presence, that is to say, as we shall see, of Nature; on the side of theory, an indictment against the negativity of the letter, in which must be read the degeneracy of culture and the disruption of the community.

If indeed one wishes to surround it with the entire constellation of concepts that shares its system, the word *supplement* seems to account for the strange unity of these two gestures.

In both cases, in fact, Rousseau considers writing as a dangerous means, a menacing aid, the critical response to a situation of distress. When Nature, as self-proximity, comes to be forbidden or interrupted, when speech fails to protect presence, writing becomes necessary. It must be *added* to the word urgently. I have identified in advance one of the forms of this *addition*; speech being natural or at least the natural expression of thought, the most natural form of institution or convention for signifying thought, writing is added to it, is adjoined, as an image or representation. In that sense, it is not natural. It diverts the immediate presence of thought to speech into representation and the imagination. This recourse is not only “bizarre,” but dangerous. It is the addition of a technique, a sort of artificial and artful ruse to make speech present when it is actually absent. It is a violence done to the natural destiny of the language:

Languages are made to be spoken, writing serves only as a supplement to speech. ... Speech represents thought by conventional signs, and writing represents the same with regard to speech. Thus the art of writing is nothing but a mediated representation of thought.

Writing is dangerous from the moment that representation there claims to be presence and the sign of the thing itself. And there is a fatal necessity, inscribed in the very functioning of the sign, that the substitute make one forget the vicariousness of its own function and make itself pass for the plenitude of a speech whose deficiency and infirmity it nevertheless only *supplements*. For the concept of the supplement – which here determines that of the representative image – harbors within itself two significations whose cohabitation is as strange as it is necessary. The supplement adds itself, it is a surplus, a plenitude enriching another plenitude, the *fullest measure* of presence. It cumulates and accumulates presence. It is thus that art, *technè*, image, representation, convention, etc., come as supplements to nature and are rich with this entire cumulating function. This kind of supplementary determines in a certain way all the conceptual oppositions within which Rousseau inscribes the notion of Nature to the extent that it *should* be self-sufficient.

But the supplement supplements. It adds only to replace. It intervenes or insinuates itself *in-the-place-of*; if it fills, it is as if one fills a void. If it represents and makes an image, it is by the anterior default of a presence. Compensatory [*suppléant*] and vicarious, the supplement is an adjunct, a subaltern instance which *takes-(the)-place* [*tient-lieu*]. As substitute, it is not simply added to the positivity of a presence, it produces no relief, its place is assigned in the structure by the mark of an emptiness. Somewhere, something can be filled up of *itself*, can accomplish itself, only by allowing itself to be filled through sign and proxy. The sign is always the supplement of the thing itself.

This second signification of the supplement cannot be separated from the first. We shall constantly have to confirm that both operate within Rousseau’s texts. But the inflection varies from moment to moment. Each of the two significations is by turns effaced or becomes discreetly vague in the presence of the other. But their common

function is shown in this: whether it adds or substitutes itself, the supplement is *exterior*, outside of the positivity to which it is super-added, alien to that which, in order to be replaced by it, must be other than it. Unlike the *complement*, dictionaries tell us, the supplement is an “*exterior addition*” (Robert’s *French Dictionary*).

According to Rousseau, the negativity of evil will always have the form of supplementarity. Evil is exterior to nature, to what is by nature innocent and good. It supervenes upon nature. But always by way of compensation for [*sous l’espèce de la suppléance*] what *ought to* lack nothing at all in itself.

Thus presence, always natural, which for Rousseau more than for others means maternal, *ought to be* self-sufficient. Its *essence*, another name for presence, may be read through the grid of this ought to be [*ce conditionnel*]. Like Nature’s love, “there is no substitute for a mother’s love,” says *Emile*.<sup>2</sup> It is in no way *supplemented*, that is to say it does not have to be supplemented, it suffices and is self-sufficient; but that also means that it is irreplaceable; what one would substitute for it would not equal it, would be only a mediocre makeshift. Finally it means that Nature does not supplement *itself* at all; Nature’s supplement does not proceed from Nature, it is not only inferior to but other than Nature.

Yet all education, the keystone of Rousseauist thought, will be described or presented as a system of substitution [*suppléance*] destined to reconstitute Nature’s edifice in the most natural way possible. The first chapter of *Emile* announces the function of this pedagogy. Although there is no substitute for a mother’s love, “it is better that the child should suck the breast of a healthy nurse rather than of a petted mother, if he has any further evil to fear from her who has given him birth” (*ibid.*) [p. 12]. It is indeed culture or cultivation that must supplement a deficient nature, a deficiency that cannot by definition be anything but an accident and a deviation from Nature. Culture or cultivation is here called habit; it is necessary and insufficient from the moment when the substitution of mothers is no longer envisaged only “from the physiological point of view”:

Other women, or even other animals, may give him the milk she denies him, but there is no substitute for a mother’s love. The woman who nurses another’s child in place of her own is a bad mother; how can she be a good nurse? She may become one in time; use [habit] will overcome nature ... (*ibid.*).

Here the problems of natural right, of the relationship between Nature and Society, the concepts of alienation, alterity, and corruption, are adapted most spontaneously to the pedagogic problem of the substitution of mothers and children:

And this affection when developed has its drawbacks, which should make every sensible woman afraid to put her child out to nurse. Is she prepared to divide her mother’s rights, or rather to abdicate them in favor of a stranger; to see her child loving another as much as and more than herself ... (*ibid.*).

If, premeditating the theme of writing, I began by speaking of the substitution of mothers, it is because, as Rousseau will himself say, “more depends on this than you realize.”

How emphatically would I speak if it were not so hopeless to keep struggling in vain on behalf of a real reform. More depends on this than you realize. Would you restore all men to their primal duties, begin with the mothers; the results will surprise you. Every evil

follows in the train of this first sin; the whole moral order is disturbed, nature is quenched in every breast ... (p. 18) [p. 13].

Childhood is the first manifestation of the deficiency which, in Nature, calls for substitution [*suppléance*]. Pedagogy illuminates perhaps more crudely the paradoxes of the supplement. How is a natural weakness possible? How can Nature ask for forces that it does not furnish? How is a child possible in general?

*First Maxim.* – Far from being too strong, children are not strong enough for all the claims of nature. Give them full use of such strength as they have and which they will not abuse.

*Second Maxim.* – Help them and supply what they lack, in intelligence or in strength, whenever the need is of the body (p. 50) [p. 35].

All the organization of, and all the time spent in, education will be regulated by this necessary evil: “supply [*suppléer*] ... [what] ... is lacking” and to replace Nature. It must be done as little and as late as possible. “One of the best rules of good farming [*culture*] is to *keep things back as much as possible*” (p. 274) [p. 193]. “Give nature time to work before you *take over her business* [act in her place – *agir à sa place*]” (p. 102; italics added) [p. 71].

Without childhood, no supplement would ever appear in Nature. The supplement is here both humanity’s good fortune and the origin of its perversion. The health of the human race:

Plants are fashioned by cultivation, and men by education. If man were born big and strong, his size and strength would be useless to him until he had learned to use them; they would create a prejudice against him, by not allowing others to think of assisting him; and, left to himself, he would die miserably before knowing his needs. We complain of the state of infancy; we do not see that, if man had not begun by being a child, the human race would have perished (p. 67).

#### The threat of perversion:

While the Author of nature has given children the active principle, He takes care that it shall do little harm by giving them small power to use it. But as soon as they can think of people as tools that they are responsible for activating, they use them to carry out their wishes and to *supplement* their own weakness. This is how they become tiresome, masterful, imperious, naughty, and unmanageable; a development which does not spring from a natural love of power, but one which gives it to them, for it does not need much experience to realize how pleasant it is to act through the hands of others and to move the world by simply moving the tongue (p. 49; italics added) [p. 34].

The supplement will always be the moving of the tongue or acting through the hands of others. In it everything is brought together: progress as the possibility of perversion, regression toward an evil that is not natural and that adheres to the power of substitution that permits us to absent ourselves and act by proxy, through representation, through the hands of others. Through the written [*par écrit*]. This substitution always has the form of the sign. The scandal is that the sign, the image, or the representer, become forces and make “the world move.”

This scandal is such, and its evil effects are sometimes so irreparable, that the world seems to turn the wrong way (and we shall see later what such a *catastrophe* can signify

for Rousseau); then Nature becomes the supplement of art and society. It is the moment when evil seems incurable: “As the child does not know how to be cured, let him know how to be ill. The one art takes the place of [*supplée*] the other and is often more successful; it is the art of nature” (p. 31) [p. 22]. It is also the moment when maternal nature, ceasing to be loved, as she ought to be, for herself and in an immediate proximity (“O Nature! O my mother! behold me under thy protection alone! Here there is no cunning or knavish mortal to thrust himself between me and thee.”) [*Confession*, Book 12] [p. 669]) becomes the substitute for another love and for another attachment:

The contemplation of Nature always had a very great attraction for his heart; he found there a supplement to the attachments that he needed; but he would have left the supplement for the thing, if he had had the choice, and he was reduced to converse with the plants only after vain efforts to converse with human beings (*Dialogues*, p. 794).

That botany becomes the supplement of society is more than a catastrophe. It is the catastrophe of the catastrophe. For in Nature, the plant is the most *natural* thing. It is natural *life*. The mineral is distinguished from the vegetable in that it is a dead and useful Nature, servile to man’s industry. When man has lost the sense and the taste of true natural riches – plants – he rummages in the entrails of his mother and risks his health:

The Mineral Kingdom has nothing in itself either amiable or attractive; its riches, enclosed in the breast [womb – *sein*] of the earth, seem to have been removed from the gaze of man in order not to tempt his cupidity; they are there like a reserve to serve one day as a *supplement* to the true wealth which is more within his grasp, and for which he loses taste according to the extent of his corruption. Then he is compelled to call in industry, to struggle, and to labor to alleviate his miseries; he searches the entrails of earth; he goes seeking to its center, at the risk of his life and at the expense of his health, for imaginary goods in place of the real good which the earth offers of herself if he knew how to enjoy it. *He flies from the sun and the day, which he is no longer worthy to see.*<sup>3</sup>

Man has thus put out his eyes, he blinds himself by the desire to rummage in these entrails. Here is the horrible spectacle of the punishment that follows the crime, in sum a simple substitution:

He buries himself alive, and does well, not being worthy of living in the light of day. There quarries, pits, forges, furnaces, a battery of anvils, hammers, smoke and fire, succeed to the fair images of his rustic labors. The wan faces of the unhappy people who languish in the poisonous vapors of mines, of black forgemen, of hideous cyclops, are the spectacle which the working of the mine substitutes, in the heart [womb] of the earth for that of green fields and flowers, the azure sky, amorous shepherds and robust laborers upon its surface.<sup>4</sup>

Such is the scandal, such the catastrophe. The supplement is what neither Nature nor Reason can tolerate. Neither Nature, our “common mother” (*Reveries*, p. 1066) [p. 143], nor the reason which is reasonable, if not reasoning (*De l’état de nature*, [Pléiade, vol. 3], p. 478). And had they not done everything to avoid this catastrophe, to protect themselves from this violence and to guard and keep us from this fatal crime? “so that,” says the second *Discourse* precisely of mines, “it looks as if nature had taken pains to keep the fatal secret from us” (p. 172) [p. 200]. And let us not forget that the violence that takes us toward the entrails of the earth, the moment of mine-blindness, that is, of metallurgy, is

the origin of society. For according to Rousseau, as we shall often confirm, agriculture, marking the organization of civil society, assumes the beginning of metallurgy. Blindness thus produces that which is born at the same time as society: the languages, the regulated substitution of signs for things, the order of the supplement. One goes *from blindness to the supplement*. But the blind person cannot see, in its origin, the very thing he produces to supplement his sight. *Blindness to the supplement* is the law. And especially blindness to its concept. Moreover, it does not suffice to locate its functioning in order to *see* its meaning. The supplement has no sense and is given to no intuition. We do not therefore make it emerge out of its strange penumbra. We speak its reserve.

Reason is incapable of thinking this double infringement upon Nature: that there is *lack* in Nature and that *because of that very fact* something is *added* to it. Yet one should not say that Reason is *powerless to think this*; it is constituted by that lack of power. It is the principle of identity. It is the thought of the self-identity of the natural being. It cannot even determine the supplement as its other, as the irrational and the non-natural, for the supplement comes *naturally* to put itself in Nature's place. The supplement is the image and the representation of Nature. The image is neither in nor out of Nature. The supplement is therefore equally dangerous for Reason, the natural health of Reason.

Dangerous supplement. These are the words that Rousseau uses in the *Confessions*. He uses them in a context which is only apparently different, and in order to explain, precisely, a "condition almost unintelligible and inconceivable [to reason]": "In a word, between myself and the most passionate lover there was only one, but that an essential, point of distinction, which makes my condition almost unintelligible and inconceivable" (*Pléiade*, vol. 1, [p. 111]).

If we lend to the text below a paradigmatic value, it is only provisional and does not prejudge what the discipline of a future reading might rigorously determine. No model of reading seems to me at the moment ready to measure up to this text – which I would like to read as a *text* and not as a document. Measure up to it fully and rigorously, that is, beyond what already makes the text most legible, and more legible than has been so far thought. My only ambition will be to draw out of it a signification which that presumed future reading will not be able to dispense with [*faire économie*]; the economy of a written text, circulating through other texts, leading back to it constantly, conforming to the element of a language and to its regulated functioning. For example, what unites the word "supplement" to its concept was not invented by Rousseau and the originality of its functioning is neither fully mastered by Rousseau nor simply imposed by history and the language, by the history of the language. To speak of the writing of Rousseau is to try to recognize what escapes these categories of passivity and activity, blindness and responsibility. And one cannot abstract from the written text to rush to the signified it *would mean*, since the signified is here the text itself. It is so little a matter of looking for a *truth signified* by these writings (metaphysical or psychological truth: Jean-Jacques' life behind his work) that if the texts that interest us *mean* something, it is the engagement and the appurtenance that encompass existence and writing in the same *tissue*, the same *text*. The same is here called supplement, another name for difference.

Here is the irruption of the dangerous supplement in Nature, between nature and nature, between natural innocence as *virginity* and natural innocence as *pucelage*\*: "In a

---

\* "*Pucelage*" is the more earthy French word for the actual physical fact of sexual intactness, in the female the membrane itself. Rousseau applies the word to his own case with some derision, contrasting it to the spiritual innocence of true "virginity."

word, between myself and the most passionate lover there was only one, but that an essential, point of distinction, which makes my condition almost unintelligible and inconceivable." Here, the lineation should not hide the fact that the following paragraph is destined to explain the "only one point of distinction" and the "almost unintelligible and inconceivable" "condition." Rousseau elaborates:

I had returned from Italy not quite the same as I had entered it, but as, perhaps, no one of my age had ever returned from it. I had brought back, not my virginity but my *pucelage*. I had felt the progress of years; my restless temperament had at last made itself felt, and its first outbreak, quite involuntary, had caused me alarm about my health in a manner which shows better than anything else the innocence in which I had lived up to that time. Soon reassured, I learned that dangerous means of assisting it [*ce dangereux supplément*], which cheats Nature and saves up for young men of my temperament many forms of excess at the expense of their health, strength, and, sometimes, their life (*Pléiade*, I, pp. 108–09 [p. 111]).

We read in *Emile* (Book IV): "If once he acquires this dangerous habit [*supplément*] he is ruined" [p. 299]. In the same book, it is also a question of "mak[ing] up ... by trading on ... inexperience" [*suppléer en gagnant de vitesse sur l'expérience*; literally "supplementing by out-distancing experience"] (p. 437) [p. 315], and of the "mind, which reinforces [*supplée*] ... the bodily strength" (p. 183) [p. 129].

The experience of auto-eroticism is lived in anguish. Masturbation reassures ("soon reassured") only through that culpability traditionally attached to the practice, obliging children to assume the fault and to interiorize the threat of castration that always accompanies it. Pleasure is thus lived as the irremediable loss of the vital substance, as exposure to madness and death. It is produced "at the expense of their health, strength, and, sometimes, their life." In the same way, the *Reveries* will say, the man who "searches the entrails of earth ... goes seeking to its center, at the risk of his life and at the expense of his health, for imaginary goods in place of the real good which the earth offers of herself if he knew how to enjoy it" (*Pléiade*, vol. 1, 1067 [p. 145]).

And indeed it is a question of the imaginary. The supplement that "cheats" maternal "nature" operates as writing, and as writing it is dangerous to life. This danger is that of the image. Just as writing opens the crisis of the living speech in terms of its "image," its painting or its representation, so onanism announces the ruin of vitality in terms of imaginary seductions:

This vice, which shame and timidity find so convenient, possesses, besides a great attraction for lively imaginations – that of being able to dispose of the whole sex as they desire, and to make the beauty which tempts them minister to their pleasures, without being obliged to obtain its consent [*Confessions*, p. 111].

The dangerous supplement, which Rousseau also calls a "fatal advantage," is properly *seductive*; it leads desire away from the good path, makes it err far from natural ways, guides it toward its loss or fall and therefore it is a sort of lapse or scandal (*scandalon*). It thus destroys Nature. But the scandal of Reason is that nothing seems more natural than this destruction of Nature. It is myself who exerts myself to separate myself from the force that Nature has entrusted to me: "Seduced by this fatal advantage, I did my best to destroy the good constitution which Nature had restored to me, and [to] which I had allowed time to strengthen itself." We know what importance *Emile* gives to time, to the slow maturation of natural forces. The entire art of pedagogy is a calculated patience,

allowing the work of Nature time to come to fruition, respecting its rhythm and the order of its stages. The dangerous supplement destroys very quickly the forces that Nature has slowly constituted and accumulated. In “out-distancing” natural experience, it runs non-stop [*brûle les étapes* – literally “burns the halting-points”] and consumes energy without possibility of recovery. As I shall confirm, like the sign it bypasses the presence of the thing and the duration of being.

