Britain and France dominated the Eastern Mediterranean from about the end of the seventeenth century on. Yet my discussion of that domination and systematic interest does not do justice to (a) the important contributions to Orientalism of Germany, Italy, Russia, Spain, and Portugal and (b) the fact that one of the important impulses toward the study of the Orient in the eighteenth century was the revolution in Biblical studies stimulated by such variously interesting pioneers as Bishop Lowth, Eichhorn, Herder, and Michaelis. In the first place, I had to focus rigorously upon the British-French and later the American material because it seemed inescapably true not only that Britain and France were the pioneer nations in the Orient and in Oriental studies, but that these vanguard positions were held by virtue of the two greatest colonial networks in pre-twentieth-century history; the American Oriental position since World War II has fit – I think, quite self-consciously – in the places excavated by the two earlier European powers. Then too, I believe that the sheer quality, consistency, and mass of British, French, and American writing on the Orient lifts it above the doubtless crucial work done in Germany, Italy, Russia, and elsewhere. But I think it is also true that the major steps in Oriental scholarship were first taken in either Britain and France, then elaborated upon by Germans. Silvestre de Sacy, for example, was not only the first modern and institutional European Orientalist, who worked on Islam, Arabic literature, the Druze religion, and Sassanid Persia; he was also the teacher of Champollion and of Franz Bopp, the founder of German comparative linguistics. A similar claim of priority and subsequent pre-eminence can be made for William Jones and Edward William Lane.

In the second place – and here the failings of my study of Orientalism are amply made up for – there has been some important recent work on the background in Biblical scholarship to the rise of what I have called modern Orientalism. The best and the most illuminatingly relevant is E. S. Shaffer's impressive "*Kubla Khan*" and *The Fall of Jerusalem*,<sup>14</sup> an indispensable study of the origins of Romanticism, and of the intellectual activity underpinning a great deal of what goes on in Coleridge, Browning, and George Eliot. To some degree Shaffer's work refines upon the outlines provided in Schwab, by articulating the material of relevance to be found in the German Biblical scholars and using that material to read, in an intelligent and always interesting way, the work of three major British writers. Yet what is missing in the book is some sense of the political as well as ideological edge given the Oriental material by the British and French writers I am principally concerned with; in addition, unlike Shaffer I attempt to elucidate subsequent developments in academic as well as literary Orientalism that bear on the connection between British and French Orientalism on the one hand and the rise of an explicitly colonial-minded imperialism on the other. Then too, I wish to show how all these earlier matters are reproduced more or less in American Orientalism after the Second World War.

Nevertheless there is a possibly misleading aspect to my study, where, aside from an occasional reference, I do not exhaustively discuss the German developments after the inaugural period dominated by Sacy. Any work that seeks to provide an understanding of academic Orientalism and pays little attention to scholars like Steinhthal, Müller, Becker, Goldziher, Brockelmann, Nöldeke – to mention only a handful – needs to be reproached, and I freely reproach myself. I particularly regret not taking more account of the great scientific prestige that accrued to German scholarship by the middle of the nineteenth century, whose neglect was made into a denunciation of insular British scholars by George Eliot. I have in mind Eliot's unforgettable portrait of Mr. Casaubon in *Middlemarch*. One reason Casaubon cannot finish his Key to All Mythologies is, according to his young cousin Will Ladislaw, that he is unacquainted with German scholarship.

For not only has Casaubon chosen a subject “as changing as chemistry: new discoveries are constantly making new points of view”: he is undertaking a job similar to a refutation of Paracelsus because “he is not an Orientalist, you know.”<sup>15</sup>

Eliot was not wrong in implying that by about 1830, which is when *Middlemarch* is set, German scholarship had fully attained its European pre-eminence. Yet at no time in German scholarship during the first two-thirds of the nineteenth century could a close partnership have developed between Orientalists and a protracted, sustained *national* interest in the Orient. There was nothing in Germany to correspond to the Anglo-French presence in India, the Levant, North Africa. Moreover, the German Orient was almost exclusively a scholarly, or at least a classical, Orient: it was made the subject of lyrics, fantasies, and even novels, but it was never actual, the way Egypt and Syria were actual for Chateaubriand, Lane, Lamartine, Burton, Disraeli, or Nerval. There is some significance in the fact that the two most renowned German works on the Orient, Goethe’s *Westöstlicher Diwan* and Friedrich Schlegel’s *Über die Sprache und Weisheit der Indier*, were based respectively on a Rhine journey and on hours spent in Paris libraries. What German Oriental scholarship did was to refine and elaborate techniques whose application was to texts, myths, ideas, and languages almost literally gathered from the Orient by imperial Britain and France.

Yet what German Orientalism had in common with Anglo-French and later American Orientalism was a kind of intellectual authority over the Orient within Western culture. This authority must in large part be the subject of any description of Orientalism, and it is so in this study. Even the name *Orientalism* suggests a serious, perhaps ponderous style of expertise; when I apply it to modern American social scientists (since they do not call themselves Orientalists, my use of the word is anomalous), it is to draw attention to the way Middle East experts can still draw on the vestiges of Orientalism’s intellectual position in nineteenth-century Europe.

There is nothing mysterious or natural about authority. It is formed, irradiated, disseminated; it is instrumental, it is persuasive; it has status, it establishes canons of taste and value; it is virtually indistinguishable from certain ideas it dignifies as true, and from traditions, perceptions, and judgments it forms, transmits, reproduces. Above all, authority can, indeed must, be analyzed. All these attributes of authority apply to Orientalism, and much of what I do in this study is to describe both the historical authority in and the personal authorities of Orientalism.

My principal methodological devices for studying authority here are what can be called *strategic location*, which is a way of describing the author’s position in a text with regard to the Oriental material he writes about, and *strategic formation*, which is a way of analyzing the relationship between texts and the way in which groups of texts, types of texts, even textual genres, acquire mass, density, and referential power among themselves and thereafter in the culture at large. I use the notion of strategy simply to identify the problem every writer on the Orient has faced: how to get hold of it, how to approach it, how not to be defeated or overwhelmed by its sublimity, its scope, its awful dimensions. Everyone who writes about the Orient must locate himself vis-à-vis the Orient; translated into his text, this location includes the kind of narrative voice he adopts, the type of structure he builds, the kinds of images, themes, motifs that circulate in his text – all of which add up to deliberate ways of addressing the reader, containing the Orient, and finally, representing it or speaking in its behalf. None of this takes place in the abstract, however. Every writer on the Orient (and this is true even of Homer) assumes some Oriental precedent, some previous knowledge of the Orient, to which he

refers and on which he relies. Additionally, each work on the Orient *affiliates* itself with other works, with audiences, with institutions, with the Orient itself. The ensemble of relationships between works, audiences, and some particular aspects of the Orient therefore constitutes an analyzable formation – for example, that of philological studies, of anthologies of extracts from Oriental literature, of travel books, of Oriental fantasies – whose presence in time, in discourse, in institutions (schools, libraries, foreign services) gives it strength and authority.

It is clear, I hope, that my concern with authority does not entail analysis of what lies hidden in the Orientalist text, but analysis rather of the text's surface, its exteriority to what it describes. I do not think that this idea can be overemphasized. Orientalism is premised upon exteriority, that is, on the fact that the Orientalist, poet or scholar, makes the Orient speak, describes the Orient, renders its mysteries plain for and to the West. He is never concerned with the Orient except as the first cause of what he says. What he says and writes, by virtue of the fact that it is said or written, is meant to indicate that the Orientalist is outside the Orient, both as an existential and as a moral fact. The principal product of this exteriority is of course representation: as early as Aeschylus's play *The Persians* the Orient is transformed from a very far distant and often threatening Otherness into figures that are relatively familiar (in Aeschylus's case, grieving Asiatic women). The dramatic immediacy of representation in *The Persians* obscures the fact that the audience is watching a highly artificial enactment of what a non-Oriental has made into a symbol for the whole Orient. My analysis of the Orientalist text therefore places emphasis on the evidence, which is by no means invisible, for such representations as *representations*, not as "natural" depictions of the Orient. This evidence is found just as prominently in the so-called truthful text (histories, philological analyses, political treatises) as in the avowedly artistic (i.e., openly imaginative) text. The things to look at are style, figures of speech, setting, narrative devices, historical and social circumstances, *not* the correctness of the representation nor its fidelity to some great original. The exteriority of the representation is always governed by some version of the truism that if the Orient could represent itself, it would; since it cannot, the representation does the job, for the West, and *faute de mieux*, for the poor Orient. "Sie können sich nicht vertreten, sie müssen vertreten werden," as Marx wrote in *The Eighteenth Brumaire of Louis Bonaparte*.

Another reason for insisting upon exteriority is that I believe it needs to be made clear about cultural discourse and exchange within a culture that what is commonly circulated by it is not "truth" but representations. It hardly needs to be demonstrated again that language itself is a highly organized and encoded system, which employs many devices to express, indicate, exchange messages and information, represent, and so forth. In any instance of at least written language, there is no such thing as a delivered presence, but a *re-presence*, or a representation. The value, efficacy, strength, apparent veracity of a written statement about the Orient therefore relies very little, and cannot instrumentally depend, on the Orient as such. On the contrary, the written statement is a presence to the reader by virtue of its having excluded, displaced, made supererogatory any such *real thing* as "the Orient." Thus all of Orientalism stands forth and away from the Orient: that Orientalism makes sense at all depends more on the West than on the Orient, and this sense is directly indebted to various Western techniques of representation that make the Orient visible, clear, "there" in discourse about it. And these representations rely upon institutions, traditions, conventions, agreed-upon codes of understanding for their effects, not upon a distant and amorphous Orient.

The difference between representations of the Orient before the last third of the eighteenth century and those after it (that is, those belonging to what I call modern Orientalism) is that the range of representation expanded enormously in the later period. It is true that after William Jones and Anquetil-Duperron, and after Napoleon's Egyptian expedition, Europe came to know the Orient more scientifically, to live in it with greater authority and discipline than ever before. But what mattered to Europe was the expanded scope and the much greater refinement given its techniques for receiving the Orient. When around the turn of the eighteenth century the Orient definitively revealed the age of its languages – thus outdated Hebrew's divine pedigree – it was a group of Europeans who made the discovery, passed it on to other scholars, and preserved the discovery in the new science of Indo-European philology. A new powerful science for viewing the linguistic Orient was born, and with it, as Foucault has shown in *The Order of Things*, a whole web of related scientific interests. Similarly William Beckford, Byron, Goethe, and Hugo restructured the Orient by their art and made its colors, lights, and people visible through their images, rhythms, and motifs. At most, the “real” Orient provoked a writer to his vision; it very rarely guided it.

Orientalism responded more to the culture that produced it than to its putative object, which was also produced by the West. Thus the history of Orientalism has both an internal consistency and a highly articulated set of relationships to the dominant culture surrounding it. My analyses consequently try to show the field's shape and internal organization, its pioneers, patriarchal authorities, canonical texts, doxological ideas, exemplary figures, its followers, elaborators, and new authorities; I try also to explain how Orientalism borrowed and was frequently informed by “strong” ideas, doctrines, and trends ruling the culture. Thus there was (and is) a linguistic Orient, a Freudian Orient, a Spenglerian Orient, a Darwinian Orient, a racist Orient – and so on. Yet never has there been such a thing as a pure, or unconditional, Orient; similarly, never has there been a nonmaterial form of Orientalism, much less something so innocent as an “idea” of the Orient. In this underlying conviction and in its ensuing methodological consequences do I differ from scholars who study the history of ideas. For the emphases and the executive form, above all the material effectiveness, of statements made by Orientalist discourse are possible in ways that any hermetic history of ideas tends completely to scant. Without those emphases and that material effectiveness Orientalism would be just another idea, whereas it is and was much more than that. Therefore I set out to examine not only scholarly works but also works of literature, political tracts, journalistic texts, travel books, religious and philological studies. In other words, my hybrid perspective is broadly historical and “anthropological,” given that I believe all texts to be worldly and circumstantial in (of course) ways that vary from genre to genre, and from historical period to historical period.

Yet unlike Michel Foucault, to whose work I am greatly indebted, I do believe in the determining imprint of individual writers upon the otherwise anonymous collective body of texts constituting a discursive formation like Orientalism. The unity of the large ensemble of texts I analyze is due in part to the fact that they frequently refer to each other: Orientalism is after all a system for citing works and authors. Edward William Lane's *Manners and Customs of the Modern Egyptians* was read and cited by such diverse figures as Nerval, Flaubert, and Richard Burton. He was an authority whose use was an imperative for anyone writing or thinking about the Orient, not just about Egypt: when Nerval borrows passages verbatim from *Modern Egyptians* it is to use Lane's authority to assist him in describing village scenes in Syria, not Egypt. Lane's authority and the

opportunities provided for citing him indiscriminately as well as indiscriminately were there because Orientalism could give his text the kind of distributive currency that he acquired. There is no way, however, of understanding Lane's currency without also understanding the peculiar features of *his* text; this is equally true of Renan, Sacy, Lamartine, Schlegel, and a group of other influential writers. Foucault believes that in general the individual text or author counts for very little; empirically, in the case of Orientalism (and perhaps nowhere else) I find this not to be so. Accordingly my analyses employ close textual readings whose goal is to reveal the dialectic between individual text or writer and the complex collective formation to which his work is a contribution.

Yet even though it includes an ample selection of writers, this book is still far from a complete history or general account of Orientalism. Of this failing I am very conscious. The fabric of as thick a discourse as Orientalism has survived and functioned in Western society because of its richness: all I have done is to describe parts of that fabric at certain moments, and merely to suggest the existence of a larger whole, detailed, interesting, dotted with fascinating figures, texts, and events. I have consoled myself with believing that this book is one installment of several, and hope there are scholars and critics who might want to write others. There is still a general essay to be written on imperialism and culture; other studies would go more deeply into the connection between Orientalism and pedagogy, or into Italian, Dutch, German, and Swiss Orientalism, or into the dynamic between scholarship and imaginative writing, or into the relationship between administrative ideas and intellectual discipline. Perhaps the most important task of all would be to undertake studies in contemporary alternatives to Orientalism, to ask how one can study other cultures and peoples from a libertarian, or a nonrepressive and nonmanipulative, perspective. But then one would have to rethink the whole complex problem of knowledge and power. These are all tasks left embarrassingly incomplete in this study.

The last, perhaps self-flattering, observation on method that I want to make here is that I have written this study with several audiences in mind. For students of literature and criticism, Orientalism offers a marvelous instance of the interrelations between society, history, and textuality; moreover, the cultural role played by the Orient in the West connects Orientalism with ideology, politics, and the logic of power, matters of relevance, I think, to the literary community. For contemporary students of the Orient, from university scholars to policymakers, I have written with two ends in mind: one, to present their intellectual genealogy to them in a way that has not been done; two, to criticize – with the hope of stirring discussion – the often unquestioned assumptions on which their work for the most part depends. For the general reader, this study deals with matters that always compel attention, all of them connected not only with Western conceptions and treatments of the Other but also with the singularly important role played by Western culture in what Vico called the world of nations. Lastly, for readers in the so-called Third World, this study proposes itself as a step towards an understanding not so much of Western politics and of the non-Western world in those politics as of the *strength* of Western cultural discourse, a strength too often mistaken as merely decorative or “superstructural.” My hope is to illustrate the formidable structure of cultural domination and, specifically for formerly colonized peoples, the dangers and temptations of employing this structure upon themselves or upon others.

The three long chapters and twelve shorter units into which this book is divided are intended to facilitate exposition as much as possible. Chapter One, “The Scope of Orientalism,” draws a large circle around all the dimensions of the subject, both in terms of historical time and experiences and in terms of philosophical and political themes.

Chapter Two, "Orientalist Structures and Restructures," attempts to trace the development of modern Orientalism by a broadly chronological description, and also by the description of a set of devices common to the work of important poets, artists, and scholars. Chapter Three, "Orientalism Now," begins where its predecessor left off, at around 1870. This is the period of great colonial expansion into the Orient, and it culminates in World War II. The very last section of Chapter Three characterizes the shift from British and French to American hegemony; I attempt there finally to sketch the present intellectual and social realities of Orientalism in the United States.

*3. The personal dimension.* In the *Prison Notebooks* Gramsci says: "The starting-point of critical elaboration is the consciousness of what one really is, and is 'knowing thyself as a product of the historical process to date, which has deposited in you an infinity of traces, without leaving an inventory.'" The only available English translation inexplicably leaves Gramsci's comment at that, whereas in fact Gramsci's Italian text concludes by adding, "therefore it is imperative at the outset to compile such an inventory."<sup>16</sup>

Much of the personal investment in this study derives from my awareness of being an "Oriental" as a child growing up in two British colonies. All of my education, in those colonies (Palestine and Egypt) and in the United States, has been Western, and yet that deep early awareness has persisted. In many ways my study of Orientalism has been an attempt to inventory the traces upon me, the Oriental subject, of the culture whose domination has been so powerful a factor in the life of all Orientals. This is why for me the Islamic Orient has had to be the center of attention. Whether what I have achieved is the inventory prescribed by Gramsci is not for me to judge, although I have felt it important to be conscious of trying to produce one. Along the way, as severely and as rationally as I have been able, I have tried to maintain a critical consciousness, as well as employing those instruments of historical, humanistic, and cultural research of which my education has made me the fortunate beneficiary. In none of that, however, have I ever lost hold of the cultural reality of, the personal involvement in having been constituted as, "an Oriental."

The historical circumstances making such a study possible are fairly complex, and I can only list them schematically here. Anyone resident in the West since the 1950s, particularly in the United States, will have lived through an era of extraordinary turbulence in the relations of East and West. No one will have failed to note how "East" has always signified danger and threat during this period, even as it has meant the traditional Orient as well as Russia. In the universities a growing establishment of area-studies programs and institutes has made the scholarly study of the Orient a branch of national policy. Public affairs in this country include a healthy interest in the Orient, as much for its strategic and economic importance as for its traditional exoticism. If the world has become immediately accessible to a Western citizen living in the electronic age, the Orient too has drawn nearer to him, and is now less a myth perhaps than a place crisscrossed by Western, especially American, interests.

One aspect of the electronic, postmodern world is that there has been a reinforcement of the stereotypes by which the Orient is viewed. Television, the films, and all the media's resources have forced information into more and more standardized molds. So far as the Orient is concerned, standardization and cultural stereotyping have intensified the hold of the nineteenth-century academic and imaginative demonology of "the mysterious Orient." This is nowhere more true than in the ways by which the Near East is grasped. Three things have contributed to making even the simplest perception of the Arabs and Islam into a highly-politicized, almost raucous matter: one, the history of popular

anti-Arab and anti-Islamic prejudice in the West, which is immediately reflected in the history of Orientalism; two the struggle between the Arabs and Israeli Zionism, and its effects upon American Jews as well as upon both the liberal culture and the population at large; three, the almost total absence of any cultural position making it possible either to identify with or dispassionately to discuss the Arabs or Islam. Furthermore, it hardly needs saying that because the Middle East is now so identified with Great Power politics, oil economics, and the simple-minded dichotomy of freedom-loving, democratic Israel and evil, totalitarian, and terroristic Arabs, the chances of anything like a clear view of what one talks about in talking about the Near East are depressingly small.

My own experiences of these matters are in part what made me write this book. The life of an Arab Palestinian in the West, particularly in America, is disheartening. There exists here an almost unanimous consensus that politically he does not exist, and when it is allowed that he does, it is either as a nuisance or as an Oriental. The web of racism, cultural stereotypes, political imperialism, dehumanizing ideology holding in the Arab or the Muslim is very strong indeed, and it is this web which every Palestinian has come to feel as his uniquely punishing destiny. It has made matters worse for him to remark that no person academically involved with the Near East – no Orientalist, that is – has ever in the United States culturally and politically identified himself whole-heartedly with the Arabs; certainly there have been identifications on some level, but they have never taken an “acceptable” form as has liberal American identification with Zionism, and all too frequently they have been radically flawed by their association either with discredited political and economic interests (oil-company and State Department Arabists, for example) or with religion.

The nexus of knowledge and power creating “the Oriental” and in a sense obliterating him as a human being is therefore not for me an exclusively academic matter. Yet it is an *intellectual* matter of some very obvious importance. I have been able to put to use my humanistic and political concerns for the analysis and description of a very worldly matter, the rise, development, and consolidation of Orientalism. Too often literature and culture are presumed to be politically, even historically innocent; it has regularly seemed otherwise to me, and certainly my study of Orientalism has convinced me (and I hope will convince my literary colleagues) that society and literary culture can only be understood and studied together. In addition, and by an almost inescapable logic, I have found myself writing the history of a strange, secret sharer of Western anti-Semitism. That anti-Semitism and, as I have discussed it in its Islamic branch, Orientalism resemble each other very closely is a historical, cultural, and political truth that needs only to be mentioned to an Arab Palestinian for its irony to be perfectly understood. But what I should like also to have contributed here is a better understanding of the way cultural domination has operated. If this stimulates a new kind of dealing with the Orient, indeed if it eliminates the “Orient” and “Occident” altogether, then we shall have advanced a little in the process of what Raymond Williams has called the “unlearning” of “the inherent dominative mode.”<sup>17</sup>

## The Scope of Orientalism

*... le génie inquiet et ambitieux de Européens ... impatient d'employer les nouveaux instruments de leur puissance ...*

– Jean-Baptiste-Joseph Fourier, *Preface historique* (1809),  
*Description de l'Égypte*

## I: Knowing the Oriental

On June 13, 1910, Arthur James Balfour lectured the House of Commons on “the problems with which we have to deal in Egypt.” These, he said, “belong to a wholly different category” than those “affecting the Isle of Wight or the West Riding of Yorkshire.” He spoke with the authority of a long-time member of Parliament, former private secretary to Lord Salisbury, former chief secretary for Ireland, former secretary for Scotland, former prime minister, veteran of numerous overseas crises, achievements, and changes. During his involvement in imperial affairs Balfour served a monarch who in 1876 had been declared Empress of India; he had been especially well placed in positions of uncommon influence to follow the Afghan and Zulu wars, the British occupation of Egypt in 1882, the death of General Gordon in the Sudan, the Fashoda Incident, the battle of Omdurman, the Boer War, the Russo-Japanese War. In addition his remarkable social eminence, the breadth of his learning and wit – he could write on such varied subjects as Bergson, Handel, theism, and golf – his education at Eton and Trinity College, Cambridge, and his apparent command over imperial affairs all gave considerable authority to what he told the Commons in June 1910. But there was still more to Balfour’s speech, or at least to his need for giving it so didactically and moralistically. Some members were questioning the necessity for “England in Egypt,” the subject of Alfred Milner’s enthusiastic book of 1892, but here designating a once-profitable occupation that had become a source of trouble now that Egyptian nationalism was on the rise and the continuing British presence in Egypt no longer so easy to defend. Balfour, then, to inform and explain.

Recalling the challenge of J. M. Robertson, the member of Tyneside, Balfour himself put Robertson’s question again: “What right have you to take up these airs of superiority with regard to people whom you choose to call Oriental?” The choice of “Oriental” was canonical; it had been employed by Chaucer and Mandeville, by Shakespeare, Dryden, Pope, and Byron. It designated Asia or the East, geographically, morally, culturally. One could speak in Europe of an Oriental personality, an Oriental atmosphere, an Oriental tale, Oriental despotism, or an Oriental mode of production, and be understood. Marx had used the word, and now Balfour was using it; his choice was understandable and called for no comment whatever.

I take up no attitude of superiority. But I ask [Robertson and anyone else] ... who has even the most superficial knowledge of history, if they will look in the face the facts with which a British statesman has to deal when he is put in a position of supremacy over great races like the inhabitants of Egypt and countries in the East. We know the civilization of Egypt better than we know the civilization of any other country. We know it further back; we know it more intimately; we know more about it. It goes far beyond the petty span of the history of our race, which is lost in the prehistoric period at a time when the Egyptian civilisation had already passed its prime. Look at all the Oriental countries. Do not talk about superiority or inferiority.

Two great themes dominate his remarks here and in what will follow: knowledge and power, the Baconian themes. As Balfour justifies the necessity for British occupation of Egypt, supremacy in his mind is associated with “our” knowledge of Egypt and not principally with military or economic power. Knowledge to Balfour means surveying

a civilization from its origins to its prime to its decline – and of course, it means *being able to do that*. Knowledge means rising above immediacy, beyond self, into the foreign and distant. The object of such knowledge is inherently vulnerable to scrutiny; this object is a “fact” which, if it develops, changes, or otherwise transforms itself in the way that civilizations frequently do, nevertheless is fundamentally, even ontologically stable. To have such knowledge of such a thing is to dominate it, to have authority over it. And authority here means for “us” to deny autonomy to “it” – the Oriental country – since we know it and it exists, in a sense, *as we know it*. British knowledge of Egypt *is* Egypt for Balfour, and the burdens of knowledge make such questions as inferiority and superiority seem petty ones. Balfour nowhere denies British superiority and Egyptian inferiority; he takes them for granted as he describes the consequences of knowledge.

First of all, look at the facts of the case. Western nations as soon as they emerge into history show the beginnings of those capacities for self-government ... having merits of their own ... You may look through the whole history of the Orientals in what is called, broadly speaking, the East, and you never find traces of self-government. All their great centuries – and they have been very great – have been passed under despotisms, under absolute government. All their great contributions to civilisation – and they have been great – have been made under that form of government. Conqueror has succeeded conqueror; one domination has followed another; but never in all the revolutions of fate and fortune have you seen one of those nations of its own motion establish what we, from a Western point of view, call self-government. That is the fact. It is not a question of superiority and inferiority. I suppose a true Eastern sage would say that the working government which we have taken upon ourselves in Egypt and elsewhere is not a work worthy of a philosopher – that it is the dirty work, the inferior work, of carrying on the necessary labour.

Since these facts are facts, Balfour must then go on to the next part of his argument.

Is it a good thing for these great nations – I admit their greatness – that this absolute government should be exercised by us? I think it is a good thing. I think that experience shows that they have got under it far better government than in the whole history of the world they ever had before, and which not only is a benefit to them, but is undoubtedly a benefit to the whole of the West ... We are in Egypt not merely for the sake of Egyptians, though we are there for their sake; we are there also for the sake of Europe at large.

Balfour produces no evidence that Egyptians and “the races with whom we deal” appreciate or even understand the good that is being done them by colonial occupation. It does not occur to Balfour, however, to let the Egyptian speak for himself, since presumably any Egyptian who would speak out is more likely to be “the agitator [who] wishes to raise difficulties” than the good native who overlooks the “difficulties” of foreign domination. And so, having settled the ethical problems, Balfour turns at last to the practical ones. “If it is our business to govern, with or without gratitude, with or without the real and genuine memory of all the loss of which we have relieved the population [Balfour by no means implies, as part of that loss, the loss or at least the indefinite postponement of Egyptian independence] and no vivid imagination of all the benefits which we have given to them; if that is our duty, how is it to be performed?” England exports “our very best to these countries.” These selfless administrators do their work “amidst

tens of thousands of persons belonging to a different creed, a different race, a different discipline, different conditions of life." What makes their work of governing possible is their sense of being supported at home by a government that endorses what they do. Yet

directly the native populations have that instinctive feeling that those with whom they have got to deal have not behind them the might, the authority, the sympathy, the full and ungrudging support of the country which sent them there, those populations lose all that sense of order which is the very basis of their civilisation, just as our officers lose all that sense of power and authority, which is the very basis of everything they can do for the benefit of those among whom they have been sent.

Balfour's logic here is interesting, not least for being completely consistent with the premises of the entire speech. England knows Egypt; Egypt is what England knows; England knows that Egypt cannot have self-government; England confirms that by occupying Egypt; for the Egyptians, Egypt is what England has occupied and now governs; foreign occupation therefore becomes "the very basis" of contemporary Egyptian civilization; Egypt requires, indeed insists upon, British occupation. But if the special intimacy between governor and governed in Egypt is disturbed by Parliament's doubts at home, then "the authority of what ... is the dominant race – and as I think ought to remain the dominant race – has been undermined." Not only does English prestige suffer; "it is vain for a handful of British officials – endow them how you like, give them all the qualities of character and genius you can imagine – it is impossible for them to carry out the great task which in Egypt, not we only, but the civilised world have imposed upon them."<sup>1</sup>

As a rhetorical performance Balfour's speech is significant for the way in which he plays the part of, and represents, a variety of characters. There are of course "the English," for whom the pronoun "we" is used with the full weight of a distinguished, powerful man who feels himself to be representative of all that is best in his nation's history. Balfour can also speak for the civilized world, the West, and the relatively small corps of colonial officials in Egypt. If he does not speak directly for the Orientals, it is because they after all speak another language; yet he knows how they feel since he knows their history, their reliance upon such as he, and their expectations. Still, he does speak for them in the sense that what they might have to say, were they to be asked and might they be able to answer, would somewhat uselessly confirm what is already evident: that they are a subject race, dominated by a race that knows them and what is good for them better than they could possibly know themselves. Their great moments were in the past; they are useful in the modern world only because the powerful and up-to-date empires have effectively brought them out of the wretchedness of their decline and turned them into rehabilitated residents of productive colonies.

Egypt in particular was an excellent case in point, and Balfour was perfectly aware of how much right he had to speak as a member of his country's parliament on behalf of England, the West, Western Civilization, about modern Egypt. For Egypt was not just another colony: it was the vindication of Western imperialism; it was, until its annexation by England, an almost academic example of Oriental backwardness; it was to become the triumph of English knowledge and power. Between 1882, the year in which England occupied Egypt and put an end to the nationalist rebellion of Colonel Arabi, and 1907 England's representative in Egypt, Egypt's master, was Evelyn Baring (also known as "Over-baring"), Lord Cromer. On July 30, 1907, it was Balfour in the Commons who

had supported the project to give Cromer a retirement prize of fifty thousand pounds as a reward for what he had done in Egypt. Cromer *made* Egypt, said Balfour:

Everything he has touched he has succeeded in ... Lord Cromer's services during the past quarter of a century have raised Egypt from the lowest pitch of social and economic degradation until it now stands among Oriental nations, I believe, absolutely alone in its prosperity, financial and moral.<sup>2</sup>

How Egypt's moral prosperity was measured, Balfour did not venture to say. British exports to Egypt equaled those to the whole of Africa; that certainly indicated a sort of financial prosperity, for Egypt and England (somewhat unevenly) together. But what really mattered was the unbroken, all-embracing Western tutelage of an Oriental country, from the scholars, missionaries, businessmen, soldiers, and teachers who prepared and then implemented the occupation to the high functionaries like Cromer and Balfour who saw themselves as providing for, directing, and sometimes even forcing Egypt's rise from Oriental neglect to its present lonely eminence.

If British success in Egypt was as exceptional as Balfour said, it was by no means an inexplicable or irrational success. Egyptian affairs had been controlled according to a general theory expressed both by Balfour in his notions about Oriental civilization and by Cromer in his management of everyday business in Egypt. The most important thing about the theory during the first decade of the twentieth century was that it worked, and worked staggeringly well. The argument, when reduced to its simplest form, was clear, it was precise, it was easy to grasp. There are Westerners, and there are Orientals. The former dominate; the latter must be dominated, which usually means having their land occupied, their internal affairs rigidly controlled, their blood and treasure put at the disposal of one or another Western power. That Balfour and Cromer, as we shall soon see, could strip humanity down to such ruthless cultural and racial essences was not at all an indication of their particular viciousness. Rather it was an indication of how streamlined a general doctrine had become by the time they put it to use – how streamlined and effective.

Unlike Balfour, whose theses on Orientals pretended to objective universality, Cromer spoke about Orientals specifically as what he had ruled or had to deal with, first in India, then for the twenty-five years in Egypt during which he emerged as the paramount consul-general in England's empire. Balfour's "Orientals" are Cromer's "subject races," which he made the topic of a long essay published in the *Edinburgh Review* in January 1908. Once again, knowledge of subject races or Orientals is what makes their management easy and profitable: knowledge gives power, more power requires more knowledge, and so on in an increasingly profitable dialectic of information and control. Cromer's notion is that England's empire will not dissolve if such things as militarism and commercial egotism at home and "free institutions" in the colony (as opposed to British government "according to the Code of Christian morality") are kept in check. For if, according to Cromer, logic is something "the existence of which the Oriental is disposed altogether to ignore," the proper method of ruling is not to impose ultrascientific measures upon him or to force him bodily to accept logic. It is rather to understand his limitations and "endeavor to find, in the contentment of the subject race, a more worthy and, it may be hoped, a stronger bond of union between the rulers and the ruled." Lurking everywhere behind the pacification of the subject race is imperial might, more effective for its refined understanding and infrequent use than for its soldiers, brutal tax gatherers,

and incontinent force. In a word, the Empire must be wise; it must temper its cupidity with selflessness, and its impatience with flexible discipline.

To be more explicit, what is meant when it is said that the commercial spirit should be under some control is this – that in dealing with Indians or Egyptians, or Shilluks, or Zulus, the first question is to consider what these people, who are all, nationally speaking, more or less *in statu pupillari*, themselves think is best in their own interests, although this is a point which deserves serious consideration. But it is essential that each special issue should be decided mainly with reference to what, by the light of Western knowledge and experience tempered by local considerations, we conscientiously think is best for the subject race, without reference to any real or supposed advantage which may accrue to England as a nation, or – as is more frequently the case – to the special interests represented by some one or more influential classes of Englishmen. If the British nation as a whole persistently bears this principle in mind, and insists sternly on its application, though we can never create a patriotism akin to that based on affinity of race or community of language, we may perhaps foster some sort of cosmopolitan allegiance grounded on the respect always accorded to superior talents and unselfish conduct, and on the gratitude derived both from favours conferred and from those to come. There may then at all events be some hope that the Egyptian will hesitate before he throws in his lot with any future Arabi ... Even the Central African savage may eventually learn to chant a hymn in honour of *Astrea Redux*, as represented by the British official who denies him gin but gives him justice. More than this, commerce will gain.<sup>3</sup>

How much “serious consideration” the ruler ought to give proposals from the subject race was illustrated in Cromer’s total opposition to Egyptian nationalism. Free native institutions, the absence of foreign occupation, a self-sustaining national sovereignty: these unsurprising demands were consistently rejected by Cromer, who asserted unambiguously that “the real future of Egypt ... lies not in the direction of a narrow nationalism, which will only embrace native Egyptians ... but rather in that of an enlarged cosmopolitanism.”<sup>4</sup> Subject races did not have it in them to know what was good for them. Most of them were Orientals, of whose characteristics Cromer was very knowledgeable since he had had experience with them both in India and Egypt. One of the convenient things about Orientals for Cromer was that managing them, although circumstances might differ slightly here and there, was almost everywhere nearly the same.<sup>5</sup> This was, of course, because Orientals were almost everywhere nearly the same.

Now at last we approach the long-developing core of essential knowledge, knowledge both academic and practical, which Cromer and Balfour inherited from a century of modern Western Orientalism: knowledge about and knowledge of Orientals, their race, character, culture, history, traditions, society, and possibilities. This knowledge was effective: Cromer believed he had put it to use in governing Egypt. Moreover, it was tested and unchanging knowledge, since “Orientals” for all practical purposes were a Platonic essence, which any Orientalist (or ruler of Orientals) might examine, understand, and expose. Thus in the thirty-fourth chapter of his two-volume work *Modern Egypt*, the magisterial record of his experience and achievement, Cromer puts down a sort of personal canon of Orientalist wisdom:

Sir Alfred Lyall once said to me: “Accuracy is abhorrent to the Oriental mind. Every Anglo-Indian should always remember that maxim.” Want of accuracy, which easily degenerates into untruthfulness, is in fact the main characteristic of the Oriental mind.

The European is a close reasoner; his statements of fact are devoid of any ambiguity; he is a natural logician, albeit he may not have studied logic; he is by nature sceptical and requires proof before he can accept the truth of any proposition; his trained intelligence works like a piece of mechanism. The mind of the Oriental, on the other hand, like his picturesque streets, is eminently wanting in symmetry. His reasoning is of the most slipshod description. Although the ancient Arabs acquired in a somewhat higher degree the science of dialectics, their descendants are singularly deficient in the logical faculty. They are often incapable of drawing the most obvious conclusions from any simple premises of which they may admit the truth. Endeavor to elicit a plain statement of facts from any ordinary Egyptian. His explanation will generally be lengthy, and wanting in lucidity. He will probably contradict himself half-a-dozen times before he has finished his story. He will often break down under the mildest process of cross-examination.

Orientals or Arabs are thereafter shown to be gullible, “devoid of energy and initiative,” much given to “fulsome flattery,” intrigue, cunning, and unkindness to animals; Orientals cannot walk on either a road or a pavement (their disordered minds fail to understand what the clever European grasps immediately, that roads and pavements are made for walking); Orientals are inveterate liars, they are “lethargic and suspicious,” and in everything oppose the clarity, directness, and nobility of the Anglo-Saxon race.<sup>6</sup>

Cromer makes no effort to conceal that Orientals for him were always and only the human material he governed in British colonies. “As I am only a diplomatist and an administrator, whose proper study is also man, but from the point of view of governing him,” Cromer says, “... I content myself with noting the fact that somehow or other the Oriental generally acts, speaks, and thinks in a manner exactly opposite to the European.”<sup>7</sup> Cromer’s descriptions are of course based partly on direct observation, yet here and there he refers to orthodox Orientalist authorities (in particular Ernest Renan and Constantin de Volney) to support his views. To these authorities he also defers when it comes to explaining why Orientals are the way they are. He has no doubt that *any* knowledge of the Oriental will confirm his views, which, to judge from his description of the Egyptian breaking under cross-examination, find the Oriental to be guilty. The crime was that the Oriental was an Oriental, and it is an accurate sign of how commonly acceptable such a tautology was that it could be written without even an appeal to European logic or symmetry of mind. Thus any deviation from what were considered the norms of Oriental behavior was believed to be unnatural; Cromer’s last annual report from Egypt consequently proclaimed Egyptian nationalism to be an “entirely novel idea” and “a plant of exotic rather than of indigenous growth.”<sup>8</sup>

We would be wrong, I think, to underestimate the reservoir of accredited knowledge, the codes of Orientalist orthodoxy, to which Cromer and Balfour refer everywhere in their writing and in their public policy. To say simply that Orientalism was a rationalization of colonial rule is to ignore the extent to which colonial rule was justified in advance by Orientalism, rather than after the fact. Men have always divided the world up into regions having either real or imagined distinction from each other. The absolute demarcation between East and West, which Balfour and Cromer accept with such complacency, had been years, even centuries, in the making. There were of course innumerable voyages of discovery; there were contacts through trade and war. But more than this, since the middle of the eighteenth century there had been two principal elements in the relation between East and West. One was a growing systematic knowledge in Europe about the Orient, knowledge reinforced by the colonial encounter as well as by

the widespread interest in the alien and unusual, exploited by the developing sciences of ethnology, comparative anatomy, philology, and history; furthermore, to this systematic knowledge was added a sizable body of literature produced by novelists, poets, translators, and gifted travelers. The other feature of Oriental-European relations was that Europe was always in a position of strength, not to say domination. There is no way of putting this euphemistically. True, the relationship of strong to weak could be disguised or mitigated, as when Balfour acknowledged the "greatness" of Oriental civilizations. But the essential relationship, on political, cultural, and even religious grounds, was seen – in the West, which is what concerns us here – to be one between a strong and a weak partner.

Many terms were used to express the relation: Balfour and Cromer, typically, used several. The Oriental is irrational, depraved (fallen), childlike, "different"; thus the European is rational, virtuous, mature, "normal." But the way of enlivening the relationship was everywhere to stress the fact that the Oriental lived in a different but thoroughly organized world of his own, a world with its own national, cultural, and epistemological boundaries and principles of internal coherence. Yet what gave the Oriental's world its intelligibility and identity was not the result of his own efforts but rather the whole complex series of knowledgeable manipulations by which the Orient was identified by the West. Thus the two features of cultural relationship I have been discussing come together. Knowledge of the Orient, because generated out of strength, in a sense *creates* the Orient, the Oriental, and his world. In Cromer's and Balfour's language the Oriental is depicted as something one judges (as in a court of law), something one studies and depicts (as in a curriculum), something one disciplines (as in a school or prison), something one illustrates (as in a zoological manual). The point is that in each of these cases the Oriental is *contained* and *represented* by dominating frameworks. Where do these come from?

Cultural strength is not something we can discuss very easily – and one of the purposes of the present work is to illustrate, analyze, and reflect upon Orientalism as an exercise of cultural strength. In other words, it is better not to risk generalizations about so vague and yet so important a notion as cultural strength until a good deal of material has been analyzed first. But at the outset one can say that so far as the West was concerned during the nineteenth and twentieth centuries, an assumption had been made that the Orient and everything in it was, if not patently inferior to, then in need of corrective study by the West. The Orient was viewed as if framed by the classroom, the criminal court, the prison, the illustrated manual. Orientalism, then, is knowledge of the Orient that places things Oriental in class, court, prison, or manual for scrutiny, study, judgment, discipline, or governing.

During the early years of the twentieth century, men like Balfour and Cromer could say what they said, in the way they did, because a still earlier tradition of Orientalism than the nineteenth-century one provided them with a vocabulary, imagery, rhetoric, and figures with which to say it. Yet Orientalism reinforced, and was reinforced by, the certain knowledge that Europe or the West literally commanded the vastly greater part of the earth's surface. The period of immense advance in the institutions and content of Orientalism coincides exactly with the period of unparalleled European expansion; from 1815 to 1914 European direct colonial dominion expanded from about 35 percent of the earth's surface to about 85 percent of it.<sup>9</sup> Every continent was affected, none more so than Africa and Asia. The two greatest empires were the British and the French; allies and partners in some things, in others they were hostile rivals.

In the Orient, from the eastern shores of the Mediterranean to Indochina and Malaya, their colonial possessions and imperial spheres of influence were adjacent, frequently overlapped, often were fought over. But it was in the Near Orient, the lands of the Arab Near East, where Islam was supposed to define cultural and racial characteristics, that the British and the French encountered each other and “the Orient” with the greatest intensity, familiarity, and complexity. For much of the nineteenth century, as Lord Salisbury put it in 1881, their common view of the Orient was intricately problematic: “When you have got a … faithful ally who is bent on meddling in a country in which you are deeply interested – you have three courses open to you. You may renounce – or monopolize – or share. Renouncing would have been to place the French across our road to India. Monopolizing would have been very near the risk of war. So we resolved to share.”<sup>10</sup>

And share they did, in ways that we shall investigate presently. What they shared, however, was not only land or profit or rule; it was kind of intellectual power I have been calling Orientalism. In a sense Orientalism was a library or archive of information commonly and, in some of its aspects, unanimously held. What bound the archive together was a family of ideas<sup>11</sup> and a unifying set of values proven in various ways to be effective. These ideas explained the behavior of Orientals; they supplied Orientals with a mentality, a genealogy, an atmosphere; most important, they allowed Europeans to deal with and even to see Orientals as a phenomenon possessing regular characteristics. But like any set of durable ideas, Orientalist notions influenced the people who were called Orientals as well as those called Occidental, European, or Western; in short, Orientalism is better grasped as a set of constraints upon and limitations of thought than it is simply as a positive doctrine. If the essence of Orientalism is the ineradicable distinction between Western superiority and Oriental inferiority, then we must be prepared to note how in its development and subsequent history Orientalism deepened and even hardened the distinction. When it became common practice during the nineteenth century for Britain to retire its administrators from India and elsewhere once they had reached the age of fifty-five, then a further refinement in Orientalism had been achieved; no Oriental was ever allowed to see a Westerner as he aged and degenerated, just as no Westerner needed ever to see himself, mirrored in the eyes of the subject race, as anything but a vigorous, rational, ever-alert young Raj.<sup>12</sup>

Orientalist ideas took a number of different forms during the nineteenth and twentieth centuries. First of all, in Europe there was a vast literature about the Orient inherited from the European past. What is distinctive about the late eighteenth and early nineteenth centuries, which is where this study assumes modern Orientalism to have begun, is that an Oriental renaissance took place, as Edgar Quinet phrased it.<sup>13</sup> Suddenly it seemed to a wide variety of thinkers, politicians, and artists that a new awareness of the Orient, which extended from China to the Mediterranean, had arisen. This awareness was partly the result of newly discovered and translated Oriental texts in languages like Sanskrit, Zend, and Arabic; it was also the result of a newly perceived relationship between the Orient and the West. For my purposes here, the keynote of the relationship was set for the Near East and Europe by the Napoleonic invasion of Egypt in 1798, an invasion which was in many ways the very model of a truly scientific appropriation of one culture by another, apparently stronger one. For with Napoleon’s occupation of Egypt processes were set in motion between East and West that still dominate our contemporary cultural and political perspectives. And the Napoleonic expedition, with its great collective monument of erudition, the *Description de l’Egypte*, provided a scene or setting for

Orientalism, since Egypt and subsequently the other Islamic lands were viewed as the live province, the laboratory, the theater of effective Western knowledge about the Orient. I shall return to the Napoleonic adventure a little later.

With such experiences as Napoleon's the Orient as a body of knowledge in the West was modernized, and this is a second form in which nineteenth- and twentieth-century Orientalism existed. From the outset of the period I shall be examining there was everywhere amongst Orientalists the ambition to formulate their discoveries, experiences, and insights suitably in modern terms, to put ideas about the Orient in very close touch with modern realities. Renan's linguistic investigations of Semitic in 1848, for example, were couched in a style that drew heavily for its authority upon contemporary comparative grammar, comparative anatomy, and racial theory; these lent his Orientalism prestige and – the other side of the coin – made Orientalism vulnerable, as it has been ever since, to modish as well as seriously influential currents of thought in the West. Orientalism has been subjected to imperialism, positivism, utopianism, historicism, Darwinism, racism, Freudianism, Marxism, Spenglerism. But Orientalism, like many of the natural and social sciences, has had "paradigms" of research, its own learned societies, its own Establishment. During the nineteenth century the field increased enormously in prestige, as did also the reputation and influence of such institutions as the Société asiatique, the Royal Asiatic Society, the Deutsche Morgenländische Gesellschaft, and the American Oriental Society. With the growth of these societies went also an increase, all across Europe, in the number of professorships in Oriental studies; consequently there was an expansion in the available means for disseminating Orientalism. Orientalist periodicals, beginning with the *Fundgraben des Orients* (1809), multiplied the quantity of knowledge as well as the number of specialties.

Yet little of this activity and very few of these institutions existed and flourished freely, for in a third form in which it existed, Orientalism imposed limits upon thought about the Orient. Even the most imaginative writers of an age, men like Flaubert, Nerval, or Scott, were constrained in what they could either experience of or say about the Orient. For Orientalism was ultimately a political vision of reality whose structure promoted the difference between the familiar (Europe, the West, "us") and the strange (the Orient, the East, "them"). This vision in a sense created and then served the two worlds thus conceived. Orientals lived in their world, "we" lived in ours. The vision and material reality propped each other up, kept each other going. A certain freedom of intercourse was always the Westerner's privilege; because his was the stronger culture, he could penetrate, he could wrestle with, he could give shape and meaning to the great Asiatic mystery, as Disraeli once called it. Yet what has, I think, been previously overlooked is the constricted vocabulary of such a privilege, and the comparative limitations of such a vision. My argument takes it that the Orientalist reality is both antihuman and persistent. Its scope, as much as its institutions and all-pervasive influence, lasts up to the present.

But how did and does Orientalism work? How can one describe it all together as a historical phenomenon, a way of thought, a contemporary problem, and a material reality? Consider Cromer again, an accomplished technician of empire but also a beneficiary of Orientalism. He can furnish us with a rudimentary answer. In "The Government of Subject Races" he wrestles with the problem of how Britain, a nation of individuals, is to administer a wide-flung empire according to a number of central principles. He contrasts the "local agent," who has both a specialist's knowledge of the native and an Anglo-Saxon individuality, with the central authority at home in London. The former

may “treat subjects of local interest in a manner calculated to damage, or even to jeopardize, Imperial interests. The central authority is in a position to obviate any danger arising from this cause.” Why? Because this authority can “ensure the harmonious working of the different parts of the machine” and “should endeavour, so far as is possible, to realise the circumstances attendant on the government of the dependency.”<sup>14</sup> The language is vague and unattractive, but the point is not hard to grasp. Cromer envisions a seat of power in the West, and radiating out from it towards the East a great embracing machine, sustaining the central authority yet commanded by it. What the machine’s branches feed into it in the East – human material, material wealth, knowledge, what have you – is processed by the machine, then converted into more power. The specialist does the immediate translation of mere Oriental matter into useful substance: the Oriental becomes, for example, a subject race, an example of an “Oriental” mentality, all for the enhancement of the “authority” at home. “Local interests” are Orientalist special interests, the “central authority” is the general interest of the imperial society as a whole. What Cromer quite accurately sees is the management of knowledge by society, the fact that knowledge – no matter how special – is regulated first by the local concerns of a specialist, later by the general concerns of a social system of authority. The interplay between local and central interests is intricate, but by no means indiscriminate.

In Cromer’s own case as an imperial administrator the “proper study is also man,” he says. When Pope proclaimed the proper study of mankind to be man, he meant all men, including “the poor Indian”; whereas Cromer’s “also” reminds us that certain men, such as Orientals, can be singled out as the subject for *proper* study. The proper study – in this sense – of Orientals is Orientalism, properly separate from other forms of knowledge, but finally useful (because finite) for the material and social reality enclosing all knowledge at any time, supporting knowledge, providing it with uses. An order of sovereignty is set up from East to West, a mock chain of being whose clearest form was given once by Kipling:

Mule, horse, elephant, or bullock, he obeys his driver, and the driver his sergeant, and the sergeant his lieutenant, and the lieutenant his captain, and the captain his major, and the major his colonel, and the colonel his brigadier commanding three regiments, and the brigadier his general, who obeys the Viceroy, who is the servant of the Empress.<sup>15</sup>

As deeply forged as is this monstrous chain of command, as strongly managed as is Cromer’s “harmonious working,” Orientalism can also express the strength of the West and the Orient’s weakness – as seen by the West. Such strength and such weakness are as intrinsic to Orientalism as they are to any view that divides the world into large general divisions, entities that coexist in a state of tension produced by what is believed to be radical difference.

For that is the main intellectual issue raised by Orientalism. Can one divide human reality, as indeed human reality seems to be genuinely divided, into clearly different cultures, histories, traditions, societies, even races, and survive the consequences humanly? By surviving the consequences humanly, I mean to ask whether there is any way of avoiding the hostility expressed by the division, say, of men into “us” (Westerners) and “they” (Orientals). For such divisions are generalities whose use historically and actually has been to press the importance of the distinction between some men and some other men, usually towards not especially admirable ends.

# CHAPTER 3

## An Image of Africa: Racism in Conrad's *Heart of Darkness*

*Chinua Achebe*

The mid-twentieth century witnessed a remarkable turn in human history, as the colonized peoples of Africa, Asia, and Europe revolted against their colonial oppressors and achieved independence. That major change led to a reconsideration of the culture that helped sustain colonialism. Joseph Conrad's *Heart of Darkness* had been taught as an example of an interesting narrative form, and nobody seemed to notice that it was a remarkably racist and quite reactionary text. Conrad, a reactionary monarchist, may have been capable of great narrative irony, but he was also capable of depicting Africans as sub-human animals whose "darkness" he summoned as a taunt against European liberal opponents of colonialism. He was critical of weak-kneed colonialism, which he measured negatively against an ideal of a more manly and true imperialism. Nigerian writer, Chinua Achebe, was raised under colonial rule and experienced the mistreatment accorded native Africans under imperial rule. His take on Conrad is therefore very different from that of those who celebrated his narrative irony.

It was a fine autumn morning at the beginning of this academic year such as encouraged friendliness to passing strangers. Brisk youngsters were hurrying in all directions, many of them obviously freshmen in their first flush of enthusiasm. An older man, going the same way as I, turned and remarked to me how very young they came these days. I agreed. Then he asked me if I was a student too. I said no, I was a teacher. What did I teach? African literature. Now that was funny, he said, because he never had thought of Africa as having that kind of stuff, you know. By this time I was walking much faster. "Oh well," I heard him say finally, behind me, "I guess I have to take your course to find out."

A few weeks later I received two very touching letters from high school children in Yonkers, New York, who – bless their teacher – had just read *Things Fall Apart*. One of them was particularly happy to learn about the customs and superstitions of an African tribe.

*Original publication details:* Chinua Achebe, "An Image of Africa," from *The Chancellor's Lecture Series*, 1974–5, printed in *The Massachusetts Review* (1976), pp. 782–794. Amherst 1976. Reproduced with permission from The Wylie Agency (UK) Ltd.

I propose to draw from these rather trivial encounters rather heavy conclusions which at first sight might seem somewhat out of proportion to them: But only at first sight.

The young fellow from Yonkers, perhaps partly on account of his age but I believe also for much deeper and more serious reasons, is obviously unaware that the life of his own tribesmen in Yonkers, New York, is full of odd customs and superstitions and, like everybody else in his culture, imagines that he needs a trip to Africa to encounter those things.

The other person being fully my own age could not be excused on the grounds of his years. Ignorance might be a more likely reason; but here again I believe that something more willful than a mere lack of information was at work. For did not that erudite British historian and Regius Professor at Oxford, Hugh Trevor Roper, pronounce a few years ago that African history did not exist?

If there is something in these utterances more than youthful experience, more than a lack of factual knowledge, what is it? Quite simply it is the desire – one might indeed say the need – in Western psychology to set Africa up as a foil in Europe, a place of negations at once remote and vaguely familiar in comparison with which Europe's own state of spiritual grace will be manifest.

This need is not new: which should relieve us of considerable responsibility and perhaps make us even willing to look at this phenomenon dispassionately. I have neither the desire nor, indeed, the competence to do so with the tools of the social and biological sciences. But, I can respond, as a novelist, to one famous book of European fiction, Joseph Conrad's *Heart of Darkness*, which better than any other work I know displays that Western desire and need which I have just spoken about. Of course, there are whole libraries of books devoted to the same purpose, but most of them are so obvious and so crude that few people worry about them today. Conrad, on the other hand, is undoubtedly one of the great stylists of modern fiction and a good storyteller into the bargain. His contribution therefore falls automatically into a different class – permanent literature – read and taught and constantly evaluated by serious academics. *Heart of Darkness* is indeed so secure today that a leading Conrad scholar has numbered it “among the half-dozen greatest short novels in the English language.”<sup>1</sup> I will return to this critical option in due course because it may seriously modify my earlier suppositions about who may or may not be guilty in the things of which I will now speak.

*Heart of Darkness* projects the image of Africa as “the other world,” the antithesis of Europe and therefore of civilization, a place where a man’s vaunted intelligence and refinement are finally mocked by triumphant bestiality. The book opens on the River Thames, tranquil, resting peacefully “at the decline of day after ages of good service done to the race that peopled its banks.” But the actual story takes place on the River Congo, the very antithesis of the Thames. The River Congo is quite decidedly not a River Emeritus. It has rendered no service and enjoys no old-age pension. We are told that “going up that river was like travelling back to the earliest beginning of the world.”

Is Conrad saying then that these two rivers are very different, one good, the other bad? Yes, but that is not the real point. What actually worries Conrad is the lurking hint of kinship, of common ancestry. For the Thames, too, “has been one of the dark places of the earth.” It conquered its darkness, of course, and is now at peace. But if it were to visit its primordial relative, the Congo, it would run the terrible risk of hearing grotesque, suggestive echoes of its own forgotten darkness, and of falling victim to an avenging recrudescence of the mindless frenzy of the first beginnings.

I am not going to waste your time with examples of Conrad's famed evocation of the African atmosphere. In the final consideration it amounts to no more than a steady, ponderous, fake-ritualistic repetition of two sentences, one about silence and the other about frenzy. An example of the former is "It was the stillness of an implacable force brooding over an inscrutable intention" and of the latter, "The steamer toiled along slowly on the edge of a black and incomprehensible frenzy." Of course, there is a judicious change of adjective from time to time so that instead of "inscrutable," for example, you might have "unspeakable," etc., etc.

The eagle-eyed English critic, F. R. Leavis, drew attention nearly thirty years ago to Conrad's "adjectival insistence upon inexpressible and incomprehensible mystery." That insistence must not be dismissed lightly, as many Conrad critics have tended to do, as a mere stylistic flaw. For it raises serious questions of artistic good faith. When a writer, while pretending to record scenes, incidents and their impact, is in reality engaged in inducing hypnotic stupor in his readers through a bombardment of emotive words and other forms of trickery much more has to be at stake than stylistic felicity. Generally, normal readers are well armed to detect and resist such underhand activity. But Conrad chose his subject well – one which was guaranteed not to put him in conflict with the psychological predisposition of his readers or raise the need for him to contend with their resistance. He chose the role of purveyor of comforting myths.

The most interesting and revealing passages in *Heart of Darkness* are, however, about people. I must quote a long passage from the middle of the story in which representatives of Europe in a steamer going down the Congo encounter the denizens of Africa:

We were wanderers on a prehistoric earth, on an earth that wore the aspect of an unknown planet. We could have fancied ourselves the first of men taking possession of an accursed inheritance, to be subdued at the cost of profound anguish and of excessive toil. But suddenly, as we struggled round a bend, there would be a glimpse of rush walls, of peaked grass-roofs, a burst of yells, a whirl of black limbs, a mass of hands clapping, of feet stamping, of bodies swaying, of eyes rolling, under the droop of heavy and motionless foliage. The steamer toiled along slowly on the edge of a black and incomprehensible frenzy. The prehistoric man was cursing us, praying to us, welcoming us – who could tell? We were cut off from the comprehension of our surroundings; we glided past like phantoms, wondering and secretly appalled, as sane men would be before an enthusiastic outbreak in a madhouse. We could not remember because we were travelling in the night of first ages, of those ages that are gone, leaving hardly a sign – and no memories.

The earth seemed unearthly. We are accustomed to look upon the shackled form of a conquered monster, but there – there you could look at a thing monstrous and free. It was unearthly, and the men were – No, they were not inhuman. Well, you know, that was the worst of it – this suspicion of their not being inhuman. It would come slowly to one. They howled and leaped, and spun, and made horrid faces; but what thrilled you was just the thought of your remote kinship with this wild and passionate uproar. Ugly. Yes, it was ugly enough; but if you were man enough you would admit to yourself that there was in you just the faintest trace of a response to the terrible frankness of that noise, a dim suspicion of there being a meaning in it which you – you so remote from the night of first ages – could comprehend.

Herein lies the meaning of *Heart of Darkness* and the fascination it holds over the Western mind: "What thrilled you was just the thought of their humanity – like yours.... Ugly."

Having shown us Africa in the mass, Conrad then zeros in on a specific example, giving us one of his rare descriptions of an African who is not just limbs or rolling eyes:

And between whiles I had to look after the savage who was fireman. He was an improved specimen; he could fire up a vertical boiler. He was there below me, and, upon my word, to look at him was as edifying as seeing a dog in a parody of breeches and a feather hat, walking on his hind legs. A few months of training had done for that really fine chap. He squinted at the steam gauge and at the water gauge with an evident effort of intrepidity – and he had filed his teeth, too, the poor devil, and the wool of his pate shaved into queer patterns, and three ornamental scars on each of his cheeks. He ought to have been clapping his hands and stamping his feet on the bank, instead of which he was hard at work, a thrall to strange witchcraft, full of improving knowledge.

As everybody knows, Conrad is a romantic on the side. He might not exactly admire savages clapping their hands and stamping their feet but they have at least the merit of being in their place, unlike this dog in a parody of breeches. For Conrad, things (and persons) being in their place is of the utmost importance.

Towards the end of the story, Conrad lavishes great attention quite unexpectedly on an African woman who has obviously been some kind of mistress to Mr. Kurtz and now presides (if I may be permitted a little imitation of Conrad) like a formidable mystery over the inexorable imminence of his departure:

She was savage and superb, wild-eyed and magnificent ... She stood looking at us without a stir and like the wilderness itself, with an air of brooding over an inscrutable purpose.

This Amazon is drawn in considerable detail, albeit of a predictable nature, for two reasons. First, she is in her place and so can win Conrad's special brand of approval; and second, she fulfills a structural requirement of the story; she is a savage counterpart to the refined, European woman with whom the story will end:

She came forward, all in black with a pale head, floating towards me in the dusk. She was in mourning.... She took both my hands in hers and murmured, "I had heard you were coming" ... She had a mature capacity for fidelity, for belief, for suffering.

The difference in the attitude of the novelist to these two women is conveyed in too many direct and subtle ways to need elaboration. But perhaps the most significant difference is the one implied in the author's bestowal of human expression to the one and the withholding of it from the other. It is clearly not part of Conrad's purpose to confer language on the "rudimentary souls" of Africa. They only "exchanged short grunting phrases" even among themselves but mostly they were too busy with their frenzy. There are two occasions in the book, however, when Conrad departs somewhat from his practice and confers speech, even English speech, on the savages. The first occurs when cannibalism gets the better of them:

"Catch 'im," he snapped, with a bloodshot widening of his eyes and a flash of sharp white teeth – "catch 'im. Give 'im to us." "To you, eh?" I asked; "what would you do with them?" "Eat 'im!" he said curtly ...

The other occasion is the famous announcement:

Mistah Kurtz – he dead.

At first sight, these instances might be mistaken for unexpected acts of generosity from Conrad. In reality, they constitute some of his best assaults. In the case of the cannibals, the incomprehensible grunts that had thus far served them for speech suddenly proved inadequate for Conrad's purpose of letting the European glimpse the unspeakable craving in their hearts. Weighing the necessity for consistency in the portrayal of the dumb brutes against the sensational advantages of securing their conviction by clear, unambiguous evidence issuing out of their own mouth, Conrad chose the latter. As for the announcement of Mr. Kurtz's death by the "insolent black head of the doorway," what better or more appropriate *finis* could be written to the horror story of that wayward child of civilization who willfully had given his soul to the powers of darkness and "taken a high seat amongst the devils of the land" than the proclamation of his physical death by the forces he had joined?

It might be contended, of course, that the attitude to the African in *Heart of Darkness* is not Conrad's but that of his fictional narrator, Marlow, and that far from endorsing it Conrad might indeed be holding it up to irony and criticism. Certainly, Conrad appears to go to considerable pains to set up layers of insulation between himself and the moral universe of his story. He has, for example, a narrator behind a narrator. The primary narrator is Marlow but his account is given to us through the filter of a second, shadowy person. But if Conrad's intention is to draw a *cordon sanitaire* between himself and the moral and psychological malaise of his narrator, his care seems to me totally wasted because he neglects to hint however subtly or tentatively at an alternative frame of reference by which we may judge the actions and opinions of his characters. It would not have been beyond Conrad's power to make that provision if he had thought it necessary. Marlow seems to me to enjoy Conrad's complete confidence – a feeling reinforced by the close similarities between their careers.

Marlow comes through to us not only as a witness of truth, but one holding those advanced and humane views appropriate to the English liberal tradition which required all Englishmen of decency to be deeply shocked by atrocities in Bulgaria or the Congo of King Leopold of the Belgians or wherever. Thus Marlow is able to toss out such bleeding-heart sentiments as these:

They were all dying slowly – it was very clear. They were not enemies, they were not criminals, they were nothing earthly now – nothing but black shadows of disease and starvation, lying confusedly in the greenish gloom. Brought from all the recesses of the coast in all the legality of time contracts, lost in uncongenial surroundings, fed on unfamiliar food, they sickened, became inefficient, and were then allowed to crawl away and rest.

The kind of liberalism espoused here by Marlow/Conrad touched all the best minds of the age in England, Europe, and America. It took different forms in the minds of different people but almost always managed to sidestep the ultimate question of equality between white people and black people. That extraordinary missionary, Albert Schweitzer, who sacrificed brilliant careers in music and theology in Europe for a life of service to Africans in much the same area as Conrad writes about, epitomizes the ambivalence. In a comment which I have often quoted but must quote one last time Schweitzer says: "The African is indeed my brother but my junior brother." And so he proceeded to build a hospital appropriate to the needs of junior brothers with standards of hygiene reminiscent of medical practice in the days before the germ theory of disease came into being.

Naturally, he became a sensation in Europe and America. Pilgrims flocked, and I believe still flock even after he has passed on, to witness the prodigious miracle in Lamberene, on the edge of the primeval forest.

Conrad's liberalism would not take him quite as far as Schweitzer's, though. He would not use the word "brother" however qualified; the farthest he would go was "kinship." When Marlow's African helmsman falls down with a spear in his heart he gives his white master one final disquieting look.

And the intimate profundity of that look he gave me when he received his hurt remains to this day in my memory – like a claim of distant kinship affirmed in a supreme moment.

It is important to note that Conrad, careful as ever with his words, is not talking so much about *distant kinship* as about someone *laying a claim* on it. The black man lays a claim on the white man which is well-nigh intolerable. It is the laying of this claim which frightens and at the same time fascinates Conrad, "... the thought of their humanity – like yours ... Ugly."

The point of my observations should be quite clear by now, namely, that Conrad was a bloody racist. That this simple truth is glossed over in criticism of his work is due to the fact that white racism against Africa is such a normal way of thinking that its manifestations go completely undetected. Students of *Heart of Darkness* will often tell you that Conrad is concerned not so much with Africa as with the deterioration of one European mind caused by solitude and sickness. They will point out to you that Conrad is, if anything, less charitable to the Europeans in the story than he is to the natives. A Conrad student told me in Scotland last year that Africa is merely a setting for the disintegration of the mind of Mr. Kurtz.

Which is partly the point: Africa as setting and backdrop which eliminates the African as human factor. Africa as a metaphysical battlefield devoid of all recognizable humanity, into which the wandering European enters at his peril. Of course, there is a preposterous and perverse kind of arrogance in thus reducing Africa to the role of props for the breakup of one petty European mind. But that is not even the point. The real question is the dehumanization of Africa and Africans which this age-long attitude has fostered and continues to foster in the world. And the question is whether a novel which celebrates this dehumanization, which depersonalizes a portion of the human race, can be called a great work of art. My answer is: No, it cannot. I would not call that man an artist, for example, who composes an eloquent instigation to one people to fall upon another and destroy them. No matter how striking his imagery or how beautiful his cadences fall such a man is no more a great artist than another may be called a priest who reads the mass backwards or a physician who poisons his patients. All those men in Nazi Germany who lent their talent to the service of virulent racism whether in science, philosophy or the arts have generally and rightly been condemned for their perversions. The time is long overdue for taking a hard look at the work of creative artists who apply their talents, alas often considerable as in the case of Conrad, to set people against people. This, I take it, is what Yevtushenko is after when he tells us that a poet cannot be a slave trader at the same time, and gives the striking example of Arthur Rimbaud who was fortunately honest enough to give up any pretenses to poetry when he opted for slave trading. For poetry surely can only be on the side of man's deliverance and not his enslavement; for the brotherhood and unity of all mankind and against the doctrines of Hitler's master races or Conrad's "rudimentary souls."

Last year was the 50th anniversary of Conrad's death. He was born in 1857, the very year in which the first Anglican missionaries were arriving among my own people in Nigeria. It was certainly not his fault that he lived his life at a time when the reputation of the black man was at a particularly low level. But even after due allowances have been made for all the influences of contemporary prejudice on his sensibility, there remains still in Conrad's attitude a residue of antipathy to black people which his peculiar psychology alone can explain. His own account of his first encounter with a black man is very revealing:

A certain enormous buck nigger encountered in Haiti fixed my conception of blind, furious, unreasoning rage, as manifested in the human animal to the end of my days. Of the nigger I used to dream for years afterwards.

Certainly, Conrad had a problem with niggers. His inordinate love of that word itself should be of interest to psychoanalysts. Sometimes his fixation on blackness is equally interesting as when he gives us this brief description:

A black figure stood up, strode on long black legs, waving long black arms.<sup>2</sup>

as though we might expect a black figure striding along on black legs to have *white* arms! But so unrelenting is Conrad's obsession.

As a matter of interest Conrad gives us in *A Personal Record* what amounts to a companion piece to the buck nigger of Haiti. At the age of sixteen Conrad encountered his first Englishman in Europe. He calls him "my unforgettable Englishman" and describes him in the following manner:

[his] calves exposed to the public gaze ... dazzled the beholder by the splendor of their marble-like condition and their rich tone of young ivory ... The light of a headlong, exalted satisfaction with the world of men ... illumined his face ... and triumphant eyes. In passing he cast a glance of kindly curiosity and a friendly gleam of big, sound, shiny teeth ... his white calves twinkled sturdily.<sup>3</sup>

Irrational love and irrational hate jostling together in the heart of that tormented man. But whereas irrational love may at worst engender foolish acts of indiscretion, irrational hate can endanger the life of the community. Naturally, Conrad is a dream for psychoanalytic critics. Perhaps the most detailed study of him in this direction is by Bernard C. Meyer, M.D. In this lengthy book, Dr. Meyer follows every conceivable lead (and sometimes inconceivable ones) to explain Conrad. As an example, he gives us long disquisitions on the significance of hair and hair-cutting in Conrad. And yet not even one word is spared for his attitude to black people. Not even the discussion of Conrad's antisemitism was enough to spark off in Dr. Meyer's mind those other dark and explosive thoughts. Which only leads one to surmise that Western psychoanalysts must regard the kind of racism displayed by Conrad as absolutely normal despite the profoundly important work done by Frantz Fanon in the psychiatric hospitals of French Algeria.

Whatever Conrad's problems were, you might say he is now safely dead. Quite true. Unfortunately, his heart of darkness plagues us still. Which is why an offensive and totally deplorable book can be described by a serious scholar as "among the half dozen greatest short novels in the English language," and why it is today perhaps the most

commonly prescribed novel in the twentieth-century literature courses in our own English Department here. Indeed the time is long overdue for a hard look at things.

There are two probable grounds on which what I have said so far may be contested. The first is that it is no concern of fiction to please people about whom it is written. I will go along with that. But I am not talking about pleasing people. I am talking about a book which parades in the most vulgar fashion prejudices and insults from which a section of mankind has suffered untold agonies and atrocities in the past and continues to do so in many ways and many places today. I am talking about a story in which the very humanity of black people is called in question. It seems to me totally inconceivable that great art or even good art could possibly reside in such unwholesome surroundings.

Secondly, I may be challenged on the grounds of actuality. Conrad, after all, sailed down the Congo in 1890 when my own father was still a babe in arms, and recorded what he saw. How could I stand up in 1975, fifty years after his death and purport to contradict him? My answer is that as a sensible man I will not accept just any traveller's tales solely on the grounds that I have not made the journey myself. I will not trust the evidence even of a man's very eyes when I suspect them to be as jaundiced as Conrad's. And we also happen to know that Conrad was, in the words of his biographer, Bernard C. Meyer, "notoriously inaccurate in the rendering of his own history."<sup>4</sup>

But more important by far is the abundant testimony about Conrad's savages which we could gather if we were so inclined from other sources and which might lead us to think that these people must have had other occupations besides merging into the evil forest or materializing out of it simply to plague Marlow and his dispirited band. For as it happened, soon after Conrad had written his book an event of far greater consequence was taking place in the art world of Europe. This is how Frank Willett, a British art historian, describes it:

Gauguin had gone to Tahiti, the most extravagant individual act of turning to a non-European culture in the decades immediately before and after 1900, when European artists were avid for new artistic experiences, but it was only about 1904–5 that African art began to make its distinctive impact. One piece is still identifiable; it is a mask that had been given to Maurice Vlaminck in 1905. He records that Derain was "speechless" and "stunned" when he saw it, bought it from Vlaminck and in turn showed it to Picasso and Matisse, who were also greatly affected by it. Ambroise Vollard then borrowed it and had it cast in bronze ...

The revolution of twentieth century art was under way!<sup>5</sup>

The mask in question was made by other savages living just north of Conrad's River Congo. They have a name, the Fang people, and are without a doubt among the world's greatest masters of the sculptured form. As you might have guessed, the event to which Frank Willett refers marked the beginning of cubism and the infusion of new life into European art that had run completely out of strength.

The point of all this is to suggest that Conrad's picture of the people of the Congo seems grossly inadequate even at the height of their subjection to the ravages of King Leopold's International Association for the Civilization of Central Africa. Travellers with closed minds can tell us little except about themselves. But even those not blinkered, like Conrad, with xenophobia, can be astonishingly blind.

Let me digress a little here. One of the greatest and most intrepid travellers of all time, Marco Polo, journeyed to the Far East from the Mediterranean in the thirteenth century and spent twenty years in the court of Kublai Khan in China. On his return to

Venice he set down in his book entitled *Description of the World* his impressions of the peoples and places and customs he had seen. There are at least two extraordinary omissions in his account. He says nothing about the art of printing unknown as yet in Europe but in full flower in China. He either did not notice it at all or if he did, failed to see what use Europe could possibly have for it. Whatever reason, Europe had to wait another hundred years for Gutenberg. But even more spectacular was Marco Polo's omission of any reference to the Great Wall of China nearly 4000 miles long and already more than 1000 years old at the time of his visit. Again, he may not have seen it; but the Great Wall of China is the only structure built by man which is visible from the moon!<sup>16</sup> Indeed, travellers can be blind.

As I said earlier, Conrad did not originate the image of Africa which we find in his book. It was and is the dominant image of Africa in the Western imagination and Conrad merely brought the peculiar gifts of his own mind to bear on it. For reasons which can certainly use close psychological inquiry, the West seems to suffer deep anxieties about the precariousness of its civilization and to have a need for constant reassurance by comparing it with Africa. If Europe, advancing in civilization, could cast a backward glance periodically at Africa trapped in primordial barbarity, it could say with faith and feeling: There go I but for the grace of God. Africa is to Europe as the picture is to Dorian Gray – a carrier onto whom the master unloads his physical and moral deformities so that he may go forward, erect and immaculate. Consequently, Africa is something to be avoided just as the picture has to be hidden away to safeguard the man's jeopardous integrity. Keep away from Africa, or else! Mr. Kurtz of *Heart of Darkness* should have heeded that warning and the prowling horror in his heart would have kept its place, chained to its lair. But he foolishly exposed himself to the wild irresistible allure of the jungle and lo! the darkness found him out.

In my original conception of this talk I had thought to conclude it nicely on an appropriately positive note in which I would suggest from my privileged position in African and Western culture some advantages the West might derive from Africa once it rid its mind of old prejudices and began to look at Africa not through a haze of distortions and cheap mystification but quite simply as a continent of people – not angels, but not rudimentary souls either – just people, often highly gifted people and often strikingly successful in their enterprise with life and society. But as I thought more about the stereotype image, about its grip and pervasiveness, about the willful tenacity with which the West holds it to its heart; when I thought of your television and the cinema and newspapers, about books read in schools and out of school, of churches preaching to empty pews about the need to send help to the heathen in Africa, I realized that no easy optimism was possible. And there is something totally wrong in offering bribes to the West in return for its good opinion of Africa. Ultimately, the abandonment of unwholesome thoughts must be its own and only reward. Although I have used the word *willful* a few times in this talk to characterize the West's view of Africa it may well be that what is happening at this stage is more akin to reflex action than calculated malice. Which does not make the situation more, but less, hopeful. Let me give you one last and really minor example of what I mean.

Last November the *Christian Science Monitor* carried an interesting article written by its Education Editor on the serious psychological and learning problems faced by little children who speak one language at home and then go to school where something else is spoken. It was a wide-ranging article taking in Spanish-speaking children in this country, the children of migrant Italian workers in Germany, the quadrilingual

phenomenon in Malaysia and so on. And all this while the article speaks unequivocally about *language*. But then out of the blue sky comes this:

In London there is an enormous immigration of children who speak Indian or Nigerian dialects, or some other native language.<sup>7</sup>

I believe that the introduction of *dialects*, which is technically erroneous in the context, is almost a reflex action caused by an instinctive desire of the writer to downgrade the discussion to the level of Africa and India. And this is quite comparable to Conrad's withholding of language from his rudimentary souls. Language is too grand for these chaps; let's give them dialects. In all this business a lot of violence is inevitably done to words and their meaning. Look at the phrase "native language" in the above excerpt. Surely the only native language possible in London is Cockney English. But our writer obviously means something else – something Indians and Africans speak.

Perhaps a change will come. Perhaps this is the time when it can begin, when the high optimism engendered by the breathtaking achievements of Western science and industry is giving way to doubt and even confusion. There is just the possibility that Western man may begin to look seriously at the achievements of other people. I read in the papers the other day a suggestion that what America needs at this time is somehow to bring back the extended family. And I saw in my mind's eye future African Peace Corps Volunteers coming to help you set up the system.

Seriously, although the work which needs to be done may appear too daunting, I believe that it is not one day too soon to begin. And where better than at a University?

# CHAPTER 4

## Three Women’s Texts and a Critique of Imperialism

*Gayatri Chakravorty Spivak*

Gayatri Chakravorty Spivak has written widely on Post-Colonialism, feminism, and Post-Structuralist literary theory. In this 1986 essay, she criticizes American feminists for ignoring the figure of Bertha Mason in Charlotte Brontë's *Jane Eyre*, and she offers an alternative to the dominant liberal individualism of US feminism that takes the historical reality of imperialism and colonialism into account.

It should not be possible to read nineteenth-century British literature without remembering that imperialism, understood as England's social mission, was a crucial part of the cultural representation of England to the English. The role of literature in the production of cultural representation should not be ignored. These two obvious "facts" continue to be disregarded in the reading of nineteenth-century British literature. This itself attests to the continuing success of the imperialist project, displaced and dispersed into more modern forms.

If these "facts" were remembered, not only in the study of British literature but in the study of the literatures of the European colonizing cultures of the great age of imperialism, we would produce a narrative, in literary history, of the "worlding" of what is now called "the Third World." To consider the Third World as distant cultures, exploited but with rich intact literary heritages waiting to be recovered, interpreted, and curricularized in English translation fosters the emergence of "the Third World" as a signifier that allows us to forget that "worlding," even as it expands the empire of the literary discipline.<sup>1</sup>

It seems particularly unfortunate when the emergent perspective of feminist criticism reproduces the axioms of imperialism. A basically isolationist admiration for the literature of the female subject in Europe and Anglo-America establishes the high feminist norm. It is supported and operated by an information-retrieval approach

*Original publication details:* Gayatri Chakravorty Spivak, "Three Women's Texts and a Critique of Imperialism" from *Race, Writing and Difference*, ed. H.L. Gates, pp. 262–80. University of Chicago Press, 1987. Reproduced with permission from Gayatri Chakravorty Spivak.

to “Third World” literature which often employs a deliberately “nontheoretical” methodology with self-conscious rectitude.

In this essay, I will attempt to examine the operation of the “worlding” of what is today “the Third World” by what has become a cult text of feminism: *Jane Eyre*.<sup>2</sup> I plot the novel’s reach and grasp, and locate its structural motors. I read *Wide Sargasso Sea* as *Jane Eyre*’s reinscription and *Frankenstein* as an analysis – even a deconstruction – of a “worlding” such as *Jane Eyre*’s.<sup>3</sup>

I need hardly mention that the object of my investigation is the printed book, not its “author.” To make such a distinction is, of course, to ignore the lessons of deconstruction. A deconstructive critical approach would loosen the binding of the book, undo the opposition between verbal text and the bio-graphy of the named subject “Charlotte Brontë,” and see the two as each other’s “scene of writing.” In such a reading, the life that writes itself as “my life” is as much a production in psychosocial space (other names can be found) as the book that is written by the holder of that named life – a book that is then consigned to what *is* most often recognized as genuinely “social”: the world of publication and distribution.<sup>4</sup> To touch Brontë’s “life” in such a way, however, would be too risky here. We must rather strategically take shelter in an essentialism which, not wishing to lose the important advantages won by US mainstream feminism, will continue to honor the suspect binary oppositions – book and author, individual and history – and start with an assurance of the following sort: my readings here do not seek to undermine the excellence of the individual artist. If even minimally successful, the readings will incite a degree of rage against the imperialist narrativization of history, that it should produce so abject a script for her. I provide these assurances to allow myself some room to situate feminist individualism in its historical determination rather than simply to canonize it as feminism as such.

Sympathetic US feminists have remarked that I do not do justice to *Jane Eyre*’s subjectivity. A word of explanation is perhaps in order. The broad strokes of my presuppositions are that what is at stake, for feminist individualism in the age of imperialism, is precisely the making of human beings, the constitution and “interpellation” of the subject not only as individual but as “individualist.”<sup>5</sup> This stake is represented on two registers: childbearing and soul making. The first is domestic-society-through-sexual-reproduction cathected as “companionate love”; the second is the imperialist project cathected as civil-society-through-social-mission. As the female individualist, not-quite/not-male, articulates herself in shifting relationship to what is at stake, the “native female” as such (*within* discourse, *as a signifier*) is excluded from any share in this emerging norm.<sup>6</sup> If we read this account from an isolationist perspective in a “metropolitan” context, we see nothing there but the psychobiography of the militant female subject. In a reading such as mine, in contrast, the effort is to wrench oneself away from the mesmerizing focus of the “subject-constitution” of the female individualist.

To develop further the notion that my stance need not be an accusing one, I will refer to a passage from Roberto Fernández Retamar’s “Caliban.”<sup>7</sup> José Enrique Rodó had argued in 1900 that the model for the Latin American intellectual in relationship to Europe could be Shakespeare’s Ariel.<sup>8</sup> In 1971 Retamar, denying the possibility of an identifiable “Latin American Culture,” recast the model as Caliban. Not surprisingly, this powerful exchange still excludes any specific consideration of the civilizations of the Maya, the Aztecs, the Incas, or the smaller nations of what is now called Latin America. Let us note carefully that, at this stage of my argument, this “conversation” between Europe and Latin America (without a specific consideration of the political economy of

the “worlding” of the “native”) provides a sufficient thematic description of our attempt to confront the ethnocentric and reverse-ethnocentric benevolent double bind (that is, considering the “native” as object for enthusiastic information-retrieval and thus denying its own “worlding”) that I sketched in my opening paragraphs.

In a moving passage in “Caliban,” Retamar locates both Caliban and Ariel in the postcolonial intellectual:

There is no real Ariel–Caliban polarity: both are slaves in the hands of Prospero, the foreign magician. But Caliban is the rude and unconquerable master of the island, while Ariel, a creature of the air, although also a child of the isle, is the intellectual.

The deformed Caliban – enslaved, robbed of his island, and taught the language by Prospero – rebukes him thus: “You taught me language, and my profit on’t / Is, I know how to curse.” [“C,” pp. 28, 11]

As we attempt to unlearn our so-called privilege as Ariel and “seek from [a certain] Caliban the honor of a place in his rebellious and glorious ranks,” we do not ask that our students and colleagues should emulate us but that they should attend to us (“C,” p. 72). If, however, we are driven by a nostalgia for lost origins, we too run the risk of effacing the “native” and stepping forth as “the real Caliban,” of forgetting that he is a name in a play, an inaccessible blankness circumscribed by an interpretable text.<sup>9</sup> The stagings of Caliban work alongside the narrativization of history: claiming to *be* Caliban legitimizes the very individualism that we must persistently attempt to undermine from within.

Elizabeth Fox-Genovese, in an article on history and women’s history, shows us how to define the historical moment of feminism in the West in terms of female access to individualism.<sup>10</sup> The battle for female individualism plays itself out within the larger theater of the establishment of meritocratic individualism, indexed in the aesthetic field by the ideology of “the creative imagination.” Fox-Genovese’s presupposition will guide us into the beautifully orchestrated opening of *Jane Eyre*.

It is a scene of the marginalization and privatization of the protagonist: “There was no possibility of taking a walk that day.... Out-door exercise was now out of the question. I was glad of it,” Brontë writes (*JE*, p. 9). The movement continues as Jane breaks the rules of the appropriate topography of withdrawal. The family at the center withdraws into the sanctioned architectural space of the withdrawing room or drawing room; Jane inserts herself – “I slipped in” – into the margin – “A small breakfast-room *adjoined* the drawing room” (*JE*, p. 9; my emphasis).

The manipulation of the domestic inscription of space within the upwardly mobilizing currents of the eighteenth- and nineteenth-century bourgeoisie in England and France is well known. It seems fitting that the place to which Jane withdraws is not only not the withdrawing room but also not the dining room, the sanctioned place of family meals. Nor is it the library, the appropriate place for reading. The breakfast room “contained a book-case” (*JE*, p. 9). As Rudolph Ackerman wrote in his *Repository* (1823), one of the many manuals of taste in circulation in nineteenth-century England, these low bookcases and stands were designed to “contain all the books that may be desired for a sitting-room without reference to the library.”<sup>11</sup> Even in this already triply off-center place, “having drawn the red moreen curtain nearly close, I [Jane] was shrined in double retirement” (*JE*, pp. 9–10).

Here in Jane’s self-marginalized uniqueness, the reader becomes her accomplice: the reader and Jane are united – both are reading. Yet Jane still preserves her odd privilege,

for she continues never quite doing the proper thing in its proper place. She cares little for reading what is *meant* to be read: the “letter-press.” *She* reads the pictures. The power of this singular hermeneutics is precisely that it can make the outside inside. “At intervals, while turning over the leaves of my book, I studied the aspect of that winter afternoon.” Under “the clear panes of glass,” the rain no longer penetrates, “the drear November day” is rather a one-dimensional “aspect” to be “studied,” not decoded like the “letter-press” but, like pictures, deciphered by the unique creative imagination of the marginal individualist (*JE*, p. 10).

Before following the track of this unique imagination, let us consider the suggestion that the progress of *Jane Eyre* can be charted through a sequential arrangement of the family/counter-family dyad. In the novel, we encounter, first, the Reeds as the legal family and Jane, the late Mr. Reed’s sister’s daughter, as the representative of a near incestuous counter-family; second, the Brocklehursts, who run the school Jane is sent to, as the legal family and Jane, Miss Temple, and Helen Burns as a counter-family that falls short because it is only a community of women; third, Rochester and the mad Mrs. Rochester as the legal family and Jane and Rochester as the illicit counter-family. Other items may be added to the thematic chain in this sequence: Rochester and Céline Varens as structurally functional counter-family; Rochester and Blanche Ingram as dissimulation of legality – and so on. It is during this sequence that Jane is moved from the counter-family to the family-in-law. In the next sequence, it is Jane who restores full family status to the as-yet-incomplete community of siblings, the Riverses. The final sequence of the book is a *community of families*, with Jane, Rochester, and their children at the center.

In terms of the narrative energy of the novel, how is Jane moved from the place of the counter-family to the family-in-law? It is the active ideology of imperialism that provides the discursive field.

(My working definition of “discursive field” must assume the existence of discrete “systems of signs” at hand in the *socius*, each based on a specific axiomatics. I am identifying these systems as discursive fields. “Imperialism as social mission” generates the possibility of one such axiomatics. How the individual artist taps the discursive field at hand with a sure touch, if not with transhistorical clairvoyance, in order to make the narrative structure move I hope to demonstrate through the following example. It is crucial that we extend our analysis of this example beyond the minimal diagnosis of “racism.”)

Let us consider the figure of Bertha Mason, a figure produced by the axiomatics of imperialism. Through Bertha Mason, the white Jamaican Creole, Brontë renders the human/animal frontier as acceptably indeterminate, so that a good greater than the letter of the Law can be broached. Here is the celebrated passage, given in the voice of Jane:

In the deep shade, at the further end of the room, a figure ran backwards and forwards. What it was, whether beast or human being, one could not ... tell: it grovelled, seemingly, on all fours; it snatched and growled like some strange wild animal: but it was covered with clothing, and a quantity of dark, grizzled hair, wild as a mane, hid its head and face.  
[*JE*, p. 295]

In a matching passage, given in the voice of Rochester speaking *to* Jane, Brontë presents the imperative for a shift beyond the Law as divine injunction rather than human motive. In the terms of my essay, we might say that this is the register not of mere

marriage or sexual reproduction but of Europe and its not-yet-human Other, of soul making. The field of imperial conquest is here inscribed as Hell:

"One night I had been awakened by her yells ... it was a fiery West Indian night...."

"‘This life,’ said I at last, ‘is hell! – this is the air – those are the sounds of the bottomless pit! *I have a right* to deliver myself from it if I can.... Let me break away, and go home to God!’..."

“A wind fresh from Europe blew over the ocean and rushed through the open casement: the storm broke, streamed, thundered, blazed, and the air grew pure.... It was true Wisdom that consoled me in that hour, and showed me the right path....”

“The sweet wind from Europe was still whispering in the refreshed leaves, and the Atlantic was thundering in glorious liberty....”

“Go,’ said Hope, ‘and live again in Europe.... You have done all that God and Humanity require of you.’” [JE, pp. 310–11; my emphasis]

It is the unquestioned ideology of imperialist axiomatics, then, that conditions Jane’s move from the counter-family set to the set of the family-in-law. Marxist critics such as Terry Eagleton have seen this only in terms of the ambiguous *class* position of the governess.<sup>12</sup> Sandra Gilbert and Susan Gubar, on the other hand, have seen Bertha Mason only in psychological terms, as Jane’s dark double.<sup>13</sup>

I will not enter the critical debates that offer themselves here. Instead, I will develop the suggestion that nineteenth-century feminist individualism could conceive of a “greater” project than access to the closed circle of the nuclear family. This is the project of soul making beyond “mere” sexual reproduction. Here the native “subject” is not almost an animal but rather the object of what might be termed the terrorism of the categorical imperative.

I am using “Kant” in this essay as a metonym for the most flexible ethical moment in the European eighteenth century. Kant words the categorical imperative, conceived as the universal moral law given by pure reason, in this way: “In all creation every thing one chooses and over which one has any power, may be used *merely as means*; man alone, and with him every rational creature, is an *end in himself*.” It is thus a moving displacement of Christian ethics from religion to philosophy. As Kant writes: “With this agrees very well the possibility of such a command as: *Love God above everything, and thy neighbor as thyself*. For as a command it requires respect for a law which *commands love* and does not leave it to our own arbitrary choice to make this our principle.”<sup>14</sup>

The “categorical” in Kant cannot be adequately represented in determinately grounded action. The dangerous transformative power of philosophy, however, is that its formal subtlety can be travestied in the service of the state. Such a travesty in the case of the categorical imperative can justify the imperialist project by producing the following formula: *make* the heathen into a human so that he can be treated as an end in himself.<sup>15</sup> This project is presented as a sort of tangent in *Jane Eyre*, a tangent that escapes the closed circle of the *narrative* conclusion. The tangent narrative is the story of St. John Rivers, who is granted the important task of concluding the *text*.

At the novel’s end, the *allegorical* language of Christian psychobiography – rather than the textually constituted and seemingly *private* grammar of the creative imagination which we noted in the novel’s opening – marks the inaccessibility of the imperialist project as such to the nascent “feminist” scenario. The concluding passage of *Jane Eyre* places St. John Rivers within the fold of *Pilgrim’s Progress*. Eagleton pays no attention to

this but accepts the novel's ideological lexicon, which establishes St. John Rivers' heroism by identifying a life in Calcutta with an unquestioning choice of death. Gilbert and Gubar, by calling *Jane Eyre* "Plain Jane's progress," see the novel as simply replacing the male protagonist with the female. They do not notice the distance between sexual reproduction and soul making, both actualized by the unquestioned idiom of imperialist presuppositions evident in the last part of *Jane Eyre*:

Firm, faithful, and devoted, full of energy, and zeal, and truth, [St. John Rivers] labours for his race.... His is the sternness of the warrior Greatheart, who guards his pilgrim convoy from the onslaught of Apollyon.... His is the ambition of the high master-spirit[s] ... who stand without fault before the throne of God; who share the last mighty victories of the Lamb; who are called, and chosen, and faithful. [*JE*, p. 455]

Earlier in the novel, St. John Rivers himself justifies the project: "My vocation? My great work? ... My hopes of being numbered in the band who have merged all ambitions in the glorious one of bettering their race – of carrying knowledge into the realms of ignorance – of substituting peace for war – freedom for bondage – religion for superstition – the hope of heaven for the fear of hell?" (*JE*, p. 376). Imperialism and its territorial and subject-constituting project are a violent deconstruction of these oppositions.

When Jean Rhys, born on the Caribbean island of Dominica, read *Jane Eyre* as a child, she was moved by Bertha Mason: "I thought I'd try to write her a life."<sup>16</sup> *Wide Sargasso Sea*, the slim novel published in 1965, at the end of Rhys' long career, is that "life."

I have suggested that Bertha's function in *Jane Eyre* is to render indeterminate the boundary between human and animal and thereby to weaken her entitlement under the spirit if not the letter of the Law. When Rhys rewrites the scene in *Jane Eyre* where Jane hears "a snarling, snatching sound, almost like a dog quarrelling" and then encounters a bleeding Richard Mason (*JE*, p. 210), she keeps Bertha's humanity, indeed her sanity as critic of imperialism, intact. Grace Poole, another character originally in *Jane Eyre*, describes the incident to Bertha in *Wide Sargasso Sea*: "So you don't remember that you attacked this gentleman with a knife? ... I didn't hear all he said except 'I cannot interfere legally between yourself and your husband'. It was when he said 'legally' that you flew at him" (*WSS*, p. 150). In Rhys' retelling, it is the dissimulation that Bertha discerns in the word "legally" – not an innate bestiality – that prompts her violent reaction.

In the figure of Antoinette, whom in *Wide Sargasso Sea* Rochester violently renames Bertha, Rhys suggests that so intimate a thing as personal and human identity might be determined by the politics of imperialism. Antoinette, as a white Creole child growing up at the time of emancipation in Jamaica, is caught between the English imperialist and the black native. In recounting Antoinette's development, Rhys reinscribes some thematics of Narcissus.

There are, noticeably, many images of mirroring in the text. I will quote one from the first section. In this passage, Tia is the little black servant girl who is Antoinette's close companion: "We had eaten the same food, slept side by side, bathed in the same river. As I ran, I thought, I will live with Tia and I will be like her.... When I was close I saw the jagged stone in her hand but I did not see her throw it.... We stared at each other, blood on my face, tears on hers. It was as if I saw myself. Like in a looking glass" (*WSS*, p. 38).

A progressive sequence of dreams reinforces this mirror imagery. In its second occurrence, the dream is partially set in a *hortus conclusus*, or "enclosed garden" – Rhys uses the phrase (*WSS*, p. 50) – a Romance rewriting of the Narcissus *topos* as the place of

encounter with Love.<sup>17</sup> In the enclosed garden, Antoinette encounters not Love but a strange threatening voice that says merely “in here,” inviting her into a prison which masquerades as the legalization of love (*WSS*, p. 50).

In Ovid’s *Metamorphoses*, Narcissus’ madness is disclosed when he recognizes his Other as his self: “Iste ego sum.”<sup>18</sup> Rhys makes Antoinette see her *self* as her Other, Brontë’s Bertha. In the last section of *Wide Sargasso Sea*, Antoinette acts out *Jane Eyre*’s conclusion and recognizes herself as the so-called ghost in Thornfield Hall: “I went into the hall again with the tall candle in my hand. It was then that I saw her – the ghost. The woman with streaming hair. She was surrounded by a gilt frame but I knew her” (*WSS*, p. 154). The gilt frame encloses a mirror: as Narcissus’ pool reflects the selfed Other, so this “pool” reflects the Othered self. Here the dream sequence ends, with an invocation of none other than Tia, the Other that could not be selfed, because the fracture of imperialism rather than the Ovidian pool intervened. (I will return to this difficult point.) “That was the third time I had my dream, and it ended.... I called ‘Tia’ and jumped and woke” (*WSS*, p. 155). It is now, at the very end of the book, that Antoinette/Bertha can say: “Now at last I know why I was brought here and what I have to do” (*WSS*, pp. 155–6). We can read this as her having been brought into the England of Brontë’s novel: “This cardboard house” – a book between cardboard covers – “where I walk at night is not England” (*WSS*, p. 148). In this fictive England, she must play out her role, act out the transformation of her “self” into that fictive Other, set fire to the house and kill herself, so that *Jane Eyre* can become the feminist individualist heroine of British fiction. I must read this as an allegory of the general epistemic violence of imperialism, the construction of a self-immolating colonial subject for the glorification of the social mission of the colonizer. At least Rhys sees to it that the woman from the colonies is not sacrificed as an insane animal for her sister’s consolidation.

Critics have remarked that *Wide Sargasso Sea* treats the Rochester character with understanding and sympathy.<sup>19</sup> Indeed, he narrates the entire middle section of the book. Rhys makes it clear that he is a victim of the patriarchal inheritance law of entailment rather than of a father’s natural preference for the firstborn: in *Wide Sargasso Sea*, Rochester’s situation is clearly that of a younger son dispatched to the colonies to buy an heiress. If in the case of Antoinette and her identity, Rhys utilizes the thematics of Narcissus, in the case of Rochester and his patrimony, she touches on the thematics of Oedipus. (In this she has her finger on our “historical moment.”) If, in the nineteenth century, subject-constitution is represented as childbearing and soul making, in the twentieth century psychoanalysis allows the West to plot the itinerary of the subject from Narcissus [the “imaginary”] to Oedipus [the “symbolic”]. This subject, however, is the normative male subject. In Rhys’ reinscription of these themes, divided between the female and the male protagonist, feminism and a critique of imperialism become complicit.)

In place of the “wind from Europe” scene, Rhys substitutes the scenario of a suppressed letter to a father, a letter which would be the “correct” explanation of the tragedy of the book.<sup>20</sup> “I thought about the letter which should have been written to England a week ago. Dear Father ...” (*WSS*, p. 57). This is the first instance: the letter not written. Shortly afterward:

Dear Father. The thirty thousand pounds have been paid to me without question or condition. No provision made for her (that must be seen to).... I will never be a disgrace to you or to my dear brother the son you love. No begging letters, no mean requests. None of the

furtive shabby manoeuvres of a younger son. I have sold my soul or you have sold it, and after all is it such a bad bargain? The girl is thought to be beautiful, she is beautiful. And yet ... [WSS, p. 59]

This is the second instance: the letter not sent. The formal letter is uninteresting; I will quote only a part of it:

Dear Father, we have arrived from Jamaica after an uncomfortable few days. This little estate in the Windward Islands is part of the family property and Antoinette is much attached to it.... All is well and has gone according to your plans and wishes. I dealt of course with Richard Mason.... He seemed to become attached to me and trusted me completely. This place is very beautiful but my illness has left me too exhausted to appreciate it fully. I will write again in a few days' time. [WSS, p. 63]

And so on.

Rhys' version of the Oedipal exchange is ironic, not a closed circle. We cannot know if the letter actually reaches its destination. "I wondered how they got their letters posted," the Rochester figure muses. "I folded mine and put it into a drawer of the desk.... There are blanks in my mind that cannot be filled up" (WSS, p. 64). It is as if the text presses us to note the analogy between letter and mind.

Rhys denies to Brontë's Rochester the one thing that is supposed to be secured in the Oedipal relay: the Name of the Father, or the patronymic. In *Wide Sargasso Sea*, the character corresponding to Rochester has no name. His writing of the final version of the letter to his father is supervised, in fact, by an image of the *loss* of the patronymic: "There was a crude bookshelf made of three shingles strung together over the desk and I looked at the books, Byron's poems, novels by Sir Walter Scott, *Confessions of an Opium Eater* ... and on the last shelf, *Life and Letters of...* The rest was eaten away" (WSS, p. 63).

*Wide Sargasso Sea* marks with uncanny clarity the limits of its own discourse in Christophine, Antoinette's black nurse. We may perhaps surmise the distance between *Jane Eyre* and *Wide Sargasso Sea* by remarking that Christophine's unfinished story is the tangent to the latter narrative, as St. John Rivers' story is to the former. Christophine is not a native of Jamaica; she is from Martinique. Taxonomically, she belongs to the category of the good servant rather than that of the pure native. But within these borders, Rhys creates a powerfully suggestive figure.

Christophine is the first interpreter and named speaking subject in the text. "The Jamaican ladies had never approved of my mother, 'because she pretty like pretty self'" Christophine said," we read in the book's opening paragraph (WSS, p. 15). I have taught this book five times, once in France, once to students who had worked on the book with the well-known Caribbean novelist Wilson Harris, and once at a prestigious institute where the majority of the students were faculty from other universities. It is part of the political argument I am making that all these students blithely stepped over this paragraph without asking or knowing what Christophine's patois, so-called incorrect English, might mean.

Christophine is, of course, a commodified person. "She was your father's wedding present to me" explains Antoinette's mother, "one of his presents" (WSS, p. 18). Yet Rhys assigns her some crucial functions in the text. It is Christophine who judges that black ritual practices are culture-specific and cannot be used by whites as cheap remedies for social evils, such as Rochester's lack of love for Antoinette. Most important,

it is Christophine alone whom Rhys allows to offer a hard analysis of Rochester's actions, to challenge him in a face-to-face encounter. The entire extended passage is worthy of comment. I quote a brief extract:

"She is Creole girl, and she have the sun in her. Tell the truth now. She don't come to your house in this place England they tell me about, she don't come to your beautiful house to beg you to marry with her. No, it's you come all the long way to her house – it's you beg her to marry. And she love you and she give you all she have. Now you say you don't love her and you break her up. What you do with her money, eh?" [And then Rochester, the white man, comments silently to himself] Her voice was still quiet but with a hiss in it when she said "money." [WSS, p. 130]

Her analysis is powerful enough for the white man to be afraid: "I no longer felt dazed, tired, half hypnotized, but alert and wary, ready to defend myself" (WSS, p. 130).

Rhys does not, however, romanticize individual heroics on the part of the oppressed. When the Man refers to the forces of Law and Order, Christophine recognizes their power. This exposure of civil inequality is emphasized by the fact that, just before the Man's successful threat, Christophine had invoked the emancipation of slaves in Jamaica by proclaiming: "No chain gang, no tread machine, no dark jail either. This is free country and I am free woman" (WS, p. 131).

As I mentioned above, Christophine is tangential to this narrative. She cannot be contained by a novel which rewrites a canonical English text within the European novelistic tradition in the interest of the white Creole rather than the native. No perspective critical of imperialism can turn the Other into a self, because the project of imperialism has always already historically refracted what might have been the absolutely Other into a domesticated Other that consolidates the imperialist self.<sup>21</sup> The Caliban of Retamar, caught between Europe and Latin America, reflects this predicament. We can read Rhys' reinscription of Narcissus as a thematization of the same problematic.

Of course, we cannot know Jean Rhys' feelings in the matter. We can, however, look at the scene of Christophine's inscription in the text. Immediately after the exchange between her and the Man, well before the conclusion, she is simply driven out of the story, with neither narrative nor characterological explanation or justice. "Read and write I don't know. Other things I know." She walked away without looking back" (WSS, p. 133).

Indeed, if Rhys rewrites the madwoman's attack on the Man by underlining of the misuse of "legality," she cannot deal with the passage that corresponds to St. John Rivers' own justification of his martyrdom, for it has been displaced into the current idiom of modernization and development. Attempts to construct the "Third World Woman" as a signifier remind us that the hegemonic definition of literature is itself caught within the history of imperialism. A full literary reinscription cannot easily flourish in the imperialist fracture or discontinuity, covered over by an alien legal system masquerading as Law as such, an alien ideology established as only Truth, and a set of human sciences busy establishing the "native" as self-consolidating Other.

In the Indian case at least, it would be difficult to find an ideological clue to the planned epistemic violence of imperialism merely by rearranging curricula or syllabi within existing norms of literary pedagogy. For a later period of imperialism – when the constituted colonial subject has firmly taken hold – straightforward experiments of comparison can be undertaken, say, between the functionally witless India of *Mrs. Dalloway*, on the one hand, and literary texts produced in India in the 1920s, on the

other. But the first half of the nineteenth century resists questioning through literature or literary criticism in the narrow sense, because both are implicated in the project of producing Ariel. To reopen the fracture without succumbing to a nostalgia for lost origins, the literary critic must turn to the archives of imperial governance.

In conclusion, I shall look briefly at Mary Shelley's *Frankenstein*, a text of nascent feminism that remains cryptic, I think, simply because it does not speak the language of feminist individualism which we have come to hail as the language of high feminism within English literature. It is interesting that Barbara Johnson's brief study tries to rescue this recalcitrant text for the service of feminist autobiography.<sup>22</sup> Alternatively, George Levine reads *Frankenstein* in the context of the creative imagination and the nature of the hero. He sees the novel as a book about its own writing and about writing itself, a Romantic allegory of reading within which Jane Eyre as unself-conscious critic would fit quite nicely.<sup>23</sup>

I propose to take *Frankenstein* out of this arena and focus on it in terms of that sense of English cultural identity which I invoked at the opening of this essay. Within that focus we are obliged to admit that, although *Frankenstein* is ostensibly about the origin and evolution of man in society, it does not deploy the axiomatics of imperialism.

Let me say at once that there is plenty of incidental imperialist sentiment in *Frankenstein*. My point, within the argument of this essay, is that the discursive field of imperialism does not produce unquestioned ideological correlatives for the narrative structuring of the book. The discourse of imperialism surfaces in a curiously powerful way in Shelley's novel, and I will later discuss the moment at which it emerges.

*Frankenstein* is not a battleground of male and female individualism articulated in terms of sexual reproduction (family and female) and social subject-production (race and male). That binary opposition is undone in Victor Frankenstein's laboratory – an artificial womb where both projects are undertaken simultaneously, though the terms are never openly spelled out. Frankenstein's apparent antagonist is God himself as Maker of Man, but his real competitor is also woman as the maker of children. It is not just that his dream of the death of mother and bride and the actual death of his bride are associated with the visit of his monstrous homoerotic "son" to his bed. On a much more overt level, the monster is a bodied "corpse," unnatural because bereft of a determinable childhood: "No father had watched my infant days, no mother had blessed me with smiles and caresses; or if they had, all my past was now a blot, a blind vacancy in which I distinguished nothing" (*F*, pp. 57, 115). It is Frankenstein's own ambiguous and miscued understanding of the real motive for the monster's vengefulness that reveals his own competition with woman as maker:

I created a rational creature and was bound towards him to assure, as far as was in my power, his happiness and well-being. This was my duty, but there was another still paramount to that. My duties towards the beings of my own species had greater claims to my attention because they included a greater proportion of happiness or misery. Urged by this view, I refused, and I did right in refusing, to create a companion for the first creature. [*F*, p. 206]

It is impossible not to notice the accents of transgression inflecting Frankenstein's demolition of his experiment to create the future Eve. Even in the laboratory, the woman-in-the-making is not a bodied corpse but "a human being." The (il)logic of the metaphor bestows on her a prior existence which Frankenstein aborts, rather than an anterior death which he reembodies: "The remains of the half-finished creature, whom

I had destroyed, lay scattered on the floor, and I almost felt as if I had mangled the living flesh of a human being" (*F*, p. 163).

In Shelley's view, man's hubris as soul maker both usurps the place of God and attempts – vainly – to sublate woman's physiological prerogative.<sup>24</sup> Indeed, indulging a Freudian fantasy here, I could urge that, if to give and withhold to/from the mother a phallus is *the* male fetish, then to give and withhold to/from the man a womb might be the female fetish.<sup>25</sup> The icon of the sublimated womb in man is surely his productive brain, the box in the head.

In the judgment of classical psychoanalysis, the phallic mother exists only by virtue of the castration-anxious son; in *Frankenstein*'s judgment, the hysterical father (Victor Frankenstein gifted with his laboratory – the womb of theoretical reason) cannot produce a daughter. Here the language of racism – the dark side of imperialism understood as social mission – combines with the hysteria of masculism into the idiom of (the withdrawal of) sexual reproduction rather than subject-constitution. The roles of masculine and feminine individualists are hence reversed and displaced. Frankenstein cannot produce a "daughter" because "she might become ten thousand times more malignant than her mate ... [and because] one of the first results of those sympathies for which the demon thirsted would be children, and a race of devils would be propagated upon the earth who might make the very existence of the species of man a condition precarious and full of terror" (*F*, p. 158). This particular narrative strand also launches a thoroughgoing critique of the eighteenth-century European discourses on the origin of society through (Western Christian) man. Should I mention that, much like Jean-Jacques Rousseau's remark in his *Confessions*, Frankenstein declares himself to be "by birth a Genevese" (*F*, p. 31)?

In this overly didactic text, Shelley's point is that social engineering should not be based on pure, theoretical, or natural-scientific reason alone, which is her implicit critique of the utilitarian vision of an engineered society. To this end, she presents in the first part of her deliberately schematic story three characters, childhood friends, who seem to represent Kant's three-part conception of the human subject: Victor Frankenstein, the forces of theoretical reason or "natural philosophy"; Henry Clerval, the forces of practical reason or "the moral relations of things"; and Elizabeth Lavenza, that aesthetic judgment – "the aerial creation of the poets" – which, according to Kant, is "a suitable mediating link connecting the realm of the concept of nature and that of the concept of freedom ... (which) promotes ... moral feeling" (*F*, pp. 37, 36).<sup>26</sup>

This three-part subject does not operate harmoniously in *Frankenstein*. That Henry Clerval, associated as he is with practical reason, should have as his "design ... to visit India, in the belief that he had in his knowledge of its various languages, and in the views he had taken of its society, the means of materially assisting the progress of European colonization and trade" is proof of this, as well as part of the incidental imperialist sentiment that I speak of above (*F*, pp. 151–2). I should perhaps point out that the language here is entrepreneurial rather than missionary:

He came to the university with the design of making himself complete master of the Oriental languages, as thus he should open a field for the plan of life he had marked out for himself. Resolved to pursue no inglorious career, he turned his eyes towards the East as affording scope for his spirit of enterprise. The Persian, Arabic, and Sanskrit languages engaged his attention. [*F*, pp. 66–7]

But it is of course Victor Frankenstein, with his strange itinerary of obsession with natural philosophy, who offers the strongest demonstration that the multiple perspectives

of the three-part Kantian subject cannot co-operate harmoniously. Frankenstein creates a putative human subject out of natural philosophy alone. According to his own misued summation: "In a fit of enthusiastic madness I created a rational creature" (*F*, p. 206). It is not at all farfetched to say that Kant's categorical imperative can most easily be mistaken for the hypothetical imperative – a command to ground in cognitive comprehension what can be apprehended only by moral will – by putting natural philosophy in the place of practical reason.

I should hasten to add here that just as readings such as this one do not necessarily accuse Charlotte Brontë the named individual of harboring imperialist sentiments, so also they do not necessarily commend Mary Shelley the named individual for writing a successful Kantian allegory. The most I can say is that it is possible to read these texts, within the frame of imperialism and the Kantian ethical moment, in a politically useful way. Such an approach presupposes that a "disinterested" reading attempts to render transparent the interests of the hegemonic readership. (Other "political" readings – for instance, that the monster is the nascent working class – can also be advanced.)

*Frankenstein* is built in the established epistolary tradition of multiple frames. At the heart of the multiple frames, the narrative of the monster (as reported by Frankenstein to Robert Walton, who then recounts it in a letter to his sister) is of his almost learning, clandestinely, to be human. It is invariably noticed that the monster reads *Paradise Lost* as true history. What is not so often noticed is that he also reads Plutarch's *Lives*, "the histories of the first founders of the ancient republics," which he compares to "the patriarchal lives of my protectors" (*F*, pp. 123, 124). And his *education* comes through "Volney's *Ruins of Empires*," which purported to be a prefiguration of the French Revolution, published after the event and after the author had rounded off his theory with practice (*F*, p. 113). It is an attempt at an enlightened universal secular, rather than a Eurocentric Christian, history, written from the perspective of a narrator "from below," somewhat like the attempts of Eric Wolf or Peter Worsley in our own time.<sup>27</sup>

This Caliban's education in (universal secular) humanity takes place through the monster's eavesdropping on the instruction of an Ariel – Safie, the Christianized "Arabian" to whom "a residence in Turkey was abhorrent" (*F*, p. 121). In depicting Safie, Shelley uses some commonplaces of eighteenth-century liberalism that are shared by many today: Safie's Muslim father was a victim of (bad) Christian religious prejudice and yet was himself a wily and ungrateful man not as morally refined as her (good) Christian mother. Having tasted the emancipation of woman, Safie could not go home. The confusion between "Turk" and "Arab" has its counterpart in present-day confusion about Turkey and Iran as "Middle Eastern" but not "Arab."

Although we are a far cry here from the unexamined and covert axiomatics of imperialism in *Jane Eyre*, we will gain nothing by celebrating the time-bound pieties that Shelley, as the daughter of two antievangelicals, produces. It is more interesting for us that Shelley differentiates the Other, works at the Caliban/Ariel distinction, and *cannot* make the monster identical with the proper recipient of these lessons. Although he had "heard of the discovery of the American hemisphere and *wept with Safie* over the helpless fate of its original inhabitants," Safie cannot reciprocate his attachment. When she first catches sight of him, "Safie, unable to attend to her friend [Agatha], rushed out of the cottage" (*F*, pp. 114 [my emphasis], 129).

*In the taxonomy of characters*, the Muslim-Christian Safie belongs with Rhys' Antoinette/Bertha. And indeed, like Christophe the good servant, the subject created by the fiat of natural philosophy is the tangential unresolved moment in *Frankenstein*.

The simple suggestion that the monster is human inside but monstrous outside and only provoked into vengefulness is clearly not enough to bear the burden of so great a historical dilemma.

At one moment, in fact, Shelley's Frankenstein does try to tame the monster, to humanize him by bringing him within the circuit of the Law. He "repair[s] to a criminal judge in the town and ... relate[s his] history briefly but with firmness" – the first and disinterested version of the narrative of Frankenstein – "marking the dates with accuracy and never deviating into invective or exclamation.... When I had concluded my narration I said, 'This is the being whom I accuse and for whose seizure and punishment I call upon you to exert your whole power. It is your duty as a magistrate'" (*F*, pp. 189, 190). The sheer social reasonableness of the mundane voice of Shelley's "Genevan magistrate" reminds us that the absolutely Other cannot be selfed, that the monster has "properties" which will not be contained by "proper" measures:

"I will exert myself [he says], and if it is in my power to seize the monster, be assured that he shall suffer punishment proportionate to his crimes. But I fear, from what you have yourself described to be his properties, that this will prove impracticable; and thus, while every proper measure is pursued, you should make up your mind to disappointment."

[*F*, p. 190]

In the end, as is obvious to most readers, distinctions of human individuality themselves seem to fall away from the novel. Monster, Frankenstein, and Walton seem to become each other's relays. Frankenstein's story comes to an end in death; Walton concludes his own story within the frame of his function as letter writer. In the *narrative* conclusion, he is the natural philosopher who learns from Frankenstein's example. At the end of the *text*, the monster, having confessed his guilt toward his maker and ostensibly intending to immolate himself, is borne away on an ice raft. We do not see the conflagration of his funeral pile – the self-immolation is not consummated in the text: he too cannot be contained by the text. In terms of narrative logic, he is "lost in darkness and distance" (*F*, p. 211) – these are the last words of the novel – into an existential temporality that is coherent with neither the territorializing individual imagination (as in the opening of *Jane Eyre*) nor the authoritative scenario of Christian psychobiography (as at the end of Brontë's work). The very relationship between sexual reproduction and social subject-production – the dynamic nineteenth-century *topos* of feminism-in-imperialism – remains problematic within the limits of Shelley's text and, paradoxically, constitutes its strength.

Earlier, I offered a reading of woman as womb holder in *Frankenstein*. I would now suggest that there is a framing woman in the book who is neither tangential, nor encircled, nor yet encircling. "Mrs. Saville," "excellent Margaret," "beloved Sister" are her address and kinship inscriptions (*F*, pp. 15, 17, 22). She is the occasion, though not the protagonist, of the novel. She is the feminine *subject* rather than the female individualist: she is the irreducible *recipient*-function of the letters that constitute *Frankenstein*. I have commented on the singular appropriative hermeneutics of the reader reading with Jane in the opening pages of *Jane Eyre*. Here the reader must read with Margaret Saville in the crucial sense that she must *intercept* the recipient-function, read the letters *as recipient*, in order for the novel to exist.<sup>28</sup> Margaret Saville does not respond to close the text as frame. The frame is thus simultaneously not a frame, and the monster can step "beyond the text" and be "lost in darkness." Within the allegory of our reading, the

place of both the English lady and the unnamable monster are left open by this great flawed text. It is satisfying for a postcolonial reader to consider this a noble resolution for a nineteenth-century English novel. This is all the more striking because, on the anecdotal level, Shelley herself abundantly “identifies” with Victor Frankenstein.<sup>29</sup>

I must myself close with an idea that I cannot establish within the limits of this essay. Earlier I contended that *Wide Sargasso Sea* is necessarily bound by the reach of the European novel. I suggested that, in contradistinction, to reopen the epistemic fracture of imperialism without succumbing to a nostalgia for lost origins, the critic must turn to the archives of imperialist governance. I have not turned to those archives in these pages. In my current work, by way of a modest and inexpert “reading” of “archives,” I try to extend, outside of the reach of the European novelistic tradition, the most powerful suggestion in *Wide Sargasso Sea*: that *Jane Eyre* can be read as the orchestration and staging of the self-immolation of Bertha Mason as “good wife.” The power of that suggestion remains unclear if we remain insufficiently knowledgeable about the history of the legal manipulation of widow-sacrifice in the entitlement of the British government in India. I would hope that an informed critique of imperialism, granted some attention from readers in the First World, will at least expand the frontiers of the politics of reading.

## Notes

- 1 My notion of the “worlding of a world” upon what must be assumed to be uninscribed earth is a vulgarization of Martin Heidegger’s idea; see “The Origin of the Work of Art,” *Poetry, Language, Thought*, trans. Albert Hofstadter (New York, 1977), pp. 17–87.
- 2 See Charlotte Brontë, *Jane Eyre* (New York, 1960); all further references to this work, abbreviated *JE*, will be included in the text.
- 3 See Jean Rhys, *Wide Sargasso Sea* (Harmondsworth, 1966); all further references to this work, abbreviated *WSS*, will be included in the text. And see Mary Shelley, *Frankenstein; or, The Modern Prometheus* (New York, 1965); all further references to this work, abbreviated *F*, will be included in the text.
- 4 I have tried to do this in my essay “Unmaking and Making in *To the Lighthouse*,” in *Women and Language in Literature and Society*, ed. Sally McConnell-Ginet, Ruth Borker, and Nelly Furman (New York, 1980), pp. 310–27.
- 5 As always, I take my formula from Louis Althusser, “Ideology an Ideological State Apparatuses (Notes towards an Investigation),” “Lenin and Philosophy” and Other Essays, trans. Ben Brewster (New York, 1971), pp. 127–86. For an acute differentiation between the individual and individualism, see V. N. Vološinov, *Marxism and the Philosophy of Language*, trans. Ladislav Matejka and I. R. Titunik, Studies in Language, vol. 1 (New York, 1973), pp. 93–4 and 152–3. For a “straight” analysis of the roots and ramifications of English “individualism,” see C. B. MacPherson, *The Political Theory of Possessive Individualism: Hobbes to Locke* (Oxford, 1962). I am grateful to Jonathan Réé for bringing this book to my attention and for giving a careful reading of all but the very end of the present essay.
- 6 I am constructing an analogy with Homi Bhabha’s powerful notion of “not-quite/not-white” in his “Of Mimicry and Man: The Ambiguity of Colonial Discourse,” *October* 28 (Spring 1984): 132. I should also add that I use the word “native” here in reaction to the term “Third World Woman.” It cannot, of course, apply with equal historical justice to both the West Indian and the Indian contexts nor to contexts of imperialism by transportation.
- 7 See Roberto Fernández Retamar, “Caliban: Notes towards a Discussion of Culture in Our America,” trans. Lynn Garafola, David Arthur McMurray, and Robert Márquez, *Massachusetts Review* 15 (Winter–Spring 1974): 7–72; all further references to this work, abbreviated “C,” will be included in the text.

- 12 See Terry Eagleton, *Myths of Power: A Marxist Study of the Brontës* (London, 1975); this is one of the general presuppositions of his book.
- 13 See Sandra M. Gilbert and Susan Gubar, *The Madwoman in the Attic: The Woman Writer and the Nineteenth-Century Literary Imagination* (New Haven, Conn., 1979), pp. 360–2.
- 14 Immanuel Kant, *Critique of Practical Reason*, the "Critique of Pure Reason," the "Critique of Practical Reason" and Other Ethical Treatises, the "Critique of Judgement," trans. J. M. D. Meiklejohn et al. (Chicago, 1952), pp. 328, 326.
- 15 I have tried to justify the reduction of sociohistorical problems to formulas or propositions in my essay "Can the Subaltern Speak?" The "travesty" I speak of does not befall the Kantian ethic in its purity as an accident but rather exists within its lineaments as a possible supplement. On the register of the human being as child rather than heathen, my formula can be found, for example, in "What Is Enlightenment?" in Kant, "Foundations of the Metaphysics of Morals," "What Is Enlightenment?" and a Passage from "The Metaphysics of Morals," trans. and ed. Lewis White Beck (Chicago, 1950). I have profited from discussing Kant with Jonathan Réé.
- 16 Jean Rhys, in an interview with Elizabeth Vreeland, quoted in Nancy R. Harrison, *Jean Rhys and the Novel as Women's Text* (Chapel Hill, NC, 1988). This is an excellent, detailed study of Rhys.
- 17 See Louise Vinge, *The Narcissus Theme in Western European Literature Up to the Early Nineteenth Century*, trans. Robert Dewsnap et al. (Lund, 1967), ch. 5.
- 18 For a detailed study of this text, see John Brenkman, "Narcissus in the Text," *Georgia Review* 30 (Summer 1976): 293–327.
- 19 See, e.g., Thomas F. Staley, *Jean Rhys: A Critical Study* (Austin, Tex. 1979), pp. 108–16; it is interesting to note Staley's masculist discomfort with this and his consequent dissatisfaction with Rhys' novel.
- 20 I have tried to relate castration and suppressed letters in my "The Letter As Cutting Edge," in *Literature and Psychoanalysis; The Question of Reading: Otherwise*, ed. Shoshana Felman (New Haven, Conn., 1981), pp. 208–26.
- 21 This is the main argument of my "Can the Subaltern Speak?"
- 22 See Barbara Johnson, "My Monster/My Self," *Diacritics* 12 (Summer 1982): 2–10.
- 23 See George Levine, *The Realistic Imagination: English Fiction from Frankenstein to Lady Chatterley* (Chicago, 1981), pp. 23–35.
- 24 Consult the publications of the Feminist International Network for the best overview of the current debate on reproductive technology.
- 25 For the male fetish, see Sigmund Freud, "Fetishism," *The Standard Edition of the Complete Psychological Works of Sigmund Freud*, ed. and trans. James Strachey et al., 24 vols. (London, 1953–74), 21:152–7. For a more "serious" Freudian study of *Frankenstein*, see Mary Jacobus, "Is There a Woman in This Text?" *New Literary History* 14 (Autumn 1982): 117–41. My "fantasy" would of course be disproved by the "fact" that it is more difficult for a woman to assume the position of fetishist than for a man; see Mary Ann Doane, "Film and the Masquerade: Theorising the Female Spectator," *Screen* 23 (Sept.–Oct. 1982): 74–87.
- 26 Kant, *Critique of Judgement*, trans. J. H. Bernard (New York, 1951), p. 39.
- 27 See [Constantin François Chasseboeuf de Volney], *The Ruins; or, Meditations on the Revolutions of Empires*, trans. pub. (London, 1811). Johannes Fabian has shown us the manipulation of time in "new" secular histories of a similar kind; see *Time and the Other: How Anthropology Makes Its Object* (New York, 1983). See also Eric R. Wolf, *Europe and the People without History* (Berkeley and Los Angeles, 1982), and Peter Worsley, *The Third World*, 2nd edn. (Chicago, 1973); I am grateful to Dennis Dworkin for bringing the latter book to my attention. The most striking ignoring of the monster's education through Volney is in Gilbert's otherwise brilliant "Horror's Twin: Mary Shelley's

Monstrous Eve," *Feminist Studies* 4 (June 1980): 48–73. Gilbert's essay reflects the absence of race-determinations in a certain sort of feminism. Her present work has most convincingly filled in this gap; see, e.g., her recent piece on H. Rider Haggard's *She* ("Rider Haggard's Heart of Darkness," *Partisan Review* 50, no. 3 [1983]: 444–53).