The dangerous supplement breaks with Nature. The entire description of this moving away from Nature has a *scene* [*théâtre*]. The *Confessions* stage the evocation of the dangerous supplement at the moment when it is a question of making visible a distancing which is neither the same nor an other; Nature draws away at the same time as the Mother, or rather “Mamma,” who already signified the disappearance of the true mother and has substituted herself in the well-known ambiguous manner. It is therefore now a question of the distance between Mamma and the person she called “Little one.”<sup>5</sup> As *Emile* says, all evil comes from the fact that “women have ceased to be mothers, they do not and will not return to their duty” (p. 18) [p. 14]. A certain absence, then, of a certain sort of mother. And the experience of which we speak is such as to reduce that absence as much as to maintain it. A *furtive* experience, that of a thief who needs invisibility: that the mother be invisible and not see. These lines are often quoted:

I should never have done, if I were to enter into the details of all the follies which the remembrance of this dear mamma caused me to commit when I was no longer in her presence. How often have I kissed my bed, since she had slept in it; my curtains, all the furniture of my room, since they belonged to her, and her beautiful hand had touched them; even the floor, on which I prostrated myself, since she had walked upon it! Sometimes, even in her presence, I was guilty of extravagances, which only the most violent love seemed capable of inspiring. At table one day, just when she had put a piece of food into her mouth, I exclaimed that I saw a hair in it; she put back the morsel on her plate, and I eagerly seized and swallowed it.<sup>6</sup> In a word, between myself and the most passionate lover there was only one, but that an essential, point of distinction, which makes my condition almost unintelligible and inconceivable ... [A little above, we read] I only felt the full strength of my attachment when I no longer saw her (p. 107) [pp. 110–11]

### The Chain of Supplements

The discovery of the dangerous supplement will be next cited *among* these “follies,” but it will still retain a privilege; Rousseau evokes it after the others and as a sort of explanation of the state inconceivable to reason. For it is not the question of diverting total enjoyment toward a particular substitute, but now of experiencing it or miming it *directly and in its totality*. It is no longer a question of kissing the bed, the floor, the curtains, the furniture, etc., not even of “swallowing” the “piece ... [that] she had put into her mouth,” but of “dispos[ing] of the whole sex as ... [one] desire[s].”

I remarked that the stage of this theater was not only a setting in the generally understood sense: an ensemble of accessories. The topographic disposition of the experience is not unimportant. Jean-Jacques is in the house of Madame de Warens; close enough to *Mamma* to see her and to nourish his imagination upon her but with the possibility of a partition. It is at the moment when the mother disappears that substitution becomes possible and necessary. The play of maternal presence or absence,

this alteration of perception and imagination must correspond to an organization of space; the text argues as follows:

Add to this habit the circumstances of my position, living as I was with a beautiful woman, caressing her image in the bottom of my heart, seeing her continually throughout the day, surrounded in the evening by objects which reminded me of her, sleeping in the bed in which I knew she had slept! What causes for excitement! Many a reader, who reflects upon them, no doubt already considers me as half-dead! Quite the contrary; that which ought to have destroyed me was just the thing that saved me, at least for a time. Intoxicated with the charm of living with her, with the ardent desire of spending my life with her, I always saw in her, whether she were absent or present, a tender mother, a beloved sister, a delightful friend, and nothing more. ... She was for me the only woman in the world; and the extreme sweetness of the feelings with which she inspired me did not allow my senses time to awake for others, and protected me against her and all her sex.

This experience was not an event marking an archaic or adolescent period. Not only did it construct or sustain a particular hidden foundation, an edifice of significations. It remained an active obsession whose “present” is constantly reactivated and constituted in its turn, until the end of Jean-Jacques Rousseau’s “life” and “text.” A little later, a little further on in the text of the *Confessions* (Book IV),<sup>7</sup> “a little incident, which I find some difficulty in relating,” [p. 150] is related to us. The encounter with a man “addicted to the same vice.” Terrified, Jean-Jacques runs away, “trembling as if” he had just “committed a crime.” “The recollection of this incident cured me of it for a long time” [p. 151].

For a long time? Rousseau will never stop having recourse to, and accusing himself of, this onanism that permits one to be himself affected by providing himself with presences, by summoning absent beauties. In his eyes it will remain the model of vice and perversion. Affecting oneself by another presence, one *corrupts* oneself [makes oneself other] by oneself [*on s’altère soi-même*]. Rousseau neither wishes to think nor can think that this alteration does not simply happen to the self, that it is the self’s very origin. He must consider it a contingent evil coming from without to affect the integrity of the subject. But he cannot give up what immediately restores to him the other desired presence; no more than one can give up language. This is why, in this respect as well, as he says in the *Dialogues* [Pléiade, vol. 1] (p. 800), “to the end of his life he will remain an aged child.”

The restitution of presence by language, restitution at the same time symbolic and immediate. This contradiction must be thought. Immediate experience of restitution because as experience, as consciousness or conscience, *it dispenses with passage through the world*. What is touching is touched, auto-affection gives itself as pure autarchy. If the presence that it then gives itself is the substitutive symbol of another presence, it has never been possible to desire that presence “in person” before this play of substitution and this symbolic experience of auto-affection. The thing itself does not appear outside of the symbolic system that does not exist without the possibility of auto-affection. Experience of *immediate* restitution, also because it *does not wait*. It is satisfied then and there and in the moment. If it waits, it is not because the other makes it wait. Pleasure seems no longer to be deferred. “Why give oneself so much trouble in a hope remote from so poor and uncertain a success, when one can, from the very instant ...” (*Dialogues*).

But what is no longer deferred is also absolutely deferred. The presence that is thus delivered to us in the present is a chimera. Auto-affection is a pure speculation. The

sign, the image, the representation, which come to supplement the absent presence are the illusions that sidetrack us. To culpability, to the anguish of death and castration, is added or rather is assimilated the experience of frustration. *Donner le change* [“sidetracking” or, “giving money”]: in whatever sense it is understood, this expression describes the recourse to the supplement admirably. In order to explain his “dislike” for “common prostitutes,” Rousseau tells us that in Venice, at thirty-one, the “propensity which had modified all my passions” (*Confessions*, p. 41) [p. 35]<sup>8</sup> has not disappeared: “I had not lost the pernicious habit of satisfying my wants [*donner le change*]” (p. 316) [p. 289].

The enjoyment of the *thing itself* is thus undermined, in its act and in its essence, by frustration. One cannot therefore say that it has an essence or an act (*eidos*, *ousia*, *energeia*, etc.). Something promises itself as it escapes, gives itself as it moves away, and strictly speaking it cannot even be called presence. Such is the constraint of the supplement, such, exceeding all the language of metaphysics, is this structure “almost inconceivable to reason.” *Almost* inconceivable: simple irrationality, the opposite of reason, are less irritating and waylaying for classical logic. The supplement is maddening because it is neither presence nor absence and because it consequently breaches both our pleasure and our virginity. “... abstinence and enjoyment, pleasure and wisdom, escaped me in equal measure” (*Confessions*, p. 12).

Are things not complicated enough? The symbolic is the immediate, presence is absence, the nondeferred is deferred, pleasure is the menace of death. But one stroke must still be added to this system, to this strange economy of the supplement. In a certain way, it was already legible. A terrifying menace, the supplement is also the first and surest protection; against that very menace. This is why it cannot be given up. And sexual auto-affection, that is auto-affection in general, neither begins nor ends with what one thinks can be circumscribed by the name of masturbation. The supplement has not only the power of *procuring* an absent presence through its image; procuring it for us through the proxy [*procuration*] of the sign, it holds it at a distance and masters it. For this presence is at the same time desired and feared. The supplement transgresses and at the same time respects the interdict. This is what also permits writing as the supplement of speech; but already also the spoken word as writing in general. Its economy exposes and protects us at the same time according to the play of forces and of the differences of forces. Thus, the supplement is dangerous in that it threatens us with death, but Rousseau thinks that it is not at all as dangerous as “cohabitation with women.” Pleasure *itself*, without symbol or suppletory, that which would accord us (to) pure presence itself, if such a thing were possible, would be only another name for death. Rousseau says it:

Enjoyment! Is such a thing made for man? Ah! If I had ever in my life tasted the delights of love even once in their plenitude, I do not imagine that my frail existence would have been sufficient for them, I would have been dead in the act (*Confessions*, Book VIII).

If one abides by the universal evidence, by the necessary and a priori value of this proposition in the form of a sigh, one must immediately recognize that “cohabitation with women,” hetero-eroticism, can be lived (effectively, really, as one believes it can be said) only through the ability to reserve within itself its own supplementary protection. In other words, between auto-eroticism and hetero-eroticism, there is not a frontier but an economic distribution. It is within this general rule that the differences are mapped out. This is Rousseau’s general rule. And before trying – what I do not pretend to be doing here – to encompass the pure singularity of Rousseau’s economy or his writing, we

must carefully raise and articulate between them all the structural or essential necessities on their different levels of generality.

It is from a certain determined representation of “cohabitation with women” that Rousseau had to have recourse throughout his life to that type of dangerous supplement that is called masturbation and that cannot be separated from his activity as a writer. To the end. Thérèse – the Thérèse of whom we can speak, Thérèse in the text, whose name and “life” belong to the writing we read – experienced it at her cost. In Book XII of the *Confessions*, at the moment when “I must speak without reserve,” the “two reasons combined” of certain “resolutions” is confided to us:

I must speak without reserve. I have never concealed either my poor mamma’s faults or my own. I must not show greater favor to Thérèse either; and, pleased as I am to render honor to one who is so dear to me, neither do I wish to conceal her faults, if so be that an involuntary change in the heart’s affections is really a fault. I had long since observed that her affection for me had cooled. ... I was conscious again of an unpleasantness, the effects of which I had formerly felt when with mamma; and the effect was the same with Thérèse. Let us not look for perfections which are not to be found in nature; it would be the same with any other woman whatsoever. ... My situation, however, was at that time the same, and even aggravated by the animosity of my enemies, who only sought to find me at fault. I was afraid of a repetition; and, not desiring to run the risk of it, I preferred to condemn myself to strict continence, than to expose Thérèse to the risk of finding herself in the same condition again. Besides, I had observed that intercourse with women distinctly aggravated my ill-health. ... These two reasons combined caused me to form resolutions which I had sometimes been very inconsistent in keeping, but in which I had persevered with greater firmness for the last three or four years (p. 595) [pp. 616–17].

In the *Manuscrit de Paris*, after “distinctly aggravated my ill-health!” we read: “the corresponding vice, of which I have never been able to cure myself completely, appeared to me to produce less injurious results. These two reasons combined ...”

This perversion consists of preferring the sign and protects me from mortal expenditure. To be sure. But this apparently egotistical economy also functions within an entire system of moral representation. Egotism is redeemed by a culpability, which determines auto-eroticism as a fatal waste and a wounding of the self by the self. But as I thus harm only myself, this perversion is not truly condemnable. Rousseau explains it in more than one letter. Thus: “With that exception and [the exception of] vices that have always done harm to me alone, I can expose to all eyes a life irreproachable in all the secrets of my heart” (to M. de Saint-Germain, 2–26–70). “I have great vices, but they have never harmed anyone but me” (to M. Le Noir, 1–15–72).<sup>10</sup>

Jean-Jacques could thus look for a supplement to Thérèse only on one condition: that the system of supplementarity in general be already open in its possibility, that the play of substitutions be already operative for a long time and that *in a certain way Thérèse herself be already a supplement*. As Mamma was already the supplement of an unknown mother, and as the “true mother” herself, at whom the known “psychoanalyses” of the case of Jean-Jacques Rousseau stop, was also in a certain way a supplement, from the first trace, and even if she had not “truly” died in giving birth. Here is the chain of supplements. The name Mamma already designates one:

Ah, my Thérèse! I am only too happy to possess you, modest and healthy, and not to find what I never looked for. [The question is of “maidenhood” [*pucelage*] which Thérèse has just

confessed to have lost in innocence and by accident.] At first I had only sought amusement; I now saw that I had found more and gained a companion. A little intimacy with this excellent girl, a little reflection upon my situation, made me feel that, while thinking only of my pleasures, I had done much to promote my happiness. *To supply the place of* my extinguished ambition, I needed a lively sentiment which should *take complete possession of* [literally “fill” – *remplit*] my heart. In a word, I needed a successor to mamma. As I should never live with her again, I wanted someone to live with her pupil, in whom I might find the simplicity and docility of heart which she had found in me. I felt it necessary that the gentle tranquillity of private and domestic life *should make up* to me for the loss of the brilliant career which I was renouncing. When I was quite alone, I felt a void in my heart, which it only needed another heart *to fill*. Destiny had deprived me of, or, at least in part, alienated me from, that heart for which Nature had formed me. From that moment I was alone; for *with me it has always been everything or nothing. I found in Thérèse the substitute [supplément] that I needed.*<sup>11</sup>

Through this sequence of supplements a necessity is announced: that of an infinite chain, ineluctably multiplying the supplementary mediations that produce the sense of the very thing they defer: the mirage of the thing itself, of immediate presence, of originary perception. Immediacy is derived. That all begins through the intermediary is what is indeed “inconceivable [to reason].”

### The Exorbitant. Question of Method

“For me there has never been an intermediary between everything or nothing.” The intermediary is the mid-point and the mediation, the middle term between total absence and the absolute plenitude of presence. It is clear that mediacy is the name of all that Rousseau wanted opinionately to efface. This wish is expressed in a deliberate, sharp, thematic way. It does not have to be deciphered. Jean-Jacques recalls it here at the very moment when he is spelling out the supplements that are linked together to replace a mother or a Nature. And here the supplement occupies the middle point between total absence and total presence. The play of substitution fills and marks a determined lack. But Rousseau argues as if the recourse to the supplement – here to Thérèse – was going to appease his impatience when confronted with the intermediary: “From that moment I was alone; for me there has never been an intermediary between everything and nothing. I found in Thérèse the substitute that I needed.” The virulence of this concept is thus appeased, as if one were able to *arrest it*, domesticate it, tame it.

This brings up the question of the usage of the word “supplement”: of Rousseau’s situation within the language and the logic that assures to this word or this concept sufficiently *surprising* resources so that the presumed subject of the sentence might always say, through using the “supplement,” more, less, or something other than what he *would mean* [*voudrait dire*]. This question is therefore not only of Rousseau’s writing but also of our reading. We should begin by taking rigorous account of this *being held within* [*prise*] or this *surprise*: the writer writes *in* a language and *in* a logic whose proper system, laws, and life his discourse by definition cannot dominate absolutely. He uses them only by letting himself, after a fashion and up to a point, be governed by the system. And the reading must always aim at a certain relationship, unperceived by the writer, between what he commands and what he does not command of the patterns of the language that he uses. This relationship is not a certain quantitative distribution of shadow and light, of weakness or of force, but a signifying structure that critical reading should *produce*.

What does produce mean here? In my attempt to explain that, I would initiate a justification of my principles of reading. A justification, as we shall see, entirely negative, outlining by exclusion a space of reading that I shall not fill here: a task of reading.

To produce this signifying structure obviously cannot consist of reproducing, by the effaced and respectful doubling of commentary, the conscious, voluntary, intentional relationship that the writer institutes in his exchanges with the history to which he belongs thanks to the element of language. This moment of doubling commentary should no doubt have its place in a critical reading. To recognize and respect all its classical exigencies is not easy and requires all the instruments of traditional criticism. Without this recognition and this respect, critical production would risk developing in any direction at all and authorize itself to say almost anything. But this indispensable guardrail has always only *protected*, it has never *opened*, a reading.

Yet if reading must not be content with doubling the text, it cannot legitimately transgress the text toward something other than it, toward a referent (a reality that is metaphysical, historical, psychobiographical, etc.) or toward a signified outside the text whose content could take place, could have taken place outside of language, that is to say, in the sense that we give here to that word, outside of writing in general. That is why the methodological considerations that we risk applying here to an example are closely dependent on general propositions that we have elaborated above; as regards the absence of the referent or the transcendental signified. *There is nothing outside of the text* [there is no outside-text; *il n'y a pas de hors-texte*]. And that is neither because Jean-Jacques' life, or the existence of Mamma or Thérèse *themselves*, is not of prime interest to us, nor because we have access to their so-called "real" existence only in the text and we have neither any means of altering this, nor any right to neglect this limitation. All reasons of this type would already be sufficient, to be sure, but there are more radical reasons. What we have tried to show by following the guiding line of the "dangerous supplement," is that in what one calls the real life of these existences "of flesh and bone," beyond and behind what one believes can be circumscribed as Rousseau's text, there has never been anything but writing; there have never been anything but supplements, substitutive significations which could only come forth in a chain of differential references, the "real" supervening, and being added only while taking on meaning from a trace and from an invocation of the supplement, etc. And thus to infinity, for we have read, *in the text*, that the absolute present, Nature, that which words like "real mother" name, have always already escaped, have never existed; that what opens meaning and language is writing as the disappearance of natural presence.

Although it is not commentary, our reading must be intrinsic and remain within the text. That is why, in spite of certain appearances, the locating of the word *supplement* is here not at all psychoanalytical, if by that we understand an interpretation that takes us outside of the writing toward a psychobiographical signified, or even toward a general psychological structure that could rightly be separated from the signifier. This method has occasionally been opposed to the traditional doubling commentary; it could be shown that it actually comes to terms with it quite easily. *The security with which the commentary considers the self-identity of the text, the confidence with which it carves out its contour, goes hand in hand with the tranquil assurance that leaps over the text toward its presumed content, in the direction of the pure signified.* And in effect, in Rousseau's case, psychoanalytical studies like those of Dr. Laforgue transgress the text only after having read it according to the most current methods. The reading of the literary "symptom" is most banal, most academic, most naive. And once one has thus blinded oneself to the

very tissue of the “symptom,” to its proper texture, one cheerfully exceeds it toward a psychobiographical signified whose link with the literary signifier then becomes perfectly extrinsic and contingent. One recognizes the other aspect of the same gesture when, in general works on Rousseau, in a package of classical shape that gives itself out to be a synthesis that faithfully restores, through commentary and compilation of themes, the totality of the work and the thought, one encounters a chapter of biographical and psychoanalytical cast on the “problem of sexuality in Rousseau,” with a reference in an Appendix to the author’s medical case-history.

If it seems to us in principle impossible to separate, through interpretation or commentary, the signified from the signifier, and thus to destroy writing by the writing that is yet reading, we nevertheless believe that this impossibility is historically articulated. It does not limit attempts at deciphering in the same way, to the same degree, and according to the same rules. Here we must take into account the history of the text in general. When we speak of the writer and of the encompassing power of the language to which he is subject, we are not only thinking of the writer in literature. The philosopher, the chronicler, the theoretician in general, and at the limit everyone writing, is thus taken by surprise. But, in each case, the person writing is inscribed in a determined textual system. Even if there is never a pure signified, there are different relationships as to that which, from the signifier, is *presented* as the irreducible stratum of the signified. For example, the philosophical text, although it is in fact always written, includes, precisely as its philosophical specificity, the project of effacing itself in the face of the signified content which it transports and in general teaches. Reading should be aware of this project, even if, in the last analysis, it intends to expose the project’s failure. The entire history of texts, and within it the history of literary forms in the West, should be studied from this point of view. With the exception of a thrust or a point of resistance which has only been very lately recognized as such, literary writing has, almost always and almost everywhere, according to some fashions and across very diverse ages, lent itself to this *transcendent* reading, in that search for the signified which we here put in question, not to annul it but to understand it within a system to which such a reading is blind. Philosophical literature is only one example within this history but it is among the most significant. And it interests us particularly in Rousseau’s case. Who at the same time and for profound reasons produced a philosophical literature to which belong *The Social Contract* and *La nouvelle Héloïse*, and chose to live by literary writing; by a writing which would not be exhausted by the message – philosophical or otherwise – which it could, so to speak, deliver. And what Rousseau has said, as philosopher or as psychologist, of writing in general, cannot be separated from the system of his own writing. We should be aware of this.

This poses formidable problems. Problems of outlining in particular. Let me give three examples.

- (1) If the course I have followed in the reading of the “supplement” is not merely psychoanalytical, it is undoubtedly because the habitual psychoanalysis of literature begins by putting the literary signifier as such within parentheses. It is no doubt also because psychoanalytic theory itself is for me a collection of texts belonging to my history and my culture. To that extent, if it marks my reading and the writing of my interpretation, it does not do so as a principle or a truth that one could abstract from the textual system that I inhabit in order to illuminate it with complete neutrality. In a certain way, I am *within* the history of psychoanalysis as I am *within* Rousseau’s text. Just as Rousseau drew upon a

language that was already there – and which is found to be somewhat our own, thus assuring us a certain minimal readability of French literature – in the same way we operate today within a certain network of significations marked by psychoanalytic theory, even if we do not master it and even if we are assured of never being able to master it perfectly.

But it is for another reason that this is not even a somewhat inarticulate psychoanalysis of Jean-Jacques Rousseau. Such a psychoanalysis is already obliged to have located all the structures of appurtenance within Rousseau's text, all that is not unique to it – by reason of the encompassing power and the already-thereness of the language or of the culture – all that could be inhabited rather than produced by writing. Around the irreducible point of originality of this writing an immense series of structures, of historical totalities of all orders, are organized, enveloped, and blended. Supposing that psychoanalysis can by rights succeed in outlining them and their interpretations, supposing that it takes into account the entire history of metaphysics – the history of that Western metaphysics that entertains relationships of cohabitation with Rousseau's text, it would still be necessary for this psychoanalysis to elucidate the law of its own appurtenance to metaphysics and Western culture. Let us not pursue this any further. We have already measured the difficulty of the task and the element of frustration in our interpretation of the supplement. We are sure that something irreducibly Rousseauist is captured there but we have carried off, at the same time, a yet quite unformed mass of roots, soil, and sediments of all sorts.

(2) Even supposing that Rousseau's text can be rigorously isolated and articulated within history in general, and then within the history of the sign "supplement," one must still take into consideration many other possibilities. Following the appearances of the word "supplement" and of the corresponding concept or concepts, we traverse a certain path within Rousseau's text. To be sure, this particular path will assure us the economy of a synopsis. But are other paths not possible? And as long as the totality of paths is not effectively exhausted, how shall we justify this one?

(3) In Rousseau's text, after having indicated – by anticipation and as a prelude – the function of the sign "supplement," I now prepare myself to give special privilege, in a manner that some might consider exorbitant, to certain texts like the *Essay on the Origin of Languages* and other fragments on the theory of language and writing. By what right? And why these short texts, published for the most part after the author's death, difficult to classify, of uncertain date and inspiration?

To all these questions and within the logic of their system, there is no satisfying response. In a certain measure and in spite of the theoretical precautions that I formulate, my choice is in fact *exorbitant*.

*But what is the exorbitant?*

I wished to reach the point of a certain exteriority in relation to the totality of the age of logocentrism. Starting from this point of exteriority, a certain deconstruction of that totality which is also a traced path, of that orb (*orbis*) which is also orbital (*orbita*), might be broached. The first gesture of this departure and this deconstruction, although subject to a certain historical necessity, cannot be given methodological or logical intraorbital assurances. Within the closure, one can only judge its style in terms of the accepted oppositions. It may be said that this style is empiricist and in a certain way that would be correct. The *departure* is radically empiricist. It proceeds like a wandering thought on the possibility of itinerary and of method. It is affected by nonknowledge as by its future and it *ventures out* deliberately.

I have myself defined the form and the vulnerability of this empiricism. But here the very concept of empiricism destroys itself. To *exceed* the metaphysical orb is an attempt to get out of the orbit (*orbita*), to think the entirety of the classical conceptual oppositions, particularly the one within which the value of empiricism is held: the opposition of philosophy and non-philosophy, another name for empiricism, for this incapability to sustain on one's own and to the limit the coherence of one's own discourse, for being produced as truth at the moment when the value of truth is shattered, for escaping the internal contradictions of skepticism, etc. *The thought of this historical opposition between philosophy and empiricism is not simply empirical and it cannot be thus qualified without abuse and misunderstanding.*

Let us make the diagram more specific. What is exorbitant in the reading of Rousseau? No doubt Rousseau, as I have already suggested, has only a very relative privilege in the history that interests us. If we merely wished to situate him within this history, the attention that we accord him would be clearly disproportionate. But that is not our intention. We wish to identify a decisive articulation of the logocentric epoch. For purposes of this identification Rousseau seems to us to be most revealing. That obviously supposes that we have already prepared the exit, determined the repression of writing as the fundamental operation of the epoch, read a certain number of texts but not all of them, a certain number of Rousseau's texts but not all of them. This avowal of empiricism can sustain itself only by the strength of the question. The opening of the question, the departure from the closure of a self-evidence, the putting into doubt of a system of oppositions, all these movements necessarily have the form of empiricism and of errancy. At any rate, they cannot be described, *as to past norms*, except in this form. No other trace is available, and as these errant questions are not absolute beginnings in every way, they allow themselves to be effectively reached, on one entire surface, by this description which is also a criticism. We must begin *wherever we are* and the thought of the trace, which cannot not take the scent into account, has already taught us that it was impossible to justify a point of departure absolutely. *Wherever we are*: in a text where we already believe ourselves to be.

Let us narrow the arguments down further. In certain respects, the theme of supplementarity is certainly no more than one theme among others. It is in a chain, carried by it. Perhaps one could substitute something else for it. *But it happens that this theme describes the chain itself, the being-chain of a textual chain, the structure of substitution, the articulation of desire and of language, the logic of all conceptual oppositions taken over by Rousseau*, and particularly the role and the function, in his system, of the concept of Nature. It tells us in a text what a text is, it tells us in writing what writing it, in Rousseau's writing it tells us Jean-Jacques' desire, etc. If we consider, according to the axial proposition of this essay, that there is nothing outside the text, our ultimate justification would be the following: the concept of the supplement and the theory of writing designate textuality itself in Rousseau's text in an indefinitely multiplied structure – *en abyme* [in an abyss] – to employ the current phrase. And we shall see that this abyss is not a happy or unhappy accident. An entire theory of the structural necessity of the abyss will be gradually constituted in our reading; the indefinite process of supplementarity has always already *infiltrated* presence, always already inscribed there the space of repetition and the splitting of the self. Representation *in the abyss* of presence is not an accident of presence; the desire of presence is, on the contrary, born from the abyss (the indefinite multiplication) of representation, from the representation of representation, etc. The supplement itself is quite exorbitant, in every sense of the word.

Thus Rousseau inscribes textuality in the text. But its operation is not simple. It tricks with a gesture of effacement, and strategic relations like the relationships of force among

the two movements form a complex design. This design seems to us to be represented in the handling of the concept of the supplement. Rousseau cannot utilize it at the same time in all the virtualities of its meaning. The way in which he determines the concept and, in so doing, lets himself be determined by that very thing that he excludes from it, the direction in which he bends it, here as addition, there as substitute, now as the positivity and exteriority of evil, now as a happy auxiliary, all this conveys neither a passivity nor an activity, neither an unconsciousness nor a lucidity on the part of the author. Reading should not only abandon these categories – which are also, let us recall in passing, the founding categories of metaphysics – but should produce the law of this relationship to the concept of the supplement. It is certainly a production, because I do not simply duplicate what Rousseau thought of this relationship. The concept of the supplement is a sort of blind spot in Rousseau's text, the not-seen that opens and limits visibility. But the production, if it attempts to make the not-seen accessible to sight, does not leave the text. It has moreover only believed it was doing so by illusion. It is contained in the transformation of the language it designates, in the regulated exchanges between Rousseau and history. We know that these exchanges only take place by way of the language and the text, in the infrastructural sense that we now give to that word. And what we call production is necessarily a text, the system of a writing and of a reading which we know is ordered around its own blind spot. We know this a priori, but only now and with a knowledge that is not a knowledge at all.

## Notes

- 1 *La transparence et l'obstacle* [Paris, 1958] p. 154. Naturally, I can only cite Rousseau's interpreters to indicate borrowings or to circumscribe a debate. But it goes without saying that every reader of Rousseau is guided by the admirable edition of the *Oeuvres complètes* now in progress at the "Bibliothèques de la Pléiade," and by the masterful work of Messrs. [François] Bouchardy, [Pierre] Burgelin, [Jean-Daniel] Candaux, [Robert] Derathé, [Jean] Fabre, [Michel] Foucault, [Bernard] Gagnebin, [Henri] Gouhier, [Bernard] Groethuysen, [Bernard] Guyon, [Robert] Osmont, [Georges] Poulet, [Marcel] Raymond, [Sven] Stelling-Michaud and, here especially, Jean Starobinski.
- 2 Edition Garnier, p. 17. My references are to the *Oeuvres complètes* (Pléiade edition) only in cases where the text has been published in one of the three volumes that have currently appeared. Other works will be cited from the Garnier editions. Of the *Essay on the Origin of Languages*, which we cite from the 1817 Bélin edition, I indicate, for the sake of convenience, only the numbers of the chapters.
- 3 *Rêveries*. Septième Promenade (*Pléiade* I, pp. 1066–67) [pp. 144–45]. Italics added. It may be objected that the animal represents a natural life even more animated than the plant, but one can only deal with it dead. "The study of animals is nothing without anatomy" (p. 1068) [p. 146].
- 4 Ibid. Without looking for a principle of reading there, I refer, out of curiosity and from among many other possible examples, to what Karl Abraham says of the Cyclops, of the fear of being blind, of the eye, of the sun, of masturbation etc. in *Oeuvres complètes*, tr. Ilse Barande [and E. Grin (Payot, 1965)] II, pp. 18 f. Let us recall that in a sequence of Egyptian mythology, Seth, helper of Thoth (god of writing here considered as a brother of Osiris), kills Osiris by trickery (cf. Vandier, op. cit., p. 46). Writing, auxiliary and suppletory, kills the father and light in the same gesture (Cf. supra, p. 101, 328–29 n. 31).
- 5 "‘Little one’ was my name; ‘Mama’ was hers; and we always remained ‘Little one’ and ‘Mama,’ even when advancing years had almost obliterated the difference between us. I find that these two names give a wonderfully good idea of the tone of our intercourse, of the simplicity of our manners, and, above all, of the mutual relation of our hearts. For me she was the tenderest of mothers, who

never sought her own pleasure, but always what was best for me; and if sensuality entered at all into her attachment for me, it did not alter its character, but only rendered it more enchanting, and intoxicated me with the delight of having a young and pretty mamma whom it was delightful to me to caress – I say caress in the strictest sense of the word, for it never occurred to her to be sparing of kisses and the tenderest caresses of a mother, and it certainly never entered my mind to abuse them. It will be objected that, in the end, we had relations of a different character; I admit it, but I must wait a little – I cannot say all at once” (p. 106) [p. 109]. Let us add this sentence from Georges Bataille: “I am myself the ‘little one,’ I have only a hidden place” (*Le petit* [2d edition (Paris, 1963), p. 9]).

- 6 This passage is often cited, but has it ever been analyzed for itself? The Pléiade editors of the *Confessions*, Gagnebin and Raymond, are no doubt right in being cautious, as they are, systematically and inevitably, of what they call psychiatry (note p. 1281. This same note checks off very usefully all the texts where Rousseau recalls his “follies” or “extravagances.”) But this caution is not legitimate, it seems to me, except to the extent that it concerns the abuse – which has hitherto no doubt been confounded with the use – of psychoanalytic reading, and where it does not prescribe the duplication of the usual commentary which has rendered this kind of text most often unreadable. We must distinguish here between, on the one hand, the often hasty and careless, but often also enlightening, analyses by Dr. René Laforgue (“Etude sur J.-J. Rousseau,” in *Revue française de psychanalyse*, I, ii [1927], pp. 370 f.; and *Psychopathologie de l'échec* [1944], [Paris], pp. 114 f.), which moreover do not consider the texts I have just cited, and, on the other hand, an interpretation which would take into more rigorous account, at least in principle, the teachings of psychoanalysis. That is one of the directions in which Jean Starobinski’s fine and careful analyses are engaged. Thus, in *L’œil vivant*, the sentence that has given us pause is reinscribed within an entire series of examples of analogous substitution, borrowed mostly from the *Nouvelle Héloïse*; this one for example, among other “erotic fetishes”: “All the parts of your scattered dress present to my ardent imagination those of your body that they conceal. This delicate headdress which sets off the large blond curls which it pretends to cover; this happy bodice shawl against which at least once I shall not have to complain; this elegant and simple gown which displays so well the taste of the wearer; these dainty slippers that a supple foot fills so easily; this corset so slender which touches and embraces ... what an enchanting form ... in front two gentle curves ... oh voluptuous sight ... the whalebone has yielded to the force of the impression ... delicious imprints, let me kiss you a thousand times!” (p. 147 [tr. Judith H. McDowell (University Park and London, 1968), pp. 122–23].

But do the singularity of these substitutions and the articulation of these displacements hold the attention of the interpreter? I wonder if, too concerned with reacting against a reductionist, causal-ist, dissociative psychology, Starobinski does not in general give too much credit to a totalitarian psychoanalysis of the phenomenological or existentialist style. Such a psychoanalysis, diffusing sexuality in the totality of behavior, perhaps risks blurring the cleavages, the differences, the displacements, the fixations of all sorts that structure that totality. Do the place or the places of sexuality not disappear in the analysis of global behavior, as Starobinski recommends: “Erotic behavior is not a fragmentary given; it is the manifestation of a total individual, and it is as such that it ought to be analyzed. Whether it is to neglect it or to make it a privileged subject of study, one cannot limit exhibitionism to the sexual ‘sphere’: the entire personality is revealed there, with some of its fundamental ‘existential choices.’” (*La transparence et l’obstacle*, pp. 210–11. A note refers us to the *Phénoménologie de la perception* of [Maurice] Merleau-Ponty [(Paris, 1945); *Phenomenology of Perception*, tr. Colin Smith (New York, 1965)]). And does one not, in this way, risk determining the pathological in a very classic manner, as “excess” thought within “existential” categories: “In the perspective of a global analysis, it will appear that certain primary givens of consciousness constitute at the same time the source of Rousseau’s speculative thought, and the source of his folly. But these given-sources are not morbid by themselves. It is only because they are lived in an excessive manner, that the malady declares itself and is developed. ... The morbid development will realize the caricatural placing in evidence of a fundamental ‘existential’ question that consciousness was not able to dominate” (p. 253).

- 7 Page 165 [p. 171].
- 8 In these celebrated pages of the first Book of the *Confessions*, Rousseau compares the first experiences of reading (“secret and ill-chosen reading”) to the first discoveries of auto-eroticism. Not that

the “filthy and licentious [books]” encouraged him in it. Quite the contrary. “Chance aided my modest disposition so well, that I was more than thirty years old before I set eyes upon any of those dangerous books which a fine lady finds inconvenient because they can only be read with one hand” (p. 40) [p. 40]. Without these “dangerous books,” Jean-Jacques gives himself to other dangers. The continuation of the paragraph which closes thus is well known: “It is sufficient for me to have defined the origin and first cause of a propensity which has modified all my passions, and which, restraining them by means of themselves, has always made me slow to act, owing to my excessive impetuosity in desire” (p. 41) [p. 41]. The intention and the letter of this passage should be related to another page of the *Confessions* (p. 444 [p. 459]. Cf. also the editors’ note), and to the page from which I quote these lines: “for I have always had a fancy for reading while eating, if I am alone; it supplies the want of society. I devour alternately a page and a morsel. It seems as if my book were dining with me” (p. 269) [p. 278].

- 9 See editors’ note, p. 1569. [The English translation includes the sentence quoted in the Pléiade note on p. 617.]
- 10 [Correspondance générale de J.-J. Rousseau (Paris, 1934), vol. 19, p. 242, vol. 20, p. 122, the latter actually addressed to M. de Sartine, Lieutenant-general of police.]. See also the *Confessions* (p. 109, editors’ note).
- 11 Pages 331–32 [pp. 340–41] (italics added), Starobinski (*La transparence et l’obstacle*, p. 221) and the editors of the *Confessions* (p. 332, n.1) justly relate the use of the word “supplement” to what is made of it on p. 109 [p. 111] (“dangerous means of assisting it” [a literal translation would be “dangerous supplement”]).

# CHAPTER 6

## The Death of the Author

*Roland Barthes*

Jacques Derrida's works of 1967, especially *Of Grammatology*, changed the direction of French thinking regarding literature. It had been concerned with the implications of Saussure's linguistics (that literary works have hidden orders or structures; that signs are embedded in discourses; that the relation between words and things is unstable). After 1967, literary theorists such as Roland Barthes became preoccupied with pursuing the implications of Derrida's theories. One implication was that the traditional French educational concern with "great writers" should be reconsidered. If what Derrida claimed was true, then the author was just one point of reference for a text. He argued that one cannot arrest the flow of signifying possibilities that a literary text generates. A text refers in multiple directions, and those possibilities cannot be summed up in or limited to the life of the author. This idea frees up the reader to work on a text, ferreting out strands of significance that the author herself may not have been aware of, actively producing readings.