- 28 "A letter is always and *a priori* intercepted,... the 'subjects' are neither the senders nor the receivers of messages.... The letter is constituted ... by its interception" (Jacques Derrida, "Discussion," after Claude Rabant, "Il n'a aucune chance de l'entendre," in *Affranchissement: Du transfert et de la lettre*, ed. René Major [Paris, 1981], p. 106; my translation). Margaret Saville is not made to appropriate the reader's "subject" into the signature of her own "individuality."
- 29 The most striking "internal evidence" is the admission in the "Author's Introduction" that, after dreaming of the yet-unnamed Victor Frankenstein figure and being terrified (through, yet not quite through, him) by the monster in a scene she later reproduced in Frankenstein's story, Shelley began her tale "on the morrow ... with the words 'It was on a dreary night of November'" (*F*, p. xi). Those are the opening words of chapter 5 of the finished book, where Frankenstein begins to recount the actual making of his monster (see *F*, p. 56).

# CHAPTER 5

## Playing in the Dark

*Toni Morrison*

Novelist Toni Morrison brought her intelligence to bear on questions of literary criticism in *Playing in the Dark* (1992), a series of lectures in which she took up the question of the place of African Americans in American literature. Drawing in this selection on the work of sociologist Orlando Patterson, who argues that the American concept of liberty depended for its definition on the existence of African slavery in America, she discusses the way the literature of the European-descended White population takes an "Africanist" presence for granted.

*I am moved by fancies that are curled  
Around these images, and cling:  
The notion of some infinitely gentle  
Infinitely suffering thing.*

T. S. Eliot,  
“Preludes, IV”

These chapters put forth an argument for extending the study of American literature into what I hope will be a wider landscape. I want to draw a map, so to speak, of a critical geography and use that map to open as much space for discovery, intellectual adventure, and close exploration as did the original charting of the New World – without the mandate for conquest. I intend to outline an attractive, fruitful, and provocative critical project, unencumbered by dreams of subversion or rallying gestures at fortress walls.

I would like it to be clear at the outset that I do not bring to these matters solely or even principally the tools of a literary critic. As a reader (before becoming a writer) I read as I had been taught to do. But books revealed themselves rather differently to me as a writer. In that capacity I have to place enormous trust in my ability to imagine others and my willingness to project consciously into the danger zones such others may represent for me. I am drawn to the ways all writers do this: the way Homer renders a heart-eating cyclops so that our hearts are wrenched with pity; the way Dostoevsky compels intimacy

*Original publication details:* Toni Morrison, “Playing in the Dark” from *Playing in the Dark*. Harvard University Press, 1992. Reproduced with permission from International Creative Management.

with Svidrigailov and Prince Myshkin. I am in awe of the authority of Faulkner's Benjy, James's Maisie, Flaubert's Emma, Melville's Pip, Mary Shelley's Frankenstein – each of us can extend the list.

I am interested in what prompts and makes possible this process of entering what one is estranged from – and in what disables the foray, for purposes of fiction, into corners of the consciousness held off and away from the reach of the writer's imagination. My work requires me to think about how free I can be as an African-American woman writer in my genderized, sexualized, wholly racialized world. To think about (and wrestle with) the full implications of my situation leads me to consider what happens when other writers work in a highly and historically racialized society. For them, as for me, imagining is not merely looking or looking at; nor is it taking oneself intact into the other. It is, for the purposes of the work, *becoming*.

My project rises from delight, not disappointment. It rises from what I know about the ways writers transform aspects of their social grounding into aspects of language, and the ways they tell other stories, fight secret wars, limn out all sorts of debates blanketed in their text. And rises from my certainty that writers always know, at some level, that they do this.

For some time now I have been thinking about the validity or vulnerability of a certain set of assumptions conventionally accepted among literary historians and critics and circulated as "knowledge." This knowledge holds that traditional, canonical American literature is free of, uninformed, and unshaped by the four-hundred-year-old presence of, first, Africans and then African-Americans in the United States. It assumes that this presence – which shaped the body politic, the Constitution, and the entire history of the culture – has had no significant place or consequence in the origin and development of that culture's literature. Moreover, such knowledge assumes that the characteristics of our national literature emanate from a particular "Americanness" that is separate from and unaccountable to this presence. There seems to be a more or less tacit agreement among literary scholars that, because American literature has been clearly the preserve of white male views, genius, and power, those views, genius, and power are without relationship to and removed from the overwhelming presence of black people in the United States. This agreement is made about a population that preceded every American writer of renown and was, I have come to believe, one of the most furtively radical impinging forces on the country's literature. The contemplation of this black presence is central to any understanding of our national literature and should not be permitted to hover at the margins of the literary imagination.

These speculations have led me to wonder whether the major and championed characteristics of our national literature – individualism, masculinity, social engagement versus historical isolation; acute and ambiguous moral problematics; the thematics of innocence coupled with an obsession with figurations of death and hell – are not in fact responses to a dark, abiding, signing Africanist presence. It has occurred to me that the very manner by which American literature distinguishes itself as a coherent entity exists because of this unsettled and unsettling population. Just as the formation of the nation necessitated coded language and purposeful restriction to deal with the racial disingenuousness and moral frailty at its heart, so too did the literature, whose founding characteristics extend into the twentieth century, reproduce the necessity for codes and restriction. Through significant and underscored omissions, startling contradictions, heavily nuanced conflicts, through the way writers peopled their work with the signs and bodies of this presence – one can see that a real or fabricated Africanist presence was crucial to their sense of Americanness. And it shows.

My curiosity about the origins and literary uses of this carefully observed, and carefully invented, Africanist presence has become an informal study of what I call American Africanism. It is an investigation into the ways in which a nonwhite, Africanlike (or Africanist) presence or persona was constructed in the United States, and the imaginative uses this fabricated presence served. I am using the term “Africanism” not to suggest the larger body of knowledge on Africa that the philosopher Valentine Mudimbe means by the term “Africanism,” nor to suggest the varieties and complexities of African people and their descendants who have inhabited this country. Rather I use it as a term for the denotative and connotative blackness that African peoples have come to signify, as well as the entire range of views, assumptions, readings, and misreadings that accompany Eurocentric learning about these people. As a trope, little restraint has been attached to its uses. As a disabling virus within literary discourse, Africanism has become, in the Eurocentric tradition that American education favors, both a way of talking about and a way of policing matters of class, sexual license, and repression, formations and exercises of power, and meditations on ethics and accountability. Through the simple expedient of demonizing and reifying the range of color on a palette, American Africanism makes it possible to say and not say, to inscribe and erase, to escape and engage, to act out and act on, to historicize and render timeless. It provides a way of contemplating chaos and civilization, desire and fear, and a mechanism for testing the problems and blessings of freedom. The United States, of course, is not unique in the construction of Africanism. South America, England, France, Germany, Spain – the cultures of all these countries have participated in and contributed to some aspect of an “invented Africa.” None has been able to persuade itself for long that criteria and knowledge could emerge outside the categories of domination. Among Europeans and the Europeanized, this shared process of exclusion – of assigning designation and value – has led to the popular and academic notion that racism is a “natural,” if irritating, phenomenon. The literature of almost all these countries, however, is now subject to sustained critiques of its racialized discourse. The United States is a curious exception, even though it stands out as being the oldest democracy in which a black population accompanied (if one can use that word) and in many cases preceded the white settlers. Here in that nexus, with its particular formulations, and in the absence of real knowledge or open-minded inquiry about Africans and African-Americans, under the pressures of ideological and imperialistic rationales for subjugation, an American brand of Africanism emerged: strongly urged, thoroughly serviceable, companionably ego-reinforcing, and pervasive. For excellent reasons of state – because European sources of cultural hegemony were dispersed but not yet valorized in the new country – the process of organizing American coherence through a distancing Africanism became the operative mode of a new cultural hegemony.

These remarks should not be interpreted as simply an effort to move the gaze of African-American studies to a different site. I do not want to alter one hierarchy in order to institute another. It is true that I do not want to encourage those totalizing approaches to African-American scholarship which have no drive other than the exchange of dominations – dominant Eurocentric scholarship replaced by dominant Afrocentric scholarship. More interesting is what makes intellectual domination possible; how knowledge is transformed from invasion and conquest to revelation and choice; what ignites and informs the literary imagination, and what forces help establish the parameters of criticism.

Above all I am interested in how agendas in criticism have disguised themselves and, in so doing, impoverished the literature it studies. Criticism as a form of knowledge is

capable of robbing literature not only of its own implicit and explicit ideology but of its ideas as well; it can dismiss the difficult, arduous work writers do to make an art that becomes and remains part of and significant within a human landscape. It is important to see how inextricable Africanism is or ought to be from the deliberations of literary criticism and the wanton, elaborate strategies undertaken to erase its presence from view.

What Africanism became for, and how it functioned in, the literary imagination is of paramount interest because it may be possible to discover, through a close look at literary “blackness,” the nature – even the cause – of literary “whiteness.” What is it *for*? What parts do the invention and development of whiteness play in the construction of what is loosely described as “American”? If such an inquiry ever comes to maturity, it may provide access to a deeper reading of American literature – a reading not completely available now, not least, I suspect, because of the studied indifference of most literary criticism to these matters.

One likely reason for the paucity of critical material on this large and compelling subject is that, in matters of race, silence and evasion have historically ruled literary discourse. Evasion has fostered another, substitute language in which the issues are encoded, foreclosing open debate. The situation is aggravated by the tremor that breaks into discourse on race. It is further complicated by the fact that the habit of ignoring race is understood to be a graceful, even generous, liberal gesture. To notice is to recognize an already discredited difference. To enforce its invisibility through silence is to allow the black body a shadowless participation in the dominant cultural body. According to this logic, every well-bred instinct argues *against noticing* and forecloses adult discourse. It is just this concept of literary and scholarly moeurs (which functions smoothly in literary criticism, but neither makes nor receives credible claims in other disciplines) that has terminated the shelf life of some once extremely well-regarded American authors and blocked access to remarkable insights in their works.

These moeurs are delicate things, however, which must be given some thought before they are abandoned. Not observing such niceties can lead to startling displays of scholarly lapses in objectivity. In 1936 an American scholar investigating the use of Negro so-called dialect in the works of Edgar Allan Poe (a short article clearly proud of its racial equanimity) opens this way: “Despite the fact that he grew up largely in the south and spent some of his most fruitful years in Richmond and Baltimore, Poe has little to say about the darky.”<sup>1</sup>

Although I know this sentence represents the polite parlance of the day, that “darky” was understood to be a term more acceptable than “nigger,” the grimace I made upon reading it was followed by an alarmed distrust of the scholar’s abilities. If it seems unfair to reach back to the thirties for samples of the kind of lapse that can occur when certain manners of polite repression are waived, let me assure you equally egregious representations of the phenomenon are still common.

Another reason for this quite ornamental vacuum in literary discourse on the presence and influence of Africanist peoples in American criticism is the pattern of thinking about racialism in terms of its consequences on the victim – of always defining it asymmetrically from the perspective of its impact on the object of racist policy and attitudes. A good deal of time and intelligence has been invested in the exposure of racism and the horrific results on its objects. There are constant, if erratic, liberalizing efforts to legislate these matters. There are also powerful and persuasive attempts to analyze the origin and fabrication of racism itself, contesting the assumption that it is an inevitable, permanent, and eternal part of all social landscapes. I do not wish to disparage these inquiries. It is

precisely because of them that any progress at all has been accomplished in matters of racial discourse. But that well-established study should be joined with another, equally important one: the impact of racism on those who perpetuate it. It seems both poignant and striking how avoided and unanalyzed is the effect of racist inflection on the subject. What I propose here is to examine the impact of notions of racial hierarchy, racial exclusion, and racial vulnerability and availability on nonblacks who held, resisted, explored, or altered those notions. The scholarship that looks into the mind, imagination, and behavior of slaves is valuable. But equally valuable is a serious intellectual effort to see what racial ideology does to the mind, imagination, and behavior of masters.

Historians have approached these areas, as have social scientists, anthropologists, psychiatrists, and some students of comparative literature. Literary scholars have begun to pose these questions of various national literatures. Urgently needed is the same kind of attention paid to the literature of the western country that has one of the most resilient Africanist populations in the world – a population that has always had a curiously intimate and unhingingly separate existence within the dominant one. When matters of race are located and called attention to in American literature, critical response has tended to be on the order of a humanistic nostrum – or a dismissal mandated by the label “political.” Excising the political from the life of the mind is a sacrifice that has proven costly. I think of this erasure as a kind of trembling hypochondria always curing itself with unnecessary surgery. A criticism that needs to insist that literature is not only “universal” but also “race-free” risks lobotomizing that literature, and diminishes both the art and the artist.

I am vulnerable to the inference here that my inquiry has vested interests; that because I am an African-American and a writer I stand to benefit in ways not limited to intellectual fulfillment from this line of questioning. I will have to risk the accusation because the point is too important: for both black and white American writers, in a wholly racialized society, there is no escape from racially inflected language, and the work writers do to unhobble the imagination from the demands of that language is complicated, interesting, and definitive.

Like thousands of avid but nonacademic readers, some powerful literary critics in the United States have never read, and are proud to say so, *any* African-American text. It seems to have done them no harm, presented them with no discernible limitations in the scope of their work or influence. I suspect, with much evidence to support the suspicion, that they will continue to flourish without any knowledge whatsoever of African-American literature. What is fascinating, however, is to observe how their lavish exploration of literature manages *not* to see meaning in the thunderous, theatrical presence of black surrogacy – an informing, stabilizing, and disturbing element – in the literature they do study. It is interesting, not surprising, that the arbiters of critical power in American literature seem to take pleasure in, indeed relish, their ignorance of African-American texts. What is surprising is that their refusal to read black texts – a refusal that makes no disturbance in their intellectual life – repeats itself when they reread the traditional, established works of literature worthy of their attention.

It is possible, for example, to read Henry James scholarship exhaustively and never arrive at a nodding mention, much less a satisfactory treatment, of the black woman who lubricates the turn of the plot and becomes the agency of moral choice and meaning in *What Maisie Knew*. Never are we invited to a reading of “The Beast in the Jungle” in which that figuration is followed to what seems to me its logical conclusion. It is hard to think of any aspect of Gertrude Stein’s *Three Lives* that has not been covered, except the

exploratory and explanatory uses to which she puts the black woman who holds center stage in that work. The urgency and anxiety in Willa Cather's rendering of black characters are liable to be missed entirely; no mention is made of the problem that race causes in the technique and the credibility of her last novel, *Sapphira and the Slave Girl*. These critics see no excitement or meaning in the tropes of darkness, sexuality, and desire in Ernest Hemingway or in his cast of black men. They see no connection between God's grace and Africanist "othering" in Flannery O'Connor. With few exceptions, Faulkner criticism collapses the major themes of that writer into discursive "mythologies" and treats the later works – whose focus is race and class – as minor, superficial, marked by decline.

An instructive parallel to this willed scholarly indifference is the centuries-long, hysterical blindness to feminist discourse and the way in which women and women's issues were read (or unread). Blatant sexist readings are on the decline, and where they still exist they have little effect because of the successful appropriation by women of their own discourse.

National literatures, like writers, get along the best way they can, and with what they can. Yet they do seem to end up describing and inscribing what is really on the national mind. For the most part, the literature of the United States has taken as its concern the architecture of a *new white man*. If I am disenchanted by the indifference of literary criticism toward examining the range of that concern, I do have a lasting resort: the writers themselves.

Writers are among the most sensitive, the most intellectually anarchic, most representative, most probing of artists. The ability of writers to imagine what is not the self, to familiarize the strange and mystify the familiar, is the test of their power. The languages they use and the social and historical context in which these languages signify are indirect and direct revelations of that power and its limitations. So it is to them, the creators of American literature, that I look for clarification about the invention and effect of Africanism in the United States.

My early assumptions as a reader were that black people signified little or nothing in the imagination of white American writers. Other than as objects of an occasional bout of jungle fever, other than to provide local color or to lend some touch of verisimilitude or to supply a needed moral gesture, humor, or bit of pathos, blacks made no appearance at all. This was a reflection, I thought, of the marginal impact that blacks had on the lives of the characters in the work as well as the creative imagination of the author. To imagine or write otherwise, to situate black people throughout the pages and scenes of a book like some government quota, would be ludicrous and dishonest.

But then I stopped reading as a reader and began to read as a writer. Living in a racially articulated and predicated world, I could not be alone in reacting to this aspect of the American cultural and historical condition. I began to see how the literature I revered, the literature I loathed, behaved in its encounter with racial ideology. American literature could not help being shaped by that encounter. Yes, I wanted to identify those moments when American literature was complicit in the fabrication of racism, but equally important, I still wanted to see when literature exploded and undermined it. Still, those were minor concerns. Much more important was to contemplate how Africanist personae, narrative, and idiom moved and enriched the text in self-conscious ways, to consider what the engagement meant for the work of the writer's imagination.

How does literary utterance arrange itself when it tries to imagine an Africanist other? What are the signs, the codes, the literary strategies designed to accommodate this encounter? What does the inclusion of Africans or African-Americans do to and for the

“work.” As a reader my assumption had always been that nothing “happens”: Africans and their descendants were not in any sense that matters, *there*; and when they were there, they were decorative – displays of the agile writer’s technical expertise. I assumed that since the author was not black, the appearance of Africanist characters or narrative or idiom in a work could never be *about* anything other than the “normal,” unracialized, illusory white world that provided the fictional backdrop. Certainly no American text of the sort I am discussing was ever written *for* black people – no more than *Uncle Tom’s Cabin* was written for Uncle Tom to read or be persuaded by. As a writer reading, I came to realize the obvious: the subject of the dream is the dreamer. The fabrication of an Africanist persona is reflexive; an extraordinary meditation on the self; a powerful exploration of the fears and desires that reside in the writerly conscious. It is an astonishing revelation of longing, of terror, of perplexity, of shame, of magnanimity. It requires hard work *not* to see this.

It is as if I had been looking at a fishbowl – the glide and flick of the golden scales, the green tip, the bolt of white careening back from the gills; the castles at the bottom, surrounded by pebbles and tiny, intricate fronds of green; the barely disturbed water, the flecks of waste and food, the tranquil bubbles traveling to the surface – and suddenly I saw the bowl, the structure that transparently (and invisibly) permits the ordered life it contains to exist in the large world. In other words, I began to rely on my knowledge of how books get written, how language arrives; my sense of how and why writers abandon or take on certain aspects of their project. I began to rely on my understanding of what the linguistic struggle requires of writers and what they make of the surprise that is the inevitable concomitant of the act of creation. What became transparent were the self-evident ways that Americans choose to talk about themselves through and within a sometimes allegorical, sometimes metaphorical, but always choked representation of an Africanist presence. I have made much here of a kind of willful critical blindness – a blindness that, if it had not existed, could have made these insights part of our routine literary heritage. Habit, manners, and political agenda have contributed to this refusal of critical insight. A case in point is Willa Cather’s *Sapphira and the Slave Girl*, a text that has been virtually jettisoned from the body of American literature by critical consensus. References to this novel in much Cather scholarship are apologetic, dismissive, even cutting in their brief documentation of its flaws – of which there are a sufficient number. What remains less acknowledged is the source of its flaws and the conceptual problems that the book both poses and represents. Simply to assert the failure of Cather’s gifts, the exhaustion of her perception, the narrowing of her canvas, evades the obligation to look carefully at what might have caused the book to fail – if “failure” is an intelligent term to apply to any fiction. (It is as if the realms of fiction and reality were divided by a line that, when maintained, offers the possibility of winning but, when crossed, signals the inevitability of losing.)

I suspect that the “problem” of *Sapphira and the Slave Girl* is not that it has a weaker vision or is the work of a weaker mind. The problem is trying to come to terms critically and artistically with the novel’s concerns: the power and license of a white slave mistress over her female slaves. How can that *content* be subsumed by some other meaning? How can the story of a white mistress be severed from a consideration of race and the violence entailed in the story’s premise? If *Sapphira and the Slave Girl* neither pleases nor engages us, it may be enlightening to discover why. It is as if this last book – this troublesome, quietly dismissed novel, very important to Cather – is not only about a fugitive but is itself a fugitive from its author’s literary estate. It is also a book that describes and inscribes its narrative’s own fugitive flight from itself. Our first hint of this flight appears

in the title, *Sapphira and the Slave Girl*. The girl referred to is named Nancy. To have called the book “Sapphira and Nancy” would have lured Cather into dangerous deep water. Such a title would have clarified and drawn attention immediately to what the novel obscures even as it makes a valiant effort at honest engagement: the sycophancy of white identity. The story, briefly, is this.

Sapphira Colbert, an invalid confined to her chair and dependent on slaves for the most intimate services, has persuaded herself that her husband is having or aching to have a liaison with Nancy, the pubescent daughter of her most devoted female slave. It is clear from the beginning that Mistress Colbert is in error: Nancy is pure to the point of vapidity; Master Colbert is a man of modest habits, ambition, and imagination. Sapphira’s suspicions, fed by her feverish imagination and by her leisure to have them, grow and luxuriate unbearably. She forms a plan. She will invite a malleable lecherous nephew, Martin, to visit and let his nature run its course: Nancy will be seduced. The purpose of arranging the rape of her young servant is to reclaim, for purposes not made clear, the full attentions of her husband.

Interference with these plans comes from Sapphira’s daughter, Rachel, estranged from her mother primarily for her abolitionist views but also, we are led to believe, because Sapphira does not tolerate opposition. It is Rachel who manages to effect Nancy’s escape to the north and freedom, with the timid help of her father, Mr. Colbert. A reconciliation of all of the white characters takes place when the daughter loses one of her children to diphtheria and is blessed with the recuperation of the other. The reconciliation of the two key black characters is rendered in a postscript in which many years later Nancy returns to see her aged mother and recount her post-flight adult narrative to the author, a child witnessing the return and the happiness that is the novel’s dénouement. The novel was published in 1940, but has the shape and feel of a tale written or experienced much earlier.

This précis in no way does justice to the novel’s complexities and its problems of execution. Both arise, I believe, not because Cather was failing in narrative power, but because of her struggle to address an almost completely buried subject: the interdependent working of power, race, and sexuality in a white woman’s battle for coherence.

In some ways this novel is a classic fugitive slave narrative: a thrilling escape to freedom. But we learn almost nothing of the trials of the fugitive’s journey because the emphasis is on Nancy’s fugitive state within the house *before her escape*. And the real fugitive, the text asserts, is the slave mistress. Furthermore, the plot escapes the author’s control and, as its own fugitive status becomes clear, is destined to point to the hopelessness of excising racial considerations from formulations of white identity.

Escape is the central focus of Nancy’s existence on the Colbert farm. From the moment of her first appearance, she is forced to hide her emotions, her thoughts, and eventually her body from pursuers. Unable to please Sapphira, plagued by the jealousy of the darker-skinned slaves, she is also barred from help, instruction, or consolation from her own mother, Till. That condition could only prevail in a slave society where the mistress can count on (and an author can believe the reader does not object to) the complicity of a mother in the seduction and rape of her own daughter. Because Till’s loyalty to and responsibility for her mistress is so primary, it never occurs and need not occur to Sapphira that Till might be hurt or alarmed by the violence planned for her only child. That assumption is based on another – that slave women are not mothers; they are “natally dead,” with no obligations to their offspring or their own parents.

This breach startles the contemporary reader and renders Till an unbelievable and unsympathetic character. It is a problem that Cather herself seems hard put to address.

She both acknowledges and banishes this wholly unanalyzed mother–daughter relationship by inserting a furtive exchange between Till and Rachel in chapter 10:

... Till asked in a low, cautious murmur: "You ain't heard nothin', Miss Rachel?"

"Not yet. When I do hear, I'll let you know. I saw her into good hands, Till. I don't doubt she's in Canada by this time, amongst English people."

"Thank you, mam, Miss Rachel. I can't say no more. I don't want them niggers to see me cryin'. If she's up there with the English folks, she'll have some chance."<sup>2</sup>

The passage seems to come out of nowhere because there has been nothing in a hundred or so pages to prepare us for such maternal concern. "You ain't heard nothin'?" Till asks of Rachel. Just that – those four words – meaning: Is Nancy all right? Did she arrive safely? Is she alive? Is anybody after her? All of these questions lie in the one she does manage to ask. Surrounding this dialogue is the silence of four hundred years. It leaps out of the novel's void and out of the void of historical discourse on slave parent–child relationships and pain. The contemporary reader is relieved when Till finally finds the language and occasion to make this inquiry about the fate of her daughter. But nothing more is made of it. And the reader is asked to believe that the silence surrounding the inquiry as well as its delay are due to Till's greater concern about her status among dark-skinned "field" niggers. Clearly Cather was driven to create the exchange not to rehabilitate Till in our readerly eyes but because at some point the silence became an unbearable violence, even in a work full of violence and evasion. Consider the pressures exerted by the subject: the need to portray the faithful slave; the compelling attraction of exploring the possibilities of one woman's absolute power over the body of another woman; confrontation with an uncontested assumption of the sexual availability of black females; the need to make credible the bottomless devotion of the person on whom Sapphira was dependent. It is after all *hers*, this slave woman's body, in a way that her own invalid flesh is not. These fictional demands stretch to breaking all narrative coherence. It is no wonder that Nancy cannot think up her own escape and must be urged into taking the risk.

Nancy has to hide her interior life from hostile fellow slaves *and* her own mother. The absence of camaraderie between Nancy and the other slave women turns on the device of color fetish – the skin-color privilege that Nancy enjoys because she is lighter than the others and therefore enviable. The absence of mother love, always a troubling concern of Cather's, is connected to the assumption of a slave's natal isolation. These are bizarre and disturbing deformations of reality that normally lie mute in novels containing Africanist characters, but Cather does not repress them altogether. The character she creates is at once a fugitive within the household and a sign of the sterility of the fiction-making imagination when there is no available language to clarify or even name the source of unbelievability.

Interestingly, the other major cause of Nancy's constant state of flight is wholly credible: that she should be unarmed in the face of the nephew's sexual assault and that she alone is responsible for extracting herself from the crisis. We do not question her vulnerability. What becomes titillating in this wicked pursuit of innocence – what makes it something other than an American variant of *Clarissa* – is the racial component. The nephew is not even required to court or flatter Nancy. After an unsuccessful reach for her from the branches of a cherry tree, he can, and plans to simply arrive wherever she is sleeping. And since Sapphira has ordered her to sleep in the hall on a pallet, Nancy is forced to sneak away in the dark to quarters where she may be, but is not certain to be, safe.

Other than Rachel, the pro-abolitionist, Nancy has access to no one to whom she can complain, explain, object, or from whom she can seek protection. We must accept her total lack of initiative, for there are no exits. She has no recourse – except in miserable looks that arouse Rachel's curiosity.

Nor is there any law, if the nephew succeeds in the rape, to entertain her complaint. If she becomes pregnant as a result of the violence, the issue is a boon to the economy of the estate, not an injury to it. There is no father or, in this case, “stepfather” to voice a protest on Nancy's behalf, since honor was the first thing stripped from the man. He is a “capon,” we are told, given to Till so that she will have no more children and can give her full attention and energy to Mistress Sapphira.

Rendered voiceless, a cipher, a perfect victim, Nancy runs the risk of losing the reader's interest. In a curious way, Sapphira's plotting, like Cather's plot, is without reference to the characters and exists solely for the ego-gratification of the slave mistress. This becomes obvious when we consider what would have been the consequences of a successful rape. Given the novel's own terms, there can be no grounds for Sapphira's thinking that Nancy can be “ruined” in the conventional sense. There is no question of marriage to Martin, to Colbert, to anybody. Then, too, why would such an assault move her slave girl outside her husband's interest? The probability is that it would secure it. If Mr Colbert is tempted by Nancy the chaste, is there anything in slavocracy to make him disdain Nancy the unchaste?

Such a breakdown in the logic and machinery of plot construction implies the powerful impact race has on narrative – and on narrative strategy. Nancy is not only the victim of Sapphira's evil, whimsical scheming. She becomes the unconsulted, appropriated ground of Cather's inquiry into what is of paramount importance to the author: the reckless, unabated power of a white woman gathering identity unto herself from the wholly available and serviceable lives of Africanist others. This seems to me to provide the coordinates of an immensely important moral debate.

This novel is not a story of a mean, vindictive mistress; it is the story of a desperate one. It concerns a troubled, disappointed woman confined to the prison of her defeated flesh, whose social pedestal rests on the sturdy spine of racial degradation; whose privileged gender has nothing that elevates it except color, and whose moral posture collapses without a whimper before the greater necessity of self-esteem, even though the source of that esteem is a delusion. For Sapphira too is a fugitive in this novel, committed to escape: from the possibility of developing her own adult personality and her own sensibilities, from her femaleness; from motherhood; from the community of women; from her body.

She escapes the necessity of inhabiting her own body by dwelling on the young, healthy, and sexually appetizing Nancy. She has transferred its care into the hands of others. In this way she escapes her illness, decay, confinement, anonymity, and physical powerlessness. In other words, she has the leisure and the instruments to construct a self; but the self she constructs must be – is conceivable only as – white. The surrogate black bodies become her hands and feet, her fantasies of sexual intimacy with her husband and not inconsiderably, her sole source of love.

If the Africanist characters and their condition are removed from the text of *Sapphira and the Slave Girl* we will not have a Miss Havisham immured or in flames. We have nothing: no process of deranged self-construction that can take for granted acquiescence in so awful an enterprise; no drama of limitless power. Sapphira can hide far more successfully than Nancy. She can, and does, remain outside the normal requirements of adult womanhood because of the infantilized Africanist population at her disposal.

The final fugitive in Cather's novel is the novel itself. The plot's own plotting to free the endangered slave girl (of no apparent interest, as we have seen, to the girl's mother or her slave associates) is designed for quite other purposes. It functions as a means for the author to meditate on the moral equivalence of free white women and enslaved black women. The fact that these equations are designed as mother–daughter pairings and relationships leads to the inescapable conclusion that Cather was dreaming and redreaming her problematic relationship with her own mother.

The imaginative strategy is a difficult one at best, an impossible one in the event – so impossible that Cather permits the novel to escape from the pages of fiction into nonfiction. For narrative credibility she substitutes her own determination to force the equation. It is an equation that must take place outside the narrative.

*Sapphira and the Slave Girl* turns at the end into a kind of memoir, the author's recollection of herself as a child witnessing the return, the reconciliation, and an imposed "all rightness" in untenable, outrageous circumstances. The silenced, acquiescent Africanist characters in the narrative are not less muzzled in the epilogue. The reunion – the drama of it, like its narrative function – is no more the slave characters' than their slave lives have been. The reunion is literally stage-managed for the author, now become a child. Till agrees to wait until little Willa is at the doorway before she permits herself the first sight she has had of her daughter in twenty-five years.

Only with Africanist characters is such a project thinkable: delayed gratification for the pleasure of a (white) child. When the embrace is over, Willa the white child accompanies the black mother and daughter into their narrative, listening to the dialogue but intervening in it at every turn. The shape and detail and substance of their lives are hers, not theirs. Just as Sapphira has employed these surrogate, serviceable black bodies for her own purposes of power without risk so the author employs them in behalf of her own desire for a *safe* participation in loss, in love, in chaos, in justice.

But things go awry. As often happens, characters make claims, impose demands of imaginative accountability over and above the author's will to contain them. Just as Rachel's intervention foils Sapphira's plot, so Cather's urgent need to know and understand this Africanist mother and daughter requires her to give them center stage. The child Cather listens to Till's stories, and the slave, silenced in the narrative, has the final words of the epilogue.

Yet even, or especially, here where the novel ends Cather feels obliged to gesture compassionately toward slavery. Through Till's agency the elevating benevolence of the institution is invoked. Serviceable to the last, this Africanist presence is permitted speech only to reinforce the slaveholders' ideology, in spite of the fact that it subverts the entire premise of the novel. Till's voluntary genuflection is as ecstatic as it is suspicious.

In returning to her childhood, at the end of her writing career, Cather returns to a very personal, indeed private experience. In her last novel she works out and toward the meaning of female betrayal as it faces the void of racism. She may not have arrived safely, like Nancy, but to her credit she did undertake the dangerous journey.

# CHAPTER 6

## A Small Place

*Jamaica Kincaid*

Jamaica Kincaid's *A Small Place* (1988) addresses the question of what might be called "secondary colonialism." Secondary colonialism occurs when inhabitants of wealthy, highly developed northern or western countries convert poorer, formerly colonial, usually southern and eastern countries into sites or objects of useful pleasure. Tourism is the most obvious example of such colonization, but it might also be said to assume more symbolic forms, as when the inhabitants of such poorer countries or the places themselves are converted into occasions for the creation of cultural meaning or the achievement of self-fulfillment by secondary colonists. E. M. Forster's *A Passage to India* is a clear example of such symbolic conversion.

If you go to Antigua as a tourist, this is what you will see. If you come by aeroplane you will land at the V. C. Bird International Airport. Vere Cornwall (V. C.) Bird is the Prime Minister of Antigua. You may be the sort of tourist who would wonder why a Prime Minister would want an airport named after him – why not a school, why not a hospital, why not some great public monument? You are a tourist and you have not yet seen a school in Antigua, you have not yet seen the hospital in Antigua, you have not yet seen a public monument in Antigua. As your plane descends to land, you might say, What a beautiful island Antigua is – more beautiful than any of the other islands you have seen, and they were very beautiful, in their way, but they were much too green, much too lush with vegetation, which indicated to you, the tourist, that they got quite a bit of rainfall, and rain is the very thing that you, just now, do not want, for you are thinking of the hard and cold and dark and long days you spent working in North America (or, worse, Europe), earning some money so that you could stay in this place (Antigua) where the sun always shines and where the climate is deliciously hot and dry for the four to ten days you are going to be staying there; and since you are on your holiday, since you are a tourist, the thought of what it might be like for someone who had to live day in day out in a place that suffers constantly from drought, and so has to watch carefully every drop of fresh water used (while at the

same time surrounded by a sea and an ocean – the Caribbean Sea on one side, the Atlantic Ocean on the other), must never cross your mind.

You disembark from your plane. You go through customs. Since you are a tourist, a North American or European – to be frank, white and not an Antiguan black returning to Antigua from Europe or North America with cardboard boxes of much needed cheap clothes and food for relatives, you move through customs swiftly, you move through customs with ease. Your bags are not searched. You emerge from customs into the hot, clean air: immediately you feel cleansed, immediately you feel blessed (which is to say special); you feel free. You see a man, a taxi driver; you ask him to take you to your destination; he quotes you a price. You immediately think that the price is in the local currency, for you are a tourist and you are familiar with these things (rates of exchange) and you feel even more free, for things seem so cheap, but then your driver ends by saying, “In US currency.” You may say, “Hmmmm, do you have a formal sheet that lists official prices and destinations?” Your driver obeys the law and shows you the sheet, and he apologizes for the incredible mistake he has made in quoting you a price off the top of his head which is so vastly different (favoring him) from the one listed. You are driven to your hotel by this taxi driver in his taxi, a brand-new Japanese-made vehicle. The road on which you are traveling is a very bad road, very much in need of repair. You are feeling wonderful, so you say, “Oh, what a marvelous change these bad roads are from the splendid highways I am used to in North America.” (Or, worse, Europe.) Your driver is reckless; he is a dangerous man who drives in the middle of the road when he thinks no other cars are coming in the opposite direction, passes other cars on blind curves that run uphill, drives at sixty miles an hour on narrow, curving roads when the road sign, a rusting, beat-up thing left over from colonial days, says 40 MPH. This might frighten you (you are on your holiday; you are a tourist); this might excite you (you are on your holiday; you are a tourist), though if you are from New York and take taxis you are used to this style of driving: most of the taxi drivers in New York are from places in the world like this. You are looking out the window (because you want to get your money’s worth); you notice that all the cars you see are brand-new, or almost brand-new, and that they are all Japanese made. There are no American cars in Antigua – no new ones, at any rate; none that were manufactured in the last ten years. You continue to look at the cars and you say to yourself, Why, they look brand-new, but they have an awful sound, like an old car – a very old, dilapidated car. How to account for that? Well, possibly it’s because they use leaded gasoline in these brand-new cars whose engines were built to use non-leaded gasoline, but you musn’t ask the person driving the car if this is so, because he or she has never heard of unleaded gasoline. You look closely at the car; you see that it’s a model of a Japanese car that you might hesitate to buy; it’s a model that’s very expensive; it’s a model that’s quite impractical for a person who has to work as hard as you do and who watches every penny you earn so that you can afford this holiday you are on. How do they afford such a car? And do they live in a luxurious house to match such a car? Well, no. You will be surprised, then, to see that most likely the person driving this brand-new car filled with the wrong gas lives in a house that, in comparison, is far beneath the status of the car; and if you were to ask why you would be told that the banks are encouraged by the government to make loans available for cars, but loans for houses not so easily available; and if you ask again why, you will be told that the two main car dealerships in Antigua are owned in part or outright by ministers in government. Oh, but you are on holiday and the sight of these brand-new cars driven by people who may or may not have really passed their driving test (there was once a scandal about driving licenses for sale)

would not really stir up these thoughts in you. You pass a building sitting in a sea of dust and you think, It's some latrines for people just passing by, but when you look again you see the building has written on it PIGOTT'S SCHOOL. You pass the hospital, the Holberton Hospital, and how wrong you are not to think about this, for though you are a tourist on your holiday, what if your heart should miss a few beats? What if a blood vessel in your neck should break? What if one of those people driving those brand-new cars filled with the wrong gas fails to pass safely while going uphill on a curve and you are in the car going in the opposite direction? Will you be comforted to know that the hospital is staffed with doctors that no actual Antiguan trusts; that Antiguans always say about the doctors, "I don't want them near me"; that Antiguans refer to them not as doctors but as "the three men" (there are three of them); that when the Minister of Health himself doesn't feel well he takes the first plane to New York to see a real doctor; that if any one of the ministers in government needs medical care he flies to New York to get it?

It's a good thing that you brought your own books with you, for you couldn't just go to the library and borrow some. Antigua used to have a splendid library but in The Earthquake (everyone talks about it that way – The Earthquake; we Antiguans, for I am one, have a great sense of things, and the more meaningful the thing, the more meaningless we make it) the library building was damaged. This was in 1974, and soon after that a sign was placed on the front of the building saying, THIS BUILDING WAS DAMAGED IN THE EARTHQUAKE OF 1974. REPAIRS ARE PENDING. The sign hangs there, and hangs there more than a decade later, with its unfulfilled promise of repair, and you might see this as a sort of quaintness on the part of these islanders, these people descended from slaves – what a strange, unusual perception of time they have. REPAIRS ARE PENDING, and here it is many years later, but perhaps in a world that is twelve miles long and nine miles wide (the size of Antigua) twelve years and twelve minutes and twelve days are all the same. The library is one of those splendid old buildings from colonial times, and the sign telling of the repairs is a splendid old sign from colonial times. Not very long after The Earthquake Antigua got its independence from Britain, making Antigua a state in its own right and Antiguans are so proud of this that each year, to mark the day, they go to church and thank God, a British God, for this. But you should not think of the confusion that must lie in all that and you must not think of the damaged library. You have brought your own books with you, and among them is one of those new books about economic history, one of those books explaining how the West (meaning Europe and North America after its conquest and settlement by Europeans) got rich: the West got nothing and then under-valued labor, for generations, of the people like me you see walking around you in Antigua but from the ingenuity of small shopkeepers in Sheffield and Yorkshire and Lancashire, or wherever; and what a great part the invention of the wristwatch played in it, for there was nothing noble-minded men could not do when they discovered they could slap time on their wrists just like that (isn't that the last straw; for not only did we have to suffer the unspeakableness of slavery, but the satisfaction to be had from "We made you bastards rich" is taken away, too), and so you needn't let that slightly funny feeling you have from time to time about exploitation, oppression, domination develop into full-fledged unease, discomfort; you could ruin your holiday. They are not responsible for what you have; you owe them nothing; in fact, you did them a big favor, and you can provide one hundred examples. For here you are now, passing by Government House. And here you are now, passing by the Prime Minister's Office and the Parliament Building, and overlooking these, with a splendid view of St John's Harbour, the American Embassy. If it were not for you, they would not have Government House, and Prime Minister's Office,

and Parliament Building and embassy of powerful country. Now you are passing a mansion, an extraordinary house painted the color of old cow dung, with more aerials and antennas attached to it than you will see even at the American Embassy. The people who live in this house are a merchant family who came to Antigua from the Middle East less than twenty years ago. When this family first came to Antigua, they sold dry goods door to door from suitcases they carried on their backs. Now they own a lot of Antigua; they regularly lend money to the government, they build enormous (for Antigua), ugly (for Antigua), concrete buildings in Antigua's capital, St John's, which the government then rents for huge sums of money; a member of their family is the Antiguan Ambassador to Syria; Antiguans hate them. Not far from this mansion is another mansion, the home of a drug smuggler. Everybody knows he's a drug smuggler, and if just as you were driving by he stepped out of his door your driver might point him out to you as the notorious person that he is, for this drug smuggler is so rich people say he buys cars in tens – ten of this one, ten of that one and that he bought a house (another mansion) near Five Islands, contents included, with cash he carried in a suitcase: three hundred and fifty thousand American dollars, and, to the surprise of the seller of the house, lots of American dollars were left over. Overlooking the drug smuggler's mansion is yet another mansion, and leading up to it is the best paved road in all of Antigua – even better than the road that was paved for the Queen's visit in 1985 (when the Queen came, all the roads that she would travel on were paved anew, so that the Queen might have been left with the impression that riding in a car in Antigua was a pleasant experience). In this mansion lives a woman sophisticated people in Antigua call Evita. She is a notorious woman. She's young and beautiful and the girlfriend of somebody very high up in the government. Evita is notorious because her relationship with this high government official has made her the owner of boutiques and property and given her a say in cabinet meetings, and all sorts of other privileges such a relationship would bring a beautiful young woman.

Oh, but by now you are tired of all this looking, and you want to reach your destination – your hotel, your room. You long to refresh yourself; you long to eat some nice lobster, some nice local food. You take a bath, you brush your teeth. You get dressed again; as you get dressed, you look out the window. That water – have you ever seen anything like it? Far out, to the horizon, the color of the water is navy-blue; nearer, the water is the color of the North American sky. From there to the shore, the water is pale, silvery, clear, so clear that you can see its pinkish-white sand bottom. Oh, what beauty! Oh, what beauty! You have never seen anything like this. You are so excited. You breathe shallow. You breathe deep. You see a beautiful boy skimming the water, godlike, on a Windsurfer. You see an incredibly unattractive, fat, pastrylike-fleshed woman enjoying a walk on the beautiful sand with a man, an incredibly unattractive, fat, pastrylike-fleshed man; you see the pleasure they're taking in their surroundings. Still standing, looking out the window, you see yourself lying on the beach, enjoying the amazing sun (a sun so powerful and yet so beautiful, the way it is always overhead as if on permanent guard, ready to stamp out any cloud that dares to darken and so empty rain on you and ruin your holiday; a sun that is your personal friend). You see yourself taking a walk on that beach, you see yourself meeting new people (only they are new in a very limited way, for they are people just like you). You see yourself eating some delicious, locally grown food. You see yourself, yourself ... You must not wonder what exactly happened to the contents of your lavatory when you flushed it. You must not wonder where your bath water went when you pulled out the stopper. You must not wonder what happened when you brushed your teeth. Oh, it might all end up in the water you are thinking of taking a swim in; the

contents of your lavatory might, just might, graze gently against your ankle as you wade carefree in the water, for you see, in Antigua, there is no proper sewage-disposal system. But the Caribbean Sea is very big and the Atlantic Ocean is even bigger; it would amaze even you to know the number of black slaves this ocean has swallowed up. When you sit down to eat your delicious meal, it's better that you don't know that most of what you are eating came off a plane from Miami. And before it got on a plane in Miami, who knows where it came from? A good guess is that it came from a place like Antigua first, where it was grown dirt-cheap, went to Miami, and came back. There is a world of something in this, but I can't go into it right now.

The thing you have always suspected about yourself the minute you become a tourist is true: A tourist is an ugly human being. You are not an ugly person all the time; you are not an ugly person ordinarily; you are not an ugly person day to day. From day to day, you are a nice person. From day to day, all the people who are supposed to love you on the whole do. From day to day, as you walk down a busy street in the large and modern and prosperous city in which you work and live, dismayed, puzzled (a cliche, but only a cliche can explain you) at how alone you feel in this crowd, how awful it is to go unnoticed, how awful it is to go unloved, even as you are surrounded by more people than you could possibly get to know in a lifetime that lasted for millennia, and then out of the corner of your eye you see someone looking at you and absolute pleasure is written all over that person's face, and then you realize that you are not as revolting a presence as you think you are (for that look just told you so). And so, ordinarily, you are a nice person, an attractive person, a person capable of drawing to yourself the affection of other people (people just like you), a person at home in your own skin (sort of; I mean, in a way; I mean, your dismay and puzzlement are natural to you, because people like you just seem to be like that, and so many of the things people like you find admirable about yourselves – the things you think about, the things you think really define you – seem rooted in these feelings): a person at home in your own house (and all its nice house things), with its nice back yard (and its nice back-yard things), at home on your street, your church, in community activities, your job, at home with your family, your relatives, your friends – you are a whole person. But one day, when you are sitting somewhere, alone in that crowd, and that awful feeling of displacedness comes over you, and really, as an ordinary person you are not well equipped to look too far inward and set yourself aright, because being ordinary is already so taxing, and being ordinary takes all you have out of you, and though the words "I must get away" do not actually pass across your lips, you make a leap from being that nice blob just sitting like a boob in your amniotic sac of the modern experience to being a person visiting heaps of death and ruin and feeling alive and inspired at the sight of it; to being a person lying on some faraway beach, your stilled body stinking and glistening in the sand, looking like something first forgotten, then remembered, then not important enough to go back for; to being a person marveling at the harmony (ordinarily, what you would say is the backwardness) and the union these other people (and they are other people) have with nature. And you look at the things they can do with a piece of ordinary cloth, the things they fashion out of cheap, vulgarly colored (to you) twines, the way they squat down over a hole they have made in the ground, the hole itself is something to marvel at, and since you are being an ugly person this ugly but joyful thought will swell inside you: their ancestors were not clever in the way yours were and not ruthless in the way yours were, for then would it not be you who would be in harmony with nature and backwards in that charming way? An ugly thing, that is what you are when you become a tourist, an ugly, empty thing, a stupid

thing, a piece of rubbish pausing here and there to gaze at this and taste that, and it will never occur to you that the people who inhabit the place in which you have just paused cannot stand you, that behind their closed doors they laugh at your strangeness (you do not look the way they look); the physical sight of you does not please them; you have bad manners (it is their custom to eat their food with their hands; you try eating their way, you look silly; you try eating the way you always eat, you look silly); they do not like the way you speak (you have an accent); they collapse helpless from laughter, mimicking the way they imagine you must look as you carry out some everyday bodily function. They do not like you. *They do not like me!* That thought never actually occurs to you. Still, you feel a little uneasy. Still you feel a little foolish. Still, you feel a little out of place. But the banality of your own life is very real to you; it drove you to this extreme, spending your days and your nights in the company of people who despise you, people you do not like really, people you would not want to have as your actual neighbor. And so you must devote yourself to puzzling out how much of what you are told is really, really true (Is ground-up bottle glass in peanut sauce really a delicacy around here, or will it do just what you think ground-up bottle glass will do? Is this rare, multicolored, snout-mouthed fish really an aphrodisiac, or will it cause you to fall asleep permanently?). Oh, the hard work all of this is, and is it any wonder, then, that on your return home you feel the need of a long rest, so that you can recover from your life as a tourist?

That the native does not like the tourist is not hard to explain. For every native of every place is a potential tourist, and every tourist is a native of somewhere. Every native everywhere lives a life of overwhelming and crushing banality and boredom and desperation and depression, and every deed, good and bad, is an attempt to forget this. Every native would like to find a way out, every native would like a rest, every native would like a tour. But some natives – most natives in the world – cannot go anywhere. They are too poor. They are too poor to go anywhere. They are too poor to escape the reality of their lives; and they are too poor to live properly in the place where they live, which is the very place you, the tourist, want to go – so when the natives see you, the tourist, they envy you, they envy your ability to leave your own banality and boredom, they envy your ability to turn their own banality and boredom into a source of pleasure for yourself.

# CHAPTER 7

## Disjuncture and Difference in the Global Cultural Economy

*Arjun Appadurai*

Modern global culture is characterized by "disjuncture," according to Arjun Appadurai, Professor of Media, Culture, and Education at New York University. Things hold together in new ways that depart from traditional anchors such as regional geography and ethnic identity, and individual lives are complexly influenced and shaped by modes of understanding and living that are provided by the media, culture, and finance.

The central problem of today's global interactions is the tension between cultural homogenization and cultural heterogenization. A vast array of empirical facts could be brought to bear on the side of the 'homogenization' argument, and much of it has come from the left end of the spectrum of media studies (Hamelink, 1983; Mattelart, 1983; Schiller, 1976), and some from other, less appealing, perspectives (Gans, 1985; Iyer, 1988). Most often, the homogenization argument subspeciates into either an argument about Americanization, or an argument about 'commoditization', and very often the two arguments are closely linked. What these arguments fail to consider is that at least as rapidly as forces from various metropolises are brought into new societies they tend to become indigenized in one or other way: this is true of music and housing styles as much as it is true of science and terrorism, spectacles and constitutions. The dynamics of such indigenization have just begun to be explored in a sophisticated manner (Barber, 1987; Feld, 1988; Hannerz, 1987, 1989; Ivy, 1988; Nicoll, 1989; Yoshimoto, 1989), and much more needs to be done. But it is worth noticing that for the people of Irian Jaya, Indonesianization may be more worrisome than Americanization, as Japanization may be for Koreans, Indianization for Sri Lankans, Vietnamization for the Cambodians, Russianization for the people of Soviet Armenia and the Baltic Republics. Such a list of alternative fears to Americanization could be greatly expanded, but it is not a shapeless

inventory: for polities of smaller scale, there is always a fear of cultural absorption by polities of larger scale, especially those that are nearby. One man's imagined community (Anderson, 1983) is another man's political prison.

This scalar dynamic, which has widespread global manifestations, is also tied to the relationship between nations and states, to which I shall return later in this essay. For the moment let us note that the simplification of these many forces (and fears) of homogenization can also be exploited by nation-states in relation to their own minorities, by posing global commoditization (or capitalism, or some other such external enemy) as more 'real' than the threat of its own hegemonic strategies.

The new global cultural economy has to be understood as a complex, overlapping, disjunctive order, which cannot any longer be understood in terms of existing center-periphery models (even those that might account for multiple centers and peripheries). Nor is it susceptible to simple models of push and pull (in terms of migration theory) or of surpluses and deficits (as in traditional models of balance of trade), or of consumers and producers (as in most neo-Marxist theories of development). Even the most complex and flexible theories of global development which have come out of the Marxist tradition (Amin, 1980; Mandel, 1978; Wallerstein, 1974; Wolf, 1982) are inadequately quirky, and they have not come to terms with what Lash and Urry (1987) have recently called 'disorganized capitalism'. The complexity of the current global economy has to do with certain fundamental disjunctures between economy, culture and politics which we have barely begun to theorize.<sup>1</sup>

I propose that an elementary framework for exploring such disjunctures is to look at the relationship between five dimensions of global cultural flow which can be termed: (a) ethnoscapes; (b) mediascapes; (c) technoscapes; (d) finanscapes; and (e) ideoscapes.<sup>2</sup> I use terms with the common suffix *scape* to indicate first of all that these are not objectively given relations which look the same from every angle of vision, but rather that they are deeply perspectival constructs, inflected very much by the historical, linguistic and political situatedness of different sorts of actors: nation-states, multinationals, diasporic communities, as well as sub-national groupings and movements (whether religious, political or economic), and even intimate face-to-face groups, such as villages, neighborhoods and families. Indeed, the individual actor is the last locus of this perspectival set of landscapes, for these landscapes are eventually navigated by agents who both experience and constitute larger formations, in part by their own sense of what these landscapes offer. These landscapes thus, are the building blocks of what, extending Benedict Anderson, I would like to call 'imagined worlds', that is, the multiple worlds which are constituted by the historically situated imaginations of persons and groups spread around the globe (Appadurai, 1989). An important fact of the world we live in today is that many persons on the globe live in such imagined 'worlds' and not just in imagined communities, and thus are able to contest and sometimes even subvert the 'imagined worlds' of the official mind and of the entrepreneurial mentality that surround them. The suffix *scape* also allows us to point to the fluid, irregular shapes of these landscapes, shapes which characterize international capital as deeply as they do international clothing styles.

By 'ethnoscape', I mean the landscape of persons who constitute the shifting world in which we live: tourists, immigrants, refugees, exiles, guestworkers and other moving groups and persons constitute an essential feature of the world, and appear to affect the politics of and between nations to a hitherto unprecedented degree. This is not to say that there are not anywhere relatively stable communities and networks, of kinship, of friendship, of work and of leisure, as well as of birth, residence and other filiative forms.

But it is to say that the warp of these stabilities is everywhere shot through with the woof of human motion, as more persons and groups deal with the realities of having to move, or the fantasies of wanting to move. What is more, both these realities as well as these fantasies now function on larger scales, as men and women from villages in India think not just of moving to Poona or Madras, but of moving to Dubai and Houston, and refugees from Sri Lanka find themselves in South India as well as in Canada, just as the Hmong are driven to London as well as to Philadelphia. And as international capital shifts its needs, as production and technology generate different needs, as nation-states shift their policies on refugee populations, these moving groups can never afford to let their imaginations rest too long, even if they wished to.

By 'technoscapes', I mean the global configuration, also ever fluid, of technology, and of the fact that technology, both high and low, both mechanical and informational, now moves at high speeds across various kinds of previously impervious boundaries. Many countries now are the roots of multinational enterprise: a huge steel complex in Libya may involve interests from India, China, Russia and Japan, providing different components of new technological configurations. The odd distribution of technologies, and thus the peculiarities of these technoscapes, are increasingly driven not by any obvious economies of scale, of political control, or of market rationality, but of increasingly complex relationships between money flows, political possibilities and the availability of both low and highly-skilled labor. So, while India exports waiters and chauffeurs to Dubai and Sharjah, it also exports software engineers to the United States (indentured briefly to Tata-Burroughs or the World Bank), then laundered through the State Department to become wealthy 'resident aliens', who are in turn objects of seductive messages to invest their money and know-how in federal and state projects in India. The global economy can still be described in terms of traditional 'indicators' (as the World Bank continues to do) and studied in terms of traditional comparisons (as in Project Link at the University of Pennsylvania), but the complicated technoscapes (and the shifting ethnoscapes), which underlie these 'indicators' and 'comparisons' are further out of the reach of the 'queen of the social sciences' than ever before. How is one to make a meaningful comparison of wages in Japan and the United States, or of real estate costs in New York and Tokyo, without taking sophisticated account of the very complex fiscal and investment flows that link the two economies through a global grid of currency speculation and capital transfer?

Thus it is useful to speak as well of 'finanscapes', since the disposition of global capital is now a more mysterious, rapid and difficult landscape to follow than ever before, as currency markets, national stock exchanges, and commodity speculations move megamoniies through national turnstiles at blinding speed, with vast absolute implications for small differences in percentage points and time units. But the critical point is that the global relationship between ethnoscapes, technoscapes and finanscapes is deeply disjunctive and profoundly unpredictable, since each of these landscapes is subject to its own constraints and incentives (some political, some informational and some technoenvironmental), at the same time as each acts as a constraint and a parameter for movements in the other. Thus, even an elementary model of global political economy must take into account the shifting relationship between perspectives on human movement, technological flow, and financial transfers, which can accommodate their deeply disjunctive relationships with one another.

Built upon these disjunctions (which hardly form a simple, mechanical global 'infrastructure' in any case) are what I have called 'mediascapes' and 'ideoscapes', though the

latter two are closely related landscapes of images. 'Mediascapes' refer both to the distribution of the electronic capabilities to produce and disseminate information (newspapers, magazines, television stations, film production studios, etc.), which are now available to a growing number of private and public interests throughout the world; and to the images of the world created by these media. These images of the world involve many complicated inflections, depending on their mode (documentary or entertainment), their hardware (electronic or pre-electronic), their audiences (local, national or transnational) and the interests of those who own and control them. What is most important about these mediascapes is that they provide (especially in their television, film and cassette forms) large and complex repertoires of images, narratives and 'ethnoscapes' to viewers throughout the world, in which the world of commodities and the world of 'news' and politics are profoundly mixed. What this means is that many audiences throughout the world experience the media themselves as a complicated and interconnected repertoire of print, celluloid, electronic screens and billboards. The lines between the 'realistic' and the fictional landscapes they see are blurred, so that the further away these audiences are from the direct experiences of metropolitan life, the more likely they are to construct 'imagined worlds' which are chimerical, aesthetic, even fantastic objects, particularly if assessed by the criteria of some other perspective, some other 'imagined world'.

'Mediascapes', whether produced by private or state interests, tend to be image-centered, narrative-based accounts of strips of reality, and what they offer to those who experience and transform them is a series of elements (such as characters, plots and textual forms) out of which scripts can be formed of imagined lives, their own as well as those of others living in other places. These scripts can and do get disaggregated into complex sets of metaphors by which people live (Lakoff and Johnson, 1980) as they help to constitute narratives of the 'other' and proto-narratives of possible lives, fantasies which could become prologemena to the desire for acquisition and movement.

'Ideoscapes' are also concatenations of images, but they are often directly political and frequently have to do with the ideologies of states and the counter-ideologies of movements explicitly oriented to capturing state power or a piece of it. These ideoscapes are composed of elements of the Enlightenment world-view, which consists of a concatenation of ideas, terms and images, including 'freedom', 'welfare', 'rights', 'sovereignty', 'representation' and the master-term 'democracy'. The master-narrative of the Enlightenment (and its many variants in England, France and the United States) was constructed with a certain internal logic and presupposed a certain relationship between reading, representation and the public sphere (for the dynamics of this process in the early history of the United States, see Warner, 1990). But their diaspora across the world, especially since the nineteenth century, has loosened the internal coherence which held these terms and images together in a Euro-American master-narrative, and provided instead a loosely structured synopticon of politics, in which different nation-states, as part of their evolution, have organized their political cultures around different 'keywords' (Williams, 1976).

As a result of the differential diaspora of these keywords, the political narratives that govern communication between elites and followings in different parts of the world involve problems of both a semantic and a pragmatic nature: semantic to the extent that words (and their lexical equivalents) require careful translation from context to context in their global movements; and pragmatic to the extent that the use of these words by political actors and their audiences may be subject to very different

sets of contextual conventions that mediate their translation into public politics. Such conventions are not only matters of the nature of political rhetoric (viz. what does the aging Chinese leadership mean when it refers to the dangers of hooliganism? What does the South Korean leadership mean when it speaks of ‘discipline’ as the key to democratic industrial growth?).

These conventions also involve the far more subtle question of what sets of communicative genres are valued in what way (newspapers versus cinema for example) and what sorts of pragmatic genre conventions govern the collective ‘readings’ of different kinds of text. So, while an Indian audience may be attentive to the resonances of a political speech in terms of some key words and phrases reminiscent of Hindi cinema, a Korean audience may respond to the subtle codings of Buddhist or neo-Confucian rhetorical strategy encoded in a political document. The very relationship of reading to hearing and seeing may vary in important ways that determine the morphology of these different ‘ideoscapes’ as they shape themselves in different national and transnational contexts. This globally variable synesthesia has hardly even been noted, but it demands urgent analysis. Thus ‘democracy’ has clearly become a master-term, with powerful echoes from Haiti and Poland to the Soviet Union and China, but it sits at the center of a variety of ideoscapes (composed of distinctive pragmatic configurations of rough ‘translations’ of other central terms from the vocabulary of the Enlightenment). This creates ever new terminological kaleidoscopes, as states (and the groups that seek to capture them) seek to pacify populations whose own ethnoscapes are in motion, and whose mediascapes may create severe problems for the ideoscapes with which they are presented. The fluidity of ideoscapes is complicated in particular by the growing diasporas (both voluntary and involuntary) of intellectuals who continuously inject new meaning-streams into the discourse of democracy in different parts of the world.

This extended terminological discussion of the five terms I have coined sets the basis for a tentative formulation about the conditions under which current global flows occur: *they occur in and through the growing disjunctions between ethnoscapes, technoscapes, finanscapes, mediascapes and ideoscapes*. This formulation, the core of my model of global cultural flow, needs some explanation. First, people, machinery, money, images, and ideas now follow increasingly non-isomorphic paths: of course, at all periods in human history, there have been some disjunctions between the flows of these things, but the sheer speed, scale and volume of each of these flows is now so great that the disjunctions have become central to the politics of global culture. The Japanese are notoriously hospitable to ideas and are stereotyped as inclined to export (all) and import (some) goods, but they are also notoriously closed to immigration, like the Swiss, the Swedes and the Saudis. Yet the Swiss and Saudis accept populations of guestworkers, thus creating labor diasporas of Turks, Italians and other circum-mediterranean groups. Some such guestworker groups maintain continuous contact with their home-nations, like the Turks, but others, like high-level South Asian migrants tend to desire lives in their new homes, raising anew the problem of reproduction in a deterritorialized context.

Deterritorialization, in general, is one of the central forces of the modern world, since it brings laboring populations into the lower class sectors and spaces of relatively wealthy societies, while sometimes creating exaggerated and intensified senses of criticism or attachment to politics in the home-state. Deterritorialization, whether of Hindus, Sikhs, Palestinians or Ukrainians, is now at the core of a variety of global fundamentalisms, including Islamic and Hindu fundamentalism. In the Hindu case for example (Appadurai and Breckenridge, forthcoming) it is clear that the overseas movement of Indians has

been exploited by a variety of interests both within and outside India to create a complicated network of finances and religious identifications, in which the problems of cultural reproduction for Hindus abroad has become tied to the politics of Hindu fundamentalism at home.

At the same time, deterritorialization creates new markets for film companies, art impressarios and travel agencies, who thrive on the need of the deterritorialized population for contact with its homeland. Naturally, these invented homelands, which constitute the mediascapes of deterritorialized groups, can often become sufficiently fantastic and one-sided that they provide the material for new ideoscapes in which ethnic conflicts can begin to erupt. The creation of 'Khalistan', an invented homeland of the deterritorialized Sikh population of England, Canada and the United States, is one example of the bloody potential in such mediascapes, as they interact with the 'internal colonialisms' (Hechter, 1974) of the nation-state. The West Bank, Namibia and Eritrea are other theaters for the enactment of the bloody negotiation between existing nation-states and various deterritorialized groupings.

The idea of deterritorialization may also be applied to money and finance, as money managers seek the best markets for their investments, independent of national boundaries. In turn, these movements of monies are the basis of new kinds of conflict, as Los Angelenos worry about the Japanese buying up their city, and people in Bombay worry about the rich Arabs from the Gulf States who have not only transformed the prices of mangoes in Bombay, but have also substantially altered the profile of hotels, restaurants and other services in the eyes of the local population, just as they continue to do in London. Yet, most residents of Bombay are ambivalent about the Arab presence there, for the flip side of their presence is the absence of friends and kinsmen earning big money in the Middle East and bringing back both money and luxury commodities to Bombay and other cities in India. Such commodities transform consumer taste in these cities, and also often end up smuggled through air and sea ports and peddled in the gray markets of Bombay's streets. In these gray markets, some members of Bombay's middle-classes and of its lumpenproletariat can buy some of these goods, ranging from cartons of Marlboro cigarettes, to Old Spice shaving cream and tapes of Madonna. Similarly gray routes, often subsidized by the moonlighting activities of sailors, diplomats, and airline stewardesses who get to move in and out of the country regularly, keep the gray markets of Bombay, Madras and Calcutta filled with goods not only from the West, but also from the Middle East, Hong Kong and Singapore.

It is this fertile ground of deterritorialization, in which money, commodities and persons are involved in ceaselessly chasing each other around the world, that the mediascapes and ideoscapes of the modern world find their fractured and fragmented counterpart. For the ideas and images produced by mass media often are only partial guides to the goods and experiences that deterritorialized populations transfer to one another. In Mira Nair's brilliant film, *India Cabaret*, we see the multiple loops of this fractured deterritorialization as young women, barely competent in Bombay's metropolitan glitz, come to seek their fortunes as cabaret dancers and prostitutes in Bombay, entertaining men in clubs with dance formats derived wholly from the prurient dance sequences of Hindi films. These scenes cater in turn to ideas about Western and foreign women and their 'looseness', while they provide tawdry career alibis for these women. Some of these women come from Kerala, where cabaret clubs and the pornographic film industry have blossomed, partly in response to the purses and tastes of Keralites returned from the Middle East, where their diasporic lives away from women distort

their very sense of what the relations between men and women might be. These tragedies of displacement could certainly be replayed in a more detailed analysis of the relations between the Japanese and German sex tours to Thailand and the tragedies of the sex trade in Bangkok, and in other similar loops which tie together fantasies about the other, the conveniences and seductions of travel, the economics of global trade and the brutal mobility fantasies that dominate gender politics in many parts of Asia and the world at large.

While far more could be said about the cultural politics of deterritorialization and the larger sociology of displacement that it expresses, it is appropriate at this juncture to bring in the role of the nation-state in the disjunctive global economy of culture today. The relationship between states and nations is everywhere an embattled one. It is possible to say that in many societies, the nation and the state have become one another's projects. That is, while nations (or more properly groups with ideas about nationhood) seek to capture or co-opt states and state power, states simultaneously seek to capture and monopolize ideas about nationhood (Baruah, 1986; Chatterjee, 1986; Nandy, 1989). In general, separatist, transnational movements, including those which have included terror in their methods, exemplify nations in search of states: Sikhs, Tamil Sri Lankans, Basques, Moros, Quebecois, each of these represent imagined communities which seek to create states of their own or carve pieces out of existing states. States, on the other hand, are everywhere seeking to monopolize the moral resources of community, either by flatly claiming perfect coevality between nation and state, or by systematically museumizing and representing all the groups within them in a variety of heritage politics that seems remarkably uniform throughout the world (Handler, 1988; Herzfeld, 1982; McQueen, 1988). Here, national and international mediascapes are exploited by nation-states to pacify separatists or even the potential fissiparousness of all ideas of difference. Typically, contemporary nation-states do this by exercising taxonomical control over difference; by creating various kinds of international spectacle to domesticate difference; and by seducing small groups with the fantasy of self-display on some sort of global or cosmopolitan stage. One important new feature of global cultural politics, tied to the disjunctive relationships between the various landscapes discussed earlier, is that state and nation are at each's throats, and the hyphen that links them is now less an icon of conjuncture than an index of disjunction. This disjunctive relationship between nation and state has two levels: at the level of any given nation-state, it means that there is a battle of the imagination, with state and nation seeking to cannibalize one another. Here is the seed-bed of brutal separatisms, majoritarianisms that seem to have appeared from nowhere, and micro-identities that have become political projects within the nation-state. At another level, this disjunctive relationship is deeply entangled with the global disjunctures discussed throughout this essay: ideas of nationhood appear to be steadily increasing in scale and regularly crossing existing state boundaries: sometimes, as with the Kurds, because previous identities stretched across vast national spaces, or, as with the Tamils in Sri Lanka, the dormant threads of a transnational diaspora have been activated to ignite the micro-politics of a nation-state.

In discussing the cultural politics that have subverted the hyphen that links the nation to the state, it is especially important not to forget its mooring in the irregularities that now characterize 'disorganized capital' (Lash and Urry, 1987; Kothari, 1989). It is because labor, finance and technology are now so widely separated that the volatilities that underlie movements for nationhood (as large as transnational Islam on the one hand, or as small as the movement of the Gurkhas for a separate state in the North-East

of India) grind against the vulnerabilities which characterize the relationships between states. States find themselves pressed to stay 'open' by the forces of media, technology, and travel which had fueled consumerism throughout the world and have increased the craving, even in the non-Western world, for new commodities and spectacles. On the other hand, these very cravings can become caught up in new ethnoscapes, mediascapes, and eventually, ideoescapes, such as 'democracy' in China, that the state cannot tolerate as threats to its own control over ideas of nationhood and 'people-hood'. States throughout the world are under siege, especially where contests over the ideoescapes of democracy are fierce and fundamental, and where there are radical disjunctures between ideoescapes and technoscapes (as in the case of very small countries that lack contemporary technologies of production and information); or between ideoescapes and finanscapes (as in countries, such as Mexico or Brazil where international lending influences national politics to a very large degree); or between ideoescapes and ethnoscapes (as in Beirut, where diasporic, local and translocal filiations are suicidally at battle); or between ideoescapes and mediascapes (as in many countries in the Middle East and Asia) where the lifestyles represented on both national and international TV and cinema completely overwhelm and undermine the rhetoric of national politics: in the Indian case, the myth of the law-breaking hero has emerged to mediate this naked struggle between the pieties and the realities of Indian politics, which has grown increasingly brutalized and corrupt (Vachani, 1989).

The transnational movement of the martial-arts, particularly through Asia, as mediated by the Hollywood and Hongkong film industries (Zarilli, forthcoming) is a rich illustration of the ways in which long-standing martial arts traditions, reformulated to meet the fantasies of contemporary (sometimes lumpen) youth populations, create new cultures of masculinity and violence, which are in turn the fuel for increased violence in national and international politics. Such violence is in turn the spur to an increasingly rapid and amoral arms trade which penetrates the entire world. The worldwide spread of the AK-47 and the Uzi, in films, in corporate and state security, in terror, and in police and military activity, is a reminder that apparently simple technical uniformities often conceal an increasingly complex set of loops, linking images of violence to aspirations for community in some 'imagined world'.

Returning then to the 'ethnoscapes' with which I began, the central paradox of ethnic politics in today's world is that primordia, (whether of language or skin color or neighborhood or of kinship) have become globalized. That is, sentiments whose greatest force is in their ability to ignite intimacy into a political sentiment and turn locality into a staging ground for identity, have become spread over vast and irregular spaces, as groups move, yet stay linked to one another through sophisticated media capabilities. This is not to deny that such primordia are often the product of invented traditions (Hobsbawm and Ranger, 1983) or retrospective affiliations, but to emphasize that because of the disjunctive and unstable interplay of commerce, media, national policies and consumer fantasies, ethnicity, once a genie contained in the bottle of some sort of locality (however large) has now become a global force, forever slipping in and through the cracks between states and borders.

But the relationship between the cultural and economic levels of this new set of global disjunctures is not a simple one-way street in which the terms of global cultural politics are set wholly by, or confined wholly within, the vicissitudes of international flows of technology, labor and finance, demanding only a modest modification of existing neo-Marxist models of uneven development and state-formation. There is a deeper change,

itself driven by the disjunctions between all the landscapes I have discussed, and constituted by their continuously fluid and uncertain interplay, which concerns the relationship between production and consumption in today's global economy. Here I begin with Marx's famous (and often mined) view of the fetishism of the commodity, and suggest that this fetishism has been replaced in the world at large (now seeing the world as one, large, interactive system, composed of many complex sub-systems) by two mutually supportive descendants, the first of which I call production fetishism, and the second of which I call the fetishism of the consumer.

By production fetishism I mean an illusion created by contemporary transnational production loci, which masks translocal capital, transnational earning-flows, global management and often faraway workers (engaged in various kinds of high-tech putting out operations) in the idiom and spectacle of local (sometimes even worker) control, national productivity and territorial sovereignty. To the extent that various kinds of Free Trade Zone have become the models for production at large, especially of high-tech commodities, production has itself become a fetish, masking not social relations as such, but the relations of production, which are increasingly transnational. The locality (both in the sense of the local factory or site of production and in the extended sense of the nation-state) becomes a fetish which disguises the globally dispersed forces that actually drive the production process. This generates alienation (in Marx's sense) twice intensified, for its social sense is now compounded by a complicated spatial dynamic which is increasingly global.

As for the fetishism of the consumer, I mean to indicate here that the consumer has been transformed, through commodity flows (and the mediascapes, especially of advertising, that accompany them) into a sign, both in Baudrillard's sense of a simulacrum which only asymptotically approaches the form of a real social agent; and in the sense of a mask for the real seat of agency, which is not the consumer but the producer and the many forces that constitute production. Global advertising is the key technology for the worldwide dissemination of a plethora of creative, and culturally well-chosen, ideas of consumer agency. These images of agency are increasingly distortions of a world of merchandising so subtle that the consumer is consistently helped to believe that he or she is an actor, where in fact he or she is at best a chooser.

The globalization of culture is not the same as its homogenization, but globalization involves the use of a variety of instruments of homogenization (armaments, advertising techniques, language hegemonies, clothing styles and the like), which are absorbed into local political and cultural economies, only to be repatriated as heterogeneous dialogues of national sovereignty, free enterprise, fundamentalism, etc. in which the state plays an increasingly delicate role: too much openness to global flows and the nation-state is threatened by revolt – the China syndrome; too little, and the state exits the international stage, as Burma, Albania and North Korea, in various ways have done. In general, the state has become the arbiter of this *repatriation of difference* (in the form of goods, signs, slogans, styles, etc.). But this repatriation or export of the designs and commodities of difference continuously exacerbates the 'internal' politics of majoritarianism and homogenization, which is most frequently played out in debates over heritage.

Thus the central feature of global culture today is the politics of the mutual effort of sameness and difference to cannibalize one another and thus to proclaim their successful hijacking of the twin Enlightenment ideas of the triumphantly universal and the resiliently particular. This mutual cannibalization shows its ugly face in riots, in refugee-flows, in state-sponsored torture and in ethnocide (with or without state support).

Its brighter side is in the expansion of many individual horizons of hope and fantasy, in the global spread of oral rehydration therapy and other low-tech instruments of well-being, in the susceptibility even of South Africa to the force of global opinion, in the inability of the Polish state to repress its own working-classes, and in the growth of a wide range of progressive, transnational alliances. Examples of both sorts could be multiplied. The critical point is that both sides of the coin of global cultural process today are products of the infinitely varied mutual contest of sameness and difference on a stage characterized by radical disjunctures between different sorts of global flows and the uncertain landscapes created in and through these disjunctures.

## Notes

A longer version of this essay appears in *Public Culture* 2 (2), Spring 1990. This longer version sets the present formulation in the context of global cultural traffic in earlier historical periods, and draws out some of its implications for the study of cultural forms more generally.

- 1 One major exception is Fredric Jameson, whose (1984) essay on the relationship between postmodernism and late capitalism has in many ways, inspired this essay. However, the debate between Jameson (1986) and Ahmad (1987) in *Social Text* shows that the creation of a globalizing Marxist narrative, in cultural matters, is difficult territory indeed. My own effort, in this context, is to begin a restructuring of the Marxist narrative (by stressing lags and disjunctures) that many Marxists might find abhorrent. Such a restructuring has to avoid the dangers of obliterating difference within the 'third world', of eliding the social referent (as some French postmodernists seem inclined to do) and of retaining the narrative authority of the Marxist tradition, in favor of greater attention to global fragmentation, uncertainty and difference.
- 2 These ideas are argued more fully in a book I am currently working on, tentatively entitled *Imploding Worlds: Imagination and Disjuncture in the Global Cultural Economy*.

# CHAPTER 8

## Cultural Identity and Diaspora

*Stuart Hall*

A leading figure in the field of Cultural Studies, Stuart Hall in this essay argues that the cultural and ethnic identities summoned as alternatives to colonial imposition are made complicated by differences and are never simple. Hall is famous for his work with the "Birmingham School" of cultural studies in England and is associated with the study of the role of the media in maintaining the power of dominant economic and social groups.

A new cinema of the Caribbean is emerging, joining the company of the other 'Third Cinemas'. It is related to, but different from the vibrant film and other forms of visual representation of the Afro-Caribbean (and Asian) 'blacks' of the diasporas of the West – the new post-colonial subjects. All these cultural practices and forms of representation have the black subject at their centre, putting the issue of cultural identity in question. Who is this emergent, new subject of the cinema? From where does he/she speak? Practices of representation always implicate the positions from which we speak or write – the positions of *enunciation*. What recent theories of enunciation suggest is that, though we speak, so to say 'in our own name', of ourselves and from our own experience, nevertheless who speaks, and the subject who is spoken of, are never identical, never exactly in the same place. Identity is not as transparent or unproblematic as we think. Perhaps instead of thinking of identity as an already accomplished fact, which the new cultural practices then represent, we should think, instead, of identity as a 'production', which is never complete, always in process, and always constituted within, not outside, representation. This view problematises the very authority and authenticity to which the term, 'cultural identity', lays claim.

We seek, here, to open a dialogue, an investigation, on the subject of cultural identity and representation. Of course, the 'I' who writes here must also be thought of as, itself, 'enunciated'. We all write and speak from a particular place and time, from a history and a culture which is specific. What we say is always 'in context', *positioned*. I was born into and spent my childhood and adolescence in a lower-middle-class family in Jamaica. I have lived all my adult life in England, in the shadow of the black diaspora – 'in the belly of the beast'. I write against the background of a lifetime's work in cultural studies. If the paper

*Original publication details:* Stuart Hall "Cultural Identity and Diaspora." *Framework* (no. 36), (1989), pp. 222–237. Reproduced with permission from *Framework*.

seems preoccupied with the diaspora experience and its narratives of displacement, it is worth remembering that all discourse is ‘placed’, and the heart has its reasons.

There are at least two different ways of thinking about ‘cultural identity’. The first position defines ‘cultural identity’ in terms of one, shared culture, a sort of collective ‘one true self’, hiding inside the many other, more superficial or artificially imposed ‘selves’, which people with a shared history and ancestry hold in common. Within the terms of this definition, our cultural identities reflect the common historical experiences and shared cultural codes which provide us, as ‘one people’, with stable, unchanging and continuous frames of reference and meaning, beneath the shifting divisions and vicissitudes of our actual history. This ‘oneness’, underlying all the other, more superficial differences, is the truth, the essence, of ‘Caribbeanness’, of the black experience. It is this identity which a Caribbean or black diaspora must discover, excavate, bring to light and express through cinematic representation.

Such a conception of cultural identity played a critical role in all the post-colonial struggles which have so profoundly reshaped our world. It lay at the centre of the vision of the poets of ‘Negritude’, like Aimee Cesaire and Leopold Senghor, and of the Pan-African political project, earlier in the century. It continues to be a very powerful and creative force in emergent forms of representation amongst hitherto marginalised peoples. In post-colonial societies, the rediscovery of this identity is often the object of what Frantz Fanon once called a

passionate research ... directed by the secret hope of discovering beyond the misery of today, beyond self-contempt, resignation and abjuration, some very beautiful and splendid era whose existence rehabilitates us both in regard to ourselves and in regard to others.

New forms of cultural practice in these societies address themselves to this project for the very good reason that, as Fanon puts it, in the recent past,

Colonisation is not satisfied merely with holding a people in its grip and emptying the native's brain of all form and content. By a kind of perverted logic, it turns to the past of oppressed people, and distorts, disfigures and destroys it.<sup>1</sup>

The question which Fanon's observation poses is, what is the nature of this ‘profound research’ which drives the new forms of visual and cinematic representation? Is it only a matter of unearthing that which the colonial experience buried and overlaid, bringing to light the hidden continuities it suppressed? Or is a quite different practice entailed – not the rediscovery but the *production* of identity. Not an identity grounded in the archaeology, but in the *re-telling* of the past?

We should not, for a moment, underestimate or neglect the importance of the act of imaginative rediscovery which this conception of a rediscovered, essential identity entails. ‘Hidden histories’ have played a critical role in the emergence of many of the most important social movements of our time – feminist, anti-colonial and anti-racist. The photographic work of a generation of Jamaican and Rastafarian artists, or of a visual artist like Armet Francis (a Jamaican-born photographer who has lived in Britain since the age of eight) is a testimony to the continuing creative power of this conception of identity within the emerging practices of representation. Francis's photographs of the peoples of The Black Triangle, taken in Africa, the Caribbean, the USA and the UK, attempt to reconstruct in visual terms ‘the underlying unity of the black people whom

colonisation and slavery distributed across the African diaspora.' His text is an act of imaginary reunification.

Crucially, such images offer a way of imposing an imaginary coherence on the experience of dispersal and fragmentation, which is the history of all enforced diasporas. They do this by representing or 'figuring' Africa as the mother of these different civilisations. This Triangle is, after all, 'centred' in Africa. Africa is the name of the missing term, the great aporia, which lies at the centre of our cultural identity and gives it a meaning which, until recently, it lacked. No one who looks at these textural images now, in the light of the history of transportation, slavery and migration, can fail to understand how the rift of separation, the 'loss of identity', which has been integral to the Caribbean experience only begins to be healed when these forgotten connections are once more set in place. Such texts restore an imaginary fullness or plentitude, to set against the broken rubric of our past. They are resources of resistance and identity, with which to confront the fragmented and pathological ways in which that experience has been reconstructed within the dominant regimes of cinematic and visual representation of the West.

There is, however, a second, related but different view of cultural identity. This second position recognises that, as well as the many points of similarity, there are also critical points of deep and significant *difference* which constitute 'what we really are'; or rather – since history has intervened – 'what we have become'. We cannot speak for very long, with any exactness, about 'one experience, one identity', without acknowledging its other side – the ruptures and discontinuities which constitute, precisely, the Caribbean's 'uniqueness'. Cultural identity, in this second sense, is a matter of 'becoming' as well as of 'being'. It belongs to the future as much as to the past. It is not something which already exists, transcending place, time, history and culture. Cultural identities come from somewhere, have histories. But, like everything which is historical, they undergo constant transformation. Far from being eternally fixed in some essentialised past, they are subject to the continuous 'play' of history, culture and power. Far from being grounded in a mere 'recovery' of the past, which is waiting to be found, and which, when found, will secure our sense of ourselves into eternity, identities are the names we give to the different ways we are positioned by, and position ourselves within, the narratives of the past.

It is only from this second position that we can properly understand the traumatic character of 'the colonial experience'. The ways in which black people, black experiences, were positioned and subject-ed in the dominant regimes of representation were the effects of a critical exercise of cultural power and normalisation. Not only, in Said's 'Orientalist' sense, were we constructed as different and other within the categories of knowledge of the West by those regimes. They had the power to make us see and experience *ourselves* as 'Other'. Every regime of representation is a regime of power formed, as Foucault reminds us, by the fatal couplet, 'power/knowledge'. But this kind of knowledge is internal, not external. It is one thing to position a subject or set of peoples as the Other of a dominant discourse. It is quite another thing to subject them to that 'knowledge', not only as a matter of imposed will and domination, by the power of inner compulsion and subjective con-formation to the norm. That is the lesson – the sombre majesty – of Fanon's insight into the colonising experience in *Black Skin, White Masks*.

This inner expropriation of cultural identity cripples and deforms. If its silences are not resisted, they produce, in Fanon's vivid phrase, 'individuals without an anchor, without horizon, colourless, stateless, rootless – a race of angels'.<sup>2</sup> Nevertheless, this idea of otherness as an inner compulsion changes our conception of 'cultural identity'. In this perspective, cultural identity is not a fixed essence at all, lying unchanged outside

history and culture. It is not some universal and transcendental spirit inside us on which history has made no fundamental mark. It is not once-and-for-all. It is not a fixed origin to which we can make some final and absolute Return. Of course, it is not a mere phantasm either. It is *something* – not a mere trick of the imagination. It has its histories – and histories have their real, material and symbolic effects. The past continues to speak to us. But it no longer addresses us as a simple, factual ‘past’, since our relation to it, like the child’s relation to the mother, is always-already ‘after the break’. It is always constructed through memory, fantasy, narrative and myth. Cultural identities are the points of identification, the unstable points of identification or suture, which are made, within the discourses of history and culture. Not an essence but a *positioning*. Hence, there is always a politics of identity, a politics of position, which has no absolute guarantee in an unproblematic, transcendental ‘law of origin’.

This second view of cultural identity is much less familiar, and more unsettling. If identity does not proceed, in a straight, unbroken line, from some fixed origin, how are we to understand its formation? We might think of black Caribbean identities as ‘framed’ by two axes or vectors, simultaneously operative: the vector of similarity and continuity; and the vector of difference and rupture. Caribbean identities always have to be thought of in terms of the dialogic relationship between these two axes. The one gives us some grounding in, some continuity with, the past. The second reminds us that what we share is precisely the experience of a profound discontinuity: the peoples dragged into slavery, transportation, colonisation, migration, came predominantly from Africa – and when that supply ended, it was temporarily refreshed by indentured labour from the Asian subcontinent. (This neglected fact explains why, when you visit Guyana or Trinidad, you see, symbolically inscribed in the faces of their peoples, the paradoxical ‘truth’ of Christopher Columbus’s mistake: you *can* find ‘Asia’ by sailing west, if you know where to look!) In the history of the modern world, there are few more traumatic ruptures to match these enforced separations from Africa – already figured, in the European imaginary, as ‘the Dark Continent’. But the slaves were also from different countries, tribal communities, villages, languages and gods. African religion, which has been so profoundly formative in Caribbean spiritual life, is precisely *different* from Christian monotheism in believing that God is so powerful that he can only be known through a proliferation of spiritual manifestations, present everywhere in the natural and social world. These gods live on, in an underground existence, in the hybridised religious universe of Haitian voodoo, pocomania, Native pentacostalism, Black baptism, Rastafarianism and the black Saints Latin American Catholicism. The paradox is that it was the uprooting of slavery and transportation and the insertion into the plantation economy (as well as the symbolic economy) of the Western world that ‘unified’ these peoples across their differences, in the same moment as it cut them off from direct access to their past.

Difference, therefore, persists – in and alongside continuity. To return to the Caribbean after any long absence is to experience again the shock of the ‘doubleness’ of similarity and difference. Visiting the French Caribbean for the first time, I also saw at once how different Martinique is from, say, Jamaica: and this is no mere difference of topography or climate. It is a profound difference of culture and history. And the difference *matters*. It positions Martiniquains and Jamaicans as *both* the same *and* different. Moreover, the boundaries of difference are continually repositioned in relation to different points of reference. Vis-a-vis the developed West, we are very much ‘the same’. We belong to the marginal, the underdeveloped, the periphery, the ‘Other’. We are at the outer edge, the ‘rim’, of the metropolitan world – always ‘South’ to someone else’s *El Norte*.

At the same time, we do not stand in the same relation of the ‘otherness’ to the metropolitan centres. Each has negotiated its economic, political and cultural dependency differently. And this ‘difference’, whether we like it or not, is already inscribed in our cultural identities. In turn, it is this negotiation of identity which makes us, vis-a-vis other Latin American people, with a very similar history, different – Caribbeans, *les Antillennes* ('islanders' to their mainland). And yet, vis-a-vis one another, Jamaican, Haitian, Cuban, Guadeloupean, Barbadian, etc ...

How, then, to describe this play of ‘difference’ within identity? The common history – transportation, slavery, colonisation – has been profoundly formative. For all these societies, unifying us across our differences. But it does not constitute a common *origin*, since it was, metaphorically as well as literally, a translation. The inscription of difference is also specific and critical. I use the word ‘play’ because the double meaning of the metaphor is important. It suggests, on the one hand, the instability, the permanent unsettlement, the lack of any final resolution. On the other hand, it reminds us that the place where this ‘doubleness’ is most powerfully to be heard is ‘playing’ within the varieties of Caribbean musics. This cultural play could not therefore be represented, cinematically, as a simple, binary opposition – ‘past/present’, ‘them/us’. Its complexity exceeds this binary structure of representation. At different places, times, in relation to different questions, the boundaries are re-sited. They become, not only what they have, at times, certainly been – mutually excluding categories, but also what they sometimes are – differential points along a sliding scale.

One trivial example is the way Martinique both *is* and *is not* ‘French’. It is, of course, a *department* of France, and this is reflected in its standard and style of life, Fort de France is a much richer, more ‘fashionable’ place than Kingston – which is not only visibly poorer, but itself at a point of transition between being ‘in fashion’ in an Anglo-African and Afro-American way – for those who can afford to be in any sort of fashion at all. Yet, what is distinctively ‘Martiniquais’ can only be described in terms of that special and peculiar supplement which the black and mulatto skin adds to the ‘refinement’ and sophistication of a Parisian-derived *haute couture*: that is, a sophistication which, because it is black, is always transgressive.

To capture this sense of difference which is not pure ‘otherness’, we need to deploy the play on words of a theorist like Jacques Derrida. Derrida uses the anomalous ‘a’ in his way of writing ‘difference’ – *differance* – as a marker which sets up a disturbance in our settled understanding or translation of the word/concept. It sets the word in motion to new meanings without erasing the *trace* of its other meanings. His sense of *differance*, as Christopher Norris puts it, thus

remains suspended between the two French verbs ‘to differ’ and ‘to defer’ (postpone), both of which contribute to its textual force but neither of which can fully capture its meaning. Language depends on difference, as Saussure showed ... the structure of distinctive propositions which make up its basic economy. Where Derrida breaks new ground ... is in the extent to which ‘differ’ shades into ‘defer’ ... the idea that meaning is always deferred, perhaps to this point of an endless supplementarity, by the play of signification.<sup>3</sup>

This second sense of difference challenges the fixed binaries which stabilise meaning and representation and show how meaning is never finished or completed, but keeps on moving to encompass other, additional or supplementary meanings, which, as Norris puts it elsewhere,<sup>4</sup> ‘disturb the classical economy of language and representation’.

Without relations of difference, no representation could occur. But what is then constituted within representation is always open to being deferred, staggered, serialised.

Where, then, does identity come in to this infinite postponement of meaning? Derrida does not help us as much as he might here, though the notion of the ‘trace’ goes some way towards it. This is where it sometimes seems as if Derrida has permitted his profound theoretical insights to be reappropriated by his disciples into a celebration of formal ‘playfulness’, which evacuates them of their political meaning. For if signification depends upon the endless repositioning of its differential terms, meaning, in any specific instance, depends on the contingent and arbitrary stop – the necessary and temporary ‘break’ in the infinite semiosis of language. This does not detract from the original insight. It only threatens to do so if we mistake this ‘cut’ of identity – this *positioning*, which makes meaning possible – as a natural and permanent, rather than an arbitrary and contingent ‘ending’ – whereas I understand every such position as ‘strategic’ and arbitrary, in the sense that there is no permanent equivalence between the particular sentence we close, and its true meaning, as such. Meaning continues to unfold, so to speak, beyond the arbitrary closure which makes it, at any moment, possible. It is always either over- or under-determined, either an excess or a supplement. There is always something ‘left over’.

It is possible, with this conception of ‘difference’, to rethink the positionings and repositionings of Caribbean cultural identities in relation to at least three ‘presences’, to borrow Aimee Cesaire’s and Leopold Senghor’s metaphor: *Presence Africaine*, *Presence Europeenne*, and the third, most ambiguous, presence of all – the sliding term, *Presence Americain*. Of course, I am collapsing, for the moment, the many other cultural ‘presences’ which constitute the complexity of Caribbean identity (Indian, Chinese, Lebanese etc). I mean America, here, not in its ‘first-world’ sense – the big cousin to the North whose ‘rim’ we occupy, but in the second, broader sense: America, the ‘New World’, *Terra Incognita*.

*Presence Africaine* is the site of the repressed. Apparently silenced beyond memory by the power of the experience of slavery, Africa was, in fact present everywhere: in the everyday life and customs of the slave quarters, in the languages and patois of the plantations, in names and words, often disconnected from their taxonomies, in the secret syntactical structures through which other languages were spoken, in the stories and tales told to children, in religious practices and beliefs, in the spiritual life, the arts, crafts, musics and rhythms of slave and post-emancipation society. Africa, the signified which could not be represented directly in slavery, remained and remains the unspoken, unspeakable ‘presence’ in Caribbean culture. It is ‘hiding’ behind every verbal inflection, every narrative twist of Caribbean cultural life. It is the secret code with which every Western text was ‘re-read’. It is the ground-bass of every rhythm and bodily movement. *This was – is – the ‘Africa’ that ‘is alive and well in the diaspora’.*<sup>5</sup>

When I was growing up in the 1940s and 1950s as a child in Kingston, I was surrounded by the signs, music and rhythms of this Africa of the diaspora, which only existed as a result of a long and discontinuous series of transformations. But, although almost everyone around me was some shade of brown or black (Africa ‘speaks’!), I never once heard a single person refer to themselves or to others as, in some way, or as having been at some time in the past, ‘African’. It was only in the 1970s that this Afro-Caribbean identity became historically available to the great majority of Jamaican people, at home and abroad. In this historic moment, Jamaicans discovered themselves to be ‘black’ – just as, in the same moment, they discovered themselves to be the sons and daughters of ‘slavery’.

This profound cultural discovery, however, was not, and could not be, made directly, without ‘mediation’. It could only be made *through* the impact on popular life of the post-colonial revolution, the civil rights struggles, the culture of Rastafarianism and the music of reggae – the metaphors, the figures or signifiers of a new construction of ‘Jamaican-ness’. These signified a ‘new’ Africa of the New World, grounded in an ‘old’ Africa: – a spiritual journey of discovery that led, in the Caribbean, to an indigenous cultural revolution; this is Africa, as we might say, necessarily ‘deferred’ – as a spiritual, cultural and political metaphor.

It is the presence/absence of Africa, in this form, which has made it the privileged signifier of new conceptions of Caribbean identity. Everyone in the Caribbean, of whatever ethnic background, must sooner or later come to terms with this African presence. Black, brown, mulatto, white – all must look *Presence Africaine* in the face, speak its name. But whether it is, in this sense, an *origin* of our identities, unchanged by four hundred years of displacement, dismemberment, transportation, to which we could in any final or literal sense return, is more open to doubt. The original ‘Africa’ is no longer there. It too has been transformed. History is, in that sense, irreversible. We must not collude with the West which, precisely, normalises and appropriates Africa by freezing it into some timeless zone of the primitive, unchanging past. Africa must at last be reckoned with by Caribbean people, but it cannot in any simple sense be merely recovered.

It belongs irrevocably, for us, to what Edward Said once called an ‘imaginative geography and history’,<sup>6</sup> which helps ‘the mind to intensify its own sense of itself by dramatising the difference between what is close to it and what is far away’. It ‘has acquired an imaginative or figurative value we can name and feel’.<sup>7</sup> Our belongingness to it constitutes what Benedict Anderson calls ‘an imagined community’.<sup>8</sup> To this ‘Africa’, which is a necessary part of the Caribbean imaginary, we can’t literally go home again.

The character of this displaced ‘homeward’ journey – its length and complexity – comes across vividly, in a variety of texts. Tony Sewell’s documentary archival photographs, *Garvey’s Children: the Legacy of Marcus Garvey*, tells the story of a ‘return’ to an African identity which went, necessarily, by the long route – through London and the United States. It ‘ends’, not in Ethiopia but with Garvey’s statue in front of the St Ann Parish Library in Jamaica: not with a traditional tribal chant but with the music of Burning Spear and Bob Marley’s *Redemption Song*. This is our long journey home. Derek Bishton’s courageous visual and written text, *Black Heart Man* – the story of the journey of a *white* photographer ‘on the trail of the promised land’ – starts in England, and goes, through Shashemene, the place in Ethiopia to which many Jamaican people have found their way on their search for the Promised Land, and slavery; but it ends in Pinnacle, Jamaica, where the first Rastafarian settlement was established, and ‘beyond’ – among the dispossessed of 20th-century Kingston and the streets of Handsworth, where Bishton’s voyage of discovery first began. These symbolic journeys are necessary for us all – and necessarily circular. This is the Africa we must return to – but ‘by another route’: what Africa has *become* in the New World, what we have made of ‘Africa’: ‘Africa’ – as we re-tell it through politics, memory and desire.

What of the second, troubling, term in the identity equation – the European presence? For many of us, this is a matter not of too little but of too much. Where Africa was a case of the unspoken, Europe was a case of that which is endlessly speaking – and endlessly speaking *us*. The European presence interrupts the innocence of the whole discourse of ‘difference’ in the Caribbean by introducing the question of power. ‘Europe’ belongs irrevocably to the play of power, to the lines of force and consent, to the role of the

*dominant*, in Caribbean culture. In terms of colonialism, underdevelopment, poverty and the racism of colour, the European presence is that which, in visual representation, has positioned the black subject within its dominant regimes of representation: the colonial discourse, the literatures of adventure and exploration, the romance of the exotic, the ethnographic and travelling eye, the tropical languages of tourism, travel brochure and Hollywood and the violent, pornographic languages of *ganja* and urban violence.

Because *Presence Européenne* is about exclusion, imposition and expropriation, we are often tempted to locate that power as wholly external to us – an extrinsic force, whose influence can be thrown off like the serpent sheds its skin. What Frantz Fanon reminds us, in *Black Skin, White Masks*, is how this power has become a constitutive element in our own identities.

The movements, the attitudes, the glances of the other fixed me there, in the sense in which a chemical solution is fixed by a dye. I was indignant; I demanded an explanation. Nothing happened. I burst apart. Now the fragments have been put together again by another self.<sup>9</sup>

This ‘look’, from – so to speak – the place of the Other, fixes us, not only in its violence, hostility and aggression, but in the ambivalence of its desire. This brings us face to face, not simply with the dominating European presence as the site or ‘scene’ of integration where those other presences which it had actively disaggregated were recomposed – re-framed, put together in a new way; but as the site of a profound splitting and doubling – what Homi Bhabha has called ‘the ambivalent identifications of the racist world … the ‘otherness’ of the self inscribed in the perverse palimpsest of colonial identity.’<sup>10</sup>

The dialogue of power and resistance, of refusal and recognition, with and against *Presence Européenne* is almost as complex as the ‘dialogue’ with Africa. In terms of popular cultural life, it is nowhere to be found in its pure, pristine state. It is always-already fused, syncretised, with other cultural elements. It is always-already creolised – not lost beyond the Middle Passage, but ever-present: from the harmonics in our musics to the ground-bass of Africa, traversing and intersecting our lives at every point. How can we stage this dialogue so that, finally, we can place it, without terror or violence, rather than being forever placed by it? Can we ever recognise its irreversible influence, whilst resisting its imperialising eye? The enigma is impossible, so far, to resolve. It requires the most complex of cultural strategies. Think, for example, of the dialogue of every Caribbean filmmaker or writer, one way or another, with the dominant cinemas and literature of the West – the complex relationship of young black British filmmakers with the ‘avant-gardes’ of European and American filmmaking. Who could describe this tense and tortured dialogue as a one way trip?

The Third, ‘New World’ presence, is not so much power, as ground, place, territory. It is the juncture-point where the many cultural tributaries meet, the ‘empty’ land (the European colonisers emptied it) where strangers from every other part of the globe collided. None of the people who now occupy the islands – black, brown, white, African, European, American, Spanish, French, East Indian, Chinese, Portuguese, Jew, Dutch – originally ‘belonged’ there. It is the space where the creolisations and assimilations and syncretisms were negotiated. The New World is the third term – the primal scene – where the fateful/fatal encounter was staged between Africa and the West. It also has to be understood as the place of many, continuous displacements: of the original pre-Columbian inhabitants, the Arawaks, Caribs and Amerindians, permanently

displaced from their homelands and decimated; of other peoples displaced in different ways from Africa, Asia and Europe; the displacements of slavery, colonisation and conquest. It stands for the endless ways in which Caribbean people have been destined to 'migrate'; it is the signifier of migration itself – of travelling, voyaging and return as fate, as destiny; of the Antillean as the prototype of the modern or postmodern New World nomad, continually moving between centre and periphery. This preoccupation with movement and migration Caribbean cinema shares with many other 'Third Cinemas', but it is one of our defining themes, and it is destined to cross the narrative of every film script or cinematic image.

*Presence Americaine* continues to have its silences, its suppressions. Peter Hulme, in his essay on 'Islands of Enchantment'<sup>11</sup> reminds us that the word 'Jamaica' is the Hispanic form of the indigenous Arawak name – 'land of wood and water' – which Columbus's re-naming ('Santiago') never replaced. The Arawak presence remains today a ghostly one, visible in the islands mainly in museums and archeological sites, part of the barely knowable or usable 'past'. Hulme notes that it is not represented in the emblem of the Jamaican National Heritage Trust, for example, which chose instead the figure of Diego Pimienta, 'an African who fought for his Spanish masters against the English invasion of the island in 1655' – a deferred, metonymic, sly and sliding representation of Jamaican identity if ever there was one! He recounts the story of how Prime Minister Edward Seaga tried to alter the Jamaican coat-of-arms, which consists of two Arawak figures holding a shield with five pineapples, surmounted by an alligator. 'Can the crushed and extinct Arawaks represent the dauntless character of Jamaicans? Does the low-slung, near extinct crocodile, a cold-blooded reptile, symbolise the warm, soaring spirit of Jamaicans?' Prime Minister Seaga asked rhetorically.<sup>12</sup> There can be few political statements which so eloquently testify to the complexities entailed in the process of trying to represent a diverse people with a diverse history through a single, hegemonic 'identity'. Fortunately, Mr Seaga's invitation to the Jamaican people, who are overwhelmingly of African descent, to start their 'remembering' by first 'forgetting' something else, got the comeuppance it so richly deserved.

The 'New World' presence – America, *Terra Incognita* – is therefore itself the beginning of diaspora, of diversity, of hybridity and difference, what makes Afro-Caribbean people already people of a diaspora. I use this term here metaphorically, not literally: diaspora does not refer us to those scattered tribes whose identity can only be secured in relation to some sacred homeland to which they must at all costs return, even if it means pushing other people into the sea. This is the old, the imperialising, the hegemonising, form of 'ethnicity'. We have seen the fate of the people of Palestine at the hands of this backward-looking conception of diaspora – and the complicity of the West with it. The diaspora experience as I intend it here is defined, not by essence or purity, but by the recognition of a necessary heterogeneity and diversity; by a conception of 'identity' which lives with and through, not despite, difference; by *hybridity*. Diaspora identities are those which are constantly producing and reproducing themselves anew, through transformation and difference. One can only think here of what is uniquely – 'essentially' – Caribbean: precisely the mixes of colour, pigmentation, physiognomic type; the 'blends' of tastes that is Caribbean cuisine; the aesthetics of the 'cross-overs', of 'cut-and-mix', to borrow Dick Hebdige's telling phrase, which is the heart and soul of black music. Young black cultural practitioners and critics in Britain are increasingly coming to acknowledge and explore in their work this 'diaspora aesthetic' and its formations in the post-colonial experience:

Across a whole range of cultural forms there is a ‘syncretic’ dynamic which critically appropriates elements from the master-codes of the dominant culture and ‘creolises’ them, disarticulating given signs and re-articulating their symbolic meaning. The subversive force of this hybridising tendency is most apparent at the level of language itself where Creoles, patois and black English decentre, destabilise and carnivalise the linguistic domination of ‘English’ – the nation-language of master-discourse – through strategic inflections, re-accentuations and other performative moves in semantic, syntactic and lexical codes.<sup>13</sup>

It is because this New World is constituted for us as place, a narrative of displacement, that it gives rise so profoundly to a certain imaginary plenitude, recreating the endless desire to return to ‘lost origins’, to be one again with the mother, to go back to the beginning. Who can ever forget, when once seen rising up out of that blue-green Caribbean, those islands of enchantment. Who has not known, at this moment, the surge of an overwhelming nostalgia for lost origins, for ‘times past? And yet, this ‘return to the beginning’ is like the imaginary in Lacan – it can neither be fulfilled nor requited, and hence is the beginning of the symbolic, of representation, the infinitely renewable source of desire, memory, myth, search, discovery – in short, the reservoir of our cinematic narratives.

We have been trying, in a series of metaphors, to put in play a different sense of our relationship to the past, and thus a different way of thinking about cultural identity, which might constitute new points of recognition in the discourses of the emerging Caribbean cinema and black British cinemas. We have been trying to theorise identity as constituted, not outside but within representation; and hence of cinema, not as a second-order mirror held up to reflect what already exists, but as that form of representation which is able to constitute us as new kinds of subjects, and thereby enable us to discover places from which to speak. Communities, Benedict Anderson argues in *Imagined Communities* are to be distinguished, not by their falsity/genuineness, but by the style in which they are imagined.<sup>14</sup> This is the vocation of modern black cinemas: by allowing us to see and recognise the different parts and histories of ourselves, to construct those points of identification, those positionalities we call in retrospect our ‘cultural identities’.

We must not therefore be content with delving into the past of a people in order to find coherent elements which will counteract colonialism’s attempts to falsify and harm ... A national culture is not a folk-lore, nor an abstract populism that believes it can discover a people’s true nature. A national culture is the whole body of efforts made by a people in the sphere of thought to describe, justify and praise the action through which that people has created itself and keeps itself in existence.<sup>15</sup>

# CHAPTER 9

## Translation, Empiricism, Ethics

*Lawrence Venuti*

Lawrence Venuti, Professor of English at Temple University, works in early modern literature, Anglophone and foreign-language poetic traditions, translation theory and history, and literary translation. He is the author of *Our Halcyon Dayes: English Prerevolutionary Texts and Postmodern Culture* (1989); *The Translator's Invisibility: A History of Translation* (1995, 2008); *The Scandals of Translation: Towards an Ethics of Difference* (1998); and *Translation Changes Everything: Theory and Practice* (2013). He is the editor of the anthology of essays *Rethinking Translation: Discourse, Subjectivity, Ideology* (1992) and of *The Translation Studies Reader* (2000, 2004, 2012), a survey of translation theory from antiquity to the present.

My case study is drawn from the work of a contemporary translator, Arthur Goldhammer, who is currently a senior affiliate of the Center for European Studies at Harvard University. During the past thirty years, Goldhammer has written English versions of over a hundred French texts in art history, literary theory and history, and philosophy and history of science. By far the bulk of his work falls in the field of social history, monographs and edited volumes by such historians as Philippe Ariès, Georges Duby, Emmanuel Le Roy Ladurie, Jacques Le Goff, and Pierre Nora. It would be no exaggeration to say that countless readers are greatly in Goldhammer's debt.

This remark, however, is an honorific cliché when said of any translator's work, and it sheds no light on what is at stake in translating. We might rather ask, In what does a reader's debt to a translator consist, a debt that clearly exceeds any translation fee (which is paid, in any case, by a publisher)? Can the debt to Goldhammer be reduced to his making intelligible to Anglophones over a hundred French texts? Is it possible to think of translation as a gift that does not incur a debt or participate in a contract, whether with a publisher or a reader? In what would the translator's gift consist and how can it be appreciated beyond debt or contract, whether to the foreign text or culture or to the receiving culture? Can answers to these questions lead to thinking

*Original publication details:* Lawrence Venuti, "Translation, Empiricism, Ethics." *Profession* (2010), pp. 72–81. Modern Language Association of America. Reproduced with permission from the Modern Language Association of America.

about translation that removes, diminishes, or perhaps redefines the neglect and misunderstanding that it continues to suffer today?

These questions consider translation vis-à-vis Jacques Derrida's exploration of the paradoxes involved in gift giving. Goldhammer, like most professional translators, is likely to see such speculation as irrelevant. "Translation is hard enough," he has said, "without hamstringing yourself with theoretical *partis pris*" (*How to Do Things*). In lectures where he has set out his own understanding of his approach, his gambit is to analyze verbal choices from various translations. "Together," he tells his audience, "we can walk through some of the questions distilled from daily practice" (*Translating*). The examples he gathers – all instances of outright error or failures to transfer the precise nuance of a word or phrase – point to one overriding question, namely, whether the translation reproduces the style of a literary text or the meaning of a scholarly text. A telling metaphor reveals the concepts underlying Goldhammer's approach. Translation, he asserts, is "like fielding a ground ball: it's almost impossible to explain in words how you do it, and anyone who tried to follow such a description would look pretty foolish on the ballfield. But any spectator can see when the job is being done well" (*Translating*).

This metaphor does assume a theory, the epistemology known as empiricism. According to Antony Easthope's succinct but dissenting account (88–89), empiricism might be said to consist of three key assumptions:

A real object or process is not constructed for knowledge but given, autonomous from the knowing subject, and on observation that object or process yields a knowledge that is free of illusion and prejudice.

The linguistic and cultural forms by which reality is known are transparent and do not materially affect the subject's observation or knowledge.

The subject too is not constructed but autonomous from any process of construction, always free to know, so that knowledge derives from the correspondence between subject and object.

In line with these assumptions, Goldhammer asserts that a good translation can be instantly perceived as such by any reader, and this union of knowing subject and object of knowledge is unmediated by the subject's cultural formation, so that the nature and value of the translation need no description, explanation, or justification, which in any case are "almost impossible" to provide and in the end "pretty foolish."

Insofar as empiricism is characteristic of British and American cultural traditions, emerging with such thinkers as Francis Bacon, Thomas Hobbes, and John Locke and evident, as Easthope shows, not only in philosophical speculation but also in history, poetry, and literary journalism, it produces a distinctively anglocentric image of translation – commonsensical, pragmatic, ultimately anti-intellectual. Under scrutiny, its limitations become apparent. If it is valid, one must wonder why academics, publishers, and readers have not recognized translation as a valuable cultural practice by rewarding it at tenure-and-promotion considerations, issuing a steady stream of translated texts, and reading them with an informed appreciation of their status as second-order creations, as translations. One must wonder why as a rule academics fail to remark on the translations that they use in their research and teaching, going so far as to quote and comment on the translation as if it were the source text. Goldhammer is an extremely accomplished translator, but he cannot present an account of his work that illuminates it

for his colleagues, his publishers, or his readers, and so he is powerless to remedy the continuing marginality of translation or to improve its effectiveness as an essential practice in cross-cultural exchange.

Empiricism is a central problem here because it gives rise to a concept of language as direct expression or reference, leading to an instrumental model of translation as the reproduction or transfer of an invariant contained in or caused by the source text, whether its form, its meaning, or its effect. In *An Essay concerning Human Understanding* (1689), Locke assumed the instrumental model in describing translation as “chang[ing] two words of the same signification one for the other” (3.4.9), where the “same signification” refers to a semantic invariant. Instrumentalism continues to guide a great deal of translation practice and research as well as translator training. It is the dominant understanding of translation everywhere today, even among scholars who look at their work as far removed from empiricism because deliberately or explicitly grounded in other theoretical discourses.

To advance the understanding of translation, we must replace instrumentalism by thinking that is hermeneutic. On the materialist assumption that language is creation thickly mediated by linguistic and cultural determinants, a hermeneutic model treats translation as an interpretation of the source text whose form, meaning, and effect are seen as variable, subject to inevitable transformation during the translating process. This is to suggest not that no formal or semantic correspondence exists between the source and translated texts but that any such correspondence results from an interpretive labor that is decisively determined by the translating language and culture. Translating never gives back the source text unaltered. It can only inscribe an interpretation, one among many possibilities, through lexical and syntactic choices that can alter source-textual features like meter and tone, point of view and characterization, narrative and genre, terminology and argument.

The translator inscribes an interpretation by applying a third category, which mediates between the source language and culture, on the one hand, and the receiving language and culture, on the other, a method of transforming the source text into the translation. This third category I call an interpretant, deriving it from Charles Peirce's semiotics. Peirce makes clear that the interpretant constitutes a “mediating representation” between a “sign” or signifier and its “object,” where the object is itself a representation, a content or signified (53–54; cf. Eco, *Theory* 69). In Peirce's theory, as Umberto Eco observes, “a sign can *stand for* something else to somebody only because this ‘standing-for’ relation is mediated by an interpretant” (15). As examples of interpretants, Eco lists a dictionary definition, an encyclopedia entry, a visual image, and a translation into other language, showing that the interpretant functions as a means of performing a semantic analysis: it is a code or theme that invests the sign with a certain intelligibility by transforming it into another chain of signifiers (“Peirce's Notion” 1469; see also Eco, *Theory* 70–71). Eco's discussion becomes somewhat misleading when he lists a translation as an interpretant, insofar as every translation, as I am arguing, requires the application of an interpretant as an essential condition of its existence. With this qualification we can see that interpretants too can precipitate an endless chain of interpretants, codes used to analyze the interpretants in processes like translation.

Peirce himself suggestively compares the notion of an interpretant to translation. He remarks that he relies on this notion “because it fulfills the office of an interpreter, who says that a foreigner says the same thing which he himself says” (53–54). Note that here the interpreter does not merely interpret or orally translate a foreigner's speech but

“says” in some unspecified way that his interpretation has met the formal requirement of adequacy or equivalence. An interpretant, it would seem, might be not only thematic in relating a signifier to a signified but formal in indicating the structural nature of the relation.

In translation, the interpretant is a principle of mediation and transformation that is both formal and thematic. Formal interpretants include a concept of equivalence, such as a semantic correspondence based on current dictionary definitions, or a concept of style, a distinctive lexicon and syntax related to a genre. Thematic interpretants are codes: they may be specific values, beliefs, and representations; a discourse in the sense of a relatively coherent body of concepts, problems, and arguments; or a particular interpretation of the source text that has been articulated independently in commentary. Interpretants are fundamentally intertextual and interdiscursive, rooted primarily in the receiving situation even if they incorporate source-cultural materials to some extent. The translator’s application of interpretants recontextualizes the source text, replacing intertextual and interdiscursive relations in the source language and culture with relations in the translating language and culture that are built into the translation.

To explore the usefulness of the hermeneutic model, I consider Goldhammer’s 1992 translation *The Village of Cannibals*. The French text is the historian Alain Corbin’s account of the social and political motives behind an incident of rural violence in nineteenth-century France: a nobleman in the Dordogne was tortured and burned to death by a crowd of peasants. Goldhammer, while making adjustments that conform to the structural features and linguistic norms of English, generally maintained a semantic correspondence according to current French-English dictionaries in a transparent style characteristic of British and American academic history. In fact, his choices recast Corbin’s writing in a recognizably academic form. Thus Goldhammer used such formulaic words and phrases as “flourished,” “played a crucial role,” and “the crux of the matter,” all of which are free renderings that deviate from the French text. The word “flourished,” employed in the sentence “This myth flourished through much of the nineteenth century,” renders “se révélera d’une grande solidité” (in a closer version, “will exhibit great stability”), while the phrase “played a crucial role” renders “constitue un élément décisif” (“constitutes a decisive element”) (*Village of Cannibals* 3; *Village des cannibales* 11). Similarly, “the crux of the matter” was used to translate the French word “l’essentiel,” which can be Englished as “the essential [thing]” or “the essential [point]” without adopting an academic formula (7, 12; 16, 22). These departures point to Goldhammer’s application of a specific formal interpretant in his translation: the stylistic conventions of academic historical writing in anglophone cultures.

Similar conventions underlie Goldhammer’s handling of Corbin’s frequent use of the term *l’imaginaire*, although here a thematic interpretant can also be perceived: the philosophical code of empiricism. *L’imaginaire* can be closely rendered into English as “the imaginary,” but Goldhammer consistently replaced it with such words as “image,” “imagination,” “imagery,” “fancy,” even “propaganda” (see *Village des cannibales* 12, 13, 33, 37, 124, 134, 141, 150; *Village of Cannibals* 4, 5, 20, 55, 89, 97, 102, 109). Thus Corbin’s assertion that “Il faut le massacre pour que se réalise pleinement la métamorphose ou, plutôt, pour que s’opère la totale incarnation des figures hostiles imposées par l’imaginaire” (66) might be given a close rendering as follows:

The slaughter was necessary for the metamorphosis to be fully achieved or, better, for the total incarnation of the hostile figures imposed by the imaginary to take place.

Goldhammer, however, translated freely:

It took a murder to bring about the full metamorphosis of the “Prussian” from figure of the imagination to incarnation of evil. (46)

In replacing *l'imaginaire* with “the imagination” and related words, Goldhammer’s translation draws the sharp distinctions between fact and fiction, truth and falsehood, reality and appearance on which empiricist epistemologies are based.

Yet Corbin’s use of the term *l'imaginaire* can be interpreted very differently, according to a materialist genealogy. This genealogy would stretch back at least to Jacques Lacan’s 1949 essay “The Mirror Stage As Formative of the Function of the I,” where the first moment in the formation of human identity is called the “imaginary phase” but is nonetheless real, “an ontological structure of the human world” that establishes the basis for the subsequent construction of subjectivity through interpersonal relationships and in language (2). During the 1960s, this psychoanalytic concept was given a social application, when Louis Althusser relied on Lacan to rethink the Marxist concept of ideology, not as political ideas or false consciousness but as a representation embodied in social practices, at once imaginary and lived, active in forming class identities and in mystifying real social relations (“Ideology” and “Marxism”). At roughly the same time, the political theorist Cornelius Castoriadis formulated the imaginary as a concept of social analysis that bears even more directly on Corbin’s use of the term. The “social imaginary,” according to Castoriadis, “is not an image *of*. It is the unceasing and essentially *undetermined* (social-historical and psychical) creation of figures / forms / images, on the basis of which alone there can ever be a question *of* something” (3). In Castoriadis’s thinking, the materialism assigned to the concept by Lacan and Althusser comes to the fore such that the imaginary not only is indistinguishable from but also creates reality. Corbin’s argument that the murdered nobleman came to embody the peasants’ social imaginary might thus be seen as giving the concept the same ontological status that it has in Castoriadis’s work.

Philippe Carrard has criticized Goldhammer’s translation for its departures from Corbin’s French text, particularly in “simplifying his theoretical apparatus” (81). The matter is more complicated, because Goldhammer’s translation cannot be judged simply as inaccurate or incorrect. He has offered an interpretation that is neither incompetent nor arbitrary by applying a distinctive set of formal and thematic interpretants. His interpretation included the idea that, as he put it in an interview, Corbin is not “a particularly theoretically self-conscious historian” but rather one who takes “a more literary, intuitive approach.” Corbin himself examined Goldhammer’s translation in unusual detail, sending the translator five pages of handwritten notes. Goldhammer explained that “nearly all the comments had to do with the ‘weight’ and ‘coloration’ of specific word choices. [Corbin] didn’t raise any issues of theoretical interpretation / misinterpretation” (Message).

Accustomed as we are to disallowing authorial intent as a reliable standard of interpretation, we might well be suspicious of Corbin’s assessment of the translation. Yet the fact remains that whether Corbin deploys the concept of *l'imaginaire* with rigorous consistency can be questioned, primarily because the historical incident he addresses raises the issue of delusion. It involved a false attribution to the victim: the crowd of peasants accused the nobleman of shouting “Vive la République!” and of being a Prussian, although at the murderers’ trial neither accusation was found to be true. Corbin argues

that the nobleman was transformed into a scapegoat by the peasants' social imaginary, a contradictory ensemble of antiaristocratic, antirepublican, and proimperial sentiments, but he occasionally uses the term *fantasmes* ("fantasies") to describe the gap between their collective anxieties and the identity and actions of their victim (e.g., see Corbin, *Village des cannibales* 119, 120). Goldhammer has in effect chosen to emphasize Corbin's use of terms like *fantasmes* instead of assigning a specifically French conceptual density or intertextual relation to his use of *l'imaginaire*. In setting up this choice as the equivalent of the French text, the translator has performed the "abstraction" that Althusser saw in empiricist truth claims, a procedure in which essential data are separated from the inessential on the basis of a privileged epistemology and in which a real object is reduced to a partial object of knowledge (Althusser and Balibar 34–43).

Goldhammer's translation thus reflects a deep investment in empiricist discourse. On the one hand, the assumption that language is transparent communication led Goldhammer to reject any jargon that too noticeably departed from current Standard English, the most familiar form of the language and therefore the most seemingly transparent. On the other hand, the assumption that historical writing discovers an objective truth based on facts led him to avoid theoretical concepts that posited the difficulty, if not impossibility, of distinguishing between textuality and reality and that thereby put into question the historian's objectivity. He inscribed the French text with the empiricism that continues to dominate British and American academic history and informs his own instrumental theory of translation.