In his story *Sarrasine*, Balzac, speaking of a castrato disguised as a woman, writes this sentence: "It was Woman, with her sudden fears, her irrational whims, her instinctive fears, her unprovoked bravado, her daring and her delicious delicacy of feeling." Who is speaking in this way? Is it the story's hero, concerned to ignore the castrato concealed beneath the woman? Is it the man Balzac, endowed by his personal experience with a philosophy of Woman? Is it the author Balzac, professing certain "literary" ideas of femininity? Is it universal wisdom? or romantic psychology? It will always be impossible to know, for the good reason that all writing is itself this special voice, consisting of several indiscernible voices, and that literature is precisely the invention of this voice, to which we cannot assign a specific origin: literature is that neuter, that composite, that oblique into which every subject escapes, the trap where all identity is lost, beginning with the very identity of the body that writes.

Probably this has always been the case: once an action is recounted, for intransitive ends, and no longer in order to act directly upon reality – that is, finally external to any function but the very exercise of the symbol – this disjunction occurs, the voice loses its origin,

*Original publication details:* Roland Barthes, "The Death of the Author" from *Rustle of Language*, trans. Richard Howard, pp. 49–55. Farrar, Straus, Giroux, 1986. English translation copyright © 1986 by Richard Howard. Reproduced with permission from Hill & Wang, a division of Farrar, Straus and Giroux, LLC.

the author enters his own death, writing begins. Nevertheless, the feeling about this phenomenon has been variable; in primitive societies, narrative is never undertaken by a person, but by a mediator, shaman or speaker, whose "performance" may be admired (that is, his mastery of the narrative code), but not his "genius." The author is a modern figure, produced no doubt by our society insofar as, at the end of the middle ages, with English empiricism, French rationalism and the personal faith of the Reformation, it discovered the prestige of the individual, or, to put it more nobly, of the "human person." Hence it is logical that with regard to literature it should be positivism, resume and the result of capitalist ideology, which has accorded the greatest importance to the author's "person." The author still rules in manuals of literary history, in biographies of writers, in magazine interviews, and even in the awareness of literary men, anxious to unite, by their private journals, their person and their work; the image of literature to be found in contemporary culture is tyrannically centered on the author, his person, his history, his tastes, his passions; criticism still consists, most of the time, in saying that Baudelaire's work is the failure of the man Baudelaire, Van Gogh's work his madness, Tchaikovsky's his vice: the explanation of the work is always sought in the man who has produced it, as if, through the more or less transparent allegory of fiction, it was always finally the voice of one and the same person, the author, which delivered his "confidence."

Though the Author's empire is still very powerful (recent criticism has often merely consolidated it), it is evident that for a long time now certain writers have attempted to topple it. In France, Mallarmé was doubtless the first to see and foresee in its full extent the necessity of substituting language itself for the man who hitherto was supposed to own it; for Mallarmé, as for us, it is language which speaks, not the author: to write is to reach, through a preexisting impersonality – never to be confused with the castrating objectivity of the realistic novelist – that point where language alone acts, "performs," and not "oneself": Mallarmé's entire poetics consists in suppressing the author for the sake of the writing (which is, as we shall see, to restore the status of the reader.) Valery, encumbered with a psychology of the Self, greatly edulcorated Mallarmé's theory, but, turning in a preference for classicism to the lessons of rhetoric, he unceasingly questioned and mocked the Author, emphasized the linguistic and almost "chance" nature of his activity, and throughout his prose works championed the essentially verbal condition of literature, in the face of which any recourse to the writer's inferiority seemed to him pure superstition. It is clear that Proust himself, despite the apparent psychological character of what is called his analyses, undertook the responsibility of inexorably blurring, by an extreme subtilization, the relation of the writer and his characters: by making the narrator not the person who has seen or felt, nor even the person who writes, but the person who will write (the young man of the novel – but, in fact, how old is he, and who is he? – wants to write but cannot, and the novel ends when at last the writing becomes possible), Proust has given modern writing its epic: by a radical reversal, instead of putting his life into his novel, as we say so often, he makes his very life into a work for which his own book was in a sense the model, so that it is quite obvious to us that it is not Charlus who imitates Montesquiou, but that Montesquiou in his anecdotal, historical reality is merely a secondary fragment, derived from Charlus. Surrealism lastly – to remain on the level of this prehistory of modernity – surrealism doubtless could not accord language a sovereign place, since language is a system and since what the movement sought was, romantically, a direct subversion of all codes – an illusory subversion, moreover, for a code cannot be destroyed, it can only be "played with"; but by abruptly violating expected meanings (this was the famous surrealist "jolt"), by entrusting to the

hand the responsibility of writing as fast as possible what the head itself ignores (this was automatic writing), by accepting the principle and the experience of a collective writing, surrealism helped secularize the image of the Author. Finally, outside of literature itself (actually, these distinctions are being superseded), linguistics has just furnished the destruction of the Author with a precious analytic instrument by showing that utterance in its entirety is a void process, which functions perfectly without requiring to be filled by the person of the interlocutors: linguistically, the author is never anything more than the man who writes, just as I is no more than the man who says I: language knows a “subject,” not a “person,” end this subject, void outside of the very utterance which defines it, suffices to make language “work,” that is, to exhaust it.

The absence of the Author (with Brecht, we might speak here of a real “alienation:” the Author diminishing like a tiny figure at the far end of the literary stage) is not only a historical fact or an act of writing: it utterly transforms the modern text (or – what is the same thing – the text is henceforth written and read so that in it, on every level, the Author absents himself). Time, first of all, is no longer the same. The Author, when we believe in him, is always conceived as the past of his own book: the book and the author take their places of their own accord on the same line, cast as a before and an after: the Author is supposed to feed the book – that is, he pre-exists it, thinks, suffers, lives for it; he maintains with his work the same relation of antecedence a father maintains with his child. Quite the contrary, the modern writer (*scriptor*) is born simultaneously with his text; he is in no way supplied with a being which precedes or transcends his writing, he is in no way the subject of which his book is the predicate; there is no other time than that of the utterance, and every text is eternally written here and now. This is because (or: it follows that) to write can no longer designate an operation of recording, of observing, of representing, of “painting” (as the Classic writers put it), but rather what the linguisticians, following the vocabulary of the Oxford school, call a performative, a rare verbal form (exclusively given to the first person and to the present), in which utterance has no other content than the act by which it is uttered: something like the / Command of kings or the I Sing of the early bards; the modern writer, having buried the Author, can therefore no longer believe, according to the “pathos” of his predecessors, that his hand is too slow for his thought or his passion, and that in consequence, making a law out of necessity, he must accentuate this gap and endlessly “elaborate” his form; for him, on the contrary, his hand, detached from any voice, borne by a pure gesture of inscription (and not of expression), traces a field without origin – or which, at least, has no other origin than language itself, that is, the very thing which ceaselessly questions any origin.

We know that a text does not consist of a line of words, releasing a single “theological” meaning (the “message” of the Author-God), but is a space of many dimensions, in which are wedded and contested various kinds of writing, no one of which is original: the text is a tissue of citations, resulting from the thousand sources of culture. Like Bouvard and Pecuchet, those eternal copyists, both sublime and comical and whose profound absurdity precisely designates the truth of writing, the writer can only imitate a gesture forever anterior, never original; his only power is to combine the different kinds of writing, to oppose some by others, so as never to sustain himself by just one of them; if he wants to express himself, at least he should know that the internal “thing” he claims to “translate” is itself only a readymade dictionary whose words can be explained (defined) only by other words, and so on ad infinitum: an experience which occurred in an exemplary fashion to the young De Quincey, so gifted in Greek that in order to translate into that dead language certain absolutely modern ideas and images, Baudelaire tells us, “he

created for it a standing dictionary much more complex and extensive than the one which results from the vulgar patience of purely literary themes" (*Paradis Artificiels*). Succeeding the Author, the writer no longer contains within himself passions, humors, sentiments, impressions, but that enormous dictionary, from which he derives a writing which can know no end or halt: life can only imitate the book, and the book itself is only a tissue of signs, a lost, infinitely remote imitation.

Once the Author is gone, the claim to "decipher" a text becomes quite useless. To give an Author to a text is to impose upon that text a stop clause, to furnish it with a final signification, to close the writing. This conception perfectly suits criticism, which can then take as its major task the discovery of the Author (or his hypostases: society, history, the psyche, freedom) beneath the work: once the Author is discovered, the text is "explained:" the critic has conquered; hence it is scarcely surprising not only that, historically, the reign of the Author should also have been that of the Critic, but that criticism (even "new criticism") should be overthrown along with the Author. In a multiple writing, indeed, everything is to be distinguished, but nothing deciphered; structure can be followed, "threaded" (like a stocking that has run) in all its recurrences and all its stages, but there is no underlying ground; the space of the writing is to be traversed, not penetrated: writing ceaselessly posits meaning but always in order to evaporate it: it proceeds to a systematic exemption of meaning. Thus literature (it would be better, henceforth, to say writing), by refusing to assign to the text (and to the world as text) a "secret:" that is, an ultimate meaning, liberates an activity which we might call counter-theological, properly revolutionary, for to refuse to arrest meaning is finally to refuse God and his hypostases, reason, science, the law.

Let us return to Balzac's sentence: no one (that is, no "person") utters it: its source, its voice is not to be located; and yet it is perfectly read; this is because the true locus of writing is reading. Another very specific example can make this understood: recent investigations (J.P. Vernant) have shed light upon the constitutively ambiguous nature of Greek tragedy, the text of which is woven with words that have double meanings, each character understanding them unilaterally (this perpetual misunderstanding is precisely what is meant by "the tragic"); yet there is someone who understands each word in its duplicity, and understands further, one might say, the very deafness of the characters speaking in front of him: this someone is precisely the reader (or here the spectator). In this way is revealed the whole being of writing: a text consists of multiple writings, issuing from several cultures and entering into dialogue with each other, into parody, into contestation; but there is one place where this multiplicity is collected, united, and this place is not the author, as we have hitherto said it was, but the reader: the reader is the very space in which are inscribed, without any being lost, all the citations a writing consists of; the unity of a text is not in its origin, it is in its destination; but this destination can no longer be personal: the reader is a man without history, without biography, without psychology; he is only that someone who holds gathered into a single field all the paths of which the text is constituted. This is why it is absurd to hear the new writing condemned in the name of a humanism which hypocritically appoints itself the champion of the reader's rights. The reader has never been the concern of classical criticism; for it, there is no other man in literature but the one who writes. We are now beginning to be the dupes no longer of such antiphrases, by which our society proudly champions precisely what it dismisses, ignores, smothers or destroys; we know that to restore to writing its future, we must reverse its myth: the birth of the reader must be ransomed by the death of the Author.

Translated by Richard Howard

# CHAPTER 7

## From Work to Text

*Roland Barthes*

In the aftermath of Jacques Derrida's work, French thinking about literature changed. Emphasis shifted from the way literary texts contained a hidden order or structure to the way literary texts generate semantic references that exceed the bounds of standard notions of meaning. In one famous passage, Derrida pointed out that Rousseau's works referred not just to Rousseau's life but also to all the other things that life referred to. Endless referentiality could only be stopped by an arbitrary decision based on conventions (academic rules about what constitutes "proper" meaning, for example). Why was this the case? Because language was made possible by a texture of differences between terms none of which could have identity apart from those differences. That texture is what Derrida calls "textuality" or simply "text." There is, he remarked famously, no outside to the text. What he meant was that one could not declare a meaning or referent or truth finally achieved that would not itself be subject to further reference, a further dissemination of meanings because to be what it is, it had to be different from something else – endlessly. Relations prevail over identities, and there are no identities without relations. For example, in the 1960s, it was accepted wisdom that the meaning of Joseph Conrad's *Heart of Darkness* was that colonialism was a bad thing. But those declaring that meaning were all for the most part white men who lived in the countries most responsible for colonialism. They were themselves signifiers of cultural assumptions that were themselves signifiers of colonial history (and so on back in time and into culture). They therefore ignored the work's racism and its implicit endorsement of a more severe colonialism than the one that was represented as failing in the novel. By pushing meaning and reference further, by opening the work to multiple possible interpretations, further layers and levels of meaning become evident. Complicate simplicity – that might be a good slogan for the import of the concept of the "text" in literary theory at this point of time in the late 1960s and early 1970s when Derrida's work was having its greatest influence on writers such as Barthes in France.

*Original publication details:* Roland Barthes, "From Work to Text" from *Rustle of Language*, trans. Richard Howard, pp. 56–64. Farrar, Straus, Giroux, 1986. English translation copyright © 1986 by Richard Howard. Reproduced with permission from Hill & Wang, a division of Farrar, Straus and Giroux, LLC.

A change has lately occurred, or is occurring, in our idea of language and consequently of the (literary) work which owes to that language at least its phenomenal existence. This change is obviously linked to the present development of (among other disciplines) linguistics, anthropology, Marxism, psychoanalysis (the word *link* is used here in a deliberately neutral manner: no determination is being invoked, however multiple and dialectical). The transformation of the notion of the work does not necessarily derive from the internal renewal of each of these disciplines, but rather from their intersection at the level of an object which traditionally proceeds from none of them. We might say, as a matter of fact, that *interdisciplinary* activity, today so highly valued in research, cannot be achieved by the simple confrontation of specialized branches of knowledge; the interdisciplinary is not a comfortable affair: it begins *effectively* (and not by the simple utterance of a pious hope) when the solidarity of the old disciplines breaks down – perhaps even violently, through the shocks of fashion – to the advantage of a new object, a new language, neither of which is precisely this discomfort of classification which permits diagnosing a certain mutation. The mutation which seems to be affecting the notion of the work must not, however, be overestimated; it is part of an epistemological shift, more than of a real break of the kind which in fact occurred in the last century upon the appearance of Marxism and Freudianism; no new break has occurred since, and we might say that for the last hundred years we have been involved in a repetition. What History, our History, allows us today is merely to displace, to vary, to transcend, to repudiate. Just as Einsteinian science compels us to include within the object studied the *relativity of reference points*, so the combined action of Marxism, Freudianism, and structuralism compels us, in literature, to relativize the relations of *scriptor*, reader, and observer (critic). Confronting the *work* – a traditional notion, long since, and still today, conceived in what we might call a Newtonian fashion – there now occurs the demand for a new object, obtained by a shift or a reversal of previous categories. This object is the *Text*. I know that this word is fashionable (I myself am compelled to use it frequently), hence suspect in some quarters; but this is precisely why I should like to review the main propositions at whose intersection the Text is located, as I see it; the word *proposition* must here be understood more grammatically than logically: these are speech-acts, not arguments, “hints,” approaches which agree to remain metaphorical. Here are these propositions: they concern method, genres, the sign, the plural, filiation, reading, pleasure.

- (1) The text must not be understood as a computable object. It would be futile to attempt a material separation of works from texts. In particular, we must not permit ourselves to say: the work is classical, the text is avant-garde; there is no question of establishing a trophy in modernity's name and declaring certain literary productions *in* and *out* by reason of their chronological situation: there can be “Text” in a very old work, and many products of contemporary literature are not texts at all. The difference is as follows: the work is a fragment of substance, it occupies a portion of the spaces of books (for example, in a library). The Text is a methodological field. The opposition may recall (though not reproduce term for term) a distinction proposed by Lacan: “reality” is shown [*se montre*], the “real” is proved [*se démontre*]; in the same way, the work is seen (in bookstores, in card catalogues, on examination syllabuses), the text is demonstrated, is spoken according to certain rules (or against certain rules); the work is held in the hand, the text is held in language: it exists only when caught up in a discourse (or rather it is Text for the very reason that it knows itself to be so); the Text is not the decomposition

of the work, it is the work which is the Text's imaginary tail. Or again: *the Text is experienced only in an activity, in a production*. It follows that the Text cannot stop (for example, at a library shelf); its constitutive moment is *traversal* (notably, it can traverse the work, several works).

(2) Similarly, the Text does not stop at (good) literature; it cannot be caught up in a hierarchy, or even in a simple distribution of genres. What constitutes it is on the contrary (or precisely) its force of subversion with regard to the old classifications. How to classify Georges Bataille? Is this writer a novelist, a poet, an essayist, an economist, a philosopher, a mystic? The answer is so uncertain that handbooks of literature generally prefer to leave Bataille out; as a matter of fact, Bataille has written texts, or even, perhaps, always one and the same text. If the Text raises problems of classification (moreover, this is one of its "social" functions), it is because it always implies a certain experience of limits. Thibaudet used to speak (but in a very restricted sense) of limit-works (such as Chateaubriand's *Life of Rancé*, a work which indeed seems to us to be a "text"): the Text is what is situated at the limit of the rules of the speech-act (rationality, readability, etc.). This notion is not rhetorical, we do not resort to it for "heroic" postures: the Text attempts to locate itself very specifically *behind* the limit of the *doxa* (is not public opinion, constitutive of our democratic societies, powerfully aided by mass communications – is not public opinion defined by its limits, its energy of exclusion, its *censorship*?); taking the word literally, we might say that the Text is always *paradoxical*.

(3) The text is approached and experienced in relation to the sign. The work closes upon a signified. We can attribute two modes of signification to this signified: either it is claimed to be apparent, and the work is then the object of a science of the letter, which is philology; or else this signified is said to be secret and final, and must be sought for, and then the work depends upon a hermeneutics, an interpretation (Marxist, psycho-analytic, thematic, etc.); in short, the work itself functions as a general sign, and it is natural that it should represent an institutional category of the civilization of the Sign. The Text, on the contrary, practices the infinite postponement of the signified, the Text is dilatory; its field is that of the signifier; the signifier must not be imagined as "the first part of the meaning," its material vestibule, but rather, on the contrary, as its *aftermath*; similarly, the signifier's *infinitude* does not refer to some notion of the ineffable (of an unnamable signified) but to a notion of *play*; the engendering of the perpetual signifier (in the fashion of a perpetual calendar) in the field of the Text is not achieved by some organic process of maturation, or a hermeneutic process of "delving deeper," but rather by a serial movement of dislocations, overlappings, variations; the logic governing the Text is not comprehensive (trying to define what the work "means") but metonymic; the activity of associations, contiguities, cross-references coincides with a liberation of symbolic energy (if it failed him, man would die). The work (in the best of cases) is *moderately* symbolic (its symbolics runs short, i.e., stops); the Text is *radically* symbolic: *a work whose integrally symbolic nature one conceives, perceives, and receives is a text*. The Text is thus restored to language; like language, it is structured but decentered, without closure (let us note, to answer the scornful suspicion of "fashion" sometimes lodged against structuralism, that the epistemological privilege nowadays granted to language derives precisely from the fact that in it [language] we have discovered a paradoxical idea of structure: a system without end or center).