How, then, should Goldhammer's translation be evaluated? The instrumental model is of no help here. The invariant that it assumes is contained in or caused by the source text – its form, meaning, or effect – becomes the sole criterion of accuracy and therefore fundamentally determines the value of the translation. Yet Corbin's text, particularly his use of the term *l'imaginaire*, can support at least two conflicting interpretations inscribed by two different translations. The hermeneutic model offers a more incisive and comprehensive account, because it treats any formal and semantic correspondence as partial and contingent: partial, because it is incomplete in re-creating the source text and slanted toward the receiving language and culture; contingent, because it is fixed by one among other possible interpretations, each of which establishes a criterion of accuracy that varies among receiving cultural constituencies, social situations, and historical moments.

Because translating always submits the source text to a transformation, a translation cannot be evaluated merely through a comparison to that text without taking into account the cultural and social conditions of the translator's interpretation. The evaluation must be shifted to a different level, a level that seems to me properly ethical: in inscribing an interpretation in the source text, a translation can stake out an ethical position and thereby perform an ideological function in relation to competing interpretations. Here I draw on Alain Badiou's thinking, specifically his concept of an ethics that challenges institutionalized knowledges and communitarian interests and pursues cultural innovation and social equality. Badiou's ethics raises a number of questions, not the least of which is his antipathy toward the communitarian, as if every social grouping were exclusionary or repressive, enforcing conformity and domination (73–74). I want precisely to worry this point in his thinking, treating as unethical not knowledge that serves any communitarian interest whatsoever but only knowledge affiliated with a group that has achieved such dominance in an institution as to exclude or marginalize the competing knowledge of other groups. A translation in the human sciences, then, might be evaluated according to its impact, potential or real, on academic disciplines in the translating

culture; according to whether it challenges the styles, genres, and discourses that have gained disciplinary authority; according to whether it stimulates innovative thinking, research, and writing and alters the course of the institution.

I would therefore question translators who conceive of their role as the importation of foreign thinking without affecting the smooth operation of the academic institutions where that thinking is to be received. Goldhammer has advocated such a role, arguing that “scholarly prose is written for consumption primarily by a scholarly community, and the translator must respect the linguistic norms of the target community” (*Translating*). But Goldhammer has done much more: he has assimilated Corbin’s French text to the styles and discourses that are invested with the greatest authority among British and American academic historians. His translation professes a greater sense of responsibility toward this audience than toward Corbin’s project or French historical discourses. This is the crucial sense in which anglophone academic historians are in Goldhammer’s debt.

The mostly positive reviews that greeted the translation, reviews that favorably received Corbin’s work and only rarely mentioned Goldhammer’s, demonstrate that the translation was successful according to the empiricist terms that the translator shared with his main academic audience. In a typical review that appeared in the *Times Literary Supplement*, Robert Tombs, a specialist in French history at Cambridge University, praised Corbin’s text as providing a “startling picture of some of the grim realities of rural life, narrated simply and sensitively, and translated plainly, so that the horrors of the act of retribution still emerge starkly amid the theoretical exegesis.” Tombs’s investment in empiricist history is evident in his preference for a “simple” narration that is not complicated by “theoretical exegesis.” To call Goldhammer’s translation “plain” also fits this bill, given its seeming transparency, but Tombs seems entirely unaware of the strongly assimilative nature of the English version, which reduces the term “plain” to a naive understatement.

Let us rather imagine a translator who assumes an oppositional stance in his or her work, a translator who is an intellectual in Edward Said’s sense, “skeptical, engaged, unremittingly devoted to rational investigation and moral judgment” (20), refusing any complacency or quiescence in relation to authoritative cultural and social institutions like the academy and the publishing industry – even when the translator is employed by them. This translator will be constantly alert to the differences that comprise foreign languages, texts, and cultures, constantly engaged in signaling those differences to constituencies and institutions in the receiving situation, and constantly inventive in finding the linguistic and cultural means to make a productive difference in that situation. Such a translator gives us the basis of a relentless interrogation of the academic status quo. The resulting translation is not given or recognized as a gift, whether to the foreign text and culture or to the receiving situation, and it is not written with the expectation of a reward, insofar as it aims at a radical questioning of the rewarding institution, of the hierarchy of values, beliefs, and representations housed in that institution. This translation – need I say? – is not likely to be received with gratitude, which it does not seek, but it may construct a new intellectual community that did not previously exist and that, when the translation has done its interrogative work, will set it aside, its work done, its critical moment past. Is this translation with a hammer, initiating a transvaluation that establishes a new critical orthodoxy? Or is this translation that is self-consuming, that sacrifices itself in its very reception, eventually superseded? Can it be both, so that we remain trapped in yet another cliché, although now revised, the notion that translation is a thankless task?

# CHAPTER 10

## Theory in Practice *National Messianism and English Choreography in King Lear*

*Jaecheol Kim*

Jaecheol Kim holds a PhD in English from the University of Buffalo. He is an Assistant Professor of English at Hansung University, Seoul.

*Through a close reading of Shakespeare's King Lear, this essay surveys English nationalism in a very specific moment – at the time of King James's accession and his propagation of the Union of kingdoms, which was soon followed by his edict of "Naturalization of the Scots". This political claim of the Scottish monarch was in conflict with his English subjects' allegiance to English nationhood, thus creating an ambiguous allegiance between the two. Shakespeare, as James's English subject, had to negotiate between the absolutist claim of the Union propagated by the Scottish monarch and his own allegiance to English territory. Thus how this ruptured consciousness creates textual-national ambiguities in Shakespeare's play and how his political negotiation develops what Hans Kohn calls "national messianism" are the most important concerns in this essay. In King Lear, along with Cordelia's redemptive features, if the national messianic craving is expressed through regional identity, it is through Kent. In early-modern literature, Kent, which includes Canterbury (the locus of the national shrine) was often a geographical symbol of essential Englishness. The regional topography of Kent expresses past English identity as uncompromised by Scottish contamination. This chorographical allegiance to English regional territory properly explains the reason why at the end of the play the stage heavily gravitates toward Dover – the end of Kent/England – embodying all the national messianic images. The Shakespearean geopolitics represented in King Lear thus negotiates the huge gap between the Scottish monarch's absolutist rhetoric of Union and English nationhood forming a national ambiguity.*

In short, the substance of nationalism as such is always morally, politically, humanly ambiguous.<sup>1</sup>

## I. Nation, Nature and *Natio*: “The King Falls from Bias of Nature”

*King Lear* is a *camera obscura* that creates upside-down images of King James’s political propagation of Union. Unearthing the rich subtext of the play, Marie Axton and her followers have demonstrated that *King Lear* was produced in the heavy referential web of James’s claim of Union (1603) and responds to the absolutist request by representing a territorial division and civil wars.<sup>3</sup> James’s claim of Union is epitomized as follows:

Hath not God first united these two *Kingdomes* [England and Scotland] both in Language, Religion, and similitude of maners? Yea, hath he not made us all in one Island, compassed with one Sea, and of it selfe by *nature* so indivisible, as almost those that were borderers themselves on the late Borders, cannot distinguish, nor know, or discerne their owne limits? These two Countries being separated neither by Sea, nor great River, Mountaine, nor other strength of *nature*, but onely by little small brookes, or demolished little walles, so as rather they were divided in apprehension, then in effect. And now in the end and fulnesse of time united, the right and title of both in my Person, alike lineally descended of both the *Crownes*, whereby it is now become like a little World within it selfe, being intrenched and fortified round about with a *naturall*, and yet admirable strong pond or ditch, whereby all the former feares of this *Nation* are now quite cut off.<sup>4</sup>

In James’s political rhetoric, kingdom, nation and nature are one indistinguishable entity. Thus there should be only one law, faith, language, parliament, king and nation in the Kingdom. Insofar as the accession of James himself reconciled all royal and national bodies of Britain and because there is no marked territorial-topographical distinction within the British Isles, the nation is one natural geographical body. This absolutist request rhetorically displaces Scottish alterities, equating “Crown” with “Nation” or his “Person” with the natural “Country”. This propagation soon develops into his proclamation of “Naturalization” of the Scots. Yet, for James’s English subjects, this anti-nationalist claim, wearing absolutist rhetoric, was hardly acceptable; it was *unnatural* for his English-born subjects. James’s claim was close to empty rhetoric without any powerful political-fiscal support along with legal bindings. The House of Commons rejected this claim for two reasons: first, they “did not want the Scots equal in rights with native born Englishmen”; and next they “objected to discard ‘ancient and honorable name England’”.<sup>5</sup> If we say the Union was achieved, it was done without the consent of the English Parliament. James, after all, only assumed the title “King of Britain” by “proclamation” rather than legal “statue” following Francis Bacon’s advice: the

proclaimed title could thus be used in letters or other treaties, though not in “any legal proceeding, instrument or assurance”.<sup>6</sup> Behind Parliament’s refusal of James’s proclamation of naturalization of the Scots, which inevitably accompanied his claim of Union, existed a very vexed question the House of Commons raised – “was the object of allegiance King or soil?”<sup>7</sup> This phrase explicitly summarizes the ambiguities or split allegiance between the Scottish monarch’s argument and his English subjects’ loyalty to English nationhood, which is metonymically expressed as “soil”. The Albanian Prince’s propagation, after all, betrays the huge chasm between “monarchy” and “nation” or between “king’s body” and “national soil”, which he wanted his English subjects to resolve, or at least, to negotiate. This national-political context of *King Lear* is crucial because it causes, as we shall see, the geopolitical problems Shakespeare’s British tragedy, performed before James, reveals.

From the very drawing up of the curtain, the question of territorial division is discussed by Lear head-on; the play directly engages the issue of Union, only reversing it. Even though Shakespeare stages the keen national-political issue of the Jacobean claim, critics have had difficulty in determining Shakespeare’s attitude toward Jacobean politics. Victor Turner argues that for a certain sense of *communitas* to be established, a temporary suspension or destruction of it is required.<sup>8</sup> *King Lear*, in this respect, creates a prerequisite suspension of the communality or order suggested by absolutism by staging territorial division and civil wars. In other words, this division-of-the-kingdom tragedy ultimately asserts, as Annabel Patterson and Leah Marcus’s readings suggest, the necessity of territorial Union and the acceptance of James’s Scottish subjects by the English people. Yet, of course, Shakespeare’s work cannot simply be reduced to a political propaganda of absolutism, as it expresses its own polemics against Jacobean politics. As Franco Moretti’s reading of the play persuasively shows, Shakespeare’s text attempts to deconsecrate monarchial sovereignty, betraying the irrationality of absolutism *per se*.<sup>9</sup> These bifurcated critical responses to *King Lear* show, then, the play’s self-contradictory attitudes toward the accession of the Scottish monarch. They also reveal the fact that *King Lear* is uncomfortably poised between British monarchy and English nationhood, King’s blood lineage and English soil, the Scottish monarch’s absolutist claim and the English Parliament’s dissension against it. But most importantly, this ambiguous political allegiance mainly evokes the huge gulf for Englishmen between, as Axton puts it, “what [they] felt” and “what [they] ought to say”<sup>10</sup> in the presence of the Albanian (Scottish) monarch and his political claims, which Shakespeare, as an English subject, probably had to negotiate as well.

James, expecting this controversy, as suggested in his Parliament speech excerpted in the foregoing text, connects the essentially distinct discourses of “Kingdom” and “Nation” with the word “nature”: he argues that the British Kingdom as a unified entity is nature regained. In this political context, the word “nature” for English subjects becomes the most ambiguous entity, evoking and embracing all the Scottish alterities insofar as it is associated with the issue of Union and naturalization of the Scots. Therefore, in *King Lear*, a “British” tragedy in which Shakespeare erases the word “England” and all its derivatives under this heated debate of Union, it is worthwhile to explore as well the semantic features of words such as “nature” and the “nation” in it – in particular, their irreducible ambiguities. Edmund argues,

Thou, *nature*, art my goddess. To thy law  
My services are bound. Wherefore should I

Stand in the plague of custom and permit  
 The curiosity of *nations* to deprive me  
 For that I am some twelve or fourteen moonshines  
 Lag of a brother? Why “bastard”? Wherefore “base”?  
 (1.2.1–6; emphasis added)<sup>11</sup>

As suggested in Edmund’s evil invocation the most recurrent motif of the tragedy is birth (*natio*) to which words such as “propinquity” (1.1.112), “property” (1.1.112), “bond” (1.1.91) and “nations” (1.2.4) are articulated. *Natio*, as its shared etymology of “nation” and “nature”, becomes the thematic joint of the play insofar as the text and subtexts of *King Lear* discuss in depth the questions of “birth” and “property” (with the motif of primogeniture) along with “nature” and “nationhood” (with the motif of unnatural national-territorial division). In the time of Shakespeare, the concept of *natio* was strongly attached to the sense of nation as well as to the notions of kinship or household. Shakespeare’s *tour de force* in the tragedy is his conflation of the problems of nation, commonweal and public sphere in the main plot, with problems of household, private property and private sphere in its sub-plot. Thus the word “nation” in the excerpt is multiply determined, suggesting family lineage, primogeniture, given order, law and state. Nonetheless, despite the presumed harmony between “nation” and “nature” together with their shared etymological root, in the very heart of the play’s poetic *agon* resides an antagonism between them; “O ruined piece of nature!” (4.5.127) properly expresses the poetic complication of the play.

In addition, Edmund’s phrases illustrate the antithetical signification structure of primal words. In the sixteenth- to seventeenth-century English language, “natural” embraces two contradictory meanings at the same time, both concerning the birth-right: it signifies “Of the transfer of a privilege, property, etc.: according to right of heredity”; and “Of a person: related genetically but not legally to his or her father; born outside marriage, illegitimate”.<sup>12</sup> As this semantic ambiguity develops in the play, *King Lear*’s tragic complication largely resides in Gloucester’s bastard becoming a “Loyal and natural boy” (2.1.83). The significations of *natio* (birth) are heavily contaminated to the extent that they are irresolvable. This creates the irreducibly double-edged semantic conditions of the play; as in the final scene of the play, when, after poisoning Regan, Goneril calls the poison “medicine” (5.3.90), the state of “nature” becomes both “cure” and “poison” (*pharmakon*) in the play.

The signification problem of nature (*natio*) thus symptomatically expresses the problems of nation (*natio*) on a subtextual level. While James, as I have discussed above, tried to bridge in vain the crevice between his notion of Britain as a unified *nation/nature* and his English subjects’ political allegiances to English soil, the play, on the contrary, creates an irreducible sense of antinomy between “nature” and “nationhood”. More strikingly, Edmund, embodying all these iconoclastic social drives, claims, “Let me, if not by birth, have lands by wit. / All with me’s meet that I can fashion fit” (1.2.160–1). In *King Lear*, *natio* could be not something naturally given by birth; it is manipulative, mercurial and artfully fashioned and negotiated. In my reading, the semantic dissociation between “nation” and “nature” lies at the heart of *King Lear*’s national argument. James based his claim of Union on his steadfast rhetorical fusion of royal lineage, nature and nation, but Shakespeare’s play, like the deep-down heart of James’s English subjects, does not conceive “Britain” or “Albion” as something naturally given as nation. Thus I take as the central claim of the play Gloucester’s bitter remark – “The King falls from bias of

nature” (1.2.101–2), which most directly expresses the schism between monarchy and sense of nationness. As we shall see in the next section of this essay, this oppressed nationhood in the tragedy generates apocalyptic narrative and messianic waiting – which is expressed chorographically rather than in religious or metaphysical terms. This is because messianic narrative is another facet of James’s rhetoric of Union, and for Shakespeare it is the best literary device to represent the rise of the Scottish national alterities and the ambiguities that they create at the same time. The complex semantic ambiguities the play develops are now translated into national or topographical messianism.

## II. Topography, *Topos* and *Telos*: Kent and National Messianism

Expecting a huge “eclipse”, in which “nature finds itself scourg’d” and “the King falls from bias of nature”, Gloucester, who facing the end, cannot but look back, laments that “We have seen the best of our time” (1.2.95–103).<sup>13</sup> Of course, by discussing *King Lear* in relation to apocalypse, I am not suggesting that Shakespeare develops a Christian narrative in a pagan setting. The play radically denies the Christian endings of its sources; as Stephen Greenblatt’s source study of the play powerfully shows, the play creates religiously redemptive imagery, but at the same time it produces a critical distance from it, finally questioning it: the rich religious imagery of the play creates a sense of self-consciously committed fraud.<sup>14</sup> On this basis, my question develops further: if the play consciously invokes spiritual or idealist belief only to reject it, how does the play generate or evoke its almost religious senses of human emancipation? In other words, if, for instance, Edgar’s demonic possession is the play’s acknowledged “self-fashioning” and if men’s anxiety about the huge eclipse merely betrays their “foppery” (1.2.108), what creates the play’s pseudo-religious impulses or drives? To answer this question, I suggest that we need to understand *King Lear*’s metaphysical desire, including its apocalyptic and messianic narrative, first politically, then nationally and finally chorographically or topographically. My answer is already hinted at by Benedict Anderson, who claims that nation replaced the huge religious sense of community and hence is akin to religion.<sup>15</sup>

Hans Kohn traces the roots of nationalism among European societies back to their Judeo-Greek cultural heritages. He claims that “Three essential traits of modern nationalism originated with the Hebrew: the idea of the chosen people, the emphasis on a common stock of memory of the past and of hopes for the future, and finally national messianism”.<sup>16</sup> The case of early-modern England was not an exception; nationalist discourses since the reign of Elizabeth had developed eschatological messianism. Richard Helgerson and Andrew Escobedo argue that the English narratives in this time were essentially nationalist as well as apocalyptic: this is largely because messianism itself was the most important rhetorical device at the time of the Tudor Reformation, which distinguished England from Catholic states.<sup>17</sup> Shakespeare’s *King Lear*, as we shall see, restores this Tudor apocalypticism in a geopolitical way, contextualizing James’s political chiliasm.

Escobedo suggests that, in the Tudor apocalyptic messianism produced during the Elizabethan era, the Queen was frequently a figure of Christ and many authors repeated discourses of historical ending. And the 1540s and 50s were the apex of apocalyptic chiliasm, which developed a very worldly idea that “the prophecy of St. John will be fulfilled in the English history, defeating anti-Christ papacy”.<sup>18</sup> This historical ending,

however, is never achieved in Elizabethan apocalyptic literatures. The reason is pretty simple: once a narrative or an event is already fully realized and uncovered, it cannot be apocalyptic (*apo + kaluptein*, to uncover) anymore. In other words, a narrative could be apocalyptic or messianic only when the real event of historical completion is still deferred and interminable, not achieved. Thus, as Escobedo argues, the apocalyptic visions of Foxe and Spenser, in this time, were inevitably narratives of deferral.<sup>19</sup>

This Tudor deferral becomes crucial for understanding Jacobean literature because one of James's political strategies was to appropriate this visionary literary tradition and to proclaim the advent of prophesied historical completion by his "Person" and national "Union". He states, for example, "I have ever ... kept Peace and amity with all, which hath been so far tied to my person, as at my coming here you are witnesses I found the State embarked in a great and tedious war, and only by mine arrival here, and by the Peace in my Person, is now amity kept, where war was before, which is no small blessing to a Christian Common-wealth".<sup>20</sup> James thus took advantage of Tudor national messianism, which seems essentially chiliastic or millenary, believing the end of history will be earthly and national rather than heavenly or religious. He equates his "coming" or "arrival" with the Advent: indeed, "the Peace", which "God hath so long ever since [his] Birth bestowed upon [him]", was his personal property as well as a blessing to the "Common-wealth". This new Jacobean national millennium, however, could not be achieved without the completion of Union; he continues, "Union of two ancient and famous Kingdomes" is "the other inward Peace annexed to my Person".<sup>21</sup> James fashioned himself as a Christ figure, and the accomplishment of the Union was another essential earthly requirement for the chiliiasm associated with his personal "arrival". James thus believed that "Britain" as a nation is the historical completion. This is Jacobean chiliiasm, which he develops by appropriating Elizabethan Protestant nationalism. It seems that, with his eschatological narrative, Shakespeare attempts to graft his pre-Christian play onto James's political discourse of Union: the territorial division and civil wars in an imminent doomsday of Britain that the play depicts are a reversed image of James's chiliiasm. For the original sin of Lear – another figure of Brutus, who first divided the land into three – being redeemed and happily reunified by James was a very widely circulating pro-absolutist discourse of that time.<sup>22</sup>

Yet Shakespeare never simply repeats the absolutist argument in the play; on the contrary, he most radically refigures the apocalyptic cast in an English nationalist context rather than in favour of the monarch. A more important motif in relation to time in *King Lear* is that, because the sense of chronological history is heavily reorganized due to messianic narrative, the redemptive images of the play are not concerned with time and history, but rather with geography and space. Thus I want to propose that *King Lear* should be read as a "chorography". Even though recently a number of critics have addressed the play's cartographical features, critics still have failed to point out its regionally represented historiography which shows chorographical allegiance to regional English territories.<sup>23</sup> As we shall see, the truly radical features of the play derive from Shakespeare's fashioning of regional-topographical allegiance in the tragedy.

In the play, the Dukes of Albany and Cornwall and the French King, who claim their own portions of Lear's land, express national alterities. These three Otherly Celtic national bodies take higher political titles and power: as a king or dukes, their titles outrank and overpower the two English Earls – Kent and Gloucester. This localized identity fashioning is interesting enough: as Edmund Spenser and Raphael Holinshed's sources depict, the traditional tale of Lear is all pre-Roman Celtic history, while in *King Lear*,

the titles of Earl of Kent and Gloucester are English ones only known after the eleventh-to twelfth-century English history.<sup>24</sup> The representation of two earls in the play, Shakespeare's own invention not found in his sources, thus compromises the tragedy's ahistorical all-Britonic narrative of national-origin with an infiltration of English national consciousness. Thus, the play, highlighting these two loyal English earls, defines the most threatening political identities as the foreign national powers of Albany, Cornwall and France. However, we might also be able to consider them as Celtic nationalities within the British Isles, because Shakespeare's struggle with French national identity is simply resolved. The King of France is actually a dummy and easily silenced at the end of the play. Though we hear about his landing in Dover, the English/British soil doesn't let him in. In the Quarto version of the text, he returns to France immediately after his landing because of "Something he left imperfect in the state" (Q.17.3), and in the Folio version, even more conveniently, he is entirely absent after the beginning of the play. Insofar as the King of France is a present *absence*, Shakespeare's British play qualifies the national struggle of the play between Englishness and Celticism within the British Isles, and if the play creates national and messianic narrative, inevitably, it is limited to British topographies.

Admittedly, in the tragedy, all the redemptive ideas focus on Cordelia. If she is alive, for Lear, it "does redeem all sorrows" (5.3.240), and Kent's receipt of a letter from Cordelia marks the beginning of messianic waiting and the deferral of narrative termination. But behind this pseudo-theological fashioning of Cordelia exist complex national-regional implications. One of Shakespeare's poetic feats in *King Lear* is his mediation of Cordelia with Lear's most loyal subject, Kent. He, along with Edgar, signifies another proper masculine power in the destroyed *patria* (fatherland), which is endangered and engendered as a feminine entity without any male heir, only with the wicked "pelican daughters" (3.4.70) of the old king. Thus, if Cordelia represents in the play both the only proper heir of Lear and, metaphorically, the English nation, Kent is her masculine displacement. This reading is supported by regional metaphors indicating her intricate connection with Kent. Recently, Valerie Traub very persuasively showed that, in *King Lear*, anatomical discourses usually articulate and metaphorize the cartographical discourses,<sup>25</sup> and this observation makes us read the close anatomical-topographical association between Cordelia and Kent in the text. It is noteworthy that Kent is the counterpart of Eubulus in *Gorboduc* and Perillus in *King Leir*, two of Shakespeare's sources,<sup>26</sup> but the regional and topographical fashioning of his loyalty is Shakespeare's own invention, stressing his/its Englishness. When Cordelia is unfairly treated by Lear, Kent feels the invasion of an arrowhead in "the region of [his] heart" (1.1.143) and Cordelia's suffocated *heart* – as she says, "I cannot heave / my heart into my mouth" (1.1.89–90) – expresses the regional heart of Englishness – Kent. As absent *presences*, in the beginning of the play, they are banished from Lear's eyes, but they ever shadow Lear. In the final scene of the play, Kent plaintively says, "from your [Lear's] first of difference and decay / Have follow'd your sad step" (5.3.263–4); but this phrase is equally applicable to Lear's Fool, who doubles as Cordelia.<sup>27</sup> Their repressed (thus absent or displaced) but surely present Englishness actually rules the entire narrative.

More importantly, if Cordelia's identities are linked with a certain regional English geography, her stubborn will to remain a virgin – "sure I shall never marry like my sisters" (1.1.101) – requires more exploration because whenever early modern literature depicts or stages virginity, it is never a mere coincidence. Louis Montrose argues in his reading of *A Midsummer Night's Dream* that, in the reign of Queen Elizabeth, the state tried to

appropriate the Virgin cult, redirecting it into the power of the nation-state, and in that course Elizabeth's virginity became the national icon of conquering power outwardly and of the unconquerable fortress internally.<sup>28</sup> For instance, Raleigh states, "Her Majesty hereby shall confirme and strengthen the opinions of al nations ... the Dominion and Empire of the *Amazones*, those women shall hereby heare the name of a virgin, which is not onely able to defend her owne territories and her neighbors, but also to invade and conquere so great Empyres and so farre removed".<sup>29</sup> This national implication of Elizabeth's virginity suffuses Spenser's Tudor national messianism in *The Faerie Queene* with his virgin characters like Britomart and Belpheobe. If Cordelia expresses this lost virgin national icon of Queen Elizabeth, who unified the senses of royal lineage and English nationhood more firmly than James did, it is Kent who topographically or regionally expresses Cordelia's virginity as a national bulwark. In the Jacobean era, as chorographically depicted in *The Roaring Girl*, a phrase such as "The purity of your wench would I fain try; she seems like Kent unconquered" seems an axiomatic expression.<sup>30</sup> For Shakespeare's Say, Kent was the "*bona terra*" (2H6 4.7.47), which cannot be the origin of rebels such as Jack Cade, as he cites a phrase of Caesar, Kent

Is termed the civil'st place of all [the] isle;  
Sweet is the country, because full of riches,  
The people liberal, valiant, active, wealthy.  
(2H6 4.7.54–6)

These kinds of description of Kent are often found in Elizabethan-Jacobean chorography: for example, William Camden describes Kent as a virgin territory, quoting from an unknown Latin source that "this County [Kent] was never conquered, ... but by concluding of a peace subjected themselves to the dominion of the Conquerour, retaining to themselves all their liberties, immunities, and customs which they had and used before time".<sup>31</sup> In addition, as Camden records, Kent is a territory which retains the memory of the Queen Elizabeth and her optic national power; in particular, "Greenwich was our late Queene Elizabeth, who heere, most happily borne to see the light by the resplendent brightness of her roiall vertue, enlightened all England".<sup>32</sup> If Queen Elizabeth as the unconquerable national body is geo-symbolically represented on English soil, it is by Kent. *King Lear*'s almost chorographical allegiance to Kent could be examined in more depth. In Elizabethan-Jacobean chorographies, the land as a personified agency of historical speeches was a persistent motif. This kind of localized loyalty was, according to Helgerson, usually against monarchial authority and stressed national-regional identities.<sup>33</sup> Then, if Kent speaks as a personified entity, what it would be like is a very intriguing question, and Michael Drayton's *Poly-Olbion* gives the best answer to it: it represents Kent as an eloquent nationalist speaker of English history. Especially when the poet describes the lands, rivers, mountains, villages, towns of Kent in Book XVIII, his pro-English jingoism is manifest. The land of Kent, especially the River Medway, recounts a long list of Anglo-Saxon victories over the French, the Irish, the Welsh and, in particular, the Scottish. The tedious national chauvinism amounts to almost 650 lines and continues until

the Kentish Nymphs doe interrupt her song,  
By letting *Medway* knowe shee tarried had too long  
Upon this warlike troupe.<sup>34</sup>

Drayton's ideologically laden political topography of Kent is summarized by the song of River Stour:

O noble *Kent*, quoth he, this praise doth thee belong,  
 The hard'st to be controld, impatient test of wrong.  
 Who, when the *Norman* first with pride and horror sway'd,  
 Threw'st off the servile yoke upon *English* lay'd;  
 And with a high resolve, most bravely didst restore  
 That libertie so long enjoy'd by thee before.  
 §. Not Suffering forraine Lawes should thy free Customes bind,  
 Then onely show'dst thy selfe of th'ancient *Saxon* kind.  
 Of all the *English* Shires be thou surnam'd the Free,  
 §. And formost ever plac't, when they shall reckoned bee.  
 And let this Towne, which Chife of thy rich Country is,  
 Of all the *British* Sees be still *Metropolis*.<sup>35</sup>

Along with its unconquerable virginity, Kent is essentially the Anglo-Saxon ethnic territory, which even “restore[s]” the national liberty from “forraine Lawes”; this regional account of Shakespeare’s contemporary might best explain why in *King Lear* national messianism is centralized around Kent. The county of Kent contains a radical utopian egalitarianism: in the foregoing text, the word “Customes” should be noted; when it is used in the context of Kent and its regional economy, it signifies an old habit of the Kentish “gavelkind”. Camden interprets it as “Give all kinne, by which they are not so bound by Copyhold, customarie tenures, or Tenant-right, as in other parts of England, but in maner every man is a free-holder and hath some part of his owne to live upon”, and he continues, “For lands of this nature are equally divided among the male children or, if there be no sonnes, among the daughters”.<sup>36</sup> This notion of gavelkind is also well depicted in William Lambarde’s *A Perambulation of Kent*. For Lambarde, Kent is a land for yeomanry and common people because of this custom and “it is agreed by all men, that there were never any bondmen (or villaines, as the law calleth them) in Kent”.<sup>37</sup> Obviously, behind the textual body of *King Lear* lie uncomfortable social feuds derived from unequal habits of property distribution, including bastardization, against which Edmund rises, and peasant rebellion, which Regan is conscious of as she exclaims, “A peasant stands up thus!” (3.7.78), slaying Gloucester’s servant. If so, the Kentish egalitarian custom called gavelkind is suitable to resolve all the problems revolving around questions of property that the tragedy raises and this might be one of the reasons Kent becomes the topographical backdrop of the play. This utopian vision, along with its virgin regional territory uncontaminated by any other nationhood, is why Kent can enjoy the status of “Chife” and “Metropolis” above all other counties.<sup>38</sup> With these geopolitical implications, in *King Lear*, Kent as a person and geographical locus embodies all the messianic anticipations and becomes at once *topos* and *telos* of the tragedy.

### III. *Alba, Albion and Albany: “Wherfore to Dover?”*

Toward the end of *King Lear*, the stage gravitates heavily toward Dover, a small port/fort in Kent: the narrative trajectory moves southward as if it wants to escape a threatening alterity from the north. Like his representations of Kent, Dover itself is Shakespeare’s

own rendering of his sources. Dover in the play is associated with redemptive images by Gloucester in act 3 scene 3; it is the place where the demented King can have “welcome and protection” (3.6.46). It is also the place where Lear’s company can “boast / To have well-armed friends” (3.7.17–18) and “preparation stands / in expectation of them” (4.3.22–3). From these phrases, we vaguely assume that Dover is where Cordelia’s French forces encamp and that they can defeat Edmund’s British powers. Yet still this is an unnatural reading given the nationalist impulse we have already surveyed because, according to this reading, Frenchness is welcomed over Britishness or Englishness. The reason for this geographical centralization into Dover, not just into Kent as an unspecified locus of Englishness, anyhow, is not very explicitly stated in the text, and when Cornwall and Regan interrogate Gloucester to locate Lear, they repeat the phrase “Wherefore to Dover?” three times (3.7.50, 51, 53). Yet Gloucester’s response to them is not sufficient to fully grasp Shakespeare’s geopolitics. The answer to this spatial centralization is only hinted at by Gloucester in the subsequent act:

There is a cliff, whose high and bending head  
 Looks fearfully in the confined deep.  
 Bring me but to the very brim of it,  
 And I’ll repair the misery thou dost bear  
 With something rich about me: from that place  
 I shall no leading need.

(4.1.67–72)

Blind Gloucester, guided by his son Edgar, treads a historical way to Dover. His destination, from which he “shall no leading need”, suggests that the doomsday is displaced from history to the specific regional locus. Richard Halpern observes the literalized *de casibus* motif in the cliff and argues that “as a machine for producing sublimity”, the cliff of Dover “creates values through its destruction”.<sup>39</sup> It thus erases the boundary between a certain value and nil, also destruction and redemption, creating an irreducible ambiguity. What my reading focuses on with regard to Shakespeare’s geopolitics of Dover, then, is the coexistence of essential English nationhood and the most threatening Scottish–Celtic alterity within the geopolitics of this. As I shall demonstrate, Dover, as a culturally and nationally liminal place, is an in-between place where the *heimlich* sense of English belonging and its exposure to the *unheimlich* existence of others coexist. More specifically, in the context of James’s claim of Union, Dover is a locus in which the absolutist claim of British Kingdom and people’s chorographical allegiance to English nationhood is negotiated. Also, for English subjects, including Shakespeare, it is a literary venue in which they can bridge the huge cleft between “what [Englishmen] felt” and “what [Englishmen] ought to say” to their Scottish monarch.

In order to show this, first, we need to explore Dover’s affiliation with Kent-Englishness. In Gloucester’s foregoing speech, even though the play does not clearly indicate the beginning point of Gloucester and Edgar’s “pilgrimage” (5.3.187), Edgar is now in disguise as a “Bedlam beggar” (2.2.171) – clearly indicating his London suburban subjectivity. It is most probable that they pass the old Watling Street, which overlaps the way from Southwark to Canterbury – the setting of Chaucer’s *Canterbury Tales*. Thus they pace through the long English literary tradition as well as the heart of Kent. No wonder Kent is the region of the national shrine, Canterbury, which might contextualize their “pilgrimage”. This properly Kentish way to Dover trodden by Edgar and

Gloucester represents the geopolitical identities of loyal Cordelia and the Earl of Kent – the national-regional purity of the land and of egalitarian utopian vision.

Indeed, their final destination, around the “cliff [of Dover], whose high and bending head / Looks fearfully in the confined deep” (4.1.67–8), invokes an enormous Shakespearean English national fantasy. In *The Comedy of Errors*, Dromio of Syracuse explains the essential quality of “England” with this “chalky cliff” in a humorous comparison to Nell’s teeth (*CE* 3.2.124–7). The cliff of Dover is the “fortress built by Nature for herself” (*R2* 2.1.43), which John of Gaunt praises, depicting the most vivid (but still questionable) Englishness in the entire English canon. It is the palisade protecting exclusive English identity from other nationalities and cultures. Facing the sea and Calais in France, it is a territory which suggests the geographical boundedness of the British Isles and its clear division from Continental influences. When it comes to Franco-Norman power, as Lambarde’s *Perambulation of Kent* proudly records, during the time of the French invasion of 1216 Dover was the only unconquered of England’s Cinque ports, and in the next year the great victory of Hubert de Burgh, who was “Constable” and “Earle of Kent”, over the French naval force saved the English realm from “for-reigne servitude”.<sup>40</sup> The national import of the Dover Cliff is rephrased in *Cymbeline* as

Neptune’s park, ribbed and paled in  
With rocks unscalable and roaring waters,  
With sands that will not bear your enemies’ boats.

(*C* 3.1.19–21)

Dover, then, as a national locus, is at once a British *port* facing Continental nations across the sea and an English *fort* against foreign invasions. Following Matthew Paris, Lambarde epitomizes the geopolitics of Dover as “*Clavis, & Repagulum totius Regni*, the verie locke and keye of the whole Realme of England”:<sup>41</sup> it is a synecdochic expression of English nationhood as such, uncompromised by other nationalities.

Given this cultural fantasy, if it is *natio* that is unnaturalized from the very beginning of the play, as stated in Edmund’s evil invocation, it is not surprising that this national place becomes the proper place of cure and redemption in *King Lear*. Dover thus becomes the literary locus where all tragic tensions should be resolved; where all the disguised and self-fashioned identities of Edgar, Kent and Edmund should be restored; where all the lost reasons and orders should be regained. Dover appears to be the proper stronghold of English values against the Celtic contaminations of Cornwall and Albany. In addition, given that *King Lear* was written in the time of James’s propagation of Union, Dover is the place at which English subjects can speak in terms of what Englishmen really felt concerning the Albanian Prince and his devouring Scottish subjects.

In *King Lear*, however, the influence of Scottish invasion is stronger than the English subject’s ability to maintain the clear-cut semantic tenor of this national locale. We must note that this symbolic location also signifies the most exclusive and xenophobic British national epithet, deriving from its white cliff – Albion. This exclusive English as well as British name is derived from the Gaelic etymology of *alba*, which it mainly relates to the Scottish monarch – Albany. Given that the tragedy presupposes a British history before the Arthurian legend, the word “Albion” itself thus evokes the British (rather than English) myth of historical origin. The Dover cliff, therefore, defines the British Isles in terms of Albion-Scottishness (or Britishness) rather than Englishness. The place

becomes eponymous for Scottish terrain and the geopolitics of Dover thus uncannily satisfies James's request – Union under the name of Albion or Britain. Indeed “Sith God hath made al under one, / Let Albione now al-be-one”<sup>42</sup> was the most dreadful political claim of that time, rigorously rejected by James's English subjects. The Shakespearean geopolitics of Dover is thus politically and semantically riven: the Janus-faced national-cultural imports of Dover never neatly dovetail with one another. This liminal location tries to satisfy both essential Englishness and the request of the Albanian monarch at the same time.

This political-national schism has clear narrative effects: it causes the notoriously unresolved ending of the play, staged “near Dover”. The most mysterious feature of the play, created by these multiple semantic ambiguities, is that Dover, as a Kentish region, as well as its Albion cliff never actually appears in the play. Both the signification of the cliff and its national implications are under deferral and dissemination. This symbolic location is heard about, desired, imaginarily created (by Edgar) and believed in (by Gloucester), but its presence is always already deferred. Toward the end of the narrative, we hear Cordelia's French forces landed on Dover, but the stage only ever resides *near* Dover. The chimerical nature of Dover has already been fully analyzed by Jonathan Goldberg, following post-structural linguistic philosophy,<sup>43</sup> but my point has more to do with nation and geography in relation to the illusive national messianism Dover creates. In *King Lear*, Dover itself is at once English and British territory – satisfying English nationalism and James's absolutist request at the same time – but Shakespeare stages Dover as an alien “French camp”. Demented Lear says in Dover, most confusingly, “Am I in France?” (4.6.69). After Edgar's imaginary creation of the cliff of Dover, which is a reality for Gloucester's imagination, Edgar says, “I know not how conceit may rob / The treasury of life” (4.5.43–4). In his understanding, the idea of reaching an essential nationness as well as the proper *telos* of history could be even a “conceit”, just as Edmund “can fashion” his birthright (1.2.161). In *King Lear* nation is no longer a nature or congenital *natio* but a manipulative creation. This is the reason why Dover, as an iconic symbol of proper nationness, is out of representation and *absent*, only creating its *effects*. This is how Shakespearean national tragedy topographically and chorographically responds to James's claim of Britain as a unified nature and nation.

#### IV. The Duke of Albany and *Macbeth*: “Is This the Promised End?”

Shakespeare's tragic rendering of the Lear story, however, fashions the Duke of Albany in general as a good-hearted figure, surviving to the end of the narrative. Cornish identity, however, is simply silenced with the premature death of Cornwall. This is understandable given that, in the Shakespearean era, the Cornish identity was already largely subsumed into England. Thus the existence of the Duke of Albany alone becomes the national alterity to the end of the tragedy, evoking the accession of James, who had held the title of Duke of Albany from February to July 1567. Shakespeare could not have been more careful in this context. Inevitably, in *King Lear*, the Duke of Albany, suggesting an adjective sense of Scottishness, becomes a very complicated character, who causes division of land and at the same time re-establishes the lost order in England at the end of the narrative.

The clear difference between the Quarto and Folio versions of the text is that, in the Quarto version, which was performed before the King during the Christmas holidays,

the closing speech falls upon Albany while in the Folio version the lost order is established by Edgar. Michael Warren summarizes his political interpretation of the textual-editorial variations as follows:

In Q, Edgar remains an immature young man and ends the play devastated by his experience, while Albany stands as the modest, diffident, but strong and morally upright man. In F Edgar grows into a potential ruler, a well intentioned resolute man in a harsh world, while Albany, a weaker man, abdicates his responsibilities. In neither text is the prospect for the country a matter of great optimism, but the vision seems bleaker and darker in F, where the young Edgar, inexperienced in rule, faces the future with little support.<sup>44</sup>

Warren suggests that Shakespeare tried to establish the superiority of Englishness over Scottishness in the later version of the play – given that we can regard the Folio version as a later and more revised edition. Even though it creates a more extreme “image of … horror” (5.3.238), in the Folio version, Shakespeare does not let Albany establish the national order. The editorial differences between the Quarto and Folio versions seem to express the crevice between the political allegiance to the Scottish-origin monarch and English nationhood. The editorial trajectory of *King Lear* fully signifies the textual unrest that derives from the alterity between the British crown and English identity. This negotiation continues until Shakespeare finishes staging *Macbeth*. In this play, Shakespeare negotiates the authorities of the Scottish Kingdom and the English nation better than in *King Lear*. In *Macbeth*, by tracing the English royal line back to Banquo, he acknowledges James’s Scottish lineage as English regal right. However, at the same time, English power, which is not contaminated by Scottish witchcraft, establishes order in morbid Scotland. The return of Malcolm and Macduff from England with an exorcizing power “Unknown to woman” (*M* 4.3.127) and shielded by Siward is nothing but the return of overriding English nationalism. The poet satisfies the national desire only with an ostensible exclamation – “Hail, King of Scotland!” (*M* 5.11.25).

## Notes

1 Nairn, 348.

2 *Oxford English Dictionary (OED)*.

3 Axton, 131–47. Marie Axton’s discussion has influenced critics interested in censorship. For example, Annabel Patterson’s reading deals with the issue of Union and the textual unrest expressed in the play (64–73). Leah Marcus, based on the subtitle of the Quarto version of the text (“played before the kings majestie at Whitehall upon S. Stephens night in Christmas Hollidays in the year of 1606”), argues that the play was produced before James on St. Stephen’s Night, a day of charity and granting hospitality. Marcus understands the play as an extended political exemplum promoting charity toward the Scottish monarch and his Scottish subjects (148–59).

4 Excerpted from James’s speech of March 1603, delivered in the Upper House (James, 271–2; emphasis added).

5 Axton, 134.

6 Francis Bacon quoted in Willson, 252.

7 For the House of Commons’s rejection of James’s claim, see Axton, 134–5; and Willson, 251–8.

8 Turner, 231–71.

9 Franco Moretti argues, based on the play’s representation of division of territory as a “darker purpose” acting against all reason, the political purpose of English tragedies from *Gorboduc* to *Lear* is ultimately the deconsecration of monarchical sovereignty.

- 10 Axton, 142. This phrase is from the closing speech of the play – “Speak what we feel, not what we ought to say” (5.3.299).
- 11 All citations to and quotations from William Shakespeare’s texts are taken from *The Norton Shakespeare* and appear parenthetically in the text. The following abbreviations are used for plays other than *King Lear*: *C* (*Cymbeline*); *CE* (*The Comedy of Errors*); *2H6* (*Henry VI, Part II*); *M* (*Macbeth*); *R2* (*Richard II*). Being conscious of the marked differences between the Quarto and Folio versions of *King Lear*, I have used the parallel text in the Norton edition. This essay is mainly founded on the Folio version and when I need to cite the Quarto version, I indicate it with a “Q.” The proper names of the play follow the conflated text edited by Barbara L. Lewalski in the Norton text.
- 12 *OED*, “Natural.”
- 13 Joseph Wittreich’s work exhaustively analyzes the apocalyptic framework in *King Lear* by reading Shakespeare’s two British tragedies, *King Lear* and *Macbeth*, in apocalyptic frameworks.
- 14 See “Shakespeare and the Exorcists” in Greenblatt, 94–128. Also a number of writers have pointed out the play’s self-conscious rejection of religious redemption. For example, for Sigmund Freud, Cordelia forms an illusory sense of redemption but she is actually a Goddess of Death in disguise (291–301). A. C. Bradley says, “The ‘gods,’ it seems, do *not* show their approval by ‘defending’ their own from adversity or death, or by giving them power and prosperity” (326). For Jonathan Dollimore, the play’s radical feature resides in its rejection of any idealist or humanist value in its final scene (202–3).
- 15 See chapter titled “Cultural Roots” in Anderson, 9–37.
- 16 Kohn, 11. Also Liah Greenfeld argues that the sense of chosen people of the Old Testament provided the most important rhetorical basis for English nationalism at the time of the Reformation. It was “the language in which they could express the novel consciousness of nationality, for which no language had existed before” (Greenfeld, 52).
- 17 See “Apocalyptic and Apologetics” in Helgerson, 249–68; Escobedo; Haller.
- 18 Escobedo, 85.
- 19 Ibid., 83.
- 20 James, 270.
- 21 Ibid., 270–1.
- 22 Anthony Munday’s pageant, *The Triumphs of Re-United Britannia*, is well discussed by Axton in this regard. In the pageant, Brutus’s sin, his division of land, is now redeemed by James, creating a motif of *felix culpa* (Axton, 136–7). This kind of political motif which praises James’s Union of territory continued until the King’s death in 1625. For example, Ben Jonson’s masque, “The Fortunate Isles, and Their Union,” (1624) typically reveals this motif.
- 23 Critics have read *King Lear* as a cartographical narrative pointing out Lear’s mapping desire saying “Give me the map” (1.1.35). For example, Valerie Traub discusses the play’s identification of anatomical science with cartographical representations. She argues that “the circulation and diffusion of western European anatomical illustrations, voyage illustrations, and maps around the end of the sixteenth century – when voyages of discovery, colonization, and trade were occurring at an unprecedented rate – resulted in a new graphic idiom, the spatializing logic of which *King Lear* appropriates, and to which it adds” (53). Bruce Avery discusses the “rhetorical purpose” of the cartographical scene in the play. According to Avery, the map in *King Lear* owes “its ability to possession” and represents “power” and “becomes as important as the territory that forms the actual possession” (51); thus it becomes the means through which Lear “intends to retain psychological control over” his daughters (52). However, critics have seldom discussed *King Lear*’s intertextual correlations with chorographical writings, and my point of discussion in this essay is how the localized narrative of *King Lear* articulates national concerns which are particularly represented in messianic anticipation.
- 24 See Holinshed, 1–3; Spenser, 2.10.27–32.
- 25 Traub, 42–4.
- 26 Passim.
- 27 The identification of Cordelia with the Fool is now generally accepted as a theatrical tradition. This dual role is suggested in phrases such as “since my young lady’s going into France, sir, the

- fool hath much pined away" (1.4.63) or "But who is with him? / None but the Fool, who labours to outjest His heart-struck injuries" (3.1.7–8).
- 28 See Montrose, 77–87. Leonard Tennenhouse also demonstrates in his reading of *Titus* the relation between national territory and virgin body. According to him, because Elizabeth, with her aristocratic virgin body, is usually identified with the body of nation-state, Tudor dramas cannot be more political than when they deal with an aristocratic virgin (111–12).
- 29 *Discovery of Guiana* quoted in Montrose, 78.
- 30 Middleton and Dekker, 2.1.324–6.
- 31 "Kent" in Camden.
- 32 Ibid.
- 33 See the chapter entitled "The Land Speak" in Helgerson, 105–48. Richard Helgerson argues that "The needs of cartographic representation [in early modern English chorography] are such that, for it to be successful, information concerning such matters as royal patronage or sovereignty must be pushed to the side," and "It strengthened the sense of both local and national identity at the expense of an identity based on dynastic loyalty" (114).
- 34 Drayton, 18.653–5.
- 35 Ibid., 5.729–40.
- 36 "Kent" in Camden. Joan Thirsk's classical account of "younger son" singles out Kent as a location of gavelkind. According to her, "Kentish gentry still held much land by gavelkind tenure, and many continued to uphold the spirit and the letter of this custom, resisting any attempt at change" (Thirsk, 340). In this light, Richard Wilson discusses one of *King Lear*'s sources – the property bequest of Brian Annesley, who had three daughters, last one named Cordelia. According to Wilson, many features of Lear himself reflect Annesley's property devise case. This source study is relevant to my reading since Annesley had his property in Kent and thus his property was "subject to the antique custom of gavelkind" (Wilson, 215). More recently Ronald W. Cooley has rehearsed this argument, by contextualizing *Lear*'s Kent in the very heavy discursive referential web of Jacobean property bequest. According to him, "As an aristocrat" the Earl of Kent "sees the dynastic disadvantage of a divided legacy, and protests Lear's division of the kingdom; as a 'man of Kent' he displays the independence and individualism that divided legacies had promoted" (Cooley, 334). However, Wilson and Cooley largely disregard the national and metropolitan identities which Kent represents and especially the messianic anticipation revolving around Dover, which I shall soon discuss.
- 37 Lambarde, 7.
- 38 As the *OED* suggests, the word "metropolis" began to be used in order to indicate a chief town with an archbishop in the fourteenth century. Yet it gradually began to manifest colonial connotations. See *OED*, "Metropolis" and "Metropolitan."
- 39 Halpern, 268.
- 40 Lambarde, 139–40.
- 41 Ibid., 138.
- 42 Robert Pont's *De unione britanniae* quoted in Patterson, 65.
- 43 Jonathan Goldberg argues that the impossible signification of Dover suggests the endless division between the signifier and signified. In this sense, "the limits that 'Dover' represents in the text are the limits of representation themselves" (134).
- 44 Warren, 35.

# CHAPTER 11

## Theory in Practice

*Elizabeth Bishop's "Brazil, January 1, 1502"*  
*and Max Jacob's "Etablissement d'une*  
*communauté au Brésil": A Study*  
*of Transformative Interpretation and Influence*

*Sylvia Henneberg*

Sylvia Henneberg is a Professor of English at Morehead State University. Her research focuses primarily on contemporary women's poetry. She has published on Adrienne Rich, Elizabeth Bishop, May Sarton, and Judy Grahn as well as on Emily Dickinson. Her book, *The Creative Crone: Aging and the Poetry of May Sarton and Adrienne Rich* (2010), examines the work of two major contemporary women poets to show how they confront aging.

Elizabeth Bishop's misgivings about free translation are well known to scholars of her work. Fearful of misappropriating creations not her own, her preference was to translate cautiously and literally.<sup>1</sup> In her unpublished *Remarks on Translation – (Of poetry, mostly)*, she enumerates several “complaints about translations,” including “inaccuracy – the wrong word” and “using three words – or more – when one would do” (2). She offers the following advice: “When a word is repeated – repeat it! (Just because English has more words than any other language except Russian – doesn’t mean we have to use them all....) When a line is repeated – repeat it – and also – stick to the structure.” Translations were to be handled, as she wrote in a letter to Anne Stevenson, “with a minimum of bloodletting or seepage” (qtd. in Lombardi, 138). Even Robert Lowell’s *Imitations* (1961), a body of work that, as most critics agree, is best understood as creative personalized reinterpretation of French poems rather than free translation, triggered discomfort

*Original publication details:* Sylvia Henneberg, “Elizabeth Bishop’s ‘Brazil, January 1, 1502’ and Max Jacob’s ‘Etablissement d’une communauté au Brésil’: A Study of Transformative Interpretation and Influence.” *Texas Studies in Literature and Language* 45.4, *Intertextual Variations* (Winter 2003), pp. 337–351.

in Bishop. Responding to *Imitations* in several letters that emphasized to Lowell the importance of fidelity to rhyme, meter, and poetic intent, she concluded with the comment: “I just can’t decide how ‘free’ one has the right to be with the poet’s intentions” (qtd. in Kalstone, 205).<sup>2</sup>

Despite such reservations about writings akin to free translation, Bishop did engage in what might be called transformative interpretation of poems in other languages. Her “Invitation to Marianne Moore,” based on Pablo Neruda’s elegy “Alberto Rojas Giménez viene volando,” is one of the better known examples. The connection between one of Bishop’s most important poems, “Brazil, January 1, 1502” (1960), and the French Modernist poet Max Jacob’s “Etablissement d’une communauté au Brésil” [“Foundation of a Religious Community in Brazil”] (1921), however, remains unexplored. It is possible that both poets independently drew on the 1502 map of Brazil that was to be reprinted in Bishop’s Time Inc. book *Brazil* (1962). Perhaps the striking similarities one notices, particularly the depiction of Brazil as garden landscape appearing in the map and in both poems, can be traced back to that coincidence. However, given not only the many affinities between their two poems but also the ways in which Bishop seems to respond and react to Jacob’s piece, it seems more likely that “Etablissement” became part of the extensive reading on Brazil Bishop did before writing her poem. A study, therefore, of Bishop’s reconfiguration of Jacob’s poem serves two important purposes: on the one hand, it calls attention to a frequently overlooked influence on Bishop’s poetry. On the other, it broadens our understanding of Bishop’s strategies of transformative interpretation as a creative means of interacting with and building on existing foreign poetry without, for as much, engaging in the free translation of which she was so deeply skeptical.

Reading Bishop’s published letters and biography, one can easily come away with the impression that the poet was not altogether fond of France and its culture. A tragic car accident in Burgundy, acute attacks of asthma during her sojourns in Paris, and too many visits to the American Hospital in Neuilly led her to exclaim in a letter to Marianne Moore, dated November 24, 1937: “I hope I never see the place again.” Bishop, it seems, came to associate many of the traumas of her life – loss, loneliness, illness, injury, the inability to write, and even alcoholism (for she had developed what Brett Millier calls “an unfortunate fondness for Pernod” [93]) – with French culture and surroundings. It is telling that after several visits in the mid- and late 1930s, she never returned.

Although she seemed to be at odds with all things French, Bishop must have been somewhat interested in the French Cubist poet Max Jacob (1876–1944). Engaging with his work enough to publish literal translations of four of his poems in 1950, she may have also been inspired by some of his titles, experiments, and themes.<sup>3</sup> Both Bishop and Jacob have a poem titled “Chemin de Fer” [“Railway”]; both have many titles evoking the concepts of travel and geography; Bishop’s “Roosters” is reminiscent of Jacob’s “Le coq et la perle” [“The Rooster and the Pearl”]; Bishop’s title “One Art” resembles Jacob’s “Art intime” [“Private Art”]; and her “Exchanging Hats” bears resemblance to his “La tante, la tarte et le chapeau” [“The Aunt, the Tart, and the Hat”]. Beyond titles, the surrealist experiment seen in “The Man-Moth” recalls one of Jacob’s most important collections, *Le cornet à dés* (1917) [*The Dice Cup*]. Moreover, Bishop’s recurrent attempts to conceptualize the relationship between home and travel in such poems as “Questions of Travel” and “Arrival at Santos” are reflected in several of Jacob’s poems including “Voyages” [“Trips”]. Bishop and Jacob again have a common denominator in that they repeatedly expressed their frustrated inability to know marginalized peoples, as in Bishop’s “Manuelzinho” and Jacob’s “La mendiane de Naples” [“The Beggar Woman of Naples”].<sup>4</sup>

The extent to which such connections can be used to develop a deeper understanding of Jacob's influence on Bishop remains to be seen.<sup>5</sup> However, there is no question about the importance of the relationship between Jacob's "Etablissement d'une communauté au Brésil" ["Foundation of a Religious Community in Brazil"] (1921) and Bishop's "Brazil, January 1, 1502" (1960). In these two poems the setting, plot, and dramatic development toward crisis all yield significant parallels. Just as important are the ways in which Bishop reacts to and departs from Jacob's model, crafting a piece that redirects and sharpens Jacob's critique of imperialism. It is such transformative interpretation of a fairly obscure poem by Max Jacob, then, that has contributed to one of most important poems Bishop ever wrote.

Formally, the two poems are different enough. Jacob's "Etablissement" is made up of grammatically complete sentences that are strongly marked by internal rhyme and cast in classic alexandrine lines punctuated by regularly recurring heroic couplets. Though similar in overall length and stanzaic structure, Bishop's "Brazil" consists of free verse whose cumulative descriptive phrases disregard conventional syntax. Irregular in length, casual in tone, the lines of this poem follow no regular rhyme scheme but rely on such devices as alliteration, repetition, and enumeration, all of which are almost entirely absent from Jacob's poem.

While the formal elements of the two poems have little in common, their respective openings usher in strong thematic affinities. The two poems begin as follows:

On fut reçu par la fougère et l'ananas  
 L'antilope craintif sous l'ipécacuanha.  
 Le moine enlumineur quitta son aquarelle  
 Et le vaisseau n'avait pas replié son aile  
 Que cent abris légers fleurissaient la forêt.  
 Les nonnes laboraient. L'une d'elles pleurait  
 Trouvant dans une lettre un sujet de chagrin  
 Un moine intempérant s'enivrait de raisin.  
 Et l'on priaît pour le pardon de ce péché  
 On cueillait des poisons à la cime des branches  
 Et les moines vanniers tressaient des urnes blanches.  
 Un forçat évadé qui vivait de la chasse

Fut guéri de ses plaies et touché de la grâce:  
 Devenu saint, de tous les autres adoré,  
 Il obligeait les fauves à leur lécher les pieds.  
 Et les oiseaux du ciel, les bêtes de la terre  
 Leur apportaient à tous les objets nécessaires.  
 Un jour on eut un orgue au creux de murs crépis  
 Des troupeaux de moutons qui mordaient les épis  
 Un moine est borrelier, l'autre est distillateur  
 Le dimanche après vêpre on herborise en chœur.

(stanza 1, Jacob's "Etablissement")

We were received by ferns and pineapple  
 The timid antelope beneath the ipecacuanha.  
 The monk abandoned his illumination  
 And the vessel had scarcely folded its wings  
 When a hundred simple shelters flowered in the forest.

The nuns labored. One of them wept  
 Finding in a letter occasion for shame  
 An intemperate monk became drunk on grape wine.  
 And we prayed for his sin to be pardoned  
 We plucked potions from the tips of the boughs  
 And the basket-making monks plaited white urns.  
 An escaped convict who survived on hunting  
 Was cured of his wounds and blessed by grace:  
 Became a saint, worshipped by all others,  
 And compelled wild creatures to lick their feet.  
 And the birds in the sky, the beasts of the earth  
 Brought them all that they needed.  
 One day an organ was housed in the hollow of the rough walls  
 Herds of sheep nibbled the ears of corn  
 One monk is a saddler, the other a distiller  
 On Sundays, after vespers, we botanize as we chant.

(translation<sup>6</sup>)

Januaries, Nature greets our eyes  
 exactly as she must have greeted theirs:  
 every square inch filling in with foliage –  
 big leaves, little leaves, and giant leaves,  
 blue, blue-green, and olive,  
 with occasional lighter veins and edges,  
 or a satin underleaf turned over;  
 monster ferns  
 in silver-gray relief,  
 and flowers, too, like giant water lilies  
 up in the air – up, rather, in the leaves –  
 purple, yellow, two yellows, pink,  
 rust red and greenish white;  
 solid but airy; fresh as if just finished  
 and taken off the frame.

(stanza 1, Bishop's "Brazil")

Both poems are set in Brazil; both evoke a period of colonization when Christians arrived on foreign soil and began to call it their own. The openings are very similar in that they both portray nature as eagerly welcoming its invaders. Jacob's poem begins with "We were received by ferns and pineapple, / the timid antelope beneath the ipecacuanha" ["On fut reçu par la fougère et l'ananas / L'antilope craintif sous l'ipécacuanha"],<sup>7</sup> and Bishop's opens, "Nature greets our eyes / exactly as she must have greeted theirs" – the intruders'. Seductively lush and abundant, landscape and nature are quickly understood as existing for the sole purpose of serving the white man.

Such fecundity and splendor lure the Christians into a false sense of harmony with their surroundings. Blinded by the Edenic vision of "wild creatures lick[ing] their feet" ["Il obligeait les fauves à leur lécher les pieds"] and "the birds in the sky, the beasts of the earth" supplying "all that they needed" ["Et les oiseaux du ciel, les bêtes de la terre / Leurs apportaient à tous les objets nécessaires"], the monks and nuns of Jacob's poem fail to understand that their peace derives not from the welcome nature extends to them but from the ideals they import and impose on it. In Bishop's "Brazil," the Portuguese

conquistadors do not appear until the last stanza; however, the poet implies from the beginning that nature's plenty blinds them in similar ways. The saturation of the surroundings, conveyed by Bishop's rich visual detail and her repeated emphasis on color, makes it impossible for these people (as well as for any visitor who came after them) to see anything but the "purple, yellow, two yellows, pink, / rust red and greenish white" vegetation. Despite or precisely because of their voyeurism, they do not recognize that they are violating this earth, domesticating it by means of their own cultural codes. What they see is a luxurious aesthetic tapestry – something they could simply "[take] off the frame" and use as they see fit – not a complex political reality.

Tracing a plot whose three cornerstones are white Christian invasion of Brazil, appropriation of land and nature, and confrontation with nonwhite peoples, both poems stage a dramatically rising tension before moving into the climactic battle. "Etablissement" foreshadows the violent events by repeatedly invoking sin. Jacob mentions a nun who weeps, "Finding in a letter occasion for shame" ["Trouvant dans une lettre un sujet de chagrin"], "An intemperate monk [who] became drunk on grape wine" ["Un moine intempérant s'enivrait de raisin"], and "An escaped convict who survived on hunting" ["Un forçat évadé qui vivait de la chasse"]. The sense of impending doom is at its strongest when, in stanza two, Jacob charges the atmosphere with such an exaggerated sense of bliss that the very walls he evokes threaten to crumble:

Saluez le manguiet et bénissez la mangue  
 La flûte du crapaud vous parle dans sa langue  
 Les autels sont parés de fleurs vraiment étranges  
 Leurs parfums attiraient le sourire des anges,  
 Des sylphes, des esprits bannis dans la forêt  
 Autour des murs carrés de la communauté.  
 (from stanza 2, Jacob's "Etablissement")

Hail to the mango tree and blessed be its flesh  
 The flute of the toad speaks to you in its tongue  
 The altars are decked with astonishing flowers  
 Their fragrance made the angels smile,  
 Sylphs, spirits huddled in the forest  
 All around the square walls of the community.  
 (translation)

This vision of Brazil, the poem's parodic tone makes clear, is unsustainable. Peaceful, pastoral, and paradisal beyond all plausibility, the descriptions create in the reader an expectation of collapse and doom.

Like Jacob, Bishop strategically builds toward the confrontation at the end of her poem. As Barbara Page has observed, her title, "Brazil, January 1, 1502," denotes the date of the naming of Rio de Janeiro by a party of Portuguese colonists and thus already represents an appropriative act that presages the ensuing violence (40). The final battle is further prepared for by Bishop's deliberate yoking of nature and culture in stanza two:

A blue-white sky, a simple web,  
 backing for feathery detail:  
 brief arcs, a pale-green broken wheel,  
 a few palms, swarthy, squat, but delicate;

and perching there in profile, beaks agape,  
 the big symbolic birds keep quiet,  
 each showing only half his puffed and padded,  
 pure-colored or spotted breast.

(from stanza 2, Bishop's "Brazil")

Just as Jacob lets not nature alone but "a hundred simple shelters flower in the forest" ["cent abris légers fleurissaient la forêt"] in his poem, so human traces stemming from the colonists, the "pale-green broken wheel," become part of the "feathery detail" that otherwise consists of palms and birds in Bishop's. In both cases, the landscape is thus marked as violated, its purity compromised by outside influences.

Paralleling Jacob, Bishop invokes sin to foreshadow the ending of the poem, capitalizing "Sin" and placing it in a prominent position in the middle of stanza two:

Still in the foreground there is Sin:  
 five sooty dragons near some massy rocks.  
 The rocks are worked with lichens, gray moonbursts  
 splattered and overlapping,  
 threatened from underneath by moss  
 in lovely hell-green flames,  
 attacked above  
 by scaling-ladder vines, oblique and neat,  
 "one leaf yes and one leaf no" (in Portuguese).  
 The lizards scarcely breathe; all eyes  
 are on the smaller, female one, back-to,  
 her wicked tail straight up and over,  
 red as a red-hot wire.

(from stanza 2, Bishop's "Brazil")

Here, the mention of "Sin," just like that of the broken wheel, interrupts the descriptions of nature and calls attention to imperialist presence. Nature itself is hardly sinful; instead, lizards that seem like "dragons" with "wicked tails," moss that is likened to "hell-green flames" capable of "attack," and birds that appear as "symbolic," in some cases (sinfully) "spotted," are all European constructions, New World nature seen through the lens of Old World myth. Reconfiguring nature as deliciously sinful "*femme fatale*," as Thomas Travisano puts it (139), Bishop prepares her contrast with the real sin at the end of the poem, the ravaging of the landscape and its population.

If Jacob's most effective device for developing such dramatic tension is his persona's exaggerated vocal praise of his New World surroundings, Bishop's is the ominous silence she creates up to her poem's final stanza. The "beaks agape" of the birds seem frozen, the pun on "Still in the foreground there is Sin" spreads a hushed atmosphere, and her "lizards scarcely breathe." Brazil's nature is lying in wait, nearing the boiling point. Like Jacob's, it is suspended but ready to explode.

The rising tension leads to a violent confrontation between Christians and nonwhite peoples in both poems. Jacob reaches this climax at the end of stanza two; Bishop does so in her final stanza:

Or voici qu'un matin quand l'Aurore saignante  
 Fit la nuée plus pure et plus fraîche la plante  
 La forêt où la vigne au cèdre s'unissait,

Parut avoir la teigne. Un nègre paraissait  
Puis deux, puis cent, puis mille et l'herbe en était teinte  
Et le Saint qui pouvait dompter les animaux  
Ne put rien sur ces gens qui furent ses bourreaux.  
La tête du couvent roula dans l'herbe verte  
Et des moines détruits la place fut déserte  
Sans que rien dans l'azur ne frémît de la mort.

(from stanza 2, Jacob's "Etablissement")

Now one morning when a dawn bleeding red  
Purified the storm cloud and refreshed all vegetation  
The forest where the cedar vines entwined,  
Seemed infected with ringworm. A negro appeared  
Then two, then a hundred, then a thousand, then the grass was tainted  
And the saint who could tame wild animals  
Could not avail against these people, his torturers.  
The head of the convent rolled in the green grass  
And, once the monks were dead, the place was deserted  
Without anything in the sky trembling with death.

(translation)

Just so the Christians, hard as nails,  
tiny as nails, and glinting,  
in creaking armor, came and found it all,  
not unfamiliar:  
no lovers' walks, no bowers,  
no cherries to be picked, no lute music,  
but corresponding, nevertheless,  
to an old dream of wealth and luxury  
already out of style when they left home –  
wealth, plus a brand-new pleasure.  
Directly after Mass, humming perhaps  
*L'Homme armé* or some such tune,  
they ripped away into the hanging fabric,  
each out to catch an Indian for himself –  
those maddening little women who kept calling,  
calling to each other (or had the birds waked up?)  
and retreating, always retreating, behind it.

(stanza 3, Bishop's "Brazil")

In "Etablissement," the aggressors are identified as Negroes who emerge from the forest and multiply by the thousands: "The forest where the cedar vines entwined, / Seemed infected with ringworm. A negro appeared / Then two, then a hundred, then a thousand, then the grass was tainted" [ "La forêt où la vigne au cèdre s'unissait, / Parut avoir la teigne. Un nègre paraissait / Puis deux, puis cent, puis mille et l'herbe en était teinte" ]. The victims, in turn, are the monks; even the convict-turned-saint "Could not avail against these people, his torturers" [ "Ne put rien sur ces gens qui furent ses bourreaux" ]. Far from positioning himself on the side of the victims, however, Jacob introduces a subtle irony that destabilizes easy assumptions about the Negro as degraded and the Christian as noble. To the speaker and the religious community, the Negroes may appear like a ringworm infection that taints their Edenic space with sin. To the reader,

however, they are presented as a natural force, an embodiment of the Brazilian forest materializing to repel the Christians from a place to which they have no right. The Christians are portrayed with the same sense of irony. While they see themselves as righteous, a perception that is indicated as religious words like “saint,” “monk,” and “convent” reinforce one another during the moment of crisis, Jacob does little to strengthen his reader’s sympathy for them.

Like Jacob, Bishop finds confrontation inevitable, and like him, she stages it to develop a critique of imperialist intervention.<sup>8</sup> However, Bishop chooses to voice this shared concern in much more explicit terms. To do so, she introduces several important variations on Jacob’s poem. First, she reverses the positions of the Christians in “Brazil.” The Portuguese colonists assume the role of brutalizing offenders as they “[rip] away into the hanging fabric.” They are cold-blooded torturers, for, as Bishop makes clear, they are not simply attacking for some vaguely justified reason; rather, they are intent on experiencing illicit stimulation, “a brand-new pleasure” they cannot get at home. Bishop calls them “Christians” once, but far from stressing their religious devotion, she evokes the term only to contrast and replace it with military imagery that recasts them as belligerent soldiers. Indeed, they become the savages whose morality Bishop questions by calling attention, as many have pointed out, to their suspicious yoking of religion and war: “Directly after Mass, [they are] humming perhaps / *L’Homme armé* or some such tune.” Their brutality does not, however, gain them an unequivocal position of power. Careful not to make them appear valiant, Bishop ridicules them, reducing them to “Christians, hard as nails, / tiny as nails, and glinting, / in creaking armor.” While Jacob made it difficult to pity his Christians, Bishop makes it impossible. Once indicted and belittled by the poet, the dwarfed intruders cannot begin to measure up to the awe and dignity commanded by, say, Brazil’s “monster ferns.” For all their violence, these tin soldiers remain impotent.

The second way in which Bishop formulates a more direct critique of imperialist appropriation is by reconfiguring the gender dynamics of Jacob’s poem. Unlike “Etablissement,” where all female presence, notably that of the nuns, disappears from the battle scene, the indigenous people who appear in the climactic moment of “Brazil” are specifically identified as women. These women are prey in the eyes of the Portuguese conquistadors; unwilling or unable to fight even in self-defense, they retreat from the hostility of their predators. Their retreat does not, however, represent defeat. Matching and surpassing Jacob’s strategy of linking nature and nonwhites, Bishop aligns these native women with their surroundings, connecting them with the female lizard, merging their cries with the birds’, and anchoring them securely in the protective tapestry of nature. “[C]alling to each other,” they break the poem’s silence as they rely on values of communion and a politics of inclusion that destabilizes the strategies of their stalkers. To be sure, these aggressors still advance, but because they fight individually, “each out to catch an Indian for himself,” they always remain on the margins of both the women’s and their own community. Clearly, then, Bishop shares Jacob’s focus on the disruption and destruction caused by imperialist intrusion. However, she expands that focus by linking sexual exploitation to geographic imperialism and by highlighting the ways in which such invasiveness might well expose the aggressors’ weaknesses more clearly than those of the victims.<sup>9</sup>

In a third key variation on Jacob’s poem, Bishop’s “Brazil” moves away from considerations of how imperialism might affect its perpetrators so as to examine its impact on the land and its people. Transforming Jacob’s “Negroes” who violently attack a holy mission into “Indians” who are pursued through no fault of their own, Bishop positions

her speaker squarely on the side of the beleaguered natives. "Etablissement" reveals the fate of the Christian monks whose deaths culminate in the "head of the convent" ["La tête du couvent"] "roll[ing] in the green grass" ["roula dans l'herbe verte"]. The Negroes, however, suddenly vanish, as does their forest, and while the last stanza provides insight into the life of the surviving speaker long after the events, we learn no more about Brazil in the aftermath of the crisis. Bishop denies her speaker (and us) the escape from the Brazilian perspective that Jacob allows his speaker, keeping her poem firmly situated in the country, among its natives. Each stride her Christians take to penetrate into the forest is directly counteracted by her Indians' retreating steps, creating a perpetual limbo that leaves us suspended in Brazil. Underscoring this suspension, Bishop leads us away from definitive victories or defeats, alluding to violence but skillfully withdrawing her profuse color imagery once its only logical use would be to suggest blood. Ironically, such resistance to closure calls attention to the scope of the country's violation. Imperialism, the poem argues, must be seen as an ongoing cycle of advance and retreat causing obvious but also insidious violations whose costs are as elusive as they are high. Just as the generalizing use of the plural in "Januaries" in the poem's opening suggests an impact so far-reaching that 1502 and the present are forever linked, so Bishop's unresolved ending indicates that imperialist acts have caused Brazil and its inhabitants to suffer far beyond what can be assessed accurately or immediately.

In what is perhaps her most significant move to both share and sharpen Jacob's concerns about the consequences of imperialism, Bishop aligns her persona with Jacob's and then repositions that voice in order to propose a constructive model for dealing with issues of guilt and complicity. The similarities between the two personae are apparent enough as both are clearly relating an event from which they have gained considerable distance. Jacob's persona has long returned home, as his last stanza implies:

C'est ainsi que vêtu d'innocence et d'amour  
J'avançais en traçant mon travail chaque jour  
Pariant Dieu et croyant à la beauté des choses  
Mais le rire cruel, les soucis qu'on m'impose  
L'argent et l'opinion, la bêtise d'autrui  
Ont fait de moi le dur bourgeois qui signe ici.  
(stanza 3, Jacob's "Etablissement")

Thus it was that I, clad in innocence and love  
Moved along laying out my task each day  
Praying to God and believing in the beauty of things  
But the cruel jeers, the troubles that are laid upon me  
The money and people's opinions, the foolishness of others  
Have made me the harsh bourgeois who attests to this.

(translation)

Bishop's, a visitor-tourist who re-imagines the events of Brazil in 1502, is even more removed from the actual events. In both cases, however, passing time does little to deflect the speakers' complicity. Jacob's cannot be exonerated as he was part of a religious community whose presence led to mass slaughter. Though the speaker of "Brazil" was never a participant or even a direct witness, Bishop takes care to overlay this visitor's critical and historical distance to imperialism with recurrent intimations of her implication in it. On the one hand, her persona is clearly aware of wrongly imposed reconstructions of

Brazil; on the other, she is as seduced by the land as were the settlers in 1502. Unable to resist the desire to mark this exotic earth as her own, she still applies her ideals and vocabulary to capture its images.<sup>10</sup>

The shared complicity and guilt of the personae, however, result in disparate responses. Far from developing a sense of responsibility, Jacob's speaker falls into a resignation that makes it impossible for him to see beyond his own person. Rather than considering his deeds and what he might do to atone for them, he focuses on his own suffering in the wake of the community's failure: "But the cruel jeers, the troubles that are laid upon me / The money and people's opinion, the foolishness of others / Have made me the harsh bourgeois who attests to this" [“Mais le rire cruel, les soucis qu'on m'impose / L'argent et l'opinion, la bêtise d'autrui / Ont fait de moi le dur bourgeois qui signe ici”]. Steeped in effusive self-pity and bitterness, he sees himself as an innocent victim, an essentially good and God-fearing man who has been hardened by the circumstances of his life. Imperialism becomes a personal tragedy that is answered by a narcissistic retreat into the self.

Jacob makes his persona so thoroughly unlikable that it becomes clear that the poet is not condoning but indicting his escape from complicity. Bishop, however, moves beyond simply exposing fruitless ways of dealing with guilt, illustrating not how one can lapse into repressing and denying one's implication in the processes of imperialism but, rather, how one might face such implication. Her main strategy for doing so consists of transforming the self-centered persona in “Etablissement” into the sympathetic voice in “Brazil.” By the end of the poem, Bishop's speaker has aligned herself with the Indian women and seems to join them as they retreat into the depths of the receding forest. The imperialist guilt of Bishop's visitor-tourist, like that of Jacob's, leads to retreat, but her retreat signals not a withdrawal into the self but a cautious affiliation with the embattled women. Bishop thus closes “Brazil” by establishing a useful, if imperfect, basis for acknowledging guilt and complicity, one that involves interacting and engaging with the violated land and its natives on their terms. Significantly, Bishop's ironic assurance that “Nature greets our eyes / exactly as she must have greeted theirs” attests to the capacity for insight of her speaker, whereas the mock-peaceful skies in Jacob's post-battle scene stress the blindness of his.

Without further investigation, the full extent of Jacob's influence on Bishop will remain unclear. However, it seems likely that as she was working on “Brazil,” he and his poem came to her attention. Drawing on “Etablissement,” Bishop developed, redirected, and politicized the critique of imperialism she found in Jacob. Her response to the model poem sheds important light on Bishop's strategies of building on existing foreign poetry to voice her own concerns more clearly and may, in the present case, serve to inform and confirm the increasing number of studies that seek to adjust the long-held misperception of Bishop's poetry as apolitical.<sup>11</sup> Given the relationship between the two poems, it is moreover perhaps time to admit Max Jacob to a more central position in the arena of Bishop studies. To be sure, “Brazil, January 1, 1502” is not literal or free translation – something, as we have seen, Bishop always associated with some measure of “bloodletting or seepage.” In line with the anti-imperialist sentiment of “Brazil, January 1, 1502,” she did not rip into the fabric of “Etablissement d'une communauté au Brésil” to create her own poem. But like the Portuguese conquerors who came to Brazil, she too was seduced into making use of a rich texture she beheld, crafting anew a work of art in a double-stitched pattern of transformative interpretation.

## Notes

- 1 In the introduction to her collection of translations from the Portuguese, *An Anthology of Twentieth-Century Brazilian Poetry* (1972), she confirmed this position by showing herself proud of her and her fellow translators' successful attempts at self-effacement, commenting that "The editors feel that the translators have done extremely well, keeping close to the texts and yet managing to produce 'poems' preserving many of the characteristics of the originals" (xv). As Victoria Harrison observes, Bishop would only translate what lent itself to literal translation, and she saw her translations from the Portuguese as her "duty for Brazilian letters" (letter to May Swenson, 30 Dec. 1963, qtd. in Harrison, 174).
- 2 For a discussion of Bishop's concern with Lowell's translations, see David Kalstone's *Becoming a Poet: Elizabeth Bishop with Marianne Moore and Robert Lowell* (203–8).
- 3 Four literal translations, "Rainbow," "Patience of an Angel," "Banks," and "Hell is Graduated," appear in Bishop's *The Complete Poems: 1927–1979* and were first published in the May 1950 issue of *Poetry*.
- 4 Some translations of titles here are generally established and accepted; others are mine.
- 5 The biographical parallels, though very possibly coincidental, warrant some attention. Bishop shared Jacob's tendency toward timidity, self-hatred, addiction, depression, and restlessness. Both poets were homosexual, and while Bishop never went so far as to refer to her lesbianism as "an atrocious accident, a tear in the robe of humanity" (Jacob, qtd. in Huffington, 58), she, like Jacob, did not feel comfortable displaying her sexual identity in her writings. With varying success, both poets attempted to separate the public and the private, and both have been described as impersonal and masked. Though Jacob evolved into a recluse and Bishop did not, his retreat from Paris to the small French village of Saint-Benoît-sur-Loire parallels Bishop's period in Brazil and her lifelong discomfort with the bustling life of New York City. Repeatedly writing about travel, the two poets moreover shared an inability or reluctance to live sedentary, stable lives with regular jobs, which resulted, in both cases, in frequent shuttling between several base locations. In their respective poetic practices, both poets concentrated on form and detail, and the scholarly community has, in both cases, vacillated between claiming them as surrealists, modernists, and postmodernists.
- 6 In my translation of Jacob's "Etablissement d'une communauté au Brésil," I am indebted to David Burnett's *Transfusions: Poems from the French*. Special thanks also to Jed Deppman, who was enormously helpful to the translation and understanding of this poem. I have made every attempt to translate as literally as possible.
- 7 According to the *Oxford English Dictionary* the ipecacuanha is a South American shrub that possesses emetic, diaphoretic, and purgative properties. The Dutch and the Portuguese brought it home from the coasts of Brazil.
- 8 One can assume that Jacob stands behind the critique in his poem and that he was, indeed, opposed to imperialist gestures. Although he passionately believed in the value of converting people to Christianity and openly serving God, he was firmly convinced that it was wrong to impose his beliefs. A Jew who, following a vision in 1909, became a devout Catholic, Jacob wanted to serve as a model to the people surrounding him, but only by letting religion take an indirect effect on them. In *La Défense de Tartufe*, Jacob lists several rules he seeks to follow in his life. The fourth rule reads: "ne pas se vanter de sa religion parce que c'est se servir de Dieu pour une attitude, et pourtant ne pas s'en cacher, donc ne pas mettre les perles devant les sourcœurs" ["do not flaunt your religion, for that is using God for the sake of appearance only. Yet do not hide it; in other words, don't throw pearls before swine"]. His fifth rule is: "ne prêcher que les gens convertissables" ["preach only to those who may be converted"]. And the sixth runs: "donner à tous l'exemple de la vie modèle, pour faire indirectement l'éloge d'une religion si admirable" ["live a model life, and in so doing, give indirect praise to an excellent religion"] (qtd. in Billy, 32–33; translations mine). Bishop appears to have been similarly sensitive about appropriative impositions. When Time, Inc. proceeded to make numerous excisions from the *Brazil* volume she had painstakingly prepared for the new Life World Library, her reactions were little short of violent. "Their idea," she protested in a letter written to May Swenson in 1962, "is to present their own undisturbed pre-conceptions of a country" (qtd. in Millier, 328). In a letter to Lowell, dated 1960, she expressed the difficulty of using the Brazilian "accumulation of exotic or picturesque or charming detail"

- while maintaining the distance and respect that a “New Englander herring-choker bluenoser” owes the country (*One Art*, 383–84).
- 9 For a reading of the bird-women as victorious, see Page’s “Nature, History, and Art in Elizabeth Bishop’s ‘Brazil, January 1, 1502’” and Lynn Keller and Cristanne Miller’s “Emily Dickinson, Elizabeth Bishop, and the Rewards of Indirection.”
  - 10 Commenting on Bishop’s own complicity, Robert Dale Parker argues, “She describes the creation of Brazil in violence and rape, and yet also pays homage to the cultural and bodily trauma of its birth, because that trauma begets the identity and heritage of the place she loves” (97).
  - 11 For examples of studies that highlight Bishop’s political dimensions, see James Longenbach’s article “Elizabeth Bishop’s Social Conscience” or Camille Roman’s *Elizabeth Bishop’s World War II – Cold War View*.

# CHAPTER 12

## Theory in Practice

### *Annals of Ice: Formations of Empire, Place and History in John Galt and Alice Munro*

*Katie Trumpener*

Katie Trumpener compares a fiction about the colonization of Canada – John Galt’s *Bogle Corbet*, which was written in the early nineteenth century and which depicts the imperial arrival in Canada of European emigrants and colonialists – with Alice Munro’s *Lives of Girls and Women*, written in the late twentieth century, which examines the same geographic and cultural terrain as Galt’s novel but from the perspective of the legacies of successful colonization.

Nineteenth-century Scots were disproportionately involved in the British Empire as army officers, administrators, engineers, settlers – and writers. John Galt and William ‘Tiger’ Dunlop in Upper Canada, Thomas McCulloch in Nova Scotia, Thomas Pringle in the Cape and Thomas McCombie in Australia wrote pioneering literary works in and about Britain’s new colonies, established new frameworks for colonial life and spread an empire-wide vogue for Scottish literature.

From the nineteenth century onward, indeed, Canada’s English-language writers closely followed Scottish literary prototypes; Canadian literature was filled with Scottish character types (from ministers to crofters) and modelled on Scottish literary genres (from historical novel to dialect poetry) (Gittings 1995; Waterston 2003). Writers of Scottish heritage, moreover, played a pre-eminent role in the literary life of Anglophone Canada; as late as the 1960s and 1970s, Margaret Laurence, Alice Munro, Mavis Gallant and Margaret Atwood were hailed as harbingers of a new national literature. Yet while steeped in Scottish cultural and literary narratives, Munro and Laurence wrote to correct long-standing Scottish views of Canada itself. This chapter reads Scotland’s

*Original publication details:* Katie Trumpener, “Annals of Ice: Formations of Empire, Place, and History in John Galt and Alice Munro” from *Scottish Literature and Postcolonial Theory: Comparative Texts and Critical Perspectives*, ed. Michael Gardiner, Graeme Macdonald, and Niall O’Gallagher, pp. 43–56. Edinburgh University Press, 2011.

most complex nineteenth-century colonial novel, Galt's half-forgotten 1831 *Bogle Corbet, or the Emigrants*, against Munro's fiction. Galt and Munro inhabit very different temporal, political and literary moments, yet describe the same area, in present-day Ontario, while sharing an interest in the local texture of historical experience, using annalistic accretion to ground new forms of historical fiction.

Galt arrived in Upper Canada in 1826 to supervise development of the Huron Tract, a million acres of largely uninhabited, previously unsurveyed land adjoining Lake Huron. He founded the towns of Guelph and Goderich – experiences he fictionalised once back in Britain. Munro claims lineal and literary descent from Scottish Romanticism. Her ancestors migrated to Upper Canada from Scotland in 1818 and, beginning in the 1840s, homesteaded on the Huron Tract. Munro grew up (and still lives) near Goderich.

In describing the same region, Galt and Munro frame it very differently. Galt's *Bogle Corbet* moves to Canada in a doomed attempt to escape politics and history: from the political unrest of the Jamaica plantations, the social transformations accompanying Scotland's Industrial Revolution, the failure of Jacobin politics. Yet these traumas continue to haunt the new colony. Munro's Ontario, in turn, is haunted by its own nineteenth-century settlement history, the legacy of colonists like Galt. *Bogle Corbet* at once allegorises Galt's own involvement with imperial political economy, and develops a far-reaching model of imperial exchange, consciousness and guilt; it both recapitulates and complicates Galt's earlier novelistic annals of Scottish life. Munro's interest is less in imperial morality than in colonial self-understanding and epistemology, as they shape contemporary life and potentially complicate nationalist or postcolonial notions of cultural reclamation.

Galt and Munro's accounts are overlapping yet asymmetrical. This asymmetry is reflected in the structure of this comparative chapter, which begins by detailing Galt's activities as a 'coloniser' in Upper Canada, highlighting the complexity of his historical circumstances, motivations and relationship to British and colonial authority. If Galt's administrative work in Upper Canada might exemplify a distinctive Scottish colonial idealism, his setbacks and disappointments discernibly shaped *Bogle Corbet* as an anti-imperial novel. The chapter then develops a rather different framework for Munro's fiction, and reads against the literary politics of Canadian nationalism (itself consciously reorienting a long Scottish-Canadian literary tradition). Yet Munro also adapts and refashions the Galtian novel of place, implicitly rejoicing Galt's inquiry into the relationship between history and neurosis, time and place, empire and nation.

Long before he became an official colonist or colonial chronicler, Galt had, as a political commentator and lobbyist, followed – and, from London, interceded in – Canadian affairs, publishing a 1807 'Statistical Account of Upper Canada' and, during the 1820s, repeatedly petitioning Parliament on behalf of Upper Canada claimants loyal to the Crown throughout the colony's 1812 American invasion and suffering damages from the invading American army. In 1825, Galt gained the lasting gratitude of Mohawk chief John Brant by securing parliamentary approval for a land claim by the Six Nations Indians, recognising their 1812 allegiance to Britain (Timothy 1977: 97). Yet other Loyalists, despite Galt's efforts, remained unrecompensed. During the colony's initial British settlement, two-sevenths of Upper Canada's land became vast 'crown and clergy reserves', set aside for public works and Protestant church use. Galt unsuccessfully proposed that the colony compensate loyalists by selling reserve land. Later, he spear-headed a move by London investors to create the Canada Company, a joint stock company, incorporated by Parliament in 1826, to buy up Upper Canada reserve lands for development and resale to emigrants.

Appointed as the Company's first Canadian superintendent, Galt sailed for North America, inspected pre-existing settlements in upstate New York, then began developing the Huron Tract: surveying, laying connective roads, building schools, receiving settlers. On St George's Day, 1827, Galt joined his woodsmen in the rainy bush, and with a ceremonial axe-stroke began tree-felling and bush clearance, founding Guelph as a new company town, sixty miles west of present-day Toronto. His report to London treats the date as happy coincidence, yet later autobiographical writings underscore his conscious choice of date – and the name Guelph, honouring Britain's royal family – to create origin myths (Stelter 1985). Soon after, on the shore of Lake Huron, Galt established Goderich, named for Fredrick Robinson, Viscount Goderich, the Canada Company's most influential parliamentary champion. Today Goderich is a small town of 8,000 while Guelph, currently a university town of over 100,000, retains many of its original limestone buildings, and a statue of Galt in front of City Hall.

On 4 August 2008, Guelph celebrated its first annual John Galt Day. But before dawn, anarchists splashed red paint on Galt's statue, an action memorialised on several anarchist websites. As one explains, the Canada Company settlement took place

at the expense of indigenous populations. John Galt was actively engaged in that process and helped lay the foundation for genocide of unimaginable proportions. John Galt's own words foretold the horrific consequences of the Canada Companies [sic] agenda of genocide on the day he ceremonially felled the first tree in the founding of the city of Guelph. He wrote that 'the tree fell with a crash of accumulating thunder, as if ancient nature were alarmed at the entrance of social man into her innocent solitudes with his sorrows, his follies and his crimes' (the *Autobiography of John Galt*, pp. 58–9). To celebrate John Galt is to celebrate the foundation of colonization and genocide among other follies and crimes of European men. ('Anarchists' 2008)

Such rhetoric positions Galt as a genocidal conqueror, a Canadian Christopher Columbus. Galt indeed supported land development in Upper Canada, envisioning a colony where Scottish and British emigrants could regain self-sufficiency. Yet he was also an early champion of indigenous land claims and government transparency.

As the tree-felling passage from his *Autobiography* suggests, Galt was no naïve memoirist, needing postcolonial reading-against-the-grain to explicate unconscious subtexts of colonial guilt. His novelistic corpus, likewise, is consistently, overtly concerned with imperialism's historical meaning and psychic consequences. In Upper Canada, amid the practical work of planning, surveying and building, Galt informed his London publisher that he envisioned a novel or series set in Upper Canada, tentatively titled *The Settlers, or Tales of Guelph* (Waterston 1977a: 2). As actually written, *Bogle Corbet* became Galt's most explicit, sustained meditation on the British imperial project; its final volume chronicles the founding of an ill-fated Upper Canada settlement.

Galt's own stay in Upper Canada ended abruptly and badly. From the outset, the Family Compact (the colony's nepotistic, wealthy, reactionary oligarchy) viewed him with enmity. Determined to extirpate republican politics, the Compact repeatedly persecuted radicals like William Lyon Mackenzie (later to foment the 1837 Upper Canada Rebellion); resolved to establish Anglican primacy in the colony, this Anglican elite not only ignored Presbyterian and Methodist claims but also falsified census data about the colonists' religious make-up. Galt, in contrast, advocated religious tolerance and actively recruited Catholic settlers; Upper Canada's reformers and radicals publicly (although sometimes without his approval) claimed him as an ally.

In 1827, Galt faced an acute humanitarian crisis, when 135 indigent Scottish settlers, fleeing a failed colony in Caracas, unexpectedly arrived at the Huron Tract, sent on from Philadelphia by the British Consul. The Tract was always envisioned as a commercial venture, designed for emigrants with means to purchase their own land. The 'La Guayrans' refugees (half of them children), in contrast, arrived penniless, yet in urgent need of food, shelter and medicine, which Galt supplied using money owed to the government. Already critical of Galt's political involvement, the Compact now charged him with usurping government functions – and denounced him to Canada Company shareholders in London. The Company, in turn, urged Galt to mollify the Compact, spend less time and money developing colonial infrastructure, eliminate charitable spending and sell more land; in their view, Galt's ambitions, social vision and poor book-keeping threatened the Company's viability.

Galt was recalled to London in 1829, fired by the Company and landed in debtors' prison. He never returned to North America (Timothy 1977; Nash-Graham 1984; Lee 2004). Yet he retained direct and indirect involvement with Canada, in 1834 co-founding the British American Land Company, and sending his three sons to settle in Canada. All three became influential figures, one as Huron County registrar, another as Ontario Chief Justice, and the youngest, Sir Alexander Tilloch Galt, as secretary and commissioner of the British American Land Company, Upper Canada parliamentarian, Inspector-General of Canada and Canada's first federal Finance Minister. He remains best remembered as a Father of Confederation, who lobbied for Canada's 1867 constitution, then for its enshrinement of minority religious rights (Timothy 1977; Skelton 1966).

John Galt, in contrast, is not usually remembered as a Father of Canadian Literature. Yet from his London debtors' prison, he drafted two contrasting novels about Scottish emigration to North America. Both the chipper narrator of Galt's best-selling *Lawrie Todd, or The Settlers in the Wood* (1830) and *Bogle Corbet*'s depressive narrator lead emigrant parties from the West of Scotland. Lawrie Todd founds a successful settlement in upstate New York. Once Corbet's party arrive in Upper Canada, most reject his oligarchic leadership, while he disowns them.

Together, these novels represent a paradoxical coda to Galt's collectively titled 'Tales of the West'. Overlapping temporally with Scott's Waverley Novels, anticipating novel cycles by John and Michael Banim, Honoré de Balzac, Anthony Trollope, Benito Pérez Galdos and Émile Zola, Galt's novel sequence measures the depth and breadth of regional history, describing crucial historical developments from various sociological, temporal and geopolitical perspectives (Trumpener 2005, 2007; Duncan 2007). Galt's early novels repeatedly experimented with annalistic structure, as an alternative to Scott's epic history. *Annals of the Parish* (1821) and *The Provost* (1822) describe Scotland's economic and political modernisation from the contrasting vantage points of a sentimental small-town clergyman and a Machiavellian small-town political operator. *Annals* suggests the accretion of a single place over time; *The Provost* tracks the emptying out of place and tradition.

Each of Scott's Waverley Novels describes a crisis or turning point in Scottish history. Yet cumulatively they evoke a deep, rich, unbroken national history. 'Tales of the West' has the opposite effect. Its novels describe key events and developments from various interested perspectives, determined by occupation, class and political ideology. Cumulatively, the series creates a multi-faceted mosaic. A sense of sentimental recuperation permeates some novels. Yet others convey a pessimistic or depressive sense of gloom,

tragedy and social dissolution. The sequence should act accretively, conveying a detailed, historically ramified sense of place. Instead, it questions Scotland's place – and future – in the world. For the 'Tales' position Scotland simultaneously as an early casualty and economic node of Britain's nascent empire. *The Entail* (1820) presents Scotland's Union with Britain – and nineteenth-century Scottish fears of cultural, political and economic disenfranchisement – as consequences of Scotland's disastrous attempt to establish its own Central American colony. Its supply lines sabotaged by the English, the Darien colony rapidly collapsed, precipitating the collapse of the Scottish economy – and, in Galt's eyes, the Act of Union. Scotland's bid to become an imperial power paradoxically reduced it to a *de facto* colony.

Yet in many more indirect ways, too, Scottish cultural tradition becomes subordinated to a new imperial logic. *The Provost* describes Scotland's economic and political modernisation process, and its widespread disenfranchisements, as by-products of local power-grabs by emerging mercantile oligarchs. *The Last of the Lairds* (1826) shows agents of empire inaugurating parallel changes; a Scottish 'nabob', returning from India with an ill-gotten colonial fortune, gradually displaces an enfeebled local aristocracy, awakening local nostalgia for more traditional stewardship.

In *Bogle Corbet*, most ambitiously, Scotland appears as part of a worldwide imperial-industrial circuit. Born in Jamaica into a Scottish planter's family and nursed there by a devoted slave, Corbet comes of age in Lowland textile mills, where Jacobin weavers inadvertently precipitate the industrial revolution yet fail to foment domestic revolution. Later, in London, Corbet observes corrupt old India hands capitalising the industrialisation process. In the novel's final third, he accompanies to Upper Canada a settlement party of politically disillusioned Jacobin weavers, old Lowland acquaintances.

As it nears the North American continent, the emigrants' ship encounters a vast iceberg. At least at first sight, its frozen sublimity emblematises Canada's chilly, unfathomable, pristine vastness. Within the imperial system Galt's novel sketches, Canada initially represents a place of new beginnings and utopian renewal, proffering refuge for political dissidents, those sickened by the taint of mills and money. Yet only hours later, the passengers shudder as their ship passes Anticosta Island, where it almost founders, amid the 'roaring tempest' (Waterston 1977b: 26). In 1828, real-life mariners shipwrecked on Anticosta Island had been forced into cannibalism, as newspapers reported worldwide. Now, in a novel whose protagonist originates in Jamaica and ends in Upper Canada, the spectre of cannibalism (and the Shakespearean conjunction of 'tempest' / shipwreck) suggests subterranean links between present-day settlement in Britain's latest Canadian colony and Christopher Columbus's much earlier voyages of conquest. Columbus's first log, describing his discovery of the Caribbean, famously emphasises its Edenic qualities. Yet logs of his subsequent voyages show cannibalism fears rapidly tainting the party's interactions with indigenes – and precipitating pre-emptive genocide.

Galt's settlers shed no blood and only once glimpse Indians, salmon-fishers grouped in tableau. None the less, *Bogle Corbet* echoes the template of cultural encounter that Columbus established and Shakespeare allegorised. Veterans of empire and revolutionary upheaval come to Upper Canada to be made whole, to start again. Yet they carry with them repressed traumas, blighted dreams, deep moral exhaustion. Already at their approach, the landscape mirrors back their own suppressed violence. At first sighting, the iceberg embodies stasis. Yet it threatens to overwhelm the ship as it approaches, appearing like a 'whole dreadful continent' before violently sundering 'with undescribable crashing' (22); even in its fragments, it remains menacing, until the vessel slips into

the safety of the seaway. Still shaken, Corbet finds the accompanying change in water colour ‘portentous’, probably ‘a consequence of some great internal turbulence’ (23).

Corbet’s own inner turbulence, buried fears of insurrection, and insistence on re-establishing class ‘distinction’ (77) will dog Upper Canada’s newest settlement. As old acquaintances and old radicals, the settlers refuse to bend to Corbet’s will. Some, seduced by the idea of representative government, pre-emptively stage what Corbet terms ‘a mutiny’ (58), forsaking the British colony for the American republic. Others stay in Upper Canada, yet retain inconvenient political hopes. Before leaving Scotland, the settlers determined to build a village and live ‘in community’ (66). Now, clearing the bush, many begin to believe that their labours entitle them to their own farms. Corbet, they insist, has no moral right to dispose of communal property, for ‘this wild country was ta’en from the Indians, who have the best right to the land, if anyone has a right’ (73). From their Jacobin perspective, Corbet’s authority has little foundation; in North America, private property is built on expropriation.

As a colonial administrator, Galt took responsibility for the ‘La Guayrans’, fleeing one failed settlement, continent, empire for another. In Nova Scotia, contemporary satirists Thomas McCulloch and Thomas Chandler Haliburton evoked the spectre of Scottish emigrants circulating among colonies, restless and increasingly rootless wanderers. Early nineteenth-century Scottish commentaries like John Leyden’s ‘Scenes of Infancy. Descriptive of Teviotdale’ (1803) and late twentieth-century Scottish-Canadian novels like Margaret Laurence’s *The Diviners* (1974) and Alistair MacLeod’s *No Great Mischief* (1999), repeatedly linked such circulation to indigenous disenfranchisement; in an imperial domino effect, Highland disasters and clearances led directly, causally, to the displacements and genocides of Canada’s First Nations (Trumpener 1997).

*Bogle Corbet* explores a related but finally different problem. As a colonial administrator, John Galt battled local oligarchs. None the less, *Bogle Corbet* persistently conflates colonial administrator with oligarch. In the bush, the settlement leader becomes the *de facto* government, forcing other settlers to conform or flee. Yet even as Corbet grumbles about ‘malcontents’, battles their attempts at self-sufficiency, and triumphs at their subordination, he also falls into paralysing ‘depression’ (79), having ruined not only their old dreams of sovereign equality but also his own. Like many Galt novels, *Bogle Corbet* turns on its narrator’s self-interest, self-delusion, bad faith and false consciousness. In Scots, ‘bogle’ means both bogeyman and scarecrow. A child – and increasingly a tool – of empire, Bogle Corbet becomes a hollow man, malign yet haunted. Canada can bring no new beginning, only an ill-fated transposition of imperial inequity, guilt and violence into yet another place. Galt’s novelistic œuvre explores the complex geopolitical layering of colonial and historical experience. As *Bogle Corbet* demonstrates, the contradictions of colonial experience necessitate mechanisms for historical amnesia – and authorise a guilt-stricken, hence paranoid reading of colonial landscapes. Yet Galt is interested less in Canada’s history of indigenous dispossession – or indeed in any facet of its prior history – than its ability to serve as a staging ground and social laboratory for the moral problems generated by empire as a whole.

In the 1820s and 1830s, McCulloch and Haliburton worried over Nova Scotia’s mercantile links to the Caribbean and slavery, and its proximity to American industrial capitalism (envisioned by Haliburton as a genocidal abattoir for wage-labourers and poor Irish immigrants). The first volume of *Bogle Corbet* makes similar links – between Jamaica and Scotland, between slavery and industrialisation. Yet Upper Canada is important to Galt not as an economic link in the imperial or capitalist economy but as a

*tabula rasa*, an isolated, empty stage on which settlers imported from older parts of the empire can play out now-ingrained, imperially tainted social dynamics.

*Bogle Corbet* diagrams imperial alienation in psycho-dynamic terms that anticipate Joseph Conrad, Jean-Paul Sartre, Frantz Fanon and George Lamming's 1954 novel *The Emigrants*. What it does not and cannot provide, consequently, is a history of Canada itself. Galt's 'Tales of the West' provides a cumulative, complex account of Scotland's history in the context of empire. *Bogle Corbet* is a covert historical novel, yet any sense of ongoing history dissipates once protagonists (and readers) reach the St Lawrence. In Upper Canada, history only repeats itself, in symbolic re-enactment of battles fought elsewhere – in and about the British Empire. Overdetermined, overshadowed by this prior history, the colony cannot develop an autochthonous, let alone annalistic history.

Latter-day Canadian nationalists had difficulty reconciling Galt's vision of Canada with their own agendas. The 1960s' and 1970s' surge in Canadian cultural nationalism was accompanied by a literary boom characterised by a resurgence of historical fiction, using narrative templates pioneered by Scott (and popular with nineteenth-century Canadian novelists and readers), now often placed in more experimental modes. Leonard Cohen, Margaret Atwood, Michael Ondaatje, Anne Hébert, Margaret Laurence, James Reaney, Marian Engel, Timothy Findley and Antonine Maillet reanimated colonial literary sources, questioning the adequacy of transmitted documents or the colonial archives to capture the full range of Canadian historical experience.

Meanwhile, Canadian scholars began rediscovering colonial literary history, republishing key nineteenth-century literary works (Lecker 1992). McClelland & Stewart's New Canadian Library virtually created a new Canadian canon and teaching canon. Yet its 1977 paperback reissue of *Bogle Corbet* (as Volume 135 in the New Canadian Library) involved severe abridgment. The 1831 London original had encompassed three volumes; McClelland & Stewart's reprint consisted solely of the third volume (beginning, with little preparation, *in medias res*). The nationalist mandate of the New Canadian Library (as of McClelland & Stewart, 'the Canadian publishers') apparently made such truncation acceptable. Ignoring the original's preoccupation with Canada's connection to other imperial sites (Jamaica, Scotland, India), the New Canadian Library produced a *Bogle Corbet* concerned solely with Canadian experience, yet in the process rendered almost incomprehensible – and largely failing to find new readers (Trumpener 1997). *Bogle's* latter-day 'editor', University of Guelph English professor Elizabeth Waterston, subsequently celebrated Galt's *Annals* as formative for Canadian writing (1985b) – and discounted *Bogle* as a 'sour novel' (2003: 97).

During the Romantic period, Scottish writers attempted to impart literary fullness to places, languages and cultures not fully comprehensible or comprehended in English letters' prior history. Yet the nineteenth-century Scottish reading public thought of Canada as a place to which relatives, and sometimes whole local communities, had departed, never to return. It was hence a place of fantasy and projection, but above all loss. Like Scottish literary nationalism before it, mid-twentieth-century Canadian literary nationalism came to understand itself as counter-acting a long history of trivialising or elegiac representations. Canada was presented as neither a void nor a distant tomb but the place of real life, worthy of literary attention. Canadian literary nationalism thus unconsciously mimicked Scottish literary strategies of self-assertion even as it challenged British – and Scottish – views of Canada. Laurence's *The Diviners* (1974), for instance, argued for a new Canadian social contract by evoking traumatic memories of the Highland Clearances; read postcolonially, however, Laurence's narrative offers a

utopian vision of Britain's dispossessed Scots grasping their structural analogies to – and hence literally embracing – Canada's dispossessed Native and Métis population.

Laurence's plot of female self-emancipation drew heavily on Munro's 1971 breakthrough novel, *Lives of Girls and Women*, a subtler interrogation and integration of Scottish models. In the early nineteenth century, Munro's family, the Laidlaws, emigrated to Upper Canada; while back in Scotland, two Laidlaw relatives assumed key roles in Romantic literary culture. Their cousin James Hogg, illiterate until the age of 40, spent his early life as a shepherd and his later life as an unconventional literary lion, championed (and patronised) by Walter Scott, publishing poetry and fascinatingly unorthodox novels, and participating in the circle around *Blackwood's Edinburgh Magazine*. In 1820, when one émigré Laidlaw sent a letter from Upper Canada, urging Scottish relatives to join them, Hogg printed it in *Blackwood's*, with a letter of his own (Thacker 2005: 15). Hogg's mother, Margaret Laidlaw, steeped in oral tradition, became a key source for Scott's revision of *Minstrelsy of the Scottish Border*, although famously upbraiding Scott for publishing – and hence ruining – works “made for singin' and no for prentin” (Hogg 1999b: 38).

Only in middle age did Munro discover her own genealogical links to Hogg and his mother. By then, Munro and, in her wake, her father Robert Laidlaw had already published fiction based on oral family sources. Written with Munro's encouragement and published posthumously in 1979, Laidlaw's historical novel, *The McGregors: A Novel of an Ontario Pioneer Family*, drew on Laidlaw family stories of homesteading in the Huron Tract. Eight years earlier, *Lives of Girls and Women* had positioned itself as a historical novel of the recent past.

In a series of short stories linking into a first-person *Bildungsroman*, *Lives'* narrator, Del Jordan, describes her girlhood in the small Ontario town of Jubilee. During the 1970s and 1980s, Canadian literary historians pointed to *Lives* (as to short story cycles by Duncan Campbell Scott, Stephen Leacock, Mordecai Richler, Laurence and Gallant) to argue the linked short story sequence as a quintessential Canadian or indigenous post-colonial form. W. H. New (1987) offered a more complex formulation, suggesting that the modern story cycle both extended and departed from nineteenth-century colonial ‘sketches’.

Yet Romantic-era Scottish experiments with narrative scale suggest alternative precedents; tale sequences, the annalistic novel and the novel sequence offer varying ways to slice and recombine time. *Lives of Girls and Women* not only develops a self-consciously idiosyncratic variation of the Galtian annalistic novel, but also repeatedly meditates on the historiographic problems in representing a community's history. On one level, Munro's novel explores ever further reaches of the Joycean concentric world Del imagines, as a girl, stretching from ‘The Flats Road, Jubilee, Wawanash County, Ontario’ to ‘The Solar System, The Universe’ (Munro 1983: 9). On another level, the novel memorialises a series of neighbours, relatives, friends and lovers whose idiosyncrasies and life philosophies consecutively, cumulatively shape Del's consciousness, while reconstructing a sequence of discrete historical micro-periods – the Depression, World War II, the 1950s – experienced from the perspective of the provinces, ostensibly removed from world-historical events. In the temporal gaps between chapters, as in the new vantage point each chapter introduces, the novel underscores the limitations of its own pretensions to historical coverage.

Del spends her early childhood on the Flats Road, a semi-rural no-man's-land between the bush and Jubilee. Uncle Benny, Del's semi-literate neighbour, embodies that liminality.

His intimate, semi-intuitive relationship to the wilderness is offset by his inability to use a map, surmount his chaotic personal life or envision a larger social order. Del's own relationship to the world veers uneasily between a pitying sympathy with Uncle Benny's plight, anxiety about her own semi-pariah status (her critical mind trapped in an embarrassingly female body), and a precarious sense of intellectual entitlement (particularly once her autodidactic mother moves into Jubilee and sells encyclopedias).

*Lives'* ethical and aesthetic crux is the problem of giving literary voice to those unable to describe themselves. Munro advocates a Galtian immersion in regional history; Del remains sceptical. A key story/chapter, 'Heirs of the Living Body', describes the obsessive attempt of Del's great-uncle Craig, former township clerk, to compile retrospective annals of the parish, the authoritative early history of the county. To Del's irreverent young eyes, the project is dogged by his completism and unreflexive sense of history.

I wanted to hear about how Jenkin's Bend was named, after a young man killed by a falling tree just a little way up the road; he had been in this country less than a month. Uncle Craig's grandfather ... had given the young man's name to it, for what else would such a young man, a bachelor, have to be remembered by?

'Where was he killed?'

'Up the road, not a quarter of a mile.'

'Can I go see where?'

'There's nothing marked. That's not the sort of thing they put a marker up for.'

Uncle Craig looked at me with disapproval; he was not moved to curiosity. He often thought me flighty and stupid and I did not care much; there was something large and impersonal about his judgment that left me free. (Munro 1983: 25)

Absorbed in, made impersonal by, his mandate to chronicle, Uncle Craig leaves all domestic drudgery and familial upkeep to his sisters. In his household, male and female spheres of experience rarely overlap. Men focus on a wide historical view; women, relegated to current burdens and pleasures, treat male privilege with mocking deference. Yet when her great-uncle dies, Del inherits his uncompleted magnum opus, with the expectation that she will finish it. Unwilling to subordinate her writerly energies to his vision of history, she stows it under her bed, then in the basement, where damp renders it illegible, unsalvageable.

If this sodden manuscript fuels inchoate guilt, the novel we hold – the novel Del grows up to write for us – offers an expanded settlement history on the traces Uncle Craig laid out, foregrounding not the political and economic history made by Jubilee's men but the private lives of women and other insignificants (Godard 1984). Uncle Craig's grandfather named a town for a man killed by a tree; Uncle Craig finds the man, even his place of death, unworthy of a marker. In nineteenth-century Huron Township, one of Munro's family was killed by a falling tree; Munro's works repeatedly rework this elusive episode, paradigmatic for problems of commemoration and reconstruction (Carrington 1996; Gittings 1997). History, she insists, happens everywhere and to everyone, whether or not their lives are deemed worthy of record. *Lives* undertakes a compassionate, collective, compensatory chronicle, in the tradition of Thomas Gray's 1751 'Elegy Written in a Country Churchyard', recording the 'short and simple annals of the poor', or of Galt's *Annals*, working to comprehend the logic, desperation and dignity of provincial lives.

As an implicit *Künstlerroman*, moreover, *Lives* explores the ways a flat, uninflected, unrecorded, apparently inconsequential place not only produces but also necessitates

literature. Munro greatly admired James Agee's 1941 *Now Let Us Praise Famous Men* (Sheila Munro 2001: 38), famously obsessed by the ethics of description. *Lives* too underscores how class, education, gender and generation implicitly divide the novelist from her subjects and the shame, self-consciousness and uncertainty this gap engenders. The act of writing, none the less, is ethically imperative. Even if its subjects do not welcome description, they have an inalienable right to be described. They may harbour a deep-rooted suspicion of map-making, even literacy itself. Yet fiction's cosmologies counteract their sense of unmooring in the universe.

Del's early taste is Gothic – and *Lives* itself is conceived in terms drawn partly from Southern Gothic (William Faulkner, Flannery O'Connor, Eudora Welty, Carson McCullers, Harper Lee), as from historical novels (*War and Peace*, Sigrid Undset's *Kristin Lavransdatter*, *Gone with the Wind*). Yet Munro's sense of novelistic form and temporality is also inflected by the experimental fictional forms of Scottish Romanticism, Scottish novelists' attempts to reanimate Scottish Enlightenment obsessions with stadialist history, to correlate geological, cultural and historical time scales. In *Lives* and subsequent short-story novel *Who Do You Think You Are? (The Beggar Maid*, 1978), Munro foregrounds the inherent novelistic tension between thick description, evoking particular moments or junctures, and the arc of narrative development. In Munro's narratives of girlhood development, each phase is important, concrete, yet takes on final meaning in retrospect and memory, after yielding to a subsequent dispensation.

Galt's 'Tales of the West' return repeatedly, obsessively, to the same region of Scotland, examined from different historical and sociological vantage points – including, finally, an imperial perspective which saw it as only one of many interdependent places. Munro's œuvre attempts a similarly comprehensive, multi-faceted survey. Like Galt, she has simultaneously immersed herself in local history (studying diaries, chronicles and newspapers) and tried to pull away from local perspectives, placing her locale in a much larger cosmology.

Munro's 1994 short-story collection *Open Secrets* involves perspectival experiments, exploring Ontario's history in annalistic layers. A key story, 'A Wilderness Station', recapitulates this project by assembling the history of one locale across successive eras. Such collation involves significant overlaps of character and collective memory, but also highlights lacunae, a drift towards forgetfulness. The story's early sections detail a widely noted tragedy, from the settlement's first epoch: a man's death – or murder – beneath a falling tree. Yet by the story's epilogue, decades later, the episode is incompletely remembered, half-legendary, the initial protagonist recalled as an eccentric bit-player. With its telescoping, collapsing and overlapping temporal slices, 'A Wilderness Station' demonstrates the layering of the past, the triumphs and failures of historical reconstruction; a human story struggles to re-emerge from distance and document, then becomes obscure again.

Other works foreground the relationship between Munro's mode of historical fiction and early nineteenth-century Scottish experimental novels, including those of Hogg. *Friend of My Youth* (1990) chronicles Munro's personal pilgrimage back to Scotland, in search of such antecedents; *The View from Castle Rock*, a speculative, fictionalised family memoir, episodically follows Munro's emigrating Laidlaw ancestors in the other direction, from Scotland to Canada, pondering the accidents which established Munro's eventual line of descent, the nature of family memory.

Such meditations are deepened in *View's* final story, 'What Do You Want to Know For?', whose narrator evokes years of drives across southern Ontario with her

geologist husband. Nominally quests for geological formations, and hence navigated with special physiographic maps (showing deep formations, alongside rivers, towns and township boundaries), these repeated journeys change the travellers' sense of their home's location, shifting and deepening their grasp of proximate places. The story ponders the land and (as the couple search for, then investigate a country churchyard) the human record, with echoes of Gray's 'Churchyard', Galt's *Annals* and Scott's 1816 *Old Mortality*.

Romantic-era British naturalists developed a new sense of 'locale', a symbiotic biotope fostering specific plants and animals. By analogue, Martha Bohrer argues, British intellectuals use locale to comprehend social ecology; George Crabbe's *The Borough* (1810), Mary Mitford's *Our Village* (1824–32) and Galt's *Annals* thus understand town, parish and village as human biotopes, microcosms (Bohrer 2003, 2007). Munro's story reunites these senses of locale, reconciling the scales of human and geological history.

The landscape here is a record of ancient events. It was formed by the advancing, stationary, and retreating ice. The ice has staged its conquests and retreats here several times, withdrawing for the last time about fifteen thousand years ago. (Munro 2006: 318)

The process of geological formation separates adjacent pieces of landscape. Like history, geology involves uneven development, creates particular figure-ground relationships.

Kame moraines show where a heap of dead ice sat, cut off from the rest of the moving glacier, earth-stuff pouring through all its holes and crevices. Or sometimes it shows where two lobes of ice pulled apart, and the crevice filled in ... wild and bumpy, unpredictable, with a look of chance and secrets. (Munro 2006: 321)

In the eighteenth century, from Europe's distance, Voltaire dismissed New France as a few leagues of ice: 'quelques arpents de glace en Canada'. In the late twentieth century, indigenous literati worked to effect Canada's literary reclamation, reassembling a New Canadian Library. For many years, Munro has been one of the three-member advisory board of the New Canadian Library, functioning literally as a keeper of the Canadian canon. *Lives of Girls and Women*, too, participated in the project of nationalist retrieval. Yet, as this chapter's comparative and historical character has demonstrated, Munro's recent fiction pushes beyond a nationalist sense of Canadian terrain to think about deep formation in local and transatlantic terms.

Bogle Corbet sailed for Canada searching for the end of history, an escape from historical and economic pressures, the plantation system, the industrial revolution. Yet he carries that local/world history with him, re-enacts it in the New World, and ends his story sunk into himself. At the dark heart of Joseph Conrad's Congo is the horror of an inhuman colonial trade in commodities and lives. At the icy heart of Corbet's Canada is a white void, reflecting back the moral hollowness of imperial, industrial Europe.

The anarchists who paint-bombed Galt's statue targeted the wrong man. Yet *Bogle Corbet* does encapsulate both the project of colonial literature and its necessary failure. The novel is intermittently attentive to natural landscapes, how weather, climate and countryside shape world-view. Yet where Galt's West of Scotland is annalistically layered and socially complex, ascertainable only through a multiplicity of vantage-points and temporal scales, Galt's Upper Canada functions primarily as an allegorical mirror, emblematising settlers' inability to leave their pasts behind, their failure to arrive.

Traversing the same geographical and literary ground, almost 200 years later, Munro finds an accreted, rich, half-buried record of human life, the annalistic micro-histories of the parish dwarfed only by the accreted, epoch-spanning natural-historical record. In their different ways, Galt and Munro each carve annals of ice. Yet their relationship remains oblique. And despite repeated calls to read them side by side (Craig 1981; Gittings 1995), so does the larger relationship between colonial and postcolonial literature. Meanwhile, the once provocative notion that postcolonial writers literally rewrite or unwrite colonial narratives has proved applicable mainly to a few famous, fiercely corrective alternative versions (Jean Rhys's 1966 *Wide Sargasso Sea*; Margaret Atwood's 1970 *Journals of Susanna Moodie*; J. M. Coetzee's 1986 *Foe*) now so over-taught that they appear calculating, as if designed to secure hyper-canonical status for themselves.

This chapter has modelled a different approach. Both colonial and postcolonial writing, it suggests, reach their greatest profundity not where they refunction specific metropolitan stories but when they understand their particular places as echo chambers or palimpsests, channelling a host of histories, narrative traditions and possible social forms. The relationship between metropolitan, colonial and postcolonial literature may not represent a direct line of descent or filiation – nor even rebuttal. Galt and Munro do think about place in relationship to models that earlier texts provide – but their interest is in utilising these texts' still-unrealised formal, linguistic, political and philosophical possibilities. In Galt's case, moreover, the 'coloniser' is simultaneously a withering critic of empire. Galt depicts Canada as empty. Yet this betokens not an annihilating colonial gaze so much as a symptomatic reading of imperial fatigue. Munro, in turn, grapples not with Galt's content but with his formal innovations, not with his ignorance, pre-emptory dismissal or suppression of Canadian history, but with the myriad possibilities his novels open up – for local history, a corrective, complex historiography, new forms of fictional meditation.

# CHAPTER 1

## Introduction *In the Body of the Text*

*Julie Rivkin and Michael Ryan*

The body is making a come-back. For decades, it was neglected in favor of ideology, culture, history, politics, discourse, and representation. One could see trouble ahead for these big concepts already in the 1980s, however, when Judith Butler theorized that gender was performance but immediately had to backtrack and announce that bodies mattered too. There were not enough critical or theoretical tools around in the 1980s to assist those who felt inclined to ask, if everything is constructed, what constructs construction? Where does it come from? A vague idea of “the body” offered itself, but not much came of the persnickety query.

In the 1990s and into the next century, more tools began to make themselves available, from affect theory, to evolutionary psychology, to the theory of embodied consciousness, and the body was well launched as a topic of critical conversation. The commitment on the part of theorists to cultural construction began to weaken as it became clear that the architecture of thought that allowed one to think that the body might be constructed might itself be shaped by bodily experience, that our minds function in ways that can only be explained as evolutionary adaptations grounded in biology, and that we do more than think during the course of each day. We also feel. And literature is very much about such feelings.

Let's begin with cognition. George Lakoff and Mark Johnson argued in their 1980 book, *Metaphors We Live By*, that much of our thinking is shaped by image schemas derived from our bodily experience. We go up and down in life, or we move ahead in our careers, while backing off from difficult situations. Lakoff and Johnson contended that the operations of the mind are determined by the location and orientation of the body, from up/down to in/out to forward/back. Derrida had noticed a similar tendency in philosophy to think in spatial categories – center/margin, for example. But Lakoff and Johnson argued that this tendency was inherent to all thinking because our minds are embodied. Thought is captive to its physical location and thinking is inherently spatial. We form concepts using basic image schema that are bodily in nature. Our moral and aesthetic measures and values are spatially grounded and graphed. We think of someone “highly” or consider something a “low” activity.

It is fairly easy to find examples from literature of these basic image schemes. Virginia Woolf builds *Mrs. Dalloway* around the two very different characters of Clarissa Dalloway and Septimus Smith, each of whom is linked to a particular spatial movement,

one up and one down. “What a lark! What a plunge!” Clarissa thinks now and then, mapping the novel’s dual existential and emotional trajectories. Clarissa is overly sane and proper and follows conventions, while Septimus verges on mental collapse and imagines all sorts of odd things that nevertheless are true measures of the world around him. Clarissa thinks about how best to negotiate a variety of social encounters that require deft adjustments in tone and self-presentation, all the time maintaining control over one’s emotions, while Septimus is the victim of involuntary fantasies that ultimately drive him to suicide. Clarissa’s passage through an ordinary day is figured as flight (“What a lark!”) while Septimus experiences it as a fall (“What a plunge!”), and he literally plunges to his death at the end. It is a novel with many facets, but one major one is its embodied cognitive dimension that characterizes everyday life as a pitched battle, graphed spatially as movements up or down, between involuntary emotional experiences and the control we exercise over them in order to maintain our social identities. Cognitive criticism emerged in the early 1990s in the work of Mark Turner, whose *Reading Minds* (1991) argued for attending to cognitive semantics (rather than the Chomskian concern with syntax) and for locating cognition within evolutionary biology. We know in order to survive. Our minds are able to transfer lessons from one environment into another using cognitive schema such as metaphor and metonymy. All of our concepts can be understood as emerging from the basic schemas our bodily experience provides us, and they have shapes similar to those found in rhetoric – especially metaphor. Later theorists in this critical tradition such as Patrick Hogan argue that because cognition is a universal human capacity, literature will manifest shared or common features that can be called universals. Those include the forms of “verbal art” such as assonance, symbolism, genres, and the like. David Herman studies the cognitive tools readers bring to the reading of narrative such as frames, schema, and scripts that allow sense to be made of a temporally unfolding story and sense to be made of fictional events through a matching with stored information about narrativity. Other cognitive theorists such as F. Elizabeth Hart use cognitive science to correct perceived flaws in post-structuralist accounts of literature by emphasizing the rootedness of language in the brain and of the brain in the body while making connections between the small-scale operations of language in texts with the large-scale concerns of history and ideology that preoccupy post-structuralist critics.