(4) The Text is plural. This does not mean only that it has several meanings but that it fulfills the very plurality of meaning: an *irreducible* (and not just acceptable) plurality. The Text is not coexistence of meaning, but passage, traversal; hence, it depends not on an interpretation, however liberal, but on an explosion, on dissemination. The plurality of the Text depends, as a matter of fact, not on the ambiguity of its contents, but on what we might call the stereographic plurality of the signifiers which weave it (etymologically, the text is a fabric): the reader of the Text might be compared to an idle subject (who has relaxed his image-repertoire): this fairly empty subject strolls (this has happened to the author of these lines, and it is for this reason that he has come to an intense awareness of the Text) along a hillside at the bottom of which flows a wadi (I use the word to attest to a certain alienation); what he perceives is multiple, irreducible, issuing from heterogeneous, detached substances and levels: lights, colors, vegetation, heat, air, tenuous explosions of sound, tiny cries of birds, children's voices from the other side of the valley, paths, gestures, garments of inhabitants close by or very far away; all these incidents are half identifiable: they issue from known codes, but their combinative operation is unique, it grounds the stroll in a difference which cannot be repeated except as *difference*. This is what happens in the Text: it can be Text only in its difference (which does not mean its individuality); its reading is semelfactive (which renders any inductive-deductive science of texts illusory: no "grammar" of the text) and yet entirely woven of quotations, references, echoes: cultural languages (what language is not cultural?), antecedent or contemporary, which traverse it through and through, in a vast stereophony. The intertextuality in which any text is apprehended, since it is itself the intertext of another text, cannot be identified with some *origin* of the text: to seek out the "sources," the "influences" of a work is to satisfy the myth of filiation; the quotations a text is made of are anonymous, irrecoverable, and yet *already read*: they are quotations without quotation marks. The work disturbs no monistic philosophy (there are antagonistic ones, as we know); for such a philosophy, plurality is Evil. Hence, confronting the work, the Text might indeed take for its motto the words of the man possessed by devils: "My name is legion, for we are many" (Mark 5:9). The plural or demonic texture which sets the Text in opposition to the work may involve profound modifications of reading, precisely where monologism seems to be the law: certain "texts" of Scripture, traditionally adopted by theological (historical or anagogical) monism, may lend themselves to a diffraction of meanings (i.e., finally, to a materialist reading), while the Marxist interpretation of the work, hitherto resolutely monistic, may become more materialist by pluralizing itself (if, of course, Marxist "institutions" permit this).

(5) The work is caught up in a process of filiation. What is postulated are a *determination* of the world (of the race, then of History) over the work, a *consecution* of works among themselves, and an *appropriation* of the work to its author. The author is reputed to be the father and the owner of his work; literary science thus teaches us to *respect* the manuscript and the author's declared intentions, and society postulates a legality of the author's relation to his work (this is the "author's rights," actually a recent affair, not legalized in France until the time of the Revolution). The Text, on the other hand, is read without the Father's inscription. The metaphor of the Text is here again detached from the metaphor of the work; the latter refers to the image of an *organism* which grows by vital expansion, by "development" (a significantly ambiguous word: biological and rhetorical); the metaphor of the Text is that of the *network*; if the Text expands, it is by the effect of a combinative operation, of a systematics (an image, moreover, close to the

views of contemporary biology concerning the living being); no vital “respect” is therefore due to the Text: it can be *broken* (moreover, this is what the Middle Ages did with two nonetheless authoritarian texts: Scripture and Aristotle); the Text can be read without its father’s guarantee; the restoration of the intertext paradoxically abolishes inheritance. It is not that the Author cannot “return” in the Text, in his text, but he does so, one might say, as a guest; if he is a novelist, he inscribes himself there as one of his characters, drawn as a figure in the carpet; his inscription is no longer privileged, paternal, alethic, but ludic: he becomes, one can say, a paper author; his life is no longer the origin of his fables, but a fable concurrent with his life; there is a reversion of the work upon life (and no longer the contrary); the work of Proust and Genet permits us to read their lives as a text: the word *bio-graphy* regains a strong, etymological meaning; and thereby the sincerity of the speech-act, a veritable “cross” of literary ethics, becomes a false problem: the *I* that writes the text is never anything but a paper *I*.

(6) The work is ordinarily the object of consumption; I intend no demagoguery by referring to what is called a consumer culture, but we must recognize that today it is the work’s “quality” (which ultimately implies an appreciation of “taste”) and not the actual operation of reading which can make differences between books: “cultivated” reading is not structurally different from reading on trains. The Text (if only by its frequent “unreadability”) decants the work (if it permits it at all) from its consumption and recuperates it as play, task, production, practice. This means that the Text requires an attempt to abolish (or at least to diminish) the distance between writing and reading, not by intensifying the reader’s projection into the work, but by linking the two together into one and the same signifying practice. The distance that separates reading from writing is historical. In the period of strongest social division (before the instauration of democratic cultures), reading and writing were *equally* class privileges: Rhetoric, the great literary code of that time, taught *writing* (even if what was ordinarily produced were discourses, not texts); it is significant that the advent of democracy reversed the watchword: the (secondary) school prides itself on teaching *reading* and no longer writing. In fact, *reading*, in the sense of *consuming*, is not *playing* with the text. “Playing” must be taken here in all the polysemy of the term: the text itself “plays” (like a door that “plays” back and forth on its hinges; like a fishing rod in which there is some “play”); and the reader plays twice over: he *plays at* the Text (ludic meaning), he seeks a practice which reproduces it; but, so that this practice is not reduced to a passive, interior *mimesis* (the Text being precisely what resists this reduction), he *plays* the Text; we must not forget that *play* is also a musical term; the history of music (as practice, not as “art”) is, moreover, quite parallel to that of the Text; there was a time when, active amateurs being numerous (at least within a certain class), “to play” and “to listen” constituted a virtually undifferentiated activity; then two roles successively appeared: first of all, that of the *interpreter*, to which the bourgeois public (though it could still play a little itself: this is the entire history of the piano) delegated its playing; then that of the (passive) amateur who listens to music without being able to play it (the piano has effectively been replaced by the record); we know that today post-serial music has disrupted the role of the “*interpreter*,” who is asked to be in a sense the co-author of the score which he completes rather than “expresses.” The Text is a little like a score of this new kind: it solicits from the reader a practical collaboration. A great novation this, for who *executes* the work? (Mallarmé raised this question: he wanted the audience to *produce* the book.) Today only the critic executes the work (pun intended). The reduction of reading to consumption is

obviously responsible for the “boredom” many feel in the presence of the modern (“unreadable”) text, the avant-garde film or painting: to be bored means one cannot produce the text, play it, release it, *make it go*.

(7) This suggests one final approach to the Text: that of pleasure. I do not know if a hedonist aesthetic ever existed (eudaemonist philosophies are certainly rare). Of course, a pleasure of the work (of certain works) exists; I can enjoy reading and rereading Proust, Flaubert, Balzac, and even – why not? – Alexandre Dumas; but this pleasure, however intense, and even when it is released from any prejudice, remains partly (unless there has been an exceptional critical effort) a pleasure of consumption: for, if I can read these authors, I also know that I cannot *rewrite* them (that one cannot, today, write “like that”); and this rather depressing knowledge suffices to separate me from the production of these works, at the very moment when their distancing founds my modernity (to be modern – is this not really to know that one cannot begin again?). The Text is linked to delectation, i.e., to pleasure without separation. Order of the signifier, the Text participates in its way in a social utopia; before History (supposing that History does not choose barbarism), the Text fulfills if not the transparency of social relations, at least the transparency of language relations: it is the space in which no language prevails over any other, where the languages circulate (retaining the *circular* meaning of the word).

These few propositions do not necessarily constitute the articulation of a Theory of the Text. This is not merely the consequence of the presenter’s inadequacies (moreover, in many points he has merely recapitulated what is being investigated and developed around him). This is a consequence of the fact that a Theory of the Text cannot be satisfied with a metalinguistic exposition: the destruction of meta-language, or at least (for it may be necessary to resort to it provisionally) calling it into question, is part of the theory itself: discourse on the Text should itself be only text, research, textual activity, since the Text is that *social* space which leaves no language safe, outside, and no subject of the speech-act in a situation of judge, master, analyst, confessor, decoder: the theory of the Text can coincide only with a practice of writing.

# CHAPTER 8

## Writing

*Barbara Johnson*

An American school of deconstructive criticism developed out of Jacques Derrida's work. Its leading proponents were Paul de Man and J. Hillis Miller. While Derrida sought to dislocate the assumptions of metaphysics in philosophy, these critics were concerned with the dislocation of naïve assumptions about meaning in literary texts. Texts are figural or rhetorical, and they refer endlessly to other texts, not to a knowable presence of truth or to determinable meanings that might, as the New Critics assumed, be said to constitute "universals." In this selection, Barbara Johnson, a student of de Man and herself a leading practitioner of American deconstruction, explains how the French concern with "writing" is linked to the deconstructive project.

How is it that the word "writing" has come to be considered a critical term? Isn't "writing" simply one of those aspects of literature that can be taken for granted? Isn't it merely the medium through which a reader encounters words on a page – for example, these?

Every essay in this volume communicates to some extent *by means of* the very thing it is talking *about*. Nowhere is this more obvious than in the case of writing. An essay about writing, therefore, is an unclosable loop: it is an attempt to comprehend that which it is comprehended by. The non-Euclidean logic of such reciprocal inclusion has often itself been an object of attention in recent theoretical discussions of writing. That is only one of the consequences that the study of writing has entailed.

Writing about writing is hardly a new phenomenon, however. From Omar Khayyám's moving finger to Rousseau's trembling hand, from the broken tables of Moses to the purloined letters of Poe and Alice Walker, from Borges's encyclopedia to Wordsworth's lines left upon a seat in a yew tree, images of writing in writing testify to an enduring fascination with the mechanics and materiality of the written word. A comprehensive treatment of the question of writing is obviously beyond the scope of the present essay. I will therefore concentrate on a particular recent moment of reflection about

writing – the theoretical “revolution” in France in 1967 – which has had a decisive impact upon the shape of literary studies today.

Writing (*l'écriture*) came to philosophical, psychoanalytic, and literary prominence in France in the 1960s, primarily through the work of Jacques Derrida, Roland Barthes, and other writers who were at that time associated with the journal *Tel Quel*. Philippe Sollers, in a “Program” that heads the group’s collective theoretical volume, proclaimed in 1967: “A comprehensive theory arising out of a thought about the practice of writing cries out for elaboration.” Writing, it seemed, was to become the key to all mythologies. The sudden spectacular interest in writing sprang from many different sources, some of which I will outline quickly here.

As early as 1953, in *Writing Degree Zero*, Roland Barthes had investigated the paradoxical relationship that existed in the nineteenth century in France between the development of a concept of Literature (with a capital *L*) and the growing sense of a breakdown in the representational capacities of language. Literature was in some ways being exalted as a substitute religion, but it was a religion whose high priests seemed only to proclaim the obscurity, imperfection, or unreliability of their own medium. The proper names associated with the elaboration of *both* sides of this phenomenon are Flaubert and Mallarmé. These writers, says Barthes, *constructed* the object Literature in the very act of announcing its death. In later essays, Barthes lays out a theory of literature based on a split between the classic notion of a *work* (*œuvre*) – considered as a closed, finished, reliable representational *object* – and the modern notion of a *text* – considered as an open, infinite *process* that is both meaning-generating and meaning-subverting. “Work” and “text” are thus not two different kinds of object but two different ways of viewing the written word. What interests Barthes is the *tension* between the concept of Literature and the concept of textuality. While Literature is seen as a series of discrete and highly meaningful Great Works, textuality is the manifestation of an open-ended, heterogeneous, disruptive force of signification and erasure that transgresses all closure – a force that is operative even within the Great Works themselves.

Closure versus subversion, product versus practice, meaning-containing object versus significance-scattering process: Barthes’ theory of writing owes a great deal, as we shall see, both to Marxism and to psychoanalysis. But the *Tel Quel* writers’ involvement with Marxism and psychoanalysis takes on its particular coloring, strangely enough, through the mediation of Saussurian linguistics. How does this happen?

In his *Course in General Linguistics* (first published by his students in 1916, with new editions in 1948 and 1966), Ferdinand de Saussure mapped out a science of linguistics based not on the historical (“diachronic”) development of families of languages but on the structural (“synchronic”) properties of language “as such,” frozen in time as a *system*. This “structuralist” perspective, also developed in the 1950s in anthropology by Claude Lévi-Strauss, involves viewing the system as a set of relations among elements governed by rules. The favorite analogy for such systems is chess: whatever the particular properties of an individual “man” (ivory, wood, plastic), the “man” is involved in a system of moves and relations that can be known and manipulated in themselves. From the structural point of view, there is no difference between ivory and plastic. There is difference between king, queen, and knight, or between white and black.

Saussure’s most enduring contribution has been his description of the *sign* as the unit of the language system. The sign is composed of two parts: a mental image or concept (the “signified”), and a phonic or graphic vehicle (the “signifier”). The sign is thus both conceptual and material, sense and sound, spirit and letter at once. The existence of

numerous languages indicates that the relation between the signifier and the signified in any given sign is arbitrary (there is no natural resemblance between sound and idea), but once fixed, that relation becomes a convention that cannot be modified at will by any individual speaker. By thus deciding that what is relevant to a structural study of language is neither history ("diachrony") nor reality (the "referent") but rather the system of differential relations among signs, Saussure set up a tremendously enabling, as well as limiting, heuristic perspective for analysis. And by asserting that signs signify not as independently meaningful units corresponding to external objects but as elements whose value is generated by their difference from neighboring elements in the system, Saussure put forth a notion of *difference* (not identity) as the origin of meaning.

Saussure's suspension of interest in history and the external world would seem to place him at the farthest remove from Marxism. But theorists of writing saw a connection between the signifier/signified relation and the materialism/idealism relation: If the signifier was the material condition of the existence of ideas, then the privileging of the signified resembled the fetishization of commodities resulting from bourgeois idealism's blindness to labor and to the material conditions of economic existence. The liberation of the signifier, the rebellion against idealist repressions, and the unleashing of the forces of difference and desire against the law and order of identity were all part of the program for change that developed in France in the 1960s. Whether linguistic materiality and economic materiality are linked *only* by analogy, or whether there is some profound interimplication between them, is still a subject for debate today. But whatever the case, the repressive return to order that followed the strikes and demonstrations in France in May 1968 squelched the optimism of those who might have believed in any simple connection between liberating the signifier and changing the class structure of society.

The understanding of what it might mean to liberate the signifier also had roots in the psychoanalytic theory of Jacques Lacan. For many years prior to the 1966 publication of his *Ecrits (Writings)*, Lacan had been conducting a seminar in which he attempted to work out a radically new way of reading Freud. What he emphasized in Freud's writing was the discovery that "the unconscious is structured like a language." The unconscious is *structured*. It is not a reservoir of amorphous drives and energies but a system of articulations through which repressed ideas return in displaced form. Freud's comparison of a dream to a rebus is extended as an analogy for all effects of the unconscious: just as each element in a rebus must be translated separately in order to decipher the total message, so each element in a dream is a knot of associations that must be explored without regard for the dream's surface coherence. Dreams, slips of the tongue, parapraxes, hysterical symptoms, and other expressions of the unconscious are for Lacan manifestations of a "signifying chain," a structure of associations that resembles an unconscious foreign language. Consciousness attempts to disregard this language in order to control and define the identity of the self, but the psychoanalyst's task is to attempt to hear that language despite the ego's efforts to scramble it. Using the terminology of Saussure, Lacan calls the units of unconscious expression "signifiers," linked to repressed "signifieds." But the search for the signified can only take the form of a sliding along the chain of signifiers. In other words, there is no one-to-one link between signifier and signified but rather an "effect of signified" generated by the movement from one signifier to another. Freud never comes to the end of his dream analyses, never "solves" their enigma, but it feels as though something like insight is achieved by following out the dreamer's chains of associations.

Lacan's troubling of Saussure's one-to-one link between signifiers and signifieds actually turns out to have its counterpart in Saussure's own work. Beginning in 1964, Jean Starobinski began publishing strange notebooks in which Saussure attempted to prove that certain late Latin poems contained hidden proper names anagrammatically dispersed throughout their texts. The poems, in other words, contained extra signifiers, readable only to those in the know. Whether or not these anagrams were a secret key to late Latin poetics, the notion that the signifier could take the lead in creating poetic effects appealed to students of poetry. Saussure's anagrams prompted Julia Kristeva, among others, to theorize an anagrammatic (or paragrammatic) functioning in poetic language as such.

The claim that signifiers can generate effects even when the signified is unknown serves as the basis for Lacan's famous reading of Poe's story "The Purloined Letter." In that story, an unscrupulous minister steals a compromising letter from the queen under the unsuspecting eyes of the king. An amateur detective, Dupin, is commissioned by the stymied prefect of police to get the letter back. Dupin suspects that the minister has hidden the letter in plain sight, just as it had been when he stole it. Dupin then repeats the minister's act and steals the letter back for the queen. Lacan emphasizes the way in which the characters' actions are determined by the position of the letter among them. Neither the letter's contents (the never-revealed "signified") nor the individual identities of the people (the psychological equivalent of Saussure's ivory and wood chessmen) determine the course of the plot. It is the movement of the letter that dictates the characters' actions.

The rebus, the anagram, and the letter are clearly all manifestations of *writing*. They are graphic, articulated, material instantiations of systems of marks that simultaneously obscure and convey meaning. They are also something other than mere transcriptions of the spoken word. In other words, they are not examples of *phonetic writing*. It is this "something other" that must be kept in mind as we now turn to the work of the most important French theorist of writing, Jacques Derrida.