Cognitive literary criticism can also focus on readers and audiences, as in Ellen Spolsky’s examination of how art helps to overcome the inherent “gappiness” of knowledge, the way our brains function in modules that are “domain specific” (or oriented towards a specific task), or the focus can be on characters and their interaction, as in Lisa Zunshine’s study of Jane Austen’s innovative depiction of characters’ awareness of other characters’ awareness. For example, Henry James’s *The Ambassadors* hinges on the issue of faulty knowledge. Lambert Strether, sent to retrieve a young man who has been seduced by Paris (and by a *parisienne*), is unaware through much of the novel of what is going on around him in the romantic lives of his friends, while they are very much aware of his lack of awareness and orchestrate deceptions to maintain it. The reader is as duped as Strether in this fiction that depicts knowledge as situational and therefore partial, always prone to “go astray” (to evoke the name of key character – Maria Gostrey) by the angles of perspectival vision that both allow and disable it. Cognitive textual criticism often focuses on linguistics, since the rules of syntax are embedded in the brain, and our brains often follow forms or patterns that are noticeable and analyzable. These patterns can be “universal,” or they can be quite specific to a historical moment. In *Shakespeare’s*

*Brain*, for example, Mary Crane describes how Shakespeare in *Twelfth Night* uses the word “suits” (from suits of clothes to law suits to love suits) in multiple ways that resonate with issues of ideology, power, and theatricality in his culture.

The brain engages in cognitive processing, but it is also the locus of emotions. Historians have long been aware of the power of emotions in our lives. Radical rightwing political movements such as Nazism derive force from their mobilization of negative feelings against reviled adversaries. And the history of religion is a history in many instances of the struggle to regulate emotions that threaten ideals of religious sanctity or norms of ethical decorum. Emotion also always has both a class and gender dimension in that ruling men have always been able to appear more “in control” in contrast to women who are angry or distraught for reasons of social subordination, and the working class often is depicted as prone to stigmatized emotions such as envy and resentment by those further up the class ladder who can “afford” to be more moderate in their feelings and who are more prone to feelings of condescension, scorn, and derision regarding those further down the class ladder. Charles Dickens’s endorsement of the moral ideals of the commercial culture in which he lived often takes the form of distinguishing poor or working-class characters who experience ugly emotions from more refined characters who regulate such emotions and adhere to bourgeois standards of taste and moderation in regard to feelings.

Affect theory begins with the perception that affect is primary in our lives. We feel before we think. Affect became an object of study in the 1960s when Silvan Tomkins first proposed that there were biologically based affects that occurred in pairs: interest–excitement, enjoyment–joy, surprise–startle, distress–anguish, anger–rage, fear–terror, and shame–humiliation. Recent fMRI studies bear out Tomkins’s theory and find that there is a distinction between the physiological basis of emotion and its social dimension. Each emotion activates a different region or regions of the brain, and the degree of activation and its specific location changes according to the varying social character of the stimulus. But recent research also finds that Tomkins’s affects are not in fact universal; culture and geography make for other kinds of affect.

Affect theory began to enter literary studies in the 1990s and 2000s through the work of scholars such as Eve Sedgwick, Lauren Berlant, and Brian Massumi. Massumi’s contention that affect precedes cognition drew on a study that found that affective experience preceded cognitive awareness. More recent studies confirm a strong relation between the body and the way such things as fear are experienced. In one study, the rhythm of the heart as it switched from systole to diastole was linked to changes in how much fear was experienced.

Literary and cultural scholars have been actively exploring the new field of affect and emotion studies. Lauren Berlant studies the way the conservatism (or neoliberalism) that has come to dominate US public discourse over the past half century fosters a sense of optimism in working- and middle-class Americans. Yet under the economic policies sustained and fostered by that discourse, those people are less likely to thrive economically because neoliberal policies exacerbate economic inequality. Other scholars such as Ann Cvetkovich have studied the boundary between public and private feelings. Ngai Sianne describes the role of what she calls “ugly feelings” such as envy and resentment in a modern administered world of “sub” subjects. That emotion has important political ramifications is clear when Sara Ahmed explores the manipulation of hate in racist and nationalist movements.

The emergence of affect studies also is part of a larger methodological displacement occurring throughout the social and cultural sciences. One way of describing that methodological change would be to say cultural science has begun to attend to smaller scale units of analysis often characterized by a non-repetitive singularity, to complex arrays and assemblages of materials rather than to single “objects,” and to aspects of reality that lack clarity and stability and are characterized instead by indeterminacy, probability, uncertainty, potentiality, emergence, virtuality, and complexity. Fields of events in motion whose direction is unpredictable and whose likely interactions are random – reality these days looks more like an ocean than a landscape. Affect and emotion are important destabilizers of the old scholarly world of cognitive objects because they draw attention to the physiological character of our lives, to the flows of feeling that course beneath and around the cognition we use to stabilize a subject position in relation to an object world that is no longer objectified but is instead in motion in us, through us, and around us, dissolving the boundary that secured a private realm of affect from the public realm of impersonal institutions, conventions, and symbols.

Evolutionary literary criticism takes its departure from the idea that all living things change form over time in response to pressure from the environment. All organisms are endowed with an ability to adapt to changing circumstances through the generation of genetic mutations. Some mutated versions of the organism survive, reproduce, and pass on the new trait, which is retained as part of the organism’s subsequent genetic make-up. In perhaps the most significant mutation/adaptation for understanding our own species, sometime around 70 to 90 ka, our ancestors in Africa became capable of abstract mimetic cognition.

For a long time, evolutionary scientists thought the mutations in genes that gave rise to new traits were entirely random and accidental, but some geneticists now think that the ability to mutate in response to circumstances may be an evolved adaptation. Influenza, for example, has acquired an ability to generate multiple versions of itself when threatened. The virus makes copies of itself that are slightly different. Some of these mutated copies survive and thrive. Certain human characteristics such as Tay-Sachs Syndrome were initially adaptations designed to address an adverse environment. The lesson is that humans may also have evolved an ability to mutate in response to stressful circumstances. Our genetic self-protective system works by generating alternative versions to repair genes, for example, and this changes their make-up. It is possible, therefore, that some mutations may be “interpretive,” or the result of prompts from the environment that set going changes in our genetic make-up that increase the likelihood we will adapt to the new circumstances. It is possible, some geneticists now claim, that stress on humans is like stress on viruses that make the viruses mutate to survive by generating slightly different copies of themselves. Like viruses, some early humans responsively mutated to give rise to a new more powerful form of cognition a hundred thousand years ago. As a result, they survived and reproduced, and soon most, but not all, *H. sapiens* possessed the new kind of cognitive power.

The evocation of evolutionary biology in literary and cultural studies, therefore, does not require that one pledge allegiance to a determinist view of human life that renders human effort futile. Genes are builders, but they are guided in part by signals from the environment. We can therefore change how our genetic make-up evolves by changing our niche environment. A caring environment fosters gene activation conducive to more civil forms of interaction, for example, while a harsh, survivalist environment will likely activate genes better suited to competitive behavior. Those different dispositions will

then be passed on. In a sense, we can choose what version of *H. sapiens* will evolve. And that makes our debates regarding the shape of our world all the more significant.

Evolutionary theory is a powerful interpretive tool because it assumes everything in our make-up is functional. A trait would not exist if it did not aid survival in the past. That idea opens interesting possibilities for interpreting aspects of our lives that might appear meaningless, immoral, or merely embarrassing. For example, narcissism, that universal human trait, is in the light of evolution a necessary feature of our make-up. It assists survival by making self-concern a primary human motive. Lacanian psychoanalysis may therefore be off the mark in suggesting narcissism is a pathological feature of human psychological life that must be overcome if we are to achieve a mature sense of realism about life. Ordinary narcissism may be a perfectly fine feature in all of us. Without it, we might not have made it this far. Similarly, *Schadenfreude*, or pleasure in someone's else's misfortune, is likely a residue of an ancestral disposition forged at a time when early humans routinely exercised great violence against one another and needed to think of others' misfortune as beneficial. Even seemingly silly features of popular cultural life such as the Manic Pixie Dream Girl stereotype of films such as *500 Days of Summer* or television shows such as *In the Flesh* are understandable in terms of the evolved difference between men's and women's brains in regard to connectivity. Men's brains are wired back to front, emphasizing skills formed when men did the hunting and women the child-rearing, while women are wired side to side, a kind of connectivity that would allow for communicative skills needed for large amounts of time spent in a small community interacting with others. Because men dominate the production of visual culture, it is not surprising, in an evolutionary sense, that many images of women in male-run visual culture project male fantasies of an "other" completely unlike men whose "oddball" wiring might represent relief or escape from the stress-inducing monomaniacal wiring men inherit from early human task differentiation and the eugenic effects it generated. Our moral behavior can also be interpreted in light of the adaptations required by successful evolution. All humans experience pleasure when someone gets their "comeuppance," payment for having broken social rules. Our cultural stories are crowded with stories of successful payback. Why? An evolutionary critic would argue that humans, in order to live together peacefully in large organized societies, had to acquire traits that made them more likely to accept the restraints on behavior imposed by social rules. Accompanying those traits was an innate sense that the breaking of rules merited punishment. All human traits and characteristics should be understood in a similar way as the results of a long evolutionary process that allowed humans to survive on earth in challenging circumstances.

Over the past several decades, evolutionary literary theory has made significant contributions to critical discussions. Joseph Carroll, Bryan Boyd, Nancy Easterlin, and Jonathan Gottschall have all written important books. Boyd's *On the Origin of Stories* (2010) describes how story-telling emerged as a human cultural practice, and he links the development to the need for the brain, as it evolved, to learn how to imagine non-empirical or play scenarios. Carroll in *Literary Darwinism* (2004) has mapped out a useful guide for performing sociobiological critical analysis using Darwinian evolutionary theory. Easterlin's *A Biocultural Approach to Literary Theory and Interpretation* (2012) combines evolutionary, cognitive, and environmental theory in a reading of several writers such as Emily Brontë and Jean Rhys. And Gottschall's *The Rape of Troy* (2008) controversially uses Darwin's theory of sexual selection to argue that rape is a mechanism for achieving fitness or the passing on of one's genes.

When it draws on the highly controversial ideas of sociobiology such as “reproductive success” and “inclusive fitness” too uncritically, evolutionary literary theory risks committing several errors. It fails to see the historical and even the political character of nature; it mistakenly assumes there is a single universal “human nature”; and it imputes a subject (a selfish gene) to a subject-less process that works in a random, happenstance fashion that lacks the kind of intentionality slogans such as “reproductive success” impute to nature. To understand the possibly historical and political character of what sociobiologists call “nature,” one need only consider gendered bodies. If women evolved smaller bodies and men larger, that process did not simply happen “naturally.” Force was likely exercised against large-bodied women as men assumed dominance in early human communities, and small-bodied women likely stood a better chance of surviving. Eugenics has probably always been a feature of human evolution. Sociobiological critics avoid such an historical understanding and instead take the current state of nature as a universal that has not changed and cannot change. It is an all-determining absolute, an archetype with authority to determine who or what we are. To do so, however, they must limit the range of the authorities they cite – Darwin and the sociobiologists mostly – and avoid engaging with current ongoing scientific research, especially research that questions and is questioning the assumptions of sociobiological theology regarding sexual selection and fitness.

Sociobiological literary criticism also assumes *H. sapiens* is undifferentiated. There is a single universal “human nature.” The species has ceased to evolve by mutating and splitting. Yet recent evidence suggests that there are remarkable physical differences between us. Conservatives, for example, have larger right amygdala than liberals, who have a larger anterior cingulate cortex. That physiological difference explains much of the ideological differences between the two groups. Approached scientifically rather than onto-theologically, *H. sapiens* would appear, as one would expect of any species, to be evolving by generating alternative versions of itself. There is no single “human nature” that is universal in all of us. To use the terminology of evolutionary theory, our differences are not just phenotypic; they are also genotypic. They pertain to how our genes operate, how they are arrayed, and what different biological versions of us they produce.

Contemporary science also provides a very different picture of evolutionary nature than is taken for granted by sociobiological literary criticism. It is a picture that accords more with the concepts and theories of Post-Structuralism and Postmodernism, theories that emphasize the stochastic character of change over time and the indeterminate, transformational, emergent, and complex character of any existing state of affairs. Because they are so devoted to the ideal of archetypal authority, sociobiological critics fail to grasp the indeterminacy and unpredictability of evolution itself. To deal with that unpredictability and indeterminacy, they have constructed metaphysical explanations for natural processes for which science itself provides simple physical descriptions.

For example, sociobiological genetic theory developed in the 1970s conceives of genes as selfish seekers of self-transmission through “reproductive success.” Genes are conceived as bearers of heritable material and as active agents of gene transmission whose actions resemble subjective intention. The intention is to be ascendant over other competing genes and to spread heritable material as widely as possible. Mainly, it is male genes that seem to be conceptualized here, since women in accounts such as Gottschall’s *Rape of Troy* are more the passive receivers of genetic material who assist competitive

men in assuring fitness or reproductive success. These already ideologically freighted ideas derive from Darwin's own well-freighted early nineteenth-century cultural assumptions, such as the then-new "liberal" notion of economic life as competition and the new racial theories that saw some races as more fit than others to lead. Darwin's theory of sexual selection holds that males compete for females who choose the most fit with whom to reproduce. The peacock's display is designed to achieve reproductive success. There is therefore a gene for sexually competitive behavior that is armed with the intention to propagate itself. Alfred Russell Wallace, the man from whom Darwin pilfered the theory of natural selection, correctly thought the theory of sexual selection erroneous and felt, as recent science has borne out, that it was far more likely the peacock's display was related to self-defense.

Moreover, since these theories were developed, the genome has been unlocked and genetics has become a more refined science. Genes are no longer conceived as transits of inherited material; they are now understood to be building tools that are complexly regulated, interactive with their environment, and stochastic or probabilistic in their activation patterns. As Eva Jablonka and Marion Lamb argue in *Evolution in Four Dimensions*, how genes pass on traits is a highly contingent process that is shaped by circumstance and situation. Because there are no guarantees that a gene will give rise to a particular effect, the idea popular in the 1970s that genes seek to reproduce and pass on their material now seems dubious. Moreover, that theory mistakes an effect (that genetic material is passed on) as a cause (a desire to pass on genetic material) and injects an agent into an agent-less process. It gives rise to such fragile claims as that of Gottschall that men rape to produce offspring in order to further the pre-eminence of their genetic material over that of other men. It is more probable, given the simply physical and random manner in which nature works, that successful reproduction at some point was associated accidentally through repeated random mutation with sexual pleasure, and this accidental linkage endured and was passed on because it induced males to engage in a higher rate of reproductive activity of which one accidental consequence was that genes linking high degrees of pleasure with reproductive activity were passed on. In other words, what sociobiology sees as the metaphysical cause – a drive or intention to achieve reproductive success – might be a misreading of a structural effect of an entirely random and purely physical process. In sociobiological theory, this physical and accidental process that aligns sexual pleasure accidentally with gene transmission becomes a metaphysical account of successful agency and intention. But it is far more likely men rape for a sexual fix rather than because they have a gene that longs for competitive success and longevity over generations. Nature's simple physicality contradicts the metaphysics of agency in sociobiology.

The bases of sociobiological evolutionary literary theory are also put in question by recent research. Researchers find that there is very little evidence of sexual selection in nature. The experiment that gave rise to Bateman's Law (that accounted for gender differences in mate selection) has proven un-reproducible. The mathematical models for "inclusive fitness" (which justifies altruistic behavior towards consanguines because that assures gene transmission) have been disproven. In addition, sexual selection theory requires that females be able to tell from visual signals if males carry "good" genes, but research has proven that it is nearly impossible to tell from visual signals what the "quality" of genes are, and experimental evidence to justify the theory of sexual selection is scant. It seems more likely that the various calls and shows that some animals put on to attract mates aid the avoidance of excess in-breeding and disease rather than guarantee

Darwin's somewhat racist assumptions about superior and inferior ethnicities who carry either "good" or "bad" genes.

Evolutionary literary theory is on much more secure ground when it puts aside what one scientist termed its "crass" preoccupation with reproduction and mating and instead explores the function of literature and of art. Arts serves a social function; reading fiction has been found to increase empathy. As humans evolved, they needed to be able to live together in larger groups, and art aided that process by training human minds in the ability to imagine other's lives as similar to their own. The sense of otherness that inspired fear and prompted violence was thereby diminished. Art also provided a play model for mental activities that were beneficial to survival, such as imagining possible scenarios or life situations and planning the future.

The cognitive-evolutionary-affective turn in literary studies holds the promise of new kinds of research that connect the humanities and the sciences. The links between human behavior and brain region are clear, and it is becoming clear as well that the interaction between our biological selves and our natural and constructed environments is crucial to both human culture and to our biological development within culture. To turn to science is not, therefore, to abandon a sense of the importance of culture or of society or, indeed, of history and politics. Nor should it be done in order to find in science an authoritative lexicon for culture. Indeed, the more one knows about the biological world, the more proximate science seems to mapping ocean currents. Change and transformation are more prevalent than stasis and predictability. And that is as true of *H. sapiens* as of anything. The historical graphing of biological modifications in humanity over time, as they are evident in culture, is likely, therefore, to be an interesting new field of scholarly endeavor.

The digitization of the humanities and of the sciences will aid this work. It is now possible through university library portals to gain easy access to scientific journals. As you explore them, you will become aware that scientists are as prone to difference and debate as we humanists are. They study physical events, but often, those physical events can be interpreted in different ways. There is no easy truth to be found, therefore, on the side of science. Rather, there seems to be a continuum of endeavor as scholars of either the physical or the cultural world try to link observed events or empirical data to ideas and narratives about them. And the two worlds blend and interact in profoundly connected ways. Geneticists, for example, have become more aware of the power of symbolic inheritance and of learning environments in determining genetic outcomes, even as we realize that physical brain structure differences with genetic bases may help account for palpable differences in kinds of cultural activity. The study of those blendings will become increasingly important for our understanding of literature and of culture in the years ahead.

What awaits next might be called a "scientific turn" in literary and cultural studies. It will consist of consulting scientific research in such areas as cognition, emotion, and the neuroscience of evolved traits such as prejudice and empathy that play so important a role in literature and in human culture. It will not be possible for literary scholars to master fully the biochemistry of emotion in brain function, but it will be possible to link the conclusions of such studies – that certain hormones are more active in certain kinds of cognition and more present in certain kinds of brain structure, for example – to the products of human culture, which is to say, the products of the human brain. An assumption and a necessary conclusion of such research will be that our cultural fantasies spring directly from our evolved biology. They are not arbitrary, contingent, random, or deter-

mined in their substance by external, non-biological, cultural, social, or rhetorical forms or conventions. They are not so much ideology as they are bio-ideology.

We need to move beyond the idea that linkages of culture to matter mean that culture is now “determined” by matter. The brain itself is a realm of culture and operates in ways we would consider both semiotic and cultural. A crucial feature of our evolved neurobiology is the capacity to make mental representations. Such mental images allowed our ancestors to control negative emotions such as fear and prejudice that stood in the way of emergent sociality. By placing an image in the place of an automatic negative emotional response such as prejudice, our ancestors learned how to exercise emotional self control, and such control allowed them eventually to live together in large communities made up of both kin and non-kin. In a sense, the capacity to signify, to arrest an automatic emotional response with a sign of it, distinguished the new model human equipped with abstract mimetic abilities, a greater power of control over negative emotions, and a better chance of forming civilization from the older model early human who was still victimized by automatic negative emotional responses. What this means is that our cultural stories (which are transposed mental representations) are connected directly to differentiated neurobiological abilities that are indexed to different evolutionary locations. Our literary and cultural stories directly express a particular balance of hormones, a specific brain region structure, an array of epigenetic switches, a different evolutionary biological achievement, and a different point in a range of possible evolutionary locations graphed both spatially and temporally. We are records and archives, each one of us, of an evolutionary biological history. One meaning of literature, then, is neurobiology, and that is the case because neurobiology is itself literary; it operates most successfully when it can build complex internal signs or mental representations that narrate and quell negative automatic emotional responses that we inherited from our very violent ancestors such as *H. erectus*.

Our interpretive protocols will change as a result of turning to science as will our sense of what particular kinds of cultural representation mean. Scientific research tends towards settled, confirmable results, and while scientific theory might locate those results in different contending paradigms, the results themselves – untheorized – tend towards indisputability. The hormone NMDA is linked to prejudice and is more present in the operations of the amygdala, which is associated with negative emotional responses such as “fight or flight” and is larger in those self-identifying as political conservatives. Numerous tests confirm the result. It is beyond dispute, a matter now of settled knowledge. Such knowledge allows us to see ideology as biology in a more settled way than the protocols of hermeneutics. Movies such as *Apocalypse Now* or *Falling Down* that expresses prejudice can now be understood in a more physically grounded manner as the expressions of certain brain structure configurations or neurological hormonal distributions. Push further, and they can be understood as part of the evolutionary archive that tells us what the function in the distant past of an older part of the brain such as the amygdala was in early human history. A fantasy such as *Falling Down* in other words is not just about troubled racial relations in the present. As an expression of traits such as more expressed NMDA and an enlarged amygdala, it points to evolutionary history and shows us what race relations were like a hundred thousand years ago, when the amygdala was a younger newer feature of the human brain (it is lodged just atop the spinal column). Such scientific analysis thus gives us access to a different kind of “long history” and makes us aware of just how much “older” each of us is in that we bear within us emotional capacities forged thousands of years in the past.

This new scientific criticism should also be able to explain aesthetic differences such as why different kinds of literary and cultural representations exist on a range from highly differentiated and complex to very simple and undifferentiated, from a film such as *Hiroshima, Mon Amour* with its complex mix of forms, its differentiated depiction of others, and its reflection on the complex ethics of forgiveness, to films such as *Argo* or *Zero Dark Thirty* that engage in the narcissistic heroizing of unquestionably virtuous protagonists, project an undifferentiated racial other lacking complex traits, and play to primitive feelings of band loyalty formed around prejudice against adversaries. More complex forms of mental representation align with greater control over negative emotions, and psychologists link it to a more successfully achieved sense of a separate self free from longings for fusion. Complexity, differentiation, and reflection characterize the representational form of literary and cinematic works infused with such mental states. Less complex forms align with less self control and greater longings for a fused identity more likely to project an adversarial other against which violence could be directed. This new bio-aesthetic axis might amplify our current tools for differentiating literary forms into genres and modes and allow for a new understanding of the way mental representations transfer brain function into public cultural form.

# CHAPTER 2

## Embodied Literature: A Cognitive-Poststructuralist Approach to Genre

*F. Elizabeth Hart*

Post-Structuralism shifts attention from genre to discourse, but in doing so, Elizabeth Hart argues, it fails to consider the mediation of all cultural institutions such as literary genres by the mind. A cognitive approach to genre focuses attention on the way the categories of genre are part of an embodied human mind and makes our understanding of genre more accurately reflective of the species specificity of cognition.

### I

Genre, like other formal aspects of literature, has been subjected to profound scrutiny over the past three decades' advance of postmodernism. Organizing the literary system into *kinds* – poetry, novel, drama; lyric, romance, tragedy – is no longer the transparent task it once seemed to a New Critical world steeped in classification. Within postmodernism, the poststructuralist critique of genre has focused on the fact that traditional genre theory has almost always been either merely descriptive or, worse, rigidly prescriptive, failing or not even attempting to explain the phenomenon of cross-textual patterning in literature. We see this in the various handbooks of literary terms, for instance, which continue to represent as viable the formalist definitions of genre based on literary ‘type’ or ‘kind’ with little acknowledgment of the complexities embedded in the idea of typicality.<sup>1</sup> Yet despite genre’s lingering associations with formalism, it continues to serve as one of the means – one of the principle means – by which literary critics distinguish themselves within the humanities. After all, if a critic’s job is to demonstrate the relevance of literary texts to culture, then the fact that texts relate to one another in a non-random, non-arbitrary fashion can provide necessary legitimization for the task. As a result of genre’s continued usefulness in this sense, discussions about it now span the

*Original publication details:* F. Elizabeth Hart, “Embodied Literature: A Cognitive-Poststructuralist Approach to Genre” from *The Work of Fiction*, ed. Alan Richardson and Ellen Spolsky, pp. 85–106. Ashgate, 2004. Reproduced with permission from Taylor & Francis.

divide between traditional or formalist criticism and contemporary, especially poststructuralist, theory.

Given poststructuralism's investment in textuality, it is not surprising that poststructuralist critics consider genre worth rescuing from its formalist past. Their critiques of formalist approaches have adopted several themes. First, denying the assumption of an *essence* or stable identity for any given genre, poststructuralists disclaim the classificatory impulses of traditional theory, noting that – as a rule and not as an exception – '[E]very [literary] work deviates from any particular set of characteristics that may be attributed to its kind' (J. Snyder, 1). A second and related charge is that, far from conforming neatly to taxonomic labels (which are implied by the presence of generic essence), most texts exhibit characteristics of more than one kind of genre and sometimes even of multiple kinds. As the critic Deborah Madsen puts it, 'Essentialist genre theory assumes that a preconceived unifying principle is a sufficient basis for interpretation, classification, and evaluation, and this kind of genre theory simply does not entertain the possibility that there may exist such a thing as a multigeneric text' (8). Taxonomy as a principle is predicated on images of fixity and stasis, and because of this critics insist that a taxonomical essentialism cannot recognize, much less explain, the evolutions and transformations that mark a genre's history. '[O]ver time,' writes Madsen, 'every work combined with all others of more or less the same kind constitutes the history of the genre: the genre *is* its history of individual instances' (9).

Predictably, virtually all the poststructuralist genre critics suggest that the way to 'de-essentialize' genre is to re-cast it in terms of discourse.<sup>2</sup> This move has turned out to be progressive in that it limits the tendency to reify literary types and encourages instead a focus on the process of discourse formation. Such a focus emphasizes the dialectical exchange between texts and cultures and aids in addressing the questions of why patterns within texts appear to shift so continuously, and why texts themselves intersect dynamically with other texts. But even more important, conceiving of genre in terms of discourse and dialectical exchange allows for a further alignment of genre with *ideology*. Once genre has been linked to ideology in this way, it is but a short step toward claiming that the repetitions that comprise textual patterning signify not the purity of a transcendent essence but the recursions of a historically situated set of social discourses. Thus, genre retains its function of helping the literary critic to relate literary texts to culture, only now this task may be accomplished on materialist and not formalist or idealist grounds.

But while the poststructuralist move toward dialectical exchange and ideology is both useful and necessary, conceiving of genre primarily in terms of discourse reveals certain limitations that are intrinsic to poststructuralism's basic approach to discourse and to the relationship envisioned between discourse and subjectivity. One of the purposes of this essay will be to explore lacunae in poststructuralist genre theory by means of a cognitive literary theory, an orientation toward the materiality of mind and language that, as I have argued elsewhere, shows poststructuralism to be unwittingly idealist in its own right (Hart, 'Matter'). In what follows, I hope to demonstrate the difficulties of a discourse-based genre analysis and then offer, in its place, a cognitive literary critique whose precepts include an important reconfiguration of the relation between ontology and epistemology. This shift of philosophical alignment, achieved through the interdisciplinary efforts of cognitive scientists, philosophers, linguists, and literary critics, has the potential, I contend, to alter our understanding of both discourse and subjectivity and of the function of each with respect to genre. I begin by reviewing the background of cognitive literary theory, paying specific attention to the discussions of genre found in

the work of the cognitive critic Ellen Spolsky. Then I examine poststructuralist genre theory in detail preparatory to a demonstration of its applicability to a literary text with a particularly problematic history of generic placement. That text is Shakespeare's *Othello*, a play that has consistently resisted categorization by the full range of genre theories, from models based on classical tragedy to twentieth-century reinterpretations of the classical and finally to more recent considerations of the play's generic status, some of which disengage it from tragedy altogether. At the essay's end, I re-examine *Othello* through the lens of what I call a 'cognitive-poststructuralism,' a cognitive literary critique that, although it may differ in terms of precepts and methods, nonetheless shares much with poststructuralism, particularly the poststructuralist insight that actively links literary genre with ideology.

## II

For some time now, literary scholars have been incorporating the insights of cognitive science into their work, focusing especially on recent shifts within cognitive science toward 'embodiment' models of the human brain and mind. The 'embodied mind,' according to these models, is a conception of mind as an aspect of – though not a reduction to – the biological brain insofar as the mind shares in the brain's interactivity with the body and thus with the body's physical, social, and cultural environments.<sup>3</sup> Literary critics are now increasingly attuned to convergences between literary and cognitive-scientific concerns, which include, to name just a few, studies of metaphor and other figurative phenomena now suspected of providing underlying structure to both thought and language; studies of the human body as a primary site of social construction; and bodily, socially, and culturally indexed approaches to epistemology. These critics have been bringing the findings of cognitive science to such literary research areas as poetics, narrative studies, rhetoric and composition, and historicist studies of literature and culture.<sup>4</sup> Some of the practitioners of cognitive literary theory have proven consistently sympathetic to the materialist agenda underlying poststructuralism, claiming a strong sense of affinity with the materialist basis of historicist criticism and a desire to eschew the methodologies of literary formalism.<sup>5</sup> Their sense of compatibility has extended in a limited way to the poststructuralist treatment of genre, which, although not yet a concentrated focus of cognitive criticism, has been the subject of incidental analyses by the cognitive literary critic Ellen Spolsky.<sup>6</sup> In various considerations of genre interspersed throughout her works, Spolsky has aligned herself with the poststructuralist view by citing as normative the tendencies for literary genres to be dynamic, i.e., ever-changing, and for texts to take on multiple rather than singular affinities with texts associated with other genres. She also places emphasis on the fact that *new* genres have sprung up throughout the course of literary history and that fresh generic labels are sometimes needed to mark newly perceived differences in older texts that once met the specifications of well-established criteria.<sup>7</sup>

But unlike the poststructuralists, whose habitual frame is restrictively epistemological, Spolsky casts her understanding of genre within a larger scope that includes both epistemological and ontological models, and she does this by appealing to an overtly materialist version of ontology made possible through cognitive theory. Spolsky's 'ontological epistemology,' as we might call it, holds as central axioms the notions that all knowledge is necessarily species-specific, contingent on the perceptual and cognitive

apparatuses that any given species comes equipped with, and that the material characteristics of the human brain and mind determine the conditions under which humans apprehend and make inferences about the world around them. Spolsky argues that certain aspects of the brain/mind's materiality – for instance the modularity or function-specificity of different parts of the brain, which promotes the ‘gaps’ in cognitive processing that she claims are the foundation for human flexibility and creativity – are largely an ‘outcome of [human] evolutionary development’ (*Gaps* 2). For Spolsky, this means that the materialist ontology of Charles Darwin is every bit as relevant to understanding postmodernism as are the materialist epistemologies of Jacques Derrida, Jacques Lacan, or other of the thinkers at the foundations of literary poststructuralism. Spolsky writes: ‘The general shape of my claim is that nothing could be more adaptationist, more Darwinian than deconstruction and poststructuralism, since both understand structuration – the production of structures … – as an activity that happens within and in response to a specific environment. It is an activity that is always already designed for cultural use but also always ready to be reused or redesigned as needed’ (*Darwin*’ 56).<sup>8</sup>

Fusing together these two forms of materialism – poststructuralism and Darwinism – has the effect, Spolsky argues, of ‘compromis[ing] the absoluteness of the deconstructive claim’ that language and thus knowledge must be ultimately unstable, since – inevitably – ontology constrains epistemology (*Darwin*’ 51). Nevertheless, despite this constraint, a Darwinian materialist ontology also has the effect of ‘affirm[ing] the gradience of the [deconstructive] claim’ (*Darwin*’ 51) – that is, of actually strengthening it:

Precisely because the human species and its ways of knowing are evolved by the accumulation of random mutations in interactions with changing environments rather than genetically engineered for the task of knowing, it is not at all surprising that they are unstable … It is just this instability, however, that provides the possibility for advantageous flexibility. People, their ways of knowing, and their languages are *responsive* … that is, adaptable within a changing environment. (*Darwin*’ 52)

In other words, the representational system described here actually thrives on flexibility rather than being crippled by instability. Through this ready adaptability, the representational system helps to enhance the survival capabilities of the human species. But importantly, whatever meaning inheres within such a representational system has to relinquish all resemblance to an *absolute* meaning. Human species survival ‘does not mean that everyone has to understand everything or that understanding is a logically watertight, foolproof system,’ Spolsky writes. ‘All it has to be is *good enough*’ (*Darwin*’ 52). In this sense, in the sense that ‘good enough’ understanding aptly serves where ‘pure’ or ‘perfect’ meaning proves impossible, Darwin’s materialist ontology most neatly complements the materialist epistemology underlying poststructuralism because *this* ontology is not a metaphysic. On the contrary, it is explicitly non-idealistic: ‘The variations and revisions [that characterize a flexible representational system] for both Darwin and post-structuralists are neither divinely nor benignly directed’ (*Darwin*’ 57) but rather operate ‘without the notion of an unchanging anchoring center, a set of platonic universals or literal meanings’ (*Darwin*’ 58).

Literary genres, in Spolsky’s view, are themselves symptomatic of the systematicity that underlies both poststructuralism and Darwinism, in which stability and predictability co-exist always with the potential for adaptation – and thus restructuration – in response

to an immediately surrounding environment. Genres, like word meanings, or even like biological species, are *categories* that are at times stable and yet always flexible, sensitive and responsive to changing environments through what Spolsky terms ‘recategorization,’ the process of moving from one state of relative categorical stability to another. A theory of semantic categories is critical to any endeavor that depends for its comprehensibility on some designation of typicality, as do our handbook-style, residually formalist definitions of genre mentioned at the beginning of this essay. Yet while some genre theorists have described genre explicitly in terms of categorization,<sup>9</sup> none but Spolsky has focused on the need to understand semantic categories themselves as mental and not transcendent phenomena –and thus as (arguably) pre-discursive, functioning both apart from and in sync with language and having a cognitive identity apart from their expression within a semiotic system. Spolsky’s analysis actively explores the idea of a cognitive framework underlying the categories that enable genre formation, finding this framework comparable to the cognitive framework underlying word meanings, and then finding *both* analogous to the mechanisms enabling biological species evolution. (Species change would thus constitute a biological example of recategorization – granting, of course, that cultural evolution takes place at a much faster rate than biological evolution.) Her introduction of the notion of re-categorization as a descriptor for the normative behaviors of genres – for the fact that genres constantly shift and adjust, and for the fact that texts are frequently multiply structured – provides what may be our most incisive vocabulary to date with which to discuss what literary genre truly ‘is.’

Therefore, throughout this essay, Spolsky’s descriptions of generic recategorization shall serve as the frame within which I will situate the difficulties of poststructuralist genre theory alongside those of such a historically problematic text as Shakespeare’s *Othello*. In this discussion, I will attempt to add a new dimension to Spolsky’s analysis by delving more deeply into the troublingly narrow definitions of ‘discourse’ and ‘subjectivity’ that poststructuralism both asserts and implies in its configurations of genre. (Again, I do this because the similarity of critical aims between poststructuralist and cognitive-poststructuralist approaches makes their differences worthy of investigation.) Nevertheless, the gist of my argument will amount to a reiteration of some of Spolsky’s key insights into recategorization, to wit: ‘The dynamic of categorization balances the need to understand something new in terms of something already familiar, so that old responses can be helpfully invoked, against the need to recognize and perhaps benefit from the peculiarity or specialness of the new experience’ (*Gaps* 73). Accordingly, ‘Making a categorization judgment … is always conditional, the making of the judgment itself an invitation to remake it’ (*Gaps* 73). This perpetually ‘conditional’ condition of genre thus enables the development of a genuinely non-essentialist view of genre that nonetheless credits genre with a degree of structural integrity or stability. Crucially, however, whatever relative stability genre may lay claim to is directly indexed to readers’ relatively stable material experiences – to their evolutionary and experientially *embodied minds*. As Spolsky puts it, ‘[A] genre categorization is no less than a way of organizing a competent reader’s ability to pattern inferences about a text and its relations to other discourse. Precisely because genre categories are, in the mind of an experienced reader, so flexible, they are a fertile source of innovation’ (*Gaps* 78). And as something that is always undergoing renovation, the genre system itself is ‘a reflection of the complexity of readers’ construal of the world and the ease with which that understanding can learn and change’ (*Gaps* 79).

## III

Poststructuralism exemplifies just the latest effort within a long and ancient tradition of attempts to understand the causes and functions of literary patterning.<sup>10</sup> The problem, of course, that has always haunted theorists of genre is the question of genre's status, its definition. Neo-Platonic and neo-Aristotelian discussions long ago set down the two opposing frameworks from within which this question has always been approached, alternately locating genre in abstract, transcendent categories said to exist prior to literary texts and in idealized relationship to those texts (the neo-Platonic approach), or locating genre within the literary text itself, viewing genre as a set of textual characteristics whose accumulation manifests generic unity and thus identity (the neo-Aristotelian approach). These opposing perspectives represent deductive and inductive methodologies respectively, and share a history of established and often simultaneous practice, informing the work of such eminent recent genre theorists as Northrop Frye and Alistair Fowler. Not surprisingly, the poststructuralist difficulty with both approaches is that each tends to reify genre into a *thing*, asserting or implying the timeless stability of this thing either within an abstract, transcendent category or within the text itself. But it is this tendency to essentialize genre, found in both traditions, that effectively closes off the means to explain two key features of genre that genre *critics* have often acknowledged even if formal theories of genre have not. These are, as mentioned before, the fact that genres constantly undergo change, maintaining some but not all the traits of previous texts assigned to any given neo-Platonic category; and the fact that many texts display categorical heterogeneity, or multiple genres within single texts, belying the faith in a unified generic identity implicit in a neo-Aristotelian analysis.

Poststructuralism has produced a variety of responses to the essentialism in both forms of traditional genre theory. By far the most important has been the assertion that genre is not a thing at all but a *process* and specifically a process of communication. Genre resides not within texts themselves nor in the pre-existing essential categories to which we try to assimilate texts. It resides, rather, within and around our discursive negotiations *about* texts. Notable examples of the genre-as-communication model have included Mikhail Bakhtin's concept of genre as a dialectical 'sociology' within the framework of a 'sociological poetics' (3–15) and Jonathan Culler's structuralist analogy between 'linguistic competence' and literary competence' (131–160), in which both linguistic and literary systems gain intelligibility through an abstract rule or code system, a coding claimed to be, in effect, genre. But by far the most influential of the poststructuralist perspectives has been Fredric Jameson's view that genre is a term we apply not to transcendent categories, to texts themselves, or to abstract code systems operating on texts, but to the critical *reception* of texts, which is both determined within and limited by historical and economic specificity. 'Genres are essentially literary *institutions*,' Jameson states, 'social contracts between a writer and a specific public, whose function is to specify the proper use of a particular cultural artifact' (106). Jacques Derrida similarly locates genre in the author or critic's choice of rhetorical strategy, a strategy whose malleability to suit ethical and political purposes allows for the utilitarian isolation of select trait-alliances within texts that are otherwise crisscrossed by a multiplicity of traits ('Law'). For both Jameson and Derrida, the point is not so much the traits that adhere within the text but those that only become visible under rhetorically and historically specific circumstances. Discourse thus constitutes a dialectic between textual content and those neo-Platonic categories of traditional classification, categories that, while no

longer the principal object of genre study, nevertheless remain useful as labeling devices. It is thus the interpretation – by writers and readers alike – of the relations between prior texts and textual categories that determines what patterns will emerge from within the literary system and what ethical ends their emergence will serve. Again, such determinations are inescapably functions of discourse, and the genre critic's role now shifts fundamentally from describing a *thing* to describing a process of mediation *between things*.

This move from an essentialist model to a process model indexed by discourse is, of course, one of poststructuralism's familiar trademark revisions. In keeping with this characteristic move, it is but a short step from adopting a discourse model to privileging the roles of history and ideology and, as a consequence, to a model of genre that fully embraces the necessity of generic change. As Madsen writes, 'A genre is always subject to change by the new texts it generates and by each new reading of these and other texts.... [G]enres are constantly redefined, revivified, and transformed intertextually by their literary context and by their cultural contexts' (23). The poststructuralist approach actively theorizes how change can be woven into the model of genre as a kind of 'constant variable' (the oxymoron notwithstanding), something always at work *on* the literary system and therefore necessarily integral to it. Similarly, and as Madsen's remarks imply, the poststructuralist focus on the role of discourse also begets a friendlier acknowledgment of intertextuality and its effects, those effects in genre manifesting themselves in the phenomenon of the multigeneric text. The result is a model that, more so than previous ones, judiciously arbitrates between the abstract and the material components of the literary system and offers what Madsen calls '[a] concept of genre based on repetition-that-is-not-quite-identity and differences-that-are-not-exactly-unique' (27; hyphens added for readability).

#### IV

In this section of the essay, I would like to demonstrate how the poststructuralist model can be especially revealing on application to a canonical text like Shakespeare's *Othello*. However, I am restrained in performing this demonstration, which out of necessity requires a review of certain aspects of *Othello* criticism, by the fact that the rhetoric of literary history assumes the objective, essential existence of literary genres such as 'tragedy,' 'comedy,' 'satire,' 'romance,' and 'Roman New Comedy' that the remainder of this essay otherwise challenges. For pragmatic reasons, I must employ these labels in my attempt to portray the history of *Othello*'s reception. But I also hope that this discussion will further illuminate these labels' fundamental fluidity, entailing the very lack of a stable or objective status for the genres in question that a poststructuralist (and cognitive-poststructuralist) theory seeks to expose.

Called a tragedy in its earliest Quarto and Folio versions, and almost always grouped by critics with *Hamlet*, *King Lear*, and *Macbeth*, *Othello* nevertheless violates major requirements traditionally assigned to tragedy and has been questioned – even scorned – by critics on that basis for centuries.<sup>11</sup> As early as the seventeenth century, the critic Thomas Rymer complained about the non-royal status of the play's title character and found the play's themes of jealousy and infidelity to be ridiculously beneath the dignity of tragedy. Others compensated for this perceived lack of dignity by developing the subcategory of the 'domestic' tragedy, thereby excusing the play from tragedy's usual necessity for high-placed protagonists and lofty themes, as well as for the cosmic and

civic dimensions of the protagonist's final sacrifice. Even so, the neo-Platonic model of tragedy still requires that the protagonist be discernibly noble of spirit and that he recover a degree of his nobility – and thus our sympathy – in the moments preceding his death. That readers and viewers have always found it difficult to respect and ultimately to pity Othello after his murder of Desdemona is attested to by the sheer volume of debate in the twentieth century alone. This debate has culminated in some critics simply giving up on tragedy or at least on tragedy as the play's dominant logic, naming other generic possibilities with which to explain our stubbornly non-tragic reactions to the play. One such alternative has been suggested by Michael Bristol in his influential essay 'Charivari and the Comedy of Abjection in *Othello*', which proposes that we revise our understanding of the play by placing it in the context of the early modern charivari, a riotous, punitive shaming ritual derived from carnival and usually practiced against the partners of unsanctioned marriages. A similar alternative has recently been offered by Pamela Brown, who in '*Othello* and Italophobia' reads the play as an example of anti-Italian and particularly anti-Venetian revenge-satire (such as we might associate with Jonson's *Volpone*). These signs of historical discomfort with the so-called tragic elements of *Othello* illustrate the play's persistent difficulties with traditional genre analysis based on comparisons to idealized notions of tragedy. Either the text or the category itself must be distorted if we are to approximate that mirror-like reflection that we would logically expect to find between texts and abstractly derived neo-Platonic categories.

Nor has the other traditional approach, the neo-Aristotelian approach, suited the peculiarities of Shakespeare's play. Text-based genre analysis assumes that the accumulation of a text's traits will *be* its genre, but this approach cannot account for textual traits that fall outside of a dominant pattern, divergent traits that might, in fact, constitute additional patterns. And so again, since the time of *Othello*'s earliest commentaries, critics have consistently found the play to be infused not just with elements of tragedy but with comedy (and in a way utterly distinct from examples of tragicomedy). Thomas Rymer was but the first of many to see the outlines of Italian *commedia dell'arte* in the spectacle of a foolish old man raging over a young wife's betrayal. Moments like Othello's Act 4 declaration that he will 'chop [Desdemona] into messes' (4.1.199)<sup>12</sup> struck Rymer as painfully, even insultingly absurd, bordering on what he called the familiar grotesqueries of 'Harlequin and Scaramuchio,' stereotypical characters he cited directly from the Italian comedy (qtd. in Fortin, 162). Modern scholars including Susan Snyder, Leslie Fiedler, Margo Hendricks, Pamela Brown and others have identified not just these and other elements of *commedia dell'arte* but also traces of the Roman New Comedy, romance, chivalric romance, and, as mentioned a moment ago, even a species of vicious early modern satire, all woven subtly into what Snyder calls the 'comic matrix' of this presumed tragedy.<sup>13</sup> To further complicate a genre analysis conducted on the expectation of finding unified form, one must also consider *Othello*'s repeated evocations of the medieval morality play. There was, by the mid-1970s, an entire generation of Shakespeare critics who looked upon the play's allegory of Christian struggle – Othello's temptation by the Vice-like Iago and then his descent into the very persona of 'black devil' (5.2.135) – as a kind of renegade morality tale actively competing with tragedy for control over the play.

Poststructuralism makes explicit what genre critics have often sensed but lacked, until recently, the vocabulary to articulate. That is, no two texts manifesting a given pattern are ever identical in their replications of that pattern; and the fact that texts often contain a puzzling mixture of patterns, each one a vehicle for its own ethos and perspective and

each one provoking its own set of conventional responses. Discourse, the mediator within this dynamic, operates at all moments of a given text's history, from the text's inception through all of its subsequent receptions, with each moment playing its own role in shaping the perception of the text's genre. The early modern cultural discourses within which Shakespeare wrote would have required him, in effect, to reinvent tragedy as he went since these discourses' particular emphases and the nature of their intersections with each other would have served purposes absolutely unique to this play. These discourses, amply documented in the criticism of recent years, included among others the domains of global imperialism, English and Venetian military cultures, the patriarchies of civic and marital institutions, and not least, of course, the early modern discourse on race. In terms of the discourses operating on *Othello*'s long history of reception (a subject too vast to survey here), it suffices to say that re-assessments of *Othello*'s generic impact are always going to be the rule rather than the exception. This is because, as the cultural materialists aptly point out, those aspects of a text that seem most relevant to a receiving audience can almost always be shown to mirror the concerns of that audience's moment – ours, for instance, when the interplay of race, gender, and colonial expansionism is of utmost concern to our cultural identity. As the critic Virginia Mason Vaughan writes, '*Othello* [is] not simply ... a product of a cultural milieu ... [it is] also ... a maker of cultural meanings, part of a complex negotiation between each episteme's cultural attitudes, its actors, and their audiences' (7).

## V

At this juncture, I would like to step outside the discourse-driven process model of post-structuralism in order to examine, from a very different perspective, the emphasis that this model places on discourse as the mediating agent out of which genre emerges. This shift in perspective is warranted, I would argue, because of the famously impoverished scope of the term 'discourse' within the poststructuralist tradition. I refer specifically to its uses as a term synonymous with 'practice' or sometimes 'history' and its very limited claims to materiality based, as Derrida portrays it, almost entirely on the 'acoustical' dimension of the Saussurean linguistic sign ('Difference' 10). While our imaginings of the powers of discourse delineated by Michel Foucault have revolutionized literary studies in our time, many now believe that we have purchased this revolutionary model at the expense of something important. That something is vaguely and even nostalgically understood to be the agency accorded to human beings that once underlay the liberal-humanist model of language but that now slips imperceptibly between the lines of strategically evasive poststructuralist rhetoric. We find ghost traces of this lost human entity, for instance, in any number of Foucault's descriptions of discourse in *The Archaeology of Knowledge*, such as: '[D]iscourse is not the majestically unfolding manifestation of a thinking, knowing, speaking subject, but, on the contrary, a totality, in which the dispersion of the subject and his discontinuity with himself may be determined' (55). In his attempt to do what many critics now agree is necessary, namely, replace our essentialist models with a process model that gives imagery to constructivity, Foucault also, in denying a 'thinking, knowing, speaking subject,' denies the means – the phenomenal apparatus – for human knowing.

Taken literally, such statements seem to deny the efficacy and perhaps even the presence of human *minds* that enable discourse and representation. They likewise efface,

if only implicitly, the fact that there must be a conceptual component to the fields of semantic categories that shape discourse and lend well-acknowledged systematicity to ideology. In practice, ironically, poststructuralist critics routinely cite ‘categories’ as playing a role in determining discourse and ideology. However, few such critics (at least in my own experience) have shown much awareness that the structure and formation of semantic categories and category systems pose legitimate scholarly research questions in their own right.<sup>14</sup> In other words, as a theory of language, poststructuralism benefits from the commonsense *assumption* of a ‘thinking, knowing, speaking subject’ even while, in theory, it anxiously erases the human particularities of that subjectivity in the interests of nullifying the threat of an idealist ontology. The result is that, as an intellectual system, poststructuralism has never really had to grapple with the phenomenological implications of what a thinking, knowing, and speaking subject must really be like.

I propose that adding a cognitive perspective to the poststructuralist scenario would help resolve this contradiction as well as open up the discussion to a field of semantic category research whose philosophical bases are strikingly compatible with poststructuralism. Taking as a starting point Spolsky’s marriage between Darwin’s materialist ontology and Derrida’s materialist epistemology, I argue that a cognitive approach allows us to circumvent the assumed dangers of ontology and thereby integrate the embodied mind into Foucault’s ‘totality’ – the social system, of which discourse is understood to be the primary shaping tool – in such a way that in speaking of ‘categories’ we can finally acknowledge that the human mind plays a key role in helping to construct that very discourse. The cognitive perspective I refer to stems from a rising tide of interdisciplinary studies by linguists, philosophers, anthropologists, and cognitive scientists of varying specialties, from neuroscience to cognitive and evolutionary psychology. These studies comprise what has been christened a ‘second generation’ of cognitive science, representing an aggressive departure from the rule-driven, computer-focused, and formally disembodied approaches to the mind that characterized earlier stages of cognitive science.<sup>15</sup> The radical nature of the departure that second-generation cognitive science represents cannot be overstated because it amounts to a large-scale rejection of philosophical rationalism, on whose premise regarding the split of mind from body much of Western philosophy has subsequently been built. The result has been a shift in the understanding of reason and realism from disembodied and transcendent to quite the opposite: to a new understanding of them as embodied and emergent from the mind-body’s accumulated interactions. This shift in the conception of reason and realism has inspired new approaches to the full range of cognitive-scientific research questions, from brain structure to mental imaging, problem-solving, categorization, language processing, discourse comprehension, and many related functions that touch not only on cognitive science but on a variety of other interested disciplines, including literary studies.

Within this second generation of cognitive research several new emphases in linguistics have emerged. One in particular, cognitive linguistics, offers a theory of semantic categories that makes it especially relevant to the problems of genre theory that I have been attempting to outline.<sup>16</sup> As I have argued at some length elsewhere, cognitive linguistics proves consistently compatible with some of poststructuralism’s most important philosophical limits (Hart, ‘Matter’). Their similarities may seem overly general at first glance; however, they turn out to be fundamental to both programs. Both, for instance, are dedicated to an agenda of defining a post-rationalist and non-realist epistemology.<sup>17</sup> Both privilege metaphor as the principal conduit of information. Both require

the characteristic of openness within the knowledge and language systems that they envision and from this openness declare the normative status of change and multiplicity over stasis and unity. Finally, like poststructuralism, cognitive linguistics rejects the idealism inherent in essentialist theories of representation and meaning, offering the criterion of meaning *coherence*, or functional understanding, to replace notions of objective correspondences or literal ‘truth.’ This criterion of coherence, one might notice, is not too far afield from Spolsky’s materialist ontological standard of a non-absolutist representational system that is ‘good enough’ for communication purposes and therefore sufficient to ensure species survival.

In cognitive-linguistic theory, semantic categories are thought to be the results of interaction between, on the one hand, sensory and kinesthetic information taken in by the human body and, on the other, mental representations constructed from this bodily experience, minimalist representations that the linguists call ‘image schemas.’ Categories emerge in a bottom-to-top direction out of the projection of image schemas from structured to unstructured domains of experience, so that the most basic experiential information brought in by our bodies becomes the basis for our on-going, more abstract constructions of knowledge and experience. Knowledge and meaning, in this sense, are wholly contingent upon the body’s physical and social interactions (i.e., its materiality) and on the structural replications of those interactions within the brain. The mind-embodiment that these replications encapsulate takes on the simple geometries of such sensorimotor-driven episodes as containment, collision, release, propulsion, attraction, and compulsion, to name only some.<sup>18</sup> These geometries are then projected, via conceptual metaphor, into additional domains of experience in order to construct new categories, to reinforce old ones, or subtly or radically to restructure already existing categories, each category itself bearing the potential to further escalate and proliferate its content into more complex and increasingly abstract categories.

Let me offer an example using the container schema, which will figure momentarily in my discussion of *Othello* in the context of its role in formulating ethnocentric ideology.<sup>19</sup> Mark Johnson describes containment as ‘one of the most pervasive features of our bodily experience’ (21). Our bodies are themselves three-dimensional containers ‘into which we put certain things (food, water, air) and out of which other things emerge (food and water wastes, air, blood, etc.). From the beginning we experience constant physical containment in our surroundings.... We move in and out of rooms, clothes, vehicles, and numerous kinds of bounded spaces. We manipulate objects, placing them in containers (cups, boxes, cans, bags, etc.)’ (Johnson 21). Through this experience of spatial boundedness, we develop inferences of *in-out* orientation, which, ‘[w]hether in one, two, or three dimensions ... involves separation, differentiation, and enclosure, [and] which implies restriction and limitation’ (22). The basic outlines of a container schema might resemble a circle with a perimeter, an outside to the perimeter, and a marker within the perimeter to indicate the condition of boundedness. The results of this simple structure are our all-important concepts for *in* and *out* (and to some extent *on*). When projected onto our experiences, containment replicates itself consistently in such a way that we speak of finding ourselves ‘in’ abstract situations like business deals or new relationships just as easily as we refer more concretely to putting a toy ‘in’ a box. The center-periphery structure of the container schema projects systematically into vast domains of experience (including the tendency to think of experience in terms of ‘domains’), extending even to our most esoteric experiences, as the role of the container schema in formal logic demonstrates (Johnson, 30–40). It so happens that the very notion of the ‘semantic category’

owes its accessibility to the container schema: a unit of meaning is thought of as a container into which semantic features gather to make up a concept.

Now, I ask, what exactly would poststructuralism gain by admitting a cognitive-linguistic (or similarly non-rationalist, non-idealist) semantics into its understanding of discourse? For one, it would gain the wider theoretical scope it needs for its formulations of discourse and representation, a scope that even its own practitioners already assume as a matter of course in their critical readings. For another, it would gain verification for its own precepts from a set of interdisciplinary fields outside of itself, this compatibility among divergent fields providing a significant and validating convergence of epistemologies. But most important, from its broader perspective – admitting of the role of at least a *materialist* ontology, in keeping with Spolsky's claims – it would acquire a wider zone within which to identify the material constraints on discourse, on texts, and ultimately on subjectivity. This latter, the search for material constraints, is not trivial since it is one of the primary concerns of all of today's historicist schools of literary studies. Yet by admitting such a semantics into its field of vision, poststructuralism would also have to commit to the idea that at least some of the material constraints on discourse, texts, and subjectivity derive from the phenomenologically 'real' effects of mind-embodiment. That is, it would have to acknowledge the way in which the human brain-mind and body's coalescent constructions are replicated in representation, discourse, and ideology; and thereby how the patterns of our experience are transmitted to literary texts and to the *systems* of literary texts that we call genres. In short, poststructuralist genre critics would have to recognize that literary genres, which they say are mediated for our awareness by discourse, are revealed as patterns to our eyes not primarily through discourse but through that which itself constructs discourse and is, more likely, the true mediator of the literary system: embodied human experience.

## VI

To illustrate how mind-embodiment constructs discourse and thus serves as the medium through which genre manifests, I would like to examine the semantics underlying one of the many discourses running throughout *Othello*, the discourse and ideology of race, which has deeply influenced recent criticism of the play.<sup>20</sup> When discussing this play, new historicists and cultural materialists are bound by their historicist methodology to delineate the distant background of the word 'Moor,' which serves so often in *Othello* both to name the title character and to place him within the social hierarchies of Renaissance Venice. Anthony Barthelemy, who has written one of the most extensive studies, points first to the etymology of 'Moor' in Greek and Latin roots for 'black'; second, to its association with the Spanish-named region of Mauretania, an ancient name for northern Africa; and third, to its changing uses between ancient and early modern periods, in which its meaning both narrowed to refer to black Africans in particular, and widened to include both black and non-black figures of the 'Other' within the white-English-Christian imagination.<sup>21</sup> At various times it was used with confidence to indicate black Africans, white Africans, Muslims, Turks, Saracens, Asians, Indians, and even Native Americans. Blackness was, by ancient trope, a metaphor for evil, and black people were singled out for sinfulness in a Christian tradition that claimed a genealogical relation between African blacks and Ham, the sinful son of Noah.<sup>22</sup> Since Ham's sinfulness had taken a sexual form, blacks and Moors in general were stereotyped with

cupiscence.<sup>23</sup> Their alleged over-passion, combined with the impressions that a few Englishmen had gained in actual contact with native Africans in their tribal environments, led to the charge of sub-humanness and therefore to the Moor being relegated to the status of beast. That black people were also associated directly with the Devil was true even before actual contact among nations for trade and military exploits. A record of black-coded devilry survives from the medieval cycle plays, whose texts make explicit that Vice characters and other demons wore dark-colored costumes and may even have been performed in black-face.

Critics assessing these semantics are often shocked by the faithfulness of Shakespeare's *Othello* to these stereotypes, even while also insisting that Shakespeare purposely inverts the racial metaphors by assigning the play's worst evils to a white man, Iago.<sup>24</sup> Iago and Roderigo's racist epithets of 'old black ram' and 'the thick-lips' (1.1.90, 68) are convincingly mitigated, some say, by representations of Othello's dignity, by Cassio's loyalty, and by the respect that the Venetian senators show for Othello in entrusting Cyprus to his care. But after witnessing Othello's steady decline into the bestial, sexual, and finally demonic dimensions of the Moor stereotype that he had at first seemed to transcend, critics – and increasingly students – tend to hear Emilia's loaded condemnation, after Desdemona's murder, as the play's finalizing statement of its racial conscience: 'O gull! O dolt! / As ignorant as dirt!' (5.2.170–1); 'O, the more angel she, / And you the blacker devil' (5.2.134–5). Vaughan aptly describes the way in which these semantics of race subtly constitute the play despite our best efforts to rationalize them: '[T]he discourse of racial difference is inescapably embedded in the play just as it was embedded in Shakespeare's culture and our own. To be totally free of racism, one would have to invent a new language with no loaded words, no color discriminations, and no associations of blackness with evil, whiteness with good' (70). We are, she writes, 'necessarily implicated in ... [the] tangled web' of this discourse, made compliant with it by mere virtue of our sitting in the audience.

A cognitive-poststructuralist reading of *Othello*'s racial and racist semantics might frame these tensions along the following lines. Ethnocentricity functions image-schematically by appealing to the containment schema, which, we might recall, is characterized by having a center-periphery structure. An 'I' or 'we' position occupies the center or inside of the container, while a 'you,' 'them,' or 'Other' position is projected onto or even outside the borderlands that define the container's periphery. Given the wildly various etymology of the word 'Moor,' it is obvious that the precise range of spatial-relations schemas constituting 'Others' on or outside the periphery of this container do not matter very much in maintaining the integrity of the container. In other words, the relationships between incongruent 'Others' is incidental because it is the structure of the *inside* of the container that the container schema marks for definition. That, at least, is how 'Moor' can encompass all the identities of black and white Africans, Muslims, Asians, Turks, etc., indiscriminately, while the white-English-Christian essence of the container's interior never loses its focus. Critics agree that Othello's rhetorical conversion at the end of the play from a Christian Venetian of African descent to the 'turbaned Turk' whom Othello kills for 'traduc[ing] the state' (5.2.363–4) represents the blurring of his character into that ill-distinguished, amorphous 'Other.'<sup>25</sup> By now, it becomes apparent that this 'Other' has been lurking all along beneath the surface imagery of a play that was only *pretending* to be about a dignified, fully human–black–man.