It was in 1967 that Derrida published three major books devoted to the question of writing: *Writing and Difference*, *Of Grammatology*, and *Speech and Phenomena*. Derrida's project in these writings is to reevaluate the structuring principles of Western metaphysics. Western philosophy, writes Derrida, has analyzed the world in terms of binary oppositions: mind vs. body, good vs. evil, man vs. woman, presence vs. absence. Each of these pairs is organized hierarchically: the first term is seen as higher or better than the second. According to Derrida, the opposition between speech and writing has been structured similarly: speech is seen as immediacy, presence, life, and identity, whereas writing is seen as deferment, absence, death, and difference. Speech is primary; writing secondary. Derrida calls this privileging of speech as self-present meaning "logocentrism."

In his three volumes of 1967, Derrida gives rigorous attention to the paradox that the Western tradition (the "Great Books") is filled with *writings* that privilege *speech*. By closely analyzing those writings, Derrida attempts to uncover the ways in which the Great Books rebel against their own stated intention to say that speech is better than writing. What his analyses reveal is that even when a text tries to privilege speech as immediacy, it cannot completely eliminate the fact that speech, like writing, is based on a *differance* (a Derridean neologism meaning both "deferment" and "difference") between signifier and signified inherent in the sign. Speakers do not beam meanings directly from one mind to another. Immediacy is an illusion. Properties normally

associated with writing inevitably creep into a discussion designed to privilege speech. Thus, for example, although Saussure wishes to treat speech as primary and writing as secondary for an understanding of language, he describes language as a “dictionary in the head” or as “linear” – a spatial term more applicable to writing than to speech. Or, to take another example, when Socrates tells Phaedrus that proper teaching must take place orally rather than in writing, he nevertheless ends up describing the truths such teaching is supposed to reach as being “*inscribed in the soul*.” Because a gap of heterogeneity and distance is fundamental to the structure of language, Derrida sees “speech” as being ultimately structured like “writing.” This emphasis on writing as the more originary category is designed to counter the history of logocentrism and to track the functioning of *differance* in structures of signification.

Many literary texts seem in fact to stage some version of this encounter between the search for spoken immediacy or identity and the recourse to writing and difference. The following poem by Edward Taylor (ca. 1642–1729), for example, does not seem to expect to end up talking about writing:

#### Meditation 6

Am I thy gold? Or purse, Lord, for thy wealth,  
 Whether in mine or mint refined for thee?  
 I'm counted so, but count me o'er thyself,  
 Lest gold washed face, and brass in heart I be.  
 I fear my touchstone touches when I try  
 Me and my counted gold too overly.

Am I new minted by thy stamp indeed?  
 Mine eyes are dim; I cannot clearly see.  
 Be thou my spectacles that I may read  
 Thine image and inscription stamped on me.  
 If thy bright image do upon me stand,  
 I am a golden angel in thy hand.

Lord, make my soul thy plate, thine image bright  
 Within the circle of the same enfile  
 And on its brims in golden letters write  
 Thy superscription in an holy style.  
 Then I shall be thy money, thou my horde:  
 Let me thy angel be, be thou my Lord.

Written in a style of extended metaphor known as the metaphysical conceit, this poem sets out to express spiritual value in terms of material value (gold). The most obvious figure for the conjunction between the spiritual and the material is the word “angel,” which means both a heavenly being and an old English coin. Through this spiritual/material alloy, the poem attempts to make human value both derive from and coincide with divine value, to eliminate the space of difference or distance between the human and the divine.

The poem is composed of a series of questions and imperatives addressed to God. While these aim to alleviate doubt, difference, and distance, they seem only to widen the gap they attempt to close. Am I gold or purse? value-object or container? the poet asks. He then pursues the first possibility, only to stumble upon a new inside/outside opposition: “Lest gold washed face, and brass in heart I be.” The gold begins to resemble a sign, with

no guaranteed correlation between face (signifier) and heart (signified). The becoming-sign process continues in the second stanza, where the speaker is “stamped” with an image and an inscription. The speaker is now a reader, and what he reads is himself. God has become an image, and a corrective lens. In the final stanza, the text (“inscription”) that was dimly decipherable in the second stanza turns out not yet to have been written. While the poem still yearns for a perfectly reciprocal container/contained relation (“I shall be thy money, thou my horde”), this relation now requires the active intervention of writing (“in golden letters write / Thy superscription”). In his increasingly aggressive submissiveness, the speaker tries to order God to take his place as the writer.

From metal to image to letters, from touching to reading to writing, from counted to almost-read to not-yet-written, the speaker seems to be farther away from coincidence with God at the end than he was at the beginning. The mediating elements only increase the *differance*. Yet this *differance* is also the space of the poem’s existence. The speaker cannot *write* his way into an immediacy that would eliminate writing. Nor can he write himself into a submissiveness great enough to overtake the fact that it is he, not God, who writes. His conceit will never succeed in erasing the “conceit” of writing itself.

The logic of writing is thus a double logic: writing is called upon as a necessary remedy for *differance*, but at the same time it is the very *differance* for which a remedy must be sought. In Derrida’s analyses of writing, this logic is called the logic of the *supplément*. In French, the word *supplément* means both an “addition” and a “substitute.” To say that “A is a *supplément* to B” is thus to say something ambiguous. Addition and substitution are not exactly contradictory, but neither can they be combined in the traditional logic of identity. In the poem, the inscriptions, images, and even spectacles function as *suppléments*: they are at once additions and substitutes simultaneously bridging and widening the gap between God and the speaker. Some sense of the way in which supplementary logic differs from the binary logic of identity ( $A = A$ ) and noncontradiction ( $A \neq \text{not } A$ ) may be derived from the following list. In this list, all statements are to be taken as *simultaneously* equivalent to the statement “A is a *supplément* to B.” (In terms of the Taylor poem, say B = the presence of, or coincidence with, God; and A = writing).

- A is added to B.
- A substitutes for B.
- A is a superfluous addition to B.
- A makes up for the absence of B.
- A usurps the place of B.
- A makes up for B’s deficiency.
- A corrupts the purity of B.
- A is necessary so that B can be restored.
- A is an accident alienating B from itself.
- A is that without which B would be lost.
- A is that through which B is lost.
- A is a danger to B.
- A is a remedy to B.
- A’s fallacious charm seduces one away from B.
- A can never satisfy the desire for B.
- A protects against direct encounter with B.

Supplementary logic is not only the logic of writing – it is also a logic that can only really exist in writing. That is, it is a nonintuitive logic that inheres (Lacan would say,

“in-sists”) in a text as a system of traces. Like an algebraic equation with more than one unknown, supplementary logic cannot be held in the head but must be worked out in external form. It is no accident that the word “differential” is central both to calculus and to Derrida’s theory of writing.

Derrida’s theory of writing turns out to have been, in fact, a theory of reading. The epigraph to his *Writing and Difference* is a quotation from Mallarmé: “Le tout sans nouveauté qu’un espacement de la lecture” (“All without innovation except for a certain spacing-out of reading”). What does it mean to introduce “space” into reading? For Mallarmé, it means two things. It means giving a signifying function to the materiality – the blanks, the typefaces, the placement on the page, the punctuation – of writing. And it also means tracking syntactic and semantic ambiguities in such a way as to generate multiple, often conflicting, meanings out of a single utterance. The “meaning” of a Mallarmé text, like that of a dream, cannot be grasped intuitively as a whole but must be worked out rigorously by following each strand in a network of relations. What Derrida generalizes and analyzes in other writings is this “spacing” that Mallarmé attempts to maximize. In his reading of Plato’s *Phaedrus*, for instance, Derrida follows the ambiguity of the word *pharmakon*, which Plato uses to describe writing itself. If *pharmakon* can mean both “poison” and “remedy,” what does it mean to call writing a *pharmakon*? As Derrida points out, translators of Plato have rendered this word by choosing to favor one side or the other of the ambiguity according to the context. They have subordinated its ambiguity to their notion of what makes the most sense. They have thus subordinated “writing” as spacing and ambiguity to “speech” as single intention. The ambiguity of the poison/remedy relation is tamed thereby into something far less unsettling. “Sense” is achieved, however, at a cost. To know the difference between poison and remedy may be reassuring, but that reassurance may well make it difficult to come to grips with the meaning of Socrates’ death.

Thus “reading,” for Derrida, involves following the “other” logics of structures of signification inscribed in writing that may or may not be in conformity with traditional logics of meaning, identity, consciousness, or intention. It involves taking seriously the elements that a standard reading disregards, overlooks, or edits out. Just as Freud rendered dreams and slips of the tongue *readable* rather than dismissing them as mere nonsense or error, so Derrida sees signifying force in the gaps, margins, figures, echoes, digressions, discontinuities, contradictions, and ambiguities of a text. When one writes, one writes more than (or less than, or other than) one thinks. The reader’s task is to read what is written rather than simply attempt to intuit what might have been meant.

The possibility of reading materiality, silence, space, and conflict within texts has opened up extremely productive ways of studying the politics of language. If each text is seen as presenting a major claim that attempts to dominate, erase, or distort various “other” claims (whose traces nevertheless remain detectable to a reader who goes against the grain of the dominant claim), then “reading” in its extended sense is deeply involved in questions of authority and power. One field of conflict and domination in discourse that has been fruitfully studied in this sense is the field of sexual politics. Alice Jardine, in *Gynesis* (1985), points out that since logocentric logic has been coded as “male,” the “other” logics of spacing, ambiguity, figuration, and indirection are often coded as “female,” and that a critique of logocentrism can enable a critique of “phallocentrism” as well. A theory and practice of female writing (*écriture féminine*) has been developed in France by such writers as Hélène Cixous and Luce Irigaray, who have attempted to write the specificity of female biological and ideological difference. While Cixous, Irigaray, and

others work on the relations between writing and the body, many feminists on both sides of the Atlantic have been interested in the gender implications of the relations between writing and silence. In *The Madwoman in the Attic* (1979), Sandra Gilbert and Susan Gubar show how nineteenth-century women writers struggle for authorship against the silence that has already been prescribed for them by the patriarchal language they must both use and transform. Adrienne Rich also explores the traces of women's silence in a collection of essays entitled *On Lies, Secrets, and Silence* (1979). These and other works have as their project the attempt to read the suppressed, distorted, or disguised messages that women's writing has encoded. They require a reading strategy that goes beyond apparent intentions or surface meanings, a reading that takes full advantage of writing's capacity to preserve that which cannot yet, perhaps, be deciphered.

The writings of Western male authorities have often encoded the silence, denigration, or idealization not only of women but also of other "others." Edward Said, in *Orientalism* (1978), analyzes the discursive fields of scholarship, art, and politics in which the "Oriental" is projected as the "other" of the European. By reading against the grain of the writers' intentions, he shows how European men of reason and benevolence could inscribe a rationale for oppression and exploitation within their very discourse of Enlightenment....

# CHAPTER 9

## Theory in Practice *Lear's After-Life*

*John Jougin*

Currently an administrator at the University of East London, John Jougin is a leading Shakespeare scholar whose books include *Shakespeare and National Culture* (1997), *Philosophical Shakespeares* (2000), and *The New Aestheticism* (2003). In this essay, he uses Derrida and deconstructive analysis to explore the complexity of meaning in *King Lear*.

### I

*It is true that, with respect to the disaster, one dies too late.*

(Maurice Blanchot, *The Writing of the Disaster*)<sup>1</sup>

What does it mean to speak of the afterlife of a literary text? And why do some texts retain an enduring significance while others simply fade away? The survival of one text over another clearly depends on its sustained ability to unsettle existing conventions and to defamiliarize habitual perceptions, and in the case of canonical texts, such as Shakespeare, this is clearly a transformative potential which is retained over a considerable period of time. In this respect, of course, the afterlife of any given text is directly dependent on its critical life, its ability to draw generations of readers back to crucial points of analysis or interpretative ambiguity. In tracking back across Shakespeare's critical heritage and dipping into the closely contested editorial squabbles of years gone by, one unearths a series of textual disputes and dilemmas which open out into questions which remain unanswered to this day. In confronting the unlikely resurrection of Hermione at the end of *The Winter's Tale*, or the confusion surrounding the whereabouts of Lady Macbeth's 'missing children', the critic encounters a form of inexplicable alterity or otherness which exceeds his or her intellectual grasp, rather than providing the grounded repleteness of a 'meaningful' solution.<sup>2</sup> In the case of a dramatic text, the

*Original publication details:* John Jougin, "Lear's Afterlife." *Shakespeare Survey* 55 (2002), pp. 67–81. Annual Bibliography of English Language and Literature. Cambridge University Press, 2002. Reproduced with permission from Cambridge University Press.

qualitative newness of a play's afterlife is clearly also linked in quite complex ways to our experience of a play in performance; often these are moments of affective intensity which linger on after the play and force us to re-evaluate our preconceptions concerning how an individual scene might be construed. In these and a multitude of other ways then, there is clearly an implicit *recognition* that the value of a literary text is that it serves to remind us of the limits of our comprehension even as it functions to sharpen our response. Yet the question remains: why do some literary afterlives prove more enduring than others? And if a key aspect of our engagement with literary and dramatic texts is the sense in which they continue to resist a definitive explanation, then why, or in what sense, can this aspect of literary experience still be said to remain distinctive or meaningful?

In some respects *Lear* remains the exemplary text through which to explore precisely these types of issues, insofar as our enduring fascination with the play seems to be inextricably linked to a sense of incomprehension and anxiety concerning its transgression of most conventional thresholds of taste and decorum. In other words, *Lear*'s position as a text which takes us beyond conventional expectations – sometimes to the point of incredulity – has the merit of offering us a type of critical degree zero against which to press *any* claims to meaningful interpretation. Such is the extent of the 'wildness' of the play's formal disintegration that for many critics there is something simultaneously implausible and unactable about Shakespeare's text which borders on barbarism. For the nineteenth-century critic Charles Lamb, *Lear* approximates to a type of disaster 'painful and disgusting', 'beyond all art' and 'essentially impossible to be represented on a stage'.<sup>3</sup> And Lamb's disparagement is already hinted at in the Preface to Samuel Johnson's edition of the play, where he is compulsively drawn back to *Lear*'s unreality, and repeatedly confronts the dilemma of 'proving' its exceptions. Here, for example, is Johnson on Gloucester's blinding:

I am not able to apologize with equal plausibility for the extrusion of Gloucester's eyes, which seems an act too horrid to be endured in dramatic exhibition, and such as must always compel the mind to relieve its distress by incredulity.<sup>4</sup>

For Johnson the fascination of witnessing these and other improbabilities is that from the very outset they transfix us *even as* they keep the audience in a state of perpetual tumult:

General Observation. The tragedy of *Lear* is deservedly celebrated among the dramas of Shakespeare. There is perhaps no play which keeps the attention so strongly fixed; which so much agitates our passions and interests our curiosity. The artful involutions of distinct interests, the striking opposition of contrary characters, the sudden changes of fortune, and the quick succession of events, fill the mind with a perpetual tumult of indignation, pity, and hope.<sup>5</sup>

Here and elsewhere in his Preface to the play, something clearly snags on Johnson's reading consciousness as he witnesses a series of events which in their 'artful involution' defy 'reasonable explanation', even as they then serve to heighten his perception of the drama to the point of extreme discomfort. Well over a century later, A. C. Bradley confirms *Lear*'s surplus effect in similar terms, observing that the play is simply

too huge for the stage ... the immense scope of the work; the mass and variety of intense experience which it contains; the interpenetration of sublime imagination, piercing pathos, and humour almost as moving as the pathos; the vastness of the convulsion both of nature and of human passion.<sup>6</sup>

As Philip Armstrong comments, these and other critical encounters with the play testify to an ‘excess that overflows generic boundaries’; it is as if ‘there must be in the play something more than the play, which returns upon the spectator’<sup>7</sup> – and here perhaps Johnson’s use of the term ‘*involution*’, both in the process of ‘involving’, but also in the literal sense of ‘involute’ – suggesting a ‘tight coil’ or ‘curled spiral’ waiting to recoil upon the spectator – might betray more than it could possibly know.

In this article I want to try to unpack the significance of one such after-effect: the ‘*pietà*-like’ image of Lear holding the dead Cordelia in his arms, a scene of ‘pity and hope’ which has continued to haunt critics, editors and spectators of the play alike. Such is the affective intensity of the scene that it seems to retain an almost totemic significance, particularly for directors of the play, who invariably recall the incident in their programme notes, as if to somehow exorcise its affect. Here, for example, is Barrie Rutter, founder and director of the Northern Broadsides theatre company, offering a ‘behind the scenes’ glimpse of the genesis of his recent touring production of the play:

So there we were in Salts Mills in 1993, rehearsing *Merry Wives*: pigeons flying around the wooden beams of the spinning lobby on the fifth floor, and Shakespeare’s comedy giving us all a lot of fun. Suddenly, I stop rehearsals and say, ‘Wouldn’t it be terrific if Lear walked the whole length of this room carrying the dead Cordelia, saying “Howl, howl howl!”?’ I turned round and the merry wives with Mistress Quickly (Polly Hemingway, Elizabeth Estensen and Ishia Bennison) all had tears rolling down their cheeks. ‘Yes’, they croaked in unison.

I’ve hung on to that image for six years, and now have a chance to use it. As a touring company, of course, we have to adapt to different venues and each theatre or space will see the equivalent of ‘the long walk’.<sup>8</sup>

Rutter’s comments testify to the fact that in performance (even, indeed, in rehearsal), there is something ‘out of joint’, ob-scene or extra about the ‘unbearable spectacle’ of Lear carrying Cordelia across the stage at the end of the play. Rutter’s ‘advance recollection’ of the scene confirms a type of ‘spectral effect’ insofar as Derrida reminds us that: ‘a specter is always a *revenant*. One cannot control its comings and goings because *it begins by coming back*’.<sup>9</sup> An analogous form of temporal dislocation is already anticipated by the position of the scene in the play itself, so that, as R. A. Foakes reminds us, strictly speaking Cordelia’s death comes ‘*after* the end’ of the play (or at least follows the formal completion of the drama with the deaths of Goneril, Regan and Edmund);<sup>10</sup> on the other hand, without the episode that comes after and disrupts the play’s formal unity, *Lear* would somehow be incomplete. These and other types of disturbance that ‘add only to replace’ confirm the contradictory logic of what Derrida would term the scene’s supplementarity.<sup>11</sup> In the process, as Foakes observes: ‘the final scene stretches out Lear’s suffering beyond the point at which to have died would have been fitting’.<sup>12</sup> Repeated but always singular, the recurring agony of Cordelia’s death confirms *Lear* as a tale that can never be told but is in some sense crucial to our experience of the play.<sup>13</sup> The untimeliness of the scene and its excessive affect, as well as its proximity to death and the compulsion of critics to repeat their engagement with the scene ever since, clearly takes us into the territory of Freud’s notion of the *Unheimlich* or uncanny.<sup>14</sup> It is quite simply a spectacle of ‘inexpressible horror’ or, as Lear himself puts it: ‘Howl, howl, howl ...’.

One should hardly be surprised, then, that in confronting the unendurable excess of the scene and in an attempt to make the play ‘fit’ for consumption, the solution of early editors and adaptors was to ‘regularize’ the ending of the play in order to confirm *Lear*

as a formal comedy more in keeping with its original source material. Nahum Tate's 'New-modelling' of the story with Edgar and Cordelia married off as a 'celestial Pair' and Lear living on into happy retirement is the obvious example. Yet traditionally, from Tate's 1681 production onwards, even in its absence, the scene troubled critics and editors of the play. For Samuel Johnson, for example, there is a lasting sense of injustice surrounding Cordelia's death, the reverberations of which carry far beyond the theatrical experience itself:

Shakespeare has suffered the virtue of Cordelia to perish in a just cause, contrary to the natural ideas of justice, to the hope of the reader, and, what is yet more strange, to the faith of the chronicles ... A play in which the wicked prosper and the virtuous miscarry may doubtless be good, because it is a just representation of the common events of human life; but since all reasonable beings naturally love justice, I cannot be easily persuaded that the observation of justice makes a play worse; or that, if other excellencies are equal, the audience will not always rise better pleased from the final triumph of persecuted virtue.

In the present case the public has decided. Cordelia, from the time of Tate, has always retired with victory and felicity. And, if my sensations could add anything to the general suffrage, I might relate, I was many years ago so shocked by Cordelia's death that I know not whether I ever endured to read again the last scenes of the play till I undertook to revise them as editor.<sup>15</sup>

In teasing out the implications of Johnson's response I would want to argue that something like the residue of the supplementary affect we noted above now re-surfacing in a critical context, and that as a consequence Johnson's appeal to 'the natural idea of justice' begins to sound a bit strained. The moment comes when Johnson the critic adopts the position of a spectator. Crucially, the critic cannot help conceding that in performance, just as the scene is unfit, it fits – so even as Cordelia's death scene flouts any 'justifiable' moral schema, it remains 'a *just* representation of the common events of human life'. In some respects, then, the episode constitutes a potentially transgressive or 'critical' location precisely *because* of its lack of fit or indeterminacy. In the process it is as if the disjuncture between moral ideal and dramatic practice itself remarks a type of discordant 'truth' about the actual predicament of moral life. Of course the predictable disavowal follows, insofar as Johnson is quick to remind the reader that 'all reasonable beings naturally love justice'; yet in the course of attempting to justify his own position Johnson feels bound to concede that:

this conduct [suffering the virtue of Cordelia to perish in a just cause, contrary to the natural ideas of justice] is justified by the Spectator, who blames Tate for giving Cordelia success and happiness in his alteration and declares that, in his opinion, *the tragedy has lost half its beauty*.<sup>16</sup>

Somewhat confusingly, then, it might be said that there are two types of 'truth' to be had here: the idealized 'truth' which depends on the formalized convention of Cordelia's recovery; and the disconcerting authenticity of the unfit yet somehow more 'just' spectacle of her 'perish[-ing] in a just cause'. The reference to the justification 'by the Spectator' is now made even more explicit, and as soon as Johnson switches to this perspective he finds himself admitting that the playwright's work sustains its relative exclusivity (its 'tragic beauty' if you like), by 'authenticating' a claim to validity that is somehow unique. The fact that this truth claim simultaneously also exceeds the restrictive

demands of empirical truth which governed the neo-classical criticism of the period is, I would want to argue, precisely the point. Johnson's remarks serve to remind us that, in performance, Cordelia's death presents us with a type of untheorizable excess; such moments threaten the critic with a relinquishment of intellectual control – the mind full of 'perpetual torment' no doubt – yet it is precisely here that the ethical demand of the play is finally disclosed. The event-like relation of performance constitutes an irruptive excess – something that 'happens' outside an a priori grid of expectations and refuses the foreclosure of conventional attempts to explain it away. As a result 'justice' is revealed as a type of acategorical category: one which at once complies with and deviates from the formal aesthetics of which it is part.

As we have seen, witnessed in performance the force of this encountered otherness ensures that the viewing subject experiences a sense of ungrounding and disorientation, so that for Rutter we might recall that the dislocation of the 'long walk' recurs outside of the rehearsal space ('Suddenly I stop rehearsals'), though still somehow within it, as – 'in character' but beside themselves with pity – the 'merry wives' shed tears and croak their affirmation of witness. As Robert Eaglestone observes: 'It is in these [uncanny] moments when our sense of our selves and our relation to the *logos* is interrupted and put into question that the ethics of literature are at their clearest.'<sup>17</sup> In occupying the same time as the characters, we effectively 'live through' a sequence of moments with them, and while we cannot actually put ourselves in the 'presence' of characters during performance, in acknowledging their specificity as particular individuals, as Stanley Cavell reminds us: 'we are in, or can put ourselves in, their *present*'.<sup>18</sup> Characters and audience confront this form of the encountered other on an almost nightly basis. Moreover, in performance, the unendurable excess of incidents like Cordelia's death retains a 'complex and shaming power': a sense of witness, for the audience that views them.

We might begin to speak here then of the ethics of interpretation, in a twofold sense: not just in the sense of our encounter with otherness in performance where we are presented with what we might term after Levinas and Derrida 'the irreducible otherness of the other', but also in terms of the act of criticism itself, insofar as it demonstrates a willingness to 'promote' the unexpected or the *unheimlich* 'within the material it examines'.<sup>19</sup> Alert to those same 'artful involutions' that continue to disrupt and plague philosophical idealism with the very impossibility of their representation – in endlessly repositioning us and in being open to a form of otherness which both attracts and defies our comprehension – this process of interpretation is necessarily open-ended, for as Eaglestone puts it: 'There can be no final reading, no last word.'<sup>20</sup> In this regard, an ethical reading is also, as Maurice Blanchot reminds us, an act of testimony, a form of reading which is no longer passive, but is passivity's reading:

Finally, there is the reading that is no longer passive, but is passivity's reading. It is without pleasure, without joy; it escapes both comprehension and desire. It is like the nocturnal vigil, that 'inspiring' insomnia when, all having been said, 'Saying' is heard, and the testimony of the last witness pronounced.<sup>21</sup>

Blanchot's incomprehension in the face of disaster is, perhaps, not so far removed from Johnson's 'perpetual tumult of indignation, pity, and hope', yet even as we live on *after*, or survive the disaster itself, we might ask what type of justice would actually be possible in such a violently unjust world? In the case of Cordelia's death, the ethical demand of the scene seems to lurk within the uncanniness of the acts of testimony we have briefly

reviewed above, even as they then serve as a palpable reminder that in some profound sense in being drawn back as witnesses we are both absent and present – this is doubtless why the scene continues to transfix us so powerfully. Yet is it possible that our continued *fascination* with *Lear*'s closing scene – its haunting afterlife, if you like – almost sustains a ‘micrology’ of our relation to the play itself, that each time the scene is performed, it secretes the truth of an ethical exigency – a ‘felt contact at a distance’ – that offers, and then refuses us, the chance of redemption? These moments of affective intensity clearly ‘live on’ in performance and thus in a fundamental sense constitute the ‘afterlife’ of Shakespeare’s play. Yet in merely testifying to the fact that we continue to survive the unendurable, can *Lear*’s ‘artful involutions’ then still be said to retain their transformative potential against all the odds, or is there simply a limit to the play’s afterlife? And – to return to the question I opened with – how, in these circumstances, can *Lear* then still be said to remain distinctive or meaningful?

## II

*We come after, and that is the nerve of our condition.*

(George Steiner, *Language and Silence*)<sup>22</sup>

These questions arguably become even more pressing for a modern audience, who ‘live on’ after the horrific events of the twentieth century. After all, in this context, as R. A. Foakes reminds us, *Lear*’s apparently ‘passive indifference to suffering’ is all too depressingly familiar:

Its [*King Lear*] exposure of the horror of torture and suffering no longer seems outrageous in the context of concentration camps, napalm bombs, anti-personnel mines, and acts of terrorism such as have become familiar in report to everyone ... It has seemed to some the play of our time in being open to nihilistic interpretation as showing not the potentially heroic journey or pilgrimage of Man through life, but rather a progression towards despair or mere nothingness.<sup>23</sup>

From Foakes’s perspective then, the danger is that by now, however sympathetically we might view the play, we are simply inured to *Lear*’s displays of cruelty. Yet ultimately, this seems to me to be a rather complacent position to take. In a certain sense Foakes is clearly right to remind us that *Lear* is ‘to some the play of our time in being open to nihilistic interpretation’, but might this not also run the risk of universalizing an encounter which finally resists universalization? While there has been a tendency for critics to suggest that our culture could be ‘valued’ according to the nature of our engagement with this play alone – and here of course Foakes’s sense of *Lear* as our contemporary consciously echoes Jan Kott’s hugely influential *Shakespeare Our Contemporary* – I would want to argue that this actually oversimplifies the nature of our relation to the play. Paradoxically of course, as I’ve already suggested above, the fact is that Shakespeare’s play constitutes a type of exemplary text precisely *because* it continues to remind us of the limits of our attempts to engage in meaningful interpretation. In teasing out the implications of this, we might push the argument on a stage further and say that the paradox is that *Lear* can still remain ‘valuable’ for us *only* in its wider perception that modern culture is increasingly found to be lacking in value; and thus, in the same process, *Lear*’s ‘value’ is somehow simultaneously to survive the experience of outliving

its own utility. In this respect the notion of *Lear* being ‘our contemporary’ clearly stands in need of some fuller interrogation, especially insofar as it echoes recent philosophical debates concerning the problem of nihilism. There are several possible ways of responding to nihilism, yet *Lear*’s delineation of the problem comes uncannily close to the experience of those philosophers who suffer a sense of belatedness in surviving the catastrophic history in which they continue to find themselves implicated. For thinkers such as Theodor Adorno for example, ‘living on’ after events such as the Holocaust, is bound up with a sense of unjustifiable survivorhood and in such a context there is something inhuman, not just in surviving disaster, but in attempting to theorize it. In the opening section of his ‘Meditations on metaphysics’ in *Negative Dialectics* Adorno is forced to wonder

whether after Auschwitz you can go on living – especially whether one who escaped by accident, one who by rights should have been killed, may go on living.<sup>24</sup>

For Adorno then, the ‘despair and or mere nothingness’ to which Foakes alludes is at once a tangible yet still somehow ‘unreal’ feature of our modern existence. In these circumstances, ‘survival’ is directly complicit with an epistemological regime it outlives, but which it now also in some sense necessarily continues to inhabit. For those who practise philosophy this means negotiating the realization that philosophy was always already non-redemptive; it ‘lives on’, we live on (precisely) because ‘the moment to realise it was missed’. Or as Adorno puts it:

survival calls for the coldness, the basic principles of bourgeois subjectivity, without which there could have been no Auschwitz; this is the drastic guilt of him who was spared. By way of atonement he will be plagued by dreams such as that he is no longer living at all, that he was sent to the ovens in 1944 and his whole existence since has been imaginary, an emanation of the insane wish of a man killed twenty years earlier.

Thinking men and artists have not infrequently described a sense of being not quite there, of not playing along, a feeling as if they were not themselves at all, but a kind of spectator.<sup>25</sup>

For those who ‘come after’, then, bearing witness once again confirms the uncanny sense ‘of being not quite there’. And again of course, it is difficult not to hear in these lines the key trope of Lear’s own journey, a character who also crucially in some sense lives life belatedly, and for whom enduring finitude entails the discovery of an identity which is now directly predicated on the loss of identity:

LEAR ... Who is it that can tell me who I am?

FOOL Lear’s shadow.<sup>26</sup>

In either form, survival constitutes a type of haunting and Lear is a shadow or a shade of what he once was. Fittingly enough, of course, in *Lear* characters reside ‘out o’th’grave’ having long outstayed their welcome. In such a world as this, the only wonder is that, as Kent puts it on the king’s eventual demise: ‘he hath endured so long; / He but usurped his life’ (5.3.315–16). Indeed, in some sense, as Francis Barker reminds us, under the conditions existing in the play: ‘one is never more truly oneself than when speaking of oneself as not oneself’.<sup>27</sup> In ‘coming after’ we are confronted with a play which refuses the comfort of narrative continuity and settled identity, and in a world lacking

the 'existential balm' of religion Shakespearian tragedy already offers us a shadow narrative of the despair and nihilism of late modernity.<sup>28</sup> The shared 'disappointment' of a post-religious world and of a post-metaphysical philosophy is one of a spectral afterlife where there is an inability to reconcile metaphysical speculation with experience.<sup>29</sup> We are presented instead with a world of acute discontinuity and self-misrecognition and the failure of religion or philosophy to make any significant or practical difference. The lack of an antidote to this situation takes us to the precipice of what Nietzsche would term 'the last form of nihilism' which: 'includes disbelief in any metaphysical world and forbids itself any belief in a *true* world', in having reached this standpoint:

one grants the reality of becoming as the *only* reality, forbids oneself every kind of clandestine access to after-worlds and false divinities – but *cannot endure this world though one does not want to deny it*.<sup>30</sup>

In this climate, as the British philosopher Simon Critchley puts it, the challenge for a newly attenuated philosophical enterprise is to locate 'a meaning to human finitude without recourse to anything that transcends that finitude'.<sup>31</sup> Baldly stated, there is no redemption, nor can there be, at least not for us, not yet ...

Yet enduring finitude means that there is always an unsettled moment of the 'post' or an aftermath and in raising contemporary questions concerning our disenchantment with metaphysics, even the most recent adaptations of the play continue to confirm Foakes's sense of *Lear*'s 'openness' to nihilistic interpretation. Unsurprisingly perhaps, these reworkings of the *Lear* myth are often tales of survival and traumatic memory too. In Jane Smiley's *A Thousand Acres*, for example, amidst a revisionist reading which transports Lear to the mid-West of America we are offered a sub-text concerning the 'recovered memory' of paternal abuse and incest,<sup>32</sup> while in the recent Dogme 95 film *The King is Alive* (2000) directed by Kristian Levring, a group of tourists find themselves abandoned in a disused mining village in the middle of the Namibian desert. In a setting which aptly evokes a sense of depletion and exhausted resource, the survivors attempt a memorial reconstruction of *Lear*, presumably in an attempt to utilize drama in order to sustain a mutually recognizing community. Yet the power of performance is reduced, as one unwilling participant is told: 'You don't have to worry, you know. Nobody has to fall in love and everybody gets to die in the end.' Digitally shot with hand-held cameras according to Dogme house-rules, the film's visual feel accentuates intimacy but also conveys the alienation and distance of docudrama. And in a further twist we are confronted with a group of recognizably Shakespearian actors, including David Calder and Janet McTeer, in the process of learning to unlearn their parts, characters who literally might be said to play along 'by not playing along'.

In several recent reviews *The King is Alive* is cast as resembling Beckett, thus indirectly substantiating Foakes's observation that Shakespearian tragedy might still more properly be construed as 'a kind of parallel' to the twentieth-century Theatre of the Absurd. For, as Foakes rightly implies, not the least disconcerting aspect of *Lear*'s timely untimeliness is that it could just as easily be read alongside plays like *Waiting for Godot* and *Endgame*.<sup>33</sup> Shakespeare's dramaturgy, like Beckett's, is littered with characters that seem to teeter on the abyss of survival, endlessly enduring an 'experience of the limit': characters who are 'unable to go on, unable not to go on',<sup>34</sup> and where the need to confront an unreconciled gap between theory and practice, action and word, in part also closely mirrors the practical failure of philosophy or art to change or transform the

world. Moreover, in the case of each playwright – Beckett and Shakespeare – we might say that we are faced with the possibility that drama has lost its therapeutic function and its ability to rekindle community.

In the course of contemplating these questions in their Shakespearian context one is inevitably drawn back here to the seminal work of Stanley Cavell (another early reader of Beckett's *Endgame*) who in the very midst of his groundbreaking analysis of *Lear* offers the following despairing aside on the relation that 'currently' obtains between tragedy and modern life:

Since we are ineluctably actors in what is happening, nothing can be present to us to which we are not present. Of course we can still know, more than ever, what is going on. But then we always could, more or less. What we do not now know is what there is to acknowledge, what it is I am to make present, what I am to make myself present to. I know there is inexplicable pain and death everywhere, and now if I ask myself why I do nothing the answer must be, I choose not to.<sup>35</sup>

Caught up (at a distance) in the same cold-war hostilities as Beckett and Kott, in its original form, as Richard Halpern reminds us, Cavell's *Lear* essay inevitably 'bears the marks of its historical moment (1967)' as 'the death and suffering to which Cavell refers is exemplified primarily, as he makes clear, in the Vietnam War'<sup>36</sup> – scenes of suffering which, we might remember at the time, appeared on television screens on an almost nightly basis, and to which, as Halpern adds: 'as citizen and intellectual he [Cavell] feels opposed – yet in regard to which he finds himself choosing the course of paralysis or inaction'.<sup>37</sup>

Yet curiously, of course, insofar as the problem of 'spectatorship' to which Cavell alludes here relates to a form of distance, it is simultaneously a form of distance which results from 'our' almost omnipresent proximity to suffering – a proximity which in its very intimacy breeds a type of passivity. In such a context there is something indifferent in the encounter itself. And the tragedy of course is that, in the very act of watching, as Cavell reminds us, 'we absent ourselves' from incidents of pain and death. In short, even in 'seeing' we could ultimately be said to avoid the confusion of contact, for as Cavell himself puts it: 'What we do not now know is what there is to acknowledge, what it is I am to make present, what I am to make myself present to'.<sup>38</sup> In glossing the fuller drift of this passage from Cavell, Richard Halpern offers the following summation:

Modernity, Cavell argues, has inverted the traditional relation between tragic theatre and the world. Theater [sic] used to be a privileged place in which we could witness human suffering without actually being obliged to intervene in it; we could be, as Cavell puts it, ethically 'present' to tragic characters without actually being in their presence. Now, however, passive indifference to suffering has become the norm, and so theatrical spectatorship is no longer a special case but depressingly ubiquitous.<sup>39</sup>

There is no simple outside to this situation, even as we continue to inhabit it. Yet for a culture which is in some sense post-metaphysical the key problem remains that, as Cavell's comments imply (and as we saw earlier with Adorno), philosophy and art are now inevitably complicit with the very process they would otherwise be expected to overcome. During his reading of *Lear* Cavell maintains his own complex sense of individual indictment, maintaining a watchful almost Adornian-like vigilance over the fact that in this context there is something inhuman not just in surviving disaster, but in

surviving disaster and failing to confront it.<sup>40</sup> In this respect then, as Jay Bernstein notes, Adorno, Cavell, Beckett (*and I* would want to add *Lear*) each indirectly circle around similar problems:

How can art stop being a pain-killer yet be appropriate to what makes all response inappropriate and still, still authenticate the call of the things of this unworldly world? How can it make a promise that is not complicit with what has undone all promises or kept them too well?<sup>41</sup>

If actual events have now shattered the basis upon which the task of thinking might be reconciled with experience,<sup>42</sup> and if theatre in its modernity falls short of empathy, the problem remains that if we choose the path of paralysis and inaction we must also finally absent ourselves from pain and death. I would simply wish to counter that, in pushing this oscillation between contact and distance to another kind of ultimate limit, in these circumstances Cordelia's death nevertheless remains a 'special case'.

### III

*Last witness, end of history, close of a period, turning point, crisis – or, end of (metaphysical) philosophy.*

(Maurice Blanchot, *The Writing of the Disaster*)<sup>43</sup>

In the course of 'opposing' a redemptive reading of *Lear* Stanley Cavell offers the following observation:

Is this a Christian play? The question is very equivocal. When it is answered affirmatively, Cordelia is viewed as a Christ figure whose love redeems nature and transfigures Lear. So far as this is intelligible to me, I find it false both to the experience of the play and to the fact that it *is* a play. *King Lear* is not illustrated theology (anyway, which theology is thought to be illustrated, what understanding of atonement, redemption, etc., is thought to be figured?), and nature and Lear are not touched, but run out. If Cordelia exemplifies Christ, it is at the moment of crucifixion, not resurrection.<sup>44</sup>

Without wanting to reinstall a theological component to suffering (although, doubtless, as Cavell's comments suggest, there almost always inevitably is one), I would want to argue that in the face of contemporary 'indifference to suffering', our enduring fascination with the image of Cordelia in Lear's arms is that, against all the odds, it continues to sustain a form of (secular) transfiguration from which there is no option of turning away, and which still seems to touch us with what Blanchot evocatively terms a 'grasping contact':

*The image*

Why fascination? Seeing implies distance, the decision that causes separation, the power not to be in contact and to avoid the confusion of contact. Seeing means that this separation has nonetheless become an encounter. But what happens when what you see, even though from a distance, seems to touch you with a grasping contact, when the manner of seeing is a sort of touch, when seeing is a *contact* at a distance? What happens when what is seen imposes itself on your gaze, as though the gaze had been seized, touched, put in contact

with appearance? Not an active contact, not the initiative and action that might still remain in a true touch; rather, the gaze is drawn, absorbed into an immobile movement and a depth without depth. What is given to us by contact at a distance is the image, and fascination is passion for the image.

What fascinates us, takes away our power to give it meaning, abandons its ‘perceptible’ nature, abandons the world, withdraws to the near side of the world and attracts us there, no longer reveals itself to us and yet asserts itself in a presence alien to the present in time and to presence in space ... Fascination is ... vision that is no longer the possibility of seeing, but the impossibility of not seeing, impossibility that turns into seeing, that preserves – always and always – in a vision that does not end: a dead gaze, a gaze that has become the ghost of an eternal vision.<sup>45</sup>

Blanchot’s ‘contact at a distance’ is not an ‘active contact’ but neither is it the passive proximity of indifference rehearsed in Cavell’s sense of our own individual participation in a ‘generalized abdication’ from responsibility. Crucially, as Jay Bernstein reminds us, for Blanchot, in yielding ‘a passion for the image’, fascination confronts us with ‘the precedence of the object’ or, as Blanchot himself puts it, ‘seeing is a sort of touch’.<sup>46</sup> In its very duration the image of Lear holding Cordelia yields something of this complex phenomenology to its audience, manifesting ‘a depth without depth’ which only in the actual process of closing unfolds itself on uncertain surfaces, as a series of pressing intangibles which barely disclose themselves as: ‘breath, mist and stain(ing)’ or the ‘chance’ of a ‘feather stirring’ (cf. 5.3.260, 264). Such is the auratic potential of the scene that it fixes our gaze, yet insofar as it demands our attention, it does so without ever quite relinquishing itself to us, and in doing so it ‘imposes itself on the gaze’ as an enduring image. In the process it is as though ‘the gaze had been seized, touched, put in contact with appearance’.<sup>47</sup>

Of course, in some sense the scene offers us a distorted perspective, and in the process of breathing life into a stone, the brutal fact of the matter might well be that she dies and he lives. Yet Lear’s preoccupation with Cordelia’s corpse also confirms an ‘aestheticization of suffering’ which, whilst it is barely recoverable, and remains beyond comprehension, still exists in such close proximity and in such extreme circumstances that the manner of ‘seeing’ itself asserts an irreducible alterity which in its partial redemption sustains the ‘touch’ of the other. And the distinction between ‘seeing’ and reading remains crucial here, as in performance, beyond the detached objectivities of editorial hindsight, what fixes us is precisely the memory of what Samuel Johnson protests himself unable to rewitness and yet is bound to disavow: ‘I was many years ago so shocked by Cordelia’s death that I know not whether I ever endured to read again the last scenes of the play till I undertook to revise them as editor.’ We might say that Cordelia’s death confirms what Blanchot terms ‘the impossibility of not seeing’, so that however much Johnson opts for it, the ‘choice’ of turning away does not ever really enter into the equation. Even as fascination maintains its endless recurring ‘contact at a distance’, then, it is also inextricably intertwined with what Blanchot elsewhere terms last-witness, and which in the present extract confirms itself as a form of spectatorship which ‘asserts itself in a presence alien to the present in time and to presence in space’, from which finally there is no absenting oneself. In short, our fascination with Cordelia’s death confirms the ‘conduct’ of turning and last witness as an incessant testament which is just and fitting though never quite *justified* by the spectator. It preserves ‘a vision that does not end’, an image which Rutter ‘hangs on to for six years’. Its moment of memorial is momentous, and it remains a compulsive trope both in terms of the decisive or critical

point it retains in the play's overall dramatic structure, but also in its confirmation of an 'ethical exigency' which eventually proves impossible to avoid or eliminate.

#### IV

*Finished, it's finished, nearly finished, it must be nearly finished ...*

(Samuel Beckett, *Endgame*)<sup>48</sup>

*Art or philosophy, or any form of practice is bound to be inadequate, an inappropriate response to the now infinite disaster ... but we are always standing somewhere, talking; so winding up, having done with art and meaning is less easy than it appears: the habit of meaning is hard to break. Maybe, but who are we to say, the task of ending meaning is infinite too (maybe that is the disaster – too), an uncompletable task; perhaps we can be stopped, but not finish.*

(Jay Bernstein on *Endgame*)<sup>49</sup>

In some form, one might say that *Lear*'s Theatre of the Absurd, like Beckett's, ends as it begins, by eking out its own utter sense of incompleteness. The untimeliness of Beckett's world, and of 'our' world, is almost wholly in keeping with *Lear*'s. In the case of *Endgame* we are confronted with an apocalyptic terrain to rival *Lear*'s, as we witness a 'master' and his 'servant' entombed in what appears to be a type of nuclear bunker where the survivors hang on to the last vestiges of 'human contact'. And in Beckett's drama, as in Shakespeare's, while writing the disaster maintains its endless unendurability, it also sustains its own form of 'waning intensity'.<sup>50</sup> Amidst their overwhelming sense of disenchantment the plays somehow retain an ethical impulse, so that a utopian glimmer that things could be otherwise, however paltry, just about remains intact. In this respect, at least, as Bernstein observes: 'having done with art and meaning is less easy than it appears: the habit of meaning is hard to break'.

For my part though, the strain at the end of *Lear* also sustains a utopian impulse and in doing so is eventually probably more Adornian than Cavellian in terms of its overall ethical trajectory. Adorno's thought, like Beckett's, is often caricatured as securing nothing more or less than a fatalistic pessimism of the intellect, yet even amidst disenchantment and indifference, the 'seismic' potential of Adorno's philosophy resides in its willingness to sustain a 'standpoint of redemption' against all the odds.<sup>51</sup> For Adorno, as for Cavell, it is true to say that there is eventually 'no conceivable standpoint from which the disaster might be named or articulated',<sup>52</sup> yet as Max Pensky reminds us, in addressing those things that fall by the wayside Adorno's work simultaneously responds to 'an ethical intuition, according to which the repressed other – the nonidentical – can reappear within the ruins of a dominant discourse' and the wreckage of its unassimilated material.<sup>53</sup> Eventually then we might say that Beckett's art, like Adorno's philosophy, 'survives its own apocalypse' in that, although art and philosophy will always come too late, in the very process of witnessing its own demise it holds on to the possibility that 'one day it will arrive in time'.<sup>54</sup> In this respect, for Adorno, as Simon Critchley puts it:

the reality or unreality of redemption hardly matters. What is important is the messianic demand [of redemption] and not whether this demand is underwritten by some guarantee of redemption.<sup>55</sup>

Adorno of course does not attempt a reading of *Lear*, yet if we were to extend the logic of his position, in reading the runes of Shakespeare's play in the face of despair

but also from a ‘standpoint of redemption’, we could say that, even in death, *Lear’s* ‘messianic demand’ is maintained. In no small part, as I have intimated above, it continues to be sustained by the ungraspable image of Cordelia, of which there is no letting go. Of course such a reading would expose us only to ‘a universe of greys’, a type of future past which oscillates between the despair of being ‘too late’ in the ‘hope against hope’ of affirmation, and in holding on to a ‘not yet’ which is finally unfulfillable.<sup>56</sup> There is evidently no straightforward sense in which this finally underwrites either an act of overcoming or a form of restoration. Yet by the final scene of Shakespeare’s play, of course, this is precisely Lear’s ‘place’. And, when they are culled from their original theatrical context, it is perhaps unsurprising that his own ‘last’ words read very much like a fragmented series of recalcitrant one liners from Beckett:

*not yet*

‘Why then she lives.’  
 ‘if it be so ...’  
 ‘stay a little. Ha?’  
 ‘What is’t thou sayst?’  
 ‘Do you see this?’  
 (5.3.261, 263, 269,  
 270, 308)

*too late*

‘she’s gone for ever’  
 ‘She’s dead as earth’  
 ‘now she’s gone for ever’  
 ‘No, no, no life!’  
 ‘Never, never, never, never, never’  
 (5.3.257, 259, 268, 304, 307)

Caught between hope and despair, Lear holding Cordelia confirms the broken halves of a type of dialectical image that will never finally add up. Or as Lear puts it:

‘I might have saved her; now she’s gone for ever’ (5.3.268)

Fittingly of course it is an ‘image of horror’ and as such it remains constitutively incomplete and unfulfillable in its very failure to reconcile a felt discrepancy between thought and experience. Yet just as *Lear’s* closing scene necessarily remains incomprehensible, it also retains its ethical imperative in sustaining its evocative demand that it must somehow still be construed for the sake of future action.<sup>57</sup> In this sense, at least, the play’s ultimate scene of departure maintains its currency. And the line ‘now she’s gone forever’ might just as easily be turned back against itself, in being said to ‘forever’ occupy the moment of the ‘now’. Alongside Lear, each one of us hangs on to this. Nothing more and nothing less. It is the play’s endlessly recurring after-image – a moment of last witness which suddenly unexpectedly resurrects its close contact at a distance:

Do you see this? Look on her: look, her lips,  
 Look there, look there! *He dies*  
 (5.3.308–9)

## V

*Metaphysics must know how to wish.<sup>58</sup>*

(Theodor Adorno, *Negative Dialectics*)

So where does this leave those who come after? How does one go on? And what form might that future action take? Fittingly of course *Lear* remains equivocal to the last:

EDGAR: The weight of this sad time we must obey,  
 Speak what we feel, not what we ought to say.  
 The oldest hath borne most we that are young  
 Shall never see so much, nor live so long.

*Exeunt with a dead march. (5.3.322–5)*

In the closing lines of the play ‘feeling’ and ‘speaking’, rather than feeling and seeing, are cast in tantalizing proximity. Perhaps then it is a form of obligation, a ‘speaking’ that eventually comes from learning by heart? Let me expand briefly on what it might mean to say this.

When I worked with a group of students on these lines recently, several of them noticed a resemblance to the well-known fourth stanza of Laurence Binyon’s poem ‘For the Fallen’:

They shall grow not old, as we that are left grow old:  
 Age shall not weary them, nor the years condemn.  
 At the going down of the sun and in the morning  
 We will remember them.<sup>59</sup>

Doubtless it was the time of year, as we were studying the play just after the Remembrance Sunday services commemorating the anniversary of Armistice Day and held annually across Britain in memory of those who have sacrificed their lives for peace. Of course, in Binyon’s stanza, in surviving the disaster, it is we who come after, we who are left to grow old and weary while our predecessors are forever young and immortalized as a consequence. In Edgar’s speech, however long we have got left, in outliving those that ‘we’ survive, those who are left will never live so long as those who are now also in some sense immortalized. So on an intuitive level at least the students’ sense of a correspondence between the two stanzas seems absolutely right. Yet something continues to trouble me in the comparison.

Even in the short term of growing old, can we never live up to our elders who are old but forever young? And even while they remain beyond reproof, as Binyon implies, will the unlived lives of our ancestors in turn effectively condemn us? Does this mean that there is no learning from experience? In suggesting that: ‘we that are young / Shall never see so much, nor live so long’, Edgar’s speech is earthbound in that it constitutes a reflection from within experience that inaugurates a degree of responsibility for those who come after. And we need to live the conditionality of our inheritance, however fraught with difficulty that ‘living’ might be. Perhaps a clue resides in the words of the obligation that precede *Lear*’s last testament?

The weight of this sad time we must obey,  
 Speak what we feel, not what we ought to say.

As Foakes reminds us in his gloss on the line, there seems to be a conscious echo of *Lear's* opening scene here: ‘in 1.1, Goneril and Regan spoke dutifully what they *ought to say*’.<sup>60</sup> But now we might notice that in closing there is also the more substantial temporal duty or ‘obedience’, which precedes what we merely ‘ought’ to say: ‘The weight of this sad time *we must obey*’ – a duty, that is to say, which is beyond mere public duty, and one which arguably marks an ethical turning point in coming after but now lying beyond the empty rhetoric which attended the official investment of power and responsibility at the beginning of the play. The outcome is discordant; yet it also arguably re-marks the recognition that ‘the obligations imposed by the dead *are* the obligations we discover and renegotiate in life’<sup>61</sup> – a form of ethical demand that lives on in our day-to-day commitments and continues to inform our relations with others in its development beyond the unredeemable lament of Binyon’s *in memoriam*.

Of course, as Foakes observes elsewhere:

The last line [of the play] remains enigmatic, since saying what one feels (*Lear* in his rages? Goneril and Regan expressing their lust for Edmund?) may be just as damaging as saying what one ought to say (Goneril and Regan speaking by the rules in the opening scene?).<sup>62</sup>

For her part, we might remember that, during the opening scene, Cordelia effectively enacted an ‘articulated silence’,<sup>63</sup> rehearsing what she felt by opting out of linguistic exchange in taking the side of things against language; thereby indirectly acknowledging the inequality of those speech acts which are based on dissimulation, and where even in speaking ‘true’, people will say anything – the ‘dutiful ought’ of Goneril and Regan in pledging their allegiance. In contrast the articulated silence of loving and being silent is one which in refusing justification and suffering false accusation is willing to risk the consequence:

LEAR	But goes thy heart with this?
CORDELIA	Ay, my good lord.
LEAR	So young and so untender?
CORDELIA	So young, my lord, and true.
LEAR	Well, let it be so. Thy truth then be thy dower

(1.1.105–9)

It is not merely that, as Foakes suggests, Cordelia ‘thought she had to conceal her feelings’ in the opening scene.<sup>64</sup> Rather, to love and to suffer the love of dutiful silence, which is still to be felt as such and to be dutiful, is a type of learning by heart which despite its unhappiness refuses to heave its heart into its mouth (1.1.91–2).

This is not to hypostasize the experience of suffering or to universalize its significance, but rather to suggest that the facticity of suffering ‘makes a virtue out of limitation’ and resides in an openness to corrigibility. Here the difference between thinking and saying cannot be merely anticipated, so that – as the philosopher Gillian Rose puts it:

To grow in love-ability is to accept the boundaries of oneself and others, while remaining vulnerable, woundable, around the bounds<sup>65</sup>

– an ability that Cordelia exhibits from the start. And, unlikely as it seems, a morsel of this sentiment still survives in the play’s closing stanza, even after the enduring memory

of her death at the end of the play. As a consequence, we are bound to acknowledge it, for its obligation is an ob-ligature, a binding-up, or bond, to which we are still bound.<sup>66</sup>

However constrictive and unrelenting it might now seem to be, this is ‘true’ even of Tate’s imposed comedic ending to the play, which unwittingly secretes its own testament to provisionality and improvisation even as it strives to forget the fact of that which will not be forgotten. After all, Tate’s original Dedication actually hinges on its own admission of an impossible juggling act. In the course of defending his ‘New-modelling of this story … whereof I had no Ground in my Author’ he protests that he was ‘wract with no small Fears for so bold a change’, and although he locates his main justification for the ‘re-modelling’ of the play in its performance, protesting the change ‘well received by the audience’, he feels bound to add one further ‘theoretical’ disclaimer:

*Neither is it of so Trivial an Undertaking to make a Tragedy end happily, for ’tis more difficult to save than ’tis to Kill: The Dagger and Cup of Poison are always in Readiness; but to bring the Action to the last Extremity, and then by probable means to recover All, will require the Art and Judgement of a Writer, and cost him many a Pang in the Performance.*<sup>67</sup>