Ethnocentricity is still with us, of course. But the exact semantic makeup of those borderland struggles is constantly shifting with history and with fresh human experience, and the particular semantics of Shakespeare's early modern ethnocentricity have inevitably

changed. The center-peripheries of today's ethnocentric schemas simply no longer match the internal logic of race in *Othello*, and this fact has had unavoidable implications for today's critical assessments of its genre. It helps explain, for instance, why critics like Michael Bristol and Pamela Brown do not even bother to address the so-called tragic elements of *Othello*, declaring instead that the play represents a cruel and obscure form of comedy that we should try to historicize on early modern terms. Brown claims, for instance, that two centuries of *Othello* criticism have 'labored to "beautify" the play, to render it "cooked" rather than cruel and raw – labor that allows us to enjoy rather than be horrified by our complicity in its violence and racism.... [This] critical labor of rendering it a civilized tragedy has caused the satire to vanish utterly, like cooking smoke' (192). Bristol's and Brown's views align neatly with what Spolsky has found among critics of autobiography, who have, Spolsky writes, consistently validated their re-categorizations of autobiographical texts by insisting on their own 'truer accounts of the way the world actually was' at the time of the texts' compositions:

Even as they acknowledge the power of their own political contexts as provocation for their recategorizations, the implied goal of the literary historians in all these studies of autobiography is to try to understand 'distant times'; their job, as they see it, is to be open to the old text in such a way that their critical assertions reflect the state of that world. The critics, thus, suggest revisions in literary historical descriptions, claiming that the new categorizations and attendant inferences are truer accounts of the way the world actually was, and that the new category names and the implications they propose are better descriptions of the generic intentions of the authors of the texts than were available under the old category names. (*Gaps* 80).

What Bristol's, Brown's, and Spolsky's analyses together imply is that, even if *Othello* was originally conceived and performed as a tragedy,<sup>26</sup> today it simply *isn't a tragedy* for an increasing number of viewers and readers – certainly not from within the experience of the many who now know first-hand the social and cultural mingling of black and white, the shuffling of real and ideological identity boundaries, and today's various discourses on race and identity that were not available to the early seventeenth century. This is not to say that no one living can ever again experience *Othello* as tragic. Some do, and some continue to write critically about the tragic elements that they discern in the play. Nevertheless, the signs of *Othello*'s active recategorization are ongoing – have been ongoing for centuries – and will continue to appear so as the shifting experiences that determine human mind-embodiment beget new semantic categories that we can't avoid deploying in our attempts to place the play within the literary system.

## VII

Genre conceived on these terms – determined by the shifting semantics of human cognitive systems as well as by the mediating powers of social discourse – is radically destabilized. But this destabilization is hardly random or arbitrary. After all, it derives from human mind-embodiment and as such finds its complements and its limits in human experience. My claiming this, that genre categorization and recategorization are constrained by experience and are thus non-arbitrary, does not alter or even add substantively to the content of poststructuralist critics' readings of *Othello*. However, it does imply revisions to the philosophical bases of poststructuralism that impact how we

are to understand poststructuralist *subjectivity* and the nature of the agency that is inherent to the subject. We have already seen how the materialist ontology that Spolsky imports from Darwinian evolution invites a subtle turn away from the terminology of ‘destabilization’ to that of ‘flexibility’ and ‘adaptability.’ In essence what Spolsky posits – at the same moment that she suggests this ontological dimension to poststructuralist imagery – is an unavoidable *phenomenology* of brains and minds embedded within real bodies that offer us physical contact with a real world, a world whose edges our brains and minds represent by imposing structural constraints on the shapes that our conceptions of reality can take. This is a poststructuralism that, in the interests of finding the widest possible scope for materialism, has dissolved the strict divisions separating epistemology, ontology, and phenomenology from one another, finding that the various modalities of materiality that each one offers can complement the others, ceasing to contradict.<sup>27</sup>

But the epistemology of such a poststructuralism must also relinquish its absolute commitment to constructivity. Specifically, it must retreat from the position of extreme anti-realism that it has taken for decades now, a position that has become no more tenable for many literary critics than the extreme realism against which it is a reaction. I have argued elsewhere for envisioning a cognitive-based epistemological continuum that features the epistemological positions of realism and relativism as two extreme ends defining a spectrum of positions, in which all the positions in between these two extremes are actually various combinations of *both* extremes, differing only in the degree of emphasis placed on either.<sup>28</sup> Cognitive literary and cultural theory of any kind, predicated on the assumption that all knowledge is species-specific, uniquely occupies this epistemological spectrum, and so would a cognitive-poststructuralism like Spolsky’s. A cognitive-poststructuralism would remain constructivist as a theory of knowledge and subjectivity, as do all cognitive-based literary approaches; but it would have to incorporate, as well, a certain degree of realism, though without having to embrace realism in its strongest and least plausible form. The cognitive-poststructuralist subject that emerges from this epistemological spectrum is a blend of ontological, phenomenological, and epistemological agencies. The first, the ontological, gives the subject a measure of stability but never in the idealist, essentialist, or absolute sense. The last, the epistemological, gives the subject flexibility, but its adaptiveness is never random, unmotivated, or irrelevant to its phenomenological experience. The cognitive apparatus is pre-discursive, contributing to interpretations of orders in the world (including assessments of literary orders) by enabling but also constraining representation and through the subject’s own condition of being enabled and constrained by representation.

Genre recategorization is thus an unsurprising effect of this cognitive-poststructuralist subjectivity, recursively reproducing the non-arbitrary limits of cognition in a display of the dynamism that characterizes the individual human’s involvement in representation. These conditions will always mean that genre is a non-arbitrary yet unpredictable phenomenon, indexed, as it is, to both the cognitive and the ideological apparatuses that together determine the shape of literary history.

## Notes

- 1 See, for example, the entry under ‘genre’ in Cuddon, *Dictionary*: ‘A French term for a kind, a literary type or class’; or in Harmon and Holman, *Handbook*: ‘Used to designate the types or categories into which literary works are grouped according to form, technique, or, sometimes, subject matter. The French term means “kind,” “genus,” or “type.”’ These and other handbooks go on to note

- the complexities of typing literature, some, such as Fowler, *Dictionary*, going out of their way actively to problematize genre. However, for the most part, the notion of ‘type’ or ‘kind’ is generally taken for granted.
- 2 See Jameson, *Political Unconscious*; Rosmarin; Cohen, ‘History and Genre’ and ‘Do Postmodern Genres Exist?’; Frow; Snyder; and Madsen.
  - 3 To name only some of the key studies in embodiment-oriented cognitive science in recent years: Lakoff, *Women, Fire, and Dangerous Things*; Edelman, *Bright Air, Brilliant Fire*; Kosslyn and Koenig, *Wet Mind*; Damasio, *Descartes’ Error* and *Feeling of What Happens*.
  - 4 The full range of scholarship is too broad to represent or cite here, but see Richardson’s survey in this volume, ‘Studies in Literature and Cognition.’ See also Richardson’s ‘Cognitive Science’ and Crane and Richardson, ‘Literary Studies.’
  - 5 To mention only the most recent book-length studies: Crane, *Shakespeare’s Brain*; Spolsky, *Satisfying Skepticism*; and Richardson, *British Romanticism*.
  - 6 Spolsky first addresses genre in her collaborative study with Schauber, *Bounds of Interpretation: Linguistic Theory and the Literary Text*; then in *Gaps in Nature*, esp. chapters 2 and 3; and most recently in ‘Darwin and Derrida.’ Another cognitive critic who mentions genre – although not in relation to poststructuralist theory or concerns – is Turner, who writes: ‘Given the cognitive scientific study of the nature of categories, we should not be surprised to find effects of the basic level in genre categories, or prototype effects in genre categories, or metaphoric members of a genre category, or radial categories within our conception of a given genre, or a gradient from the categorical to the analogical in the ways literary works are connected, or (perhaps most obviously) family resemblance as a creator of genres, and so on. The analysis of genre theory in the light of the cognitive scientific study of conceptual connections would be a large, intricate, and important work. It is so necessary and obvious that its development as a literary critical project in the age of cognitive science seems inevitable’ (150). See also Sinding, ‘Assembling Spaces.’
  - 7 Spolsky’s views in this vein appear throughout her chapters on genre in *Gaps in Nature* and in ‘Darwin and Derrida.’
  - 8 The feminist philosopher Elizabeth Grosz makes similar claims in ‘Darwin and Ontology.’
  - 9 Notable examples include Cohen, who describes genres as ‘open categories’ (‘History and Genre,’ 204); and Jameson, whose assessment of the need for a theory of historically flexible categories anticipates Spolsky’s genre theory and the cognitive semantic theory of categories in general: ‘The older generic categories do not ... die out, but persist in the half-life of the subliterary genres of mass culture.... Meanwhile, it would seem necessary to invent a new, historically reflexive, way of using categories, such as those of genre, which are so clearly implicated in the literary history and the formal production they were traditionally supposed to classify and neutrally to describe’ (107). For background on cognitive semantics, see Lakoff, *Women, Fire and Talmy, Toward a Cognitive Semantics*, vols. 1 and 2. The latter part of this essay will more directly address the image-schema theory at the basis of cognitive semantics.
  - 10 I am indebted for my understanding of this tradition to discussions by Cohen and Madsen in particular, whose observations I summarize but without hope of capturing the full complexities of the genre debates they outline.
  - 11 Early modern English playwrights were notorious for mixing genres, often to profitable effect, as evidenced by the popularity of Jacobean tragicomedy. They were not, however, un-self-conscious about this mixing. Shakespeare’s joke at Polonius’ expense about the staging of ‘pastoral-comical, historical-pastoral, tragical-historical, [and] tragical-comical-historical-pastoral’ (*Hamlet*, 2.2.397–99) suggests nothing if not acute awareness of a trend that perhaps had begun to border on the incomprehensible. But the obverse of such an awareness is a cognizance of certain accepted norms. I think it is fair, therefore, to discuss an early modern norm for tragedy despite the early modern reputation for mixing.
  - 12 All quotations of *Othello* are from Shakespeare, *Complete Works*, ed. Bevington.
  - 13 See S. Snyder; Fiedler; Hendricks; and Brown.
  - 14 In fact, poststructuralist critics routinely perform readings based on the open but unexplored acknowledgment that discourses are shaped by semantic categories. To give an example just from my reading in the *Othello* criticism as preparation for writing this essay: Vaughan, discussing the impact on *Othello* of its military discourses, writes: ‘While the changing categories embedded in

- sixteenth-century military discourse do not directly cause the tragedy, they do provide Iago with linguistic tools he can use with Roderigo, Cassio, and Othello' (50, emphasis added).
- 15 The descriptor 'second-generation cognitive science' appears throughout Lakoff and Mark Johnson's *Philosophy in the Flesh*; see esp. 75–78.
  - 16 The other two are functional linguistics and corpus linguistics, both of which reject the theoretical commitment to '*langue*' over '*parole*' as a premise for research (associated, for instance, with Saussurean structuralism or Chomskyan generative-transformational linguistics), instead embracing actual language practice as a starting point for linguistic research.
  - 17 This agenda is the subject of another of my articles, 'Epistemology of Cognitive Literary Studies.'
  - 18 There is now a large body of work being generated by linguists on an international scale that examines image schemas and their resulting complexes of categories in a wide selection of languages. For literary critics and other non-linguists, however, the best introduction to the theory of image schemas (with ample examples) remains Johnson's *The Body in the Mind*. For specialists' discussions, see (to cite only a few) Lakoff; Langacker, *Foundations of Cognitive Grammar* and *Concept, Image, and Symbol*; and Goldberg, *Constructions*.
  - 19 The container schema may turn out to be particularly salient for a variety of ideological systems, including those that inform theatrical experience. The theater historian Bruce McConachie has focused almost exclusively on this schema in his studies of American, Broadway-based Cold War drama of the 1950s. See 'Doing Things with Image Schemas' and *American Theater*.
  - 20 To cite only a handful of the relevant studies: Hunter; Greenblatt; Berry; Neill; Loomba; and Adelman.
  - 21 Barthelemy, 1–17. The remainder of this paragraph is indebted for its general descriptions to Barthelemy's work, along with that of Vitkus; D'Amico, and Vaughan.
  - 22 Genesis 10.6.
  - 23 Vitkus discusses the long-standing tradition of assigning lechery to Muslims in particular: 'In Western European texts, from the medieval to the early modern period, Islam was usually defined as a licentious religion of sensuality and sexuality' (156). Further highlighting the blurring of ethnic and racial distinctions, Vitkus also notes that the 'alleged sexual excesses of the Muslims were linked to those of the Moors or black Africans, who are frequently described ... as a people naturally given to promiscuity' (159).
  - 24 There is some tension between those critics who localize the play's racist elements to the character of Iago and those who view these elements as woven into the play's ethical fabric, subsuming the particular agents of a racist perspective into a larger whole. A recent example of the former is Adelman, who offers a psychoanalytic reading of Iago's racist projections onto Othello and other characters.
  - 25 'Conversion' is the term that Vitkus uses, arguing that Othello's last-minute metamorphosis into the enemy Turk resonates with English anxiety in the seventeenth century over real or imagined threats of religious conversions, from Protestantism to Catholicism and from Christianity to Islam.
  - 26 I should stress that Brown, even more so than Bristol, takes the stand that the play was *not* conceived or received as tragedy.
  - 27 The phenomenology I refer to here and in the following paragraph very closely resembles the 'embodied consciousness' of the French philosopher Maurice Merleau-Ponty. While there is not space in this essay to develop the Merleau-Pontyan connections to the ontological-epistemological nexus that Spolsky suggests (and which I adopt), it should be noted that Merleau-Ponty's ideas have proved influential for second-generation cognitive science. See, for instance, Varela, Thompson, and Rosch, 3–4; or Lakoff and Johnson, 97.

# CHAPTER 3

## Narrative Empathy

*Suzanne Keane*

Suzanne Keane's work is part of the move to study the confluence of affect and cognition in the brain. That our knowledge of others' pain can provoke feelings of identification and affect-sharing has been known since Aristotle, but modern neuroscience allows for a deepening of our understanding of how that happens. Mirror neurons in the brain allow us to feel other people's sufferings as our own. Keane explores the implications of these findings for the study of fiction. Reading fiction has been found to increase readers' capacity for empathy, and Keane notes that novel writers have been found to score higher for empathy than the general population. The invitation when we open a novel to see the world from someone else's point of view seems to strengthen our mind's empathetic capacities.

We are living in a time when the activation of mirror neuron areas in the brains of onlookers can be recorded as they witness another's actions and emotional reactions.<sup>1</sup> Contemporary neuroscience has brought us much closer to an understanding of the neural basis for human mind-reading and emotion-sharing abilities – the mechanisms underlying empathy. The activation of onlookers' mirror neurons by a coach's demonstration of technique or an internal visualization of proper form and by representations in television, film, visual art, and pornography has already been recorded.<sup>2</sup> Simply hearing a description of an absent other's actions lights up mirror neuron areas during fMRI imaging of the human brain.<sup>3</sup> The possibility that novel reading stimulates mirror neurons' activation can now, as never before, undergo neuroscientific investigation. Neuroscientists have already declared that people scoring high on empathy tests have especially busy mirror neuron systems in their brains.<sup>4</sup> Fiction writers are likely to be among these high-empathy individuals. For the first time we might investigate whether human differences in mirror neuron activity can be altered by exposure to art, to teaching, to literature.

This newly enabled capacity to study empathy at the cellular level encourages speculation about human empathy's positive consequences. These speculations are not new, as any student of eighteenth-century moral sentimentalism will affirm, but they dovetail

*Original publication details:* Suzanne Keene, "Narrative Empathy" from *Towards a Cognitive Theory of Narrative Acts*, pp. 61–93. University of Texas Press, 2010. Reproduced with permission from University of Texas Press.

with efforts on the part of contemporary virtue ethicists, political philosophers, educators, theologians, librarians, and interested parties such as authors and publishers to connect the experience of empathy, including its literary form, with outcomes of changed attitudes, improved motives, and better care and justice. Thus a very specific, limited version of empathy located in the neural substrate meets in the contemporary moment a more broadly and loosely defined, fuzzier sense of empathy as the feeling precursor to and prerequisite for liberal aspirations to greater humanitarianism. The sense of crisis stirred up by reports of stark declines in reading goes into this mix, catalyzing fears that the evaporation of a reading public leaves behind a population incapable of feeling with others. Yet the apparently threatened set of links between novel reading, experiences of narrative empathy, and altruism has not yet been proven to exist. This chapter undertakes three tasks preliminary to the scrutiny of the empathy-altruism hypothesis<sup>5</sup> as it might apply to experiences of narrative empathy, an argument I develop more fully in *Empathy and the Novel* (2007).<sup>6</sup> These tasks include: a discussion of empathy as psychologists understand and study it; a brief introduction to my theory of narrative empathy, including proposals about how narrative empathy works; and a review of the current research on the effects of specific narrative techniques on real readers.

## What Is Empathy?

*Empathy*, a vicarious, spontaneous sharing of affect, can be provoked by witnessing another's emotional state, by hearing about another's condition, or even by reading. Mirroring what a person might be expected to feel in that condition or context, empathy is thought to be a precursor to its semantic close relative, *sympathy*. *Personal distress*, an aversive emotional response also characterized by apprehension of another's emotion, differs from empathy in that it focuses on the self and leads not to sympathy but to avoidance. The distinction between empathy and personal distress matters because empathy is associated with the moral emotion *sympathy* (also called *empathic concern*) and thus with prosocial or altruistic action.<sup>7</sup> Empathy that leads to sympathy is by definition other-directed, whereas an over-aroused empathic response that creates personal distress (self-oriented and aversive) causes a turning away from the provocative condition of the other. No philosophers who put stock in the morally improving experience of narrative empathy include personal distress in their theories. Because novel reading can be so easily stopped or interrupted by an unpleasant emotional reaction to a book, however, personal distress has no place in a literary theory of empathy, though it certainly contributes to aesthetic emotions, such as those Sianne Ngai describes in her important book *Ugly Feelings*.

In empathy, sometimes described as an emotion in its own right,<sup>8</sup> we feel what we believe to be the emotions of others.<sup>9</sup> Empathy is thus agreed to be both affective and cognitive by most psychologists. Empathy is distinguished in both psychology and philosophy (though not in popular usage) from *sympathy*, in which feelings *for* another occur. So, for instance, one may distinguish empathy from sympathy in this fashion:

*Empathy:*  
I feel what you feel.  
*I feel your pain.*

*Sympathy:*

I feel a supportive emotion about your feelings.

*I feel pity for your pain.*

These examples emphasize negative emotions – pain and pity – but it should be noted from the outset that although psychological and philosophical studies of empathy have tended to gravitate toward the negative, empathy also occurs for positive feelings of happiness, satisfaction, elation, triumph, and sexual arousal.<sup>10</sup> All of these positive kinds of empathy play into readers' pleasure, or *jouissance*.<sup>11</sup>

Experts on *emotional contagion*, the communication of one's mood to others, have done a better job of studying the full range of emotional states that can be shared through our automatic mimicry of one another.<sup>12</sup> Indeed, primitive emotional contagion, or “the tendency to automatically mimic and synchronize facial expressions, vocalizations, postures, and movements with those of another person and consequently, to converge emotionally” (Hatfield, Cacioppo, and Rapson, 81) offers a compelling explanation of a component of our empathy as arising from our physical and social awareness of one another, from birth. Inherited traits play an important role in our disposition to experience emotional contagion,<sup>13</sup> but our personal histories and cultural contexts affect the way we understand automatically shared feelings.<sup>14</sup>

So, for instance, emotional contagion comes into play in our reactions to narrative, for we are also story-sharing creatures. The oral storyteller not only takes advantage of our tendency to share feelings socially by doing the voices and facial expressions of characters, but also tacitly trains young children and members of the wider social group to recognize and give priority to culturally valued emotional states.<sup>15</sup> This education does not create our feelings, but renders emotional states legible through their labels, and activates our expectations about what emotions mean. Narratives in prose and film infamously manipulate our feelings and call upon our built-in capacity to feel with others. Indeed, the early history of empathy as a subject of study emphasized both emotional contagion and aesthetic responses.

The word *empathy* appeared as a translation of *Einfühlung* in the early twentieth century. In 1909, the experimental psychologist E. B. Titchener translated as “empathy” aesthetician Theodor Lipps’s term *Einfühlung* (which meant the process of “feeling one’s way into” an art object or another person).<sup>16</sup> Notably, Titchener’s 1915 elaboration of the concept in *Beginner’s Psychology* exemplifies empathy through a description of a reading experience: “We have a natural tendency to feel ourselves into what we perceive or imagine. As we read about the forest, we may, as it were, become the explorer; we feel for ourselves the gloom, the silence, the humidity, the oppression, the sense of lurking danger; everything is strange, but it is to us that strange experience has come” (198). In the beginning of the twentieth century, the English novelist Vernon Lee brought *Einfühlung* and empathy to a broader literary audience. In a public lecture followed by a magazine piece in a popular journal,<sup>17</sup> Lee advanced a theory of aesthetic perception of form involving empathy, though not (at first) so named. Originally Lee’s aesthetics focused on bodily sensations and muscular adjustments made by beholders of works of art and architecture and downplayed emotional responsiveness. By the time she revised and expanded her ideas for presentation in book form, however, Lee had adapted Lipps’s understanding of empathy, a parallel development from common sources in German aesthetics.

Defining the purpose of art as, in part, “the awakening, intensifying, or maintaining of definite emotional states” (Lee 99–100), Lee makes empathy a central feature of our

collaborative responsiveness (128). In an account that combines motor mimicry, memory, and psychological responsiveness to inanimate objects, Lee argues that empathy enters into “imagination, sympathy, and also into that inference from our own inner experience which has shaped all our conceptions of an outer world, and given to the intermittent and heterogeneous sensations received from without the framework of our constant and highly unified inner experience, that is to say, of our own activities and aims” (68). No sooner had the term been announced and situated so centrally in aesthetic theory for an English-language audience, however, than it received brisk challenge from high modernist quarters. The disdain of Bertolt Brecht for empathy (and his advocacy of so-called alienation effects), the embrace of difficulty by modernist poets, and the dominance of New Criticism, which taught students to avoid the affective fallacy, all interfered with the integration of empathy into literary theory until recently. Novelists and novel readers who prized experiences of emotional fusion cultivated narrative empathy throughout periods when the term was in eclipse.

## How Is Empathy Studied?

The focus on our embodied experience in feminist criticism, disability studies, cognitive approaches to narrative, and some ecocriticism, draws literary studies closer to disciplines that accept the use of making measurements, doing tests and experiments, and interpreting empirical evidence. This section explains some of the methods being used by neuroscientists and developmental and social psychologists to study empathy. Developing the conversation between literature and psychology ought to benefit both disciplines, however, and the subsequent comments on what is known and especially what has not yet been tested about the effects of narrative techniques contribute to a more nuanced application of psychonarratology to questions of interest to social and developmental psychologists.

Psychologists test and record empathy in a variety of ways. Physiological measures, sometimes combined with self-report, can show the strength or weakness (or presence and absence) of empathic responses.<sup>18</sup> Psychologists measure changes in heart rate and skin conductance (palm sweat). They collect data on perceptible and imperceptible facial reactions, the latter captured by EMG (electromyographic) procedures.<sup>19</sup> They ask subjects how they feel or how they would act in certain situations, gathering responses through self-reports during or immediately after experiments and through surveys. Specialized surveys known as “empathy scales” are used to assess subjects’ strength of empathic feeling.<sup>20</sup> Recently, Functional Magnetic Resonance Imaging (fMRI) has had a profound impact on brain science, including the study of empathy.<sup>21</sup>

Tania Singer and her colleagues have recently published a study in *Science* documenting empathetic responses to witnessing another’s pain, supported by fMRI data. This study broke new ground in demonstrating why a person perceives that she feels another’s pain, while not literally experiencing the identical sensations. Singer compared what happened in a subject’s brain when she was actually shocked, when pain regions in the limbic system (the anterior cingulate cortex, the insula, the thalamus, and the somatosensory cortices) lit up on the fMRI, with what the brain looked like during observation of another’s pain. When watching a loved one in the same room receiving a sharp shock, subjects showed active responses in the *affective* parts of the brain’s pain matrix (in the anterior insula and anterior cingulate cortex, the lateral cerebellum, and the brain stem),

but not in the somatosensory cortices of the brain. The affective brain areas responded to both real and imagined pain. A person not actually experiencing pain but observing a loved one being shocked showed brain activation of matching emotional areas, though not the sensory areas. Empathy alone did not light up the sensory areas for pain. Singer and her colleagues conclude that empathy is mediated by the part of the pain network associated with pain's affective qualities, but not its sensory qualities (Singer et al., 1157). They observed that subjects with higher scores on general empathy scales<sup>22</sup> "showed stronger activations in areas significantly activated when the subjects perceived their partner as being in pain" (1159). They also discovered that the same empathetic effects could be elicited without an emotional cue – in other words, subjects did not need to see their partners grimacing in pain in order to show empathic responses. An "arbitrary cue" signaling the feeling state of another was sufficient to elicit empathy (1158). This set of results affirms what neuroscientists working on mirror neurons on monkeys have theorized and what philosophers since David Hume have been saying about empathy for centuries. For the first time, brain images supporting the long-standing introspective account of empathy have been recorded.

The questions of how and why empathy works in the bodies and brains of human beings can still only be answered with theoretical speculations about the physiological substrate,<sup>23</sup> though the fMRI-based research described above and recent neuroscience on the shared manifold for intersubjectivity get researchers closer than they have been before. Stephanie Preston and Frans de Waal propose that witnessing or imagining another in an emotional state activates automatic representations of that same state in the onlooker, including responses in the nervous system and the body. They write that "empathy processes likely contain fast reflexive sub-cortical processes (directly from sensory cortices to thalamus to amygdala to response) and slower cortical processes (from thalamus to cortex to amygdala to response). These roughly map onto contagious and cognitive forms of empathy, respectively" (Preston and de Waal, 12). The advantages of automatic responses lie in their speediness. Joseph LeDoux has written about how fear responses in the amygdala provide a quick-and-dirty, possibly life-saving response to environmental threats, which can then be evaluated as the slightly slower cognitive evaluation of a threat kicks in (Le Doux, 168–178). What is sometimes called "primitive empathy" may work in the same way, providing a first, fast, feeling response to seeing or learning about another's emotional state, before cognitive evaluation through deliberate role taking occurs.<sup>24</sup>

The human capacity for primitive empathy, or the phenomenon of spontaneously matching feelings, suggests that human beings are basically similar to one another, with a limited range of variations. Psychologist Martin Hoffman, for instance, believes that the structural similarities in people's physiological and cognitive response systems cause similar feelings to be evoked by similar events (Hoffman, *Moral Development*, 62). However, Hoffman would be the first to concede that similarity itself is not enough to guarantee an empathetic response. Singer and her colleagues believe that our survival depends on effective functioning in social contexts, and that feeling what others feel, empathizing, contributes to that success. They suggest that "our ability to empathize has evolved from a system for representing our internal bodily states and subjective feeling states" to ourselves (Singer et al., 1161). In other words, empathy as Singer's group understands it participates in a theory of mind that links second-order re-representations of others to the system that allows us to predict the results of emotional stimuli for ourselves. Recent research suggests a mechanism at the neural level that would enable

such representations of others' actions, including facial expressions and bodily postures that may convey emotional states.<sup>25</sup> Contemporary neuroscience theorizes a system for representation of others' feelings that participates in the task of enabling us to understand the motives, beliefs, and thoughts of others. This work on empathy thus supports the theories of evolutionary psychology that emphasize the adaptive function of our social relations.<sup>26</sup> Given this basis in human shared intersubjectivity, empathy thus appears to many to be a key element in our responsiveness to others.

My work seeks to clarify why the link between narrative empathy and altruism is nonetheless so tenuous. For a novel reader who experiences either empathy or personal distress, there can be no expectancy of reciprocation involved in the aesthetic response. The very nature of fictionality renders social contracts between people and person-like characters null and void. Unlike the hostage children in Beslan who wished that Harry Potter would come to their rescue, adult readers know that fictional characters cannot offer us aid. Similarly, we accept that we cannot help them out, much as we may wish to intervene: Don't marry him, Dorothea! We may feel intense interest in characters, but incurring obligations toward them violates the terms of fictionality. That is, an empathetic response can be diverted from a prosocial outcome through interfering cognition.

The treatment of emotions and rationality as separate and dichotomous features of our experience has been challenged in recent decades. Thinking and feeling, for Antonio R. Damasio, are part of the same package.<sup>27</sup> In a series of academic articles and popular books, he has shown that clinical patients suffering from emotional disorders have cognitive difficulties. Ronald DeSousa has also advocated recognition of the rationality of emotions, and Joseph LeDoux's cognitive neuroscience focuses on *The Emotional Brain*. Evolutionary psychologists Leda Cosmides and John Tooby<sup>28</sup> speak for a growing group of scientists who believe that "one cannot sensibly talk about emotion affecting cognition because 'cognition' refers to a language for describing all of the brain's operations, including emotions and reasoning (whether deliberative or nonconscious), and not to any particular subset of operations" (Cosmides and Tooby, "Evolutionary Psychology," 98).<sup>29</sup> In the relatively recent field known as Cognitive Approaches to Literary Studies, where the work of LeDoux and Damasio has virtually canonical status, matters of affect are generally considered to fall under the umbrella of the term *cognitive*. Few literary cognitivists acknowledge that a psychologist might not readily accede to the centrality of emotions to cognition. The sub-disciplinary boundaries within the extremely diverse field of psychology result in different emphases and perspectives on the place of the emotions. Empathy studies have from the start challenged the division of emotion and cognition, but they have also been altered by the convictions and disciplinary affiliations of those who study empathy.

I set aside for the moment the view that emotions and cognition describe different processes of the central nervous system, for empathy itself clearly involves both feeling and thinking. Memory, experience, and the capacity to take another's perspective (all matters traditionally considered cognitive) have roles in empathy. Yet the experience of empathy in the feeling subject involves the emotions, including sensations in the body. In any case, narrative empathy invoked by reading must involve cognition, for reading itself relies upon complex cognitive operations. Yet overall, emotional response to reading is the more neglected aspect of what literary cognitivists refer to under the umbrella term *cognition*. This does not need to be so. The discipline of aesthetics, which has historical ties both to philosophy and to psychology, as well as to literary studies, has

been interested for over a century in empathy as a facet of creativity and an explanation of human response to artworks.<sup>30</sup> In its strongest form, aesthetics' empathy describes a projective fusing with an object – which may be another person or an animal, but may also be a fictional character made of words, or even, in some accounts, inanimate things such as landscapes, artworks, or geological features.<sup>31</sup> The acts of imagination and projection involved in such empathy certainly deserve the label “cognitive,” but the sensations, however strange, deserve to be registered as feelings. Thus I do not quarantine narrative empathy in the zone of either affect or cognition: as a process, it involves both. When texts invite readers to feel, they also stimulate readers’ thinking.<sup>32</sup> Whether novel reading comprises a significant enough feature of the environment of literate people to play a critical role in their prosocial development remains to be seen. Even the leap between reading and empathizing can fall short, impeded by inattention, indifference, or personal distress. Readers’ cognitive and affective responses do not inevitably lead to empathizing, but fiction does disarm readers of some of the protective layers of cautious reasoning that may inhibit empathy in the real world.

Narrative theorists, novel critics, and reading specialists have already singled out a small set of narrative techniques – such as the use of first-person narration and the interior representation of characters’ consciousness and emotional states – as devices supporting character identification, contributing to empathetic experiences, opening readers’ minds to others, changing attitudes, and even predisposing readers to altruism. In the course of reviewing the available research on this subject, I point out the gaps in our knowledge of potentially empathetic narrative techniques. No specific set of narrative techniques has yet been verified to override the resistance to empathizing often displayed by members of an in-group regarding the emotional states of others marked out as different by their age, race, gender, weight, disabilities, and so forth.<sup>33</sup> Human beings, like other primates, tend to experience empathy most readily and accurately for those who seem like us, as David Hume and Adam Smith predicted.<sup>34</sup> We may find ourselves regarding the feelings of those who seem outside the tribe with a range of emotions, but without empathy.<sup>35</sup> If empathetic reading experiences start a chain reaction leading to mature sympathy and altruistic behavior, as advocates of the empathy-altruism hypothesis believe, then discovering the narrative techniques involved matters. It is one thing to discover, however, that high empathizers report empathetic reading experiences, and quite another to show that empathetic reading experiences can contribute to changing a reader’s disposition, motivations, and attitudes. If novels could extend readers’ sense of shared humanity beyond the predictable limitations, then the narrative techniques involved in such an accomplishment should be especially prized.

## A Theory of Narrative Empathy

Character identification often invites empathy, even when the fictional character and reader differ from one another in all sorts of practical and obvious ways, but empathy for fictional characters appears to require only minimal elements of identity, situation, and feeling, not necessarily complex or realistic characterization. Whether a reader’s empathy or her identification with a character comes first is an open question: spontaneous empathy for a fictional character’s feelings sometimes opens the way for character identification. Not all feeling states of characters evoke empathy; indeed, empathetic responses to fictional characters and situations occur more readily for negative emotions, whether or

not a match in details of experience exists. Finally, readers' experiences differ from one another, and empathy with characters doesn't always occur as a result of reading an emotionally evocative fiction.

Several observations help to explain the differences in readers' responses. Most important, readers' empathic dispositions are not identical to one another. Some humans are more empathetic to real others, and some feel little empathy at all. (Some research suggests that empathizers are better readers, because their role-taking abilities allow them to more readily comprehend causal relations in stories.)<sup>36</sup> The timing and the context of the reading experience matters: the capacity of novels to evoke readers' empathy changes over time, and some novels may only activate the empathy of their first, immediate audience, while others must survive to reach a later generation of readers in order to garner an emotionally resonant reading. Readers' empathy for situations depicted in fiction may be enhanced by chance relevance to particular historical, economic, cultural, or social circumstances, either in the moment of first publication or in later times, fortuitously anticipated or prophetically foreseen by the novelist.

Novelists do not exert complete control over the responses to their fiction. Empathy for a fictional character does not invariably correspond with what the author appears to set up or invite. Situational empathy, which responds primarily to aspects of plot and circumstance, involves less self-extension in imaginative role taking and more recognition of prior (or current) experience. A novelist invoking situational empathy can only hope to reach readers with appropriately correlating experiences. The generic and formal choices made by authors in crafting fictional worlds play a role in inviting (or retarding) readers' empathic responses. This means that for some readers, the author's use of the formulaic conventions of a thriller or a romance novel would increase empathic resonance, while for other readers (perhaps better educated and attuned to literary effects), unusual or striking representations promote foregrounding and open the way to empathic reading.<sup>37</sup>

Novelists themselves often vouch for the centrality of empathy to novel reading and writing, and express belief in narrative empathy's power to change the minds and lives of readers. This belief mirrors their experiences as ready empathizers. Yet even the most fervent employers of their empathetic imaginations realize that this key ingredient of fictional worldmaking does not always transmit to readers without interference. Authors' empathy can be devoted to socially undesirable ends that may be rejected by a disapproving reader. Indeed, empathic distress at feeling with a character whose actions are at odds with a reader's moral code may be a result of successfully exercised authorial empathy. Both authors' empathy and readers' empathy have rhetorical uses, which come more readily to notice when they conflict in instances of empathic inaccuracy (discordance arising from gaps between an author's intention and a reader's experience of narrative empathy). Experiences of empathic inaccuracy may contribute to a reader's outraged sense that the author's perspective is simply wrong, while strong concord in authors' empathy and readers' empathy can be a motivating force to move beyond literary response to prosocial action. The position of the reader with respect to the author's strategic empathizing in fictional worldmaking limits these potential results. I theorize that *bounded strategic empathy* operates with an in-group, stemming from experiences of mutuality and leading to feeling with familiar others. *Ambassadorial strategic empathy* addresses chosen others with the aim of cultivating their empathy for the in-group, often to a specific end. *Broadcast strategic empathy* calls upon every reader to feel with members of a group, by emphasizing common vulnerabilities and hopes through universalizing representations.

## Empathetic Narrative Techniques

Consider the commonplace that first-person fiction more readily evokes feeling responsiveness than the whole variety of third-person narrative situations. Even a college sophomore with a few weeks' training in theoretical terms can report that within the category of first-person narratives, empathy may be enhanced or impeded by narrative consonance or dissonance, unreliability, discordance, an excess of narrative levels with multiple narrators, extremes of disorder, or an especially convoluted plot. Genre, setting, and time period may help or hinder readers' empathy. Feeling out of sorts with the implied readership, or fitting it exactly, may make the difference between a dutiful reading and an experience of emotional fusion.<sup>38</sup> Contrasting first-person with third-person puts the question too broadly, with too many other variables, to reach a valid conclusion. Narrative theorists can contribute specificity and subtlety to the research into narrative empathy.

A variety of narrative techniques have been associated with empathy by narrative theorists and discourse processing experts carrying out empirical research into literary reading. The formal devices themselves are regarded as empathic in nature by some theorists and researchers, while for others the disposition of the reader toward the text can be measured by inquiring about particular consequences of literary reading. The observations made by this latter group often lead to speculations about narrative technique. Mapping these ostensibly empathic narrative techniques draws attention to the many aspects of narrative form that have *not yet* been associated with readers' empathy, but which ought not to be ruled out without careful consideration.

The most commonly nominated feature of narrative fiction to be associated with empathy is *character identification*. Specific aspects of characterization, such as naming, description, indirect implication of traits, reliance on types, relative flatness or roundness, depicted actions, roles in plot trajectories, quality of attributed speech, and mode of representation of consciousness, may be assumed to contribute to the potential for character identification and thus for empathy.<sup>39</sup> The link between readers' reports of character identification and their experiences of narrative empathy has not yet been explained.

A close second for formal quality most often associated with empathy would be *narrative situation* (including point of view and perspective): the nature of the mediation between author and reader, including the person of the narration, the implicit location of the narrator, the relation of the narrator to the characters, and the internal or external perspective on characters, including in some cases the style of representation of characters' consciousness.<sup>40</sup> Many other elements of fiction have been supposed to contribute to readers' empathy, including the repetitions of works in series,<sup>41</sup> the length of novels,<sup>42</sup> genre expectations,<sup>43</sup> vivid use of settings,<sup>44</sup> metanarrative commentary,<sup>45</sup> and aspects of the discourse that slow readers' pace (foregrounding, uses of disorder, etc.).<sup>46</sup> The confirmation of many of the hypotheses about specific narrative techniques and empathy has yet to be undertaken in most cases, but the work that has been done *as often* fails fully to support the commonplaces of narratology as it authenticates them.<sup>47</sup> Whether this has to do with faulty experimental design, insufficient grasp of the nuances of narrative theory, or verifiable confutations of theory has yet to be discovered.

## Character Identification

To begin with the necessary clarification, character identification is not a narrative technique (it occurs in the reader, not in the text), but a consequence of reading that may be precipitated by the use of particular techniques of characterization.<sup>48</sup> These qualities have not yet been investigated in a comprehensive fashion. Peter Dixon and Marisa Bortolussi emphasize aesthetic qualities of narrative that open the way to personal involvement<sup>49</sup> In contrast, Jemeljan Hakemulder suggests that readers experiencing strong admiration of an author's writing style may engage less readily with the fictional world and its inhabitants (Hakemulder, *Laboratory*, 73–74). Readers' personal involvement with a fictional character may (or may not) be contingent upon the use of a particular technique or the presence of certain representational elements that meet with their approval.<sup>50</sup> Keith Oatley believes that readers' personal experiences of patterns of emotional response provoke sympathy for characters, especially as readers identify with characters' goals and plans.<sup>51</sup> David S. Miall and Don Kuiken argue that emotional experiences of literature depend upon the engagement of the literary text with the reader's experiences,<sup>52</sup> but they emphasize foregrounding effects at the level of literary style that shake up conventions, slow the pace, and invite more active reading that opens the way for empathy.<sup>53</sup> Don Kuiken's research shows that readers who linked themselves to story characters through personal experiences were more likely to report changes in self-perception, if not actual empathy.<sup>54</sup> Max Louwerese and Kuiken suggest that empathy may work as a gap-filling mechanism, by which a reader supplements given character traits with a fuller psychologically resonant portrait.<sup>55</sup> Readers' judgments about the realism of the characters are supposed to have an impact on identification,<sup>56</sup> and the similarity of the reader to the character is widely believed to promote identification.<sup>57</sup> None of these phenomena, however, inhere in particular narrative techniques contributing to character identification.

A few techniques of characterization have actually been tested for their relation to readers' emotional responsiveness or empathy. Characters' involvement in a suspenseful situation provokes physiological responses of arousal in readers even when they disdain the quality of the narrative.<sup>58</sup> Plot-laden action-stories have been shown to promote faster reading than narratives focusing on characters' inner lives,<sup>59</sup> which may suggest by contrast greater reflectiveness on the part of character-focused readers, as Hakemulder supposes (Hakemulder, *Laboratory*, 74). However, this does not account for the quick, apparently involuntary responses to particular plot situations inspired by trashy novels. Speedy reading may be a token of involvement in a character's fate, identification, and even empathy. With the exception of appraisal of causality, virtually nothing about the role of plot structure has been associated with readers' empathetic responses, or tested in controlled settings.<sup>60</sup> Aspects of plot structure and narration that might have a role in invoking readers' empathy include the control of timing (pace), order (anachronies), the use of nested levels of narrative (stories within stories)<sup>61</sup>, serial narrative, strong or weak closure, the use of subsidiary (supplementary, satellite) plot events, repetition, and gaps. Since each one of these structural categories contains an array of possibilities for characterization, their neglect leaves us with an incomplete picture of the devices whose use makes character identification possible.

Many aspects of characterization familiar to narrative theorists have not yet been tested in controlled experiments, despite their nomination by theorists. The naming of characters (including the withholding of a name, the use of an abbreviation or a role-title

in place of a full name, or allegorical or symbolic naming, etc.) may play a role in the potential for character identification. The descriptive language through which readers encounter characters is assumed to make a difference (content matters!), but what about grammar and syntax? Does the use of present tense (over the usual past tense) really create effects of immediacy and direct connection, as many contemporary authors believe? The old “show, don’t tell” shibboleth of creative writing classes remains to be verified: direct description of a character’s emotional state or circumstances by a third-person narrator may produce empathy in readers just as effectively as indirect implication of emotional states through actions and context.<sup>62</sup> David S. Miall has suggested in “Affect and Narrative” that characters’ motives, rather than their traits, account for the affective engagement and self-projection of readers into characters, though it remains unclear when, and at which cues, readers’ emotional self-involvement jump-starts the process of interpretation. Bortolussi and Dixon believe that “transparency,” or the judgment of characters’ behavior as sensible and practical, contributes to identification (Bortolussi and Dixon 240). This may be too simple: even traditional novels are complex, polyvocal, and various, and Wayne Booth offers this sensible caution: “What we call ‘involvement’ or ‘sympathy’ or ‘identification,’ is usually made up of *many reactions* to author, narrators, observers, and other characters” (Booth 158, my emphasis). Some way of accounting for the multiplicity of reactions making up a normal novel-reading experience needs to be devised in order to study the transition from distributed characterization in narrative fiction and readers’ everyday synthesis of their reactions into an experience of character identification.<sup>63</sup>

This may mean setting aside some common value judgments about techniques. For instance, the critical preference for psychological depth expressed by the “roundness” of characters “capable of surprising in a convincing way” (Forster 78) does not preclude empathetic response to flat characters, minor characters, or stereotyped villains and antagonists. Drawing on the literature of cognitive social psychology, Richard J. Gerrig has suggested that readers are likely to make category-based judgments about fictional characters, and to emphasize attributed dispositions of characters over their actual behavior in situations.<sup>64</sup> This theory suggests, as Forster intuited, that flat characters – easily comprehended and recalled – may play a greater role in readers’ engagement in novels than is usually understood. Fast and easy character identification suffers in theorists’ accounts of the reading process, which often privilege more arduous self-extension and analogical reasoning. Patrick Colm Hogan, for instance, regards categorical empathy (with characters matching a reader’s group identity) as the more prevalent form, while situational empathy, the more ethically desirable role taking, depends upon a reader’s having a memory of a comparable experience, which is never guaranteed.<sup>65</sup> If Hogan’s situational empathy alone leads to the ethics of compassion, as he has it, then quick-match categorical empathy looks weaker and more vulnerable to bias through ethnocentrism or exclusionary thinking. We do not know, however, that categorical empathy does *not* lead to compassion, no more than we know the ethical results of situational empathy for fictional characters. Neither hypothesis has yet been tested. While literary critics and professionals value novels that unsettle convictions and contest norms, readers’ reactions to familiar situations and formulaic plot trajectories may underlie their genuinely empathetic reactions to predictable plot events and to the stereotyped figures that enact them.<sup>66</sup> The fullness and fashion by which speech, thoughts, and feelings of characters reach the reader are very often supposed by narrative theorists to enhance character identification, as I discuss below, but relatively externalized and brief statements

about a character's experiences and mental state may be sufficient to invoke empathy in a reader. Novelists do not need to be reminded of the rhetorical power of understatement, or indeed of the peril of revealing too much. Indeed, sometimes the potential for character identification and readers' empathy *decreases* with sustained exposure to a particular figure's thoughts or voice.<sup>67</sup>

### Narrative Situation

It has been a commonplace of narrative theory that an internal perspective, achieved either through first-person self-narration, through figural narration (in which the third-person narrator stays covert and reports only on a single, focal center of consciousness located in a main character), or through authorial (omniscient) narration that moves inside characters' minds, best promotes character identification and readers' empathy. Wayne Booth, for instance, writes, “*If* an author wants intense sympathy for characters who do not have strong virtues to recommend them, *then* the psychic vividness of prolonged inside views will help him” (Booth 377–378, emphasis in original). The technique also works for characters in which readers have a natural rooting interest, such as Jane Austen’s heroines. Booth’s detailed account of how Austen uses the inside view to promote sympathy for the flawed Emma is a classic of narrative theory (245–256). Booth asserts, “By showing most of the story through Emma’s eyes, the author insures that we will travel with Emma rather than stand against her” (245). Austen, one of the early masters of narrated monologue to represent characters’ consciousness, crafts smooth transitions between her narrator’s generalizations about characters’ mental states (psychonarration) and transcriptions of their inner thoughts, in language that preserves the tense and person of the narration.<sup>68</sup> Also called free indirect discourse, narrated monologue presents the character’s mental discourse in the grammatical tense and person of the narrator’s discourse.

Subsequent theorists have agreed that narrated monologue has a strong effect on readers’ responses to characters. David Miall specifically mentions the means of providing “privileged information about a character’s mind,” free indirect discourse, as especially likely to cue literariness and invite empathic decentering (Miall, “Necessity,” 54). Sylvia Adamson arrives independently at a similar point, arguing that narrated monologue should be understood as “empathetic narrative.” In Adamson’s language the representational technique and its ostensible effects fuse. *Quoted monologue* (also called interior monologue, the direct presentation of characters’ thoughts in the person and tense of their speech) also has its champions, who regard the move into first-person as invariably more authentic and direct than the more mediated or double-voiced narrated monologue. *Psychonarration*, or the narrator’s generalizations about the mental states or thoughts of a character, has fewer advocates, perhaps because it is associated with traditional narratives such as epics. However, both Wayne Booth and Dorrit Cohn suggest that psychonarration can powerfully invoke character identification, and Cohn points out that both poetic analogies and metaphors for feeling states (as Virginia Woolf often employs) require the use of psychonarration.<sup>69</sup> Despite the frequent mention of narrated monologue as the most likely to produce empathy,<sup>70</sup> quoted monologue and psychonarration also give a reader access to the inner life of characters. Most theorists agree that purely externalized narration tends not to invite readers’ empathy.<sup>71</sup>

In addition to these speculations about modes of representing inner life, the person of the narration often seems likely to effect readers' responses to narrative fiction and its inhabitants. In particular, first-person fiction, in which the narrator self-narrates about his or her own experiences and perceptions, is thought to invite an especially close relationship between reader and narrative voice. For instance, Franz Stanzel believes that the choice of internal representation of the thoughts and feelings of a character in third-person fiction and the use of first-person self-narration have a particularly strong effect on readers. Novelist and literary theorist David Lodge speculates that historical and philosophical contexts may explain the preference for first-person or figural third-person narrative voice: "In a world where nothing is certain, in which transcendental belief has been undermined by scientific materialism, and even the objectivity of science is qualified by relativity and uncertainty, the single human voice, telling its own story, can seem the only authentic way of rendering consciousness" (Lodge 87). However, the existing experimental results for such an association of technique and reaction are not robust. In several studies of Dutch teenagers, W. van Peer and H. Pander Maat tested the notion that first-person narration creates a "greater illusion of closeness ... allowing the reader a greater and better fusion with the world of the character."<sup>72</sup> They conclude, "It remains unclear why point of view has no more powerful and no more overall effect on readers, given the effort devoted by authors in order to create these devices that produce a point of view" (van Peer and Pander Maat 152). While noting that readers certainly express preferences about point of view and prefer consistency over inconsistency, they found that enhancement of sympathy for protagonists through positive internal focalization actually weakened as teenagers matured (152–154).

Lodge concedes that the first-person voice "is just as artful, or artificial, a method as writing about a character in the third-person," but he insists that it "creates an illusion of reality, it commands the willing suspension of the reader's disbelief, by modeling itself on the discourses of personal witness: the confession, the diary, autobiography, the memoir, the deposition" (Lodge 87–88). In my book I argue the opposite, that paratexts cuing readers to understand a work as fictional unleash their emotional responsiveness, in spite of fiction's historical mimicry of non-fictional, testimonial forms. My research suggests that readers' perception of a text's fictionality plays a role in subsequent empathic response, by releasing readers from the obligations of self-protection through skepticism and suspicion. Thus they may respond with greater empathy to an unreal situation and characters because of the protective fictionality, but still internalize the experience of empathy with possible later real-world responsiveness to others' needs. While a full-fledged political movement, an appropriately inspiring social context, or an emergent structure of feeling promoting change may be necessary for efficacious action to arise out of internalized experiences of narrative empathy, readers may respond in those circumstances as a result of earlier reading.

## How Narrative Empathy Works: Authors and Audiences

The dispositions and beliefs of novelists themselves also belong in a thorough study of narrative empathy. Fiction writers report looking at and eavesdropping on their characters, engaging in conversations with them, struggling with them over their actions, bargaining with them, and feeling for them: characters seem to possess independent agency. In a remarkable study of fifty fiction writers, Taylor and her collaborators

discovered that 92 percent of the authors reported some experience of the illusion of independent agency (IIA) and that the more successful fiction writers (those who had published) had more frequent and more intense experiences of it. Taylor hypothesizes that IIA could be related to authors' expertise in fantasy production (Taylor 361, 376–377), suggesting that it occurs more easily and spontaneously with practice, or that writers naturally endowed with creative gifts may experience it more readily. Though clearly novelists still do exercise their authority by choosing the words that end up on the page, they may experience the creative process as akin to involuntarily empathizing with a person out there, separate from themselves. Several tests administered by Taylor to her subjects support this connection. Taylor found that the fiction writers as a group scored higher than the general population on empathy (361). Using Davis's Interpersonal Reactivity Index (IRI), a frequently used empathy scale, Taylor measured her subjects' tendency to fantasize, to feel empathic concern for others, to experience personal distress in the face of others' suffering, and to engage in perspective taking (369–370). Both men and women in her sample of fiction writers scored significantly higher than Davis's reported norms for the general population, with females scoring higher in all four areas than males. Fiction writers of both genders stood out on all four subscales of Davis's IRI, but they were particularly off the charts for fantasy and perspective taking. Taylor speculates that "these two subscales tap the components of empathy that seem most conceptually related to IIA and might be seen as 'grown-up' versions of variables associated with children who have imaginary companions (pretend play and theory of mind skills)" (377).

Taylor's discoveries lead to speculation about the function of narrative empathy from the authors' perspective: *fiction writers as a group may be more empathetic than the general population*. However, we must also consider the difficulty of pinning down the difference between innate dispositions and results of practice and habitual use in groups of people; thus, *the activity of fiction writing may cultivate novelists' role-taking skills and make them more habitually empathetic*. These proposals do not imply that the actual behavior of fiction writers is any better than that of the population at large. Even the most ardent advocates of narrative ethics hesitate to argue that being a novelist correlates with being a better person, and novelists known to be nice people sometimes also exercise their empathy on behalf of nasty characters.

Most theories of narrative empathy assume that empathy can be transacted accurately from author to reader by way of a literary text (critiques of literary empathy disparage this goal as an unwholesome fantasy or projection). The comments of writers about their craft suggest the formation of a triangulated empathic bond. In this model authors' empathy contributes to the creation of textual beings designed to elicit empathic responses from readers. In fact there is no guarantee that an individual reader will respond empathetically to a particular representation. Because real people – for instance, objects of pity presented by charitable organizations – might find their position in that empathic triangle discomforting, critics of empathy claim it results in misunderstanding or worse.

From the failures of empathic individuals to question whether their assessments of the other's feelings could be off base comes a great deal of the negative reputation of empathy as a particularly invasive form of selfishness. (I impose my feelings on you and call them your feelings. Your feelings, whatever they were, undergo erasure.) Contrary to this fearful scenario, the research on empathic accuracy records the remarkable degree of correctness in human mind-reading abilities, though to be sure more cross-cultural

verification of these findings would be welcome.<sup>73</sup> Whether from expert reading of facial cues, body language, tone of voice, context, or effective role taking on the part of the empathizer, ordinary subjects tend to do pretty well in laboratory tests of empathic accuracy. Verification can be achieved readily enough through interviews cross-checked with physical measurements and observations.

When we respond empathetically to a novel, we do not have the luxury of questioning the character: we cannot ask, Is that how you really felt? The text, however, may verify our reactions even as it elicits them. No one narrative technique assures readers that our empathic reaction precisely catches the feelings embedded in the fictional characters. For this reason, extratextual sources, such as interviews with authors, become important tools in assessing literary empathic accuracy. My term *empathic inaccuracy* describes a potential effect of narrative empathy: *a strong conviction of empathy that incorrectly identifies the feeling of a literary persona*. Empathic inaccuracy occurs when a reader responds empathetically to a fictional character at cross-purposes with an author's intentions. Authors also sometimes evoke empathy unintentionally. This accident contributes to empathic inaccuracy. Unlike in real-world, face-to-face circumstances, the novel-reading situation allows empathic inaccuracy to persist because neither author nor fictional character directly confutes it. Indeed, literary studies privilege against-the-grain interpretations of fiction that may be founded on deliberate acts of role taking that subvert the authors' apparent intentions and increase empathic inaccuracy. A reader persuaded that she has felt with a fictional character may defy the stated or implicit intentions of an author. When the author's intention matches the reader's feelings and the agreement resonates with empathic accord, then the introduction of alternative perspectives on the matter at hand may meet with disbelief or outrage. *Empathic inaccuracy*, to craft a proposal out of this circumstance, *may then contribute to a strong sense that the author's perspective is simply wrong*. This is by no means an unproductive critical stance.

For those writers who hope to reach readers with emotionally resonant representations, the struggle against empathic inaccuracy thus has two component liabilities, failure and falsity. On *failure* of narrative empathy, I propose that *while authors' empathy may be an intrinsic element of successful fictional worldmaking, its exercise does not always transmit to readers without interference*. A second form of empathic inaccuracy occurs when authors represent a practice or experience that unintentionally evokes empathy in readers, against authors' apparent or proclaimed representational goals.

Focus on the *falsity* of narrative empathy expresses the concern that experiencing narrative empathy short-circuits the impulse to act compassionately or to respond with political engagement. In this view, narrative empathy is amoral (Posner 19), a weak form of appeal to humanity in the face of organized hatred (Gourevitch 95), an obstacle to agitation for racial justice (Delgado 4–36), a waste of sentiment and encouragement of withdrawal (Williams 109), and even a pornographic indulgence of sensation acquired at the expense of suffering others (Wood 36). To some feminist and postcolonial critics, empathy loses credence the moment it appears to depend on a notion of universal human emotions, a cost too great to bear even if basic human rights depend upon it.<sup>74</sup> The fearful view of authors' empathy as corrupting readers by offering them others' feelings for callous consumption leads in some quarters to the depiction of empathy itself as a quality that weakens humans and makes them vulnerable to others' crudest manipulations. Narrative empathy becomes yet another example of the Western imagination's imposition of its own values on cultures and peoples that it scarcely knows, but presumes to feel with, in a cultural imperialism of the emotions. Empathic inaccuracy, in this quarrel

with moral sentimentalism, then becomes evidence of the falsity of the whole enterprise of sympathetic representation.

Rather than attempting to eliminate empathic inaccuracy by arguing with or correcting readers' feeling responses, recognizing the conflict between authors' empathy and readers' empathy opens the way to an understanding of narrative empathy as rhetorical. *Both authors' empathy and readers' empathy have rhetorical uses, which may be more noticeable when they conflict in instances of empathic inaccuracy.* By using their powers of empathetic projection, authors may attempt to persuade readers to feel with them on politically charged subjects. Readers, in turn, may experience narrative empathy in ways not anticipated or intended by authors. When those readers articulate their differences with a text's or an author's apparent claims, they may call upon their own empathetic responses as a sort of witness to an alternative perspective. Arguments over empathetic differences between authors and readers, or among readers with different emotional reactions to a shared text, give feeling responsiveness to fiction a status it has not often been granted in academic analyses of literature. Narrative empathy can impede or assist arguments staged in the public sphere. Indeed, the existence of empathic novel reading experiences, whether accurate or not, often enters into debates covertly. More self-consciousness about our own experiences of narrative empathy depends in part upon identifying where we stand as members of the diverse audiences reached by authors' empathic representations.

Narrative empathy intersects with identities in problematic ways. Do we respond because we belong to an in-group, or can narrative empathy call to us across boundaries of difference? Even this formulation could be read as participating in a hierarchical model of empathy. The habit of making the reactions of white, Western, educated readers home base for consideration of reader response has not yet been corrected by transnational studies of readers, though narrative theorists such as Peter J. Rabinowitz offer subtle ways of understanding the various audiences narrative fiction may simultaneously address. When the subject positions of empathizer and object of empathetic identification are removed from the suspect arrangement that privileges white Western responses to subaltern suffering, the apparent condescension of empathy can be transformed by its strategic use.

In advancing a theory of *authorial strategic empathizing* I hope to add to the theoretical understanding of the relationship among authorial audiences (comprised of those ideal readers imagined and hoped for by authors) and actual, historic audiences made up of a variety of real readers. The resources of rhetoric, with its traditional emphases on authorial tactics, textual strategies, and audience responses, appropriately match the critical needs of a theory of narrative empathy, which must account for the empathy of both authors and readers, as well as the potentially empathetic tropes and techniques of narrative texts, as discussed above. My term *strategic empathizing*, coined in slant rhyme with Gayatri Chakravorty Spivak's strategic essentializing,<sup>75</sup> indicates the intentional (not always efficacious) work of narrative artists to evoke emotions of audiences closer and further from the authors and subjects of representation. (That many narratives have more than one built-in audience, as Peter J. Rabinowitz and Brian Richardson have argued, I assume.<sup>76</sup>) Like strategic essentializing, strategic empathizing occurs when an author employs empathy in the crafting of fictional texts, in service of "a scrupulously visible political interest."<sup>77</sup> These interests make different demands on the various audiences that may read and respond to the invitation to emotional resonance. Thus I enquire, How does strategic narrative empathy reach readers in immediate, more

distant, and totally remote audiences, where the metaphor of nearness/distance also correlates with familiarity/strangeness and sameness/otherness?

*Strategic empathizing*, a variety of authors' empathy, describes how authors attempt to direct an emotional transaction through a fictional work aimed at a particular audience, not necessarily including every reader who happens upon the text. *Bounded strategic empathy occurs within an in-group, stemming from experiences of mutuality, and leading to feeling with familiar others.* This kind of empathy can be called upon by the bards of the in-group, and it may indeed prevent outsiders from joining the empathic circle. Though we are prone to notice the delineations of class, gender, sexuality, and ethnicity that mark a text as for one audience and not so much for another, an effort of strategic empathizing may also be bounded by the toggle switch of experience. Either you have lost a partner, or you have not; either you have battled a life-threatening illness, or you have not; either you have been assaulted or imprisoned, or you have not. The gate swings open to invite you in, or it stays closed. Nothing prevents a reader who has not shared an experience from exercising the role-taking imagination while reading a remote or forbidding work, but some works do not extend the invitation to all potential readers. The persistent reader *may or may not* join the authorial audience, in Rabinowitz's term. The disinherited reader may not choose or be able to live up to the terms of the ideal audience projected by a narrative.

As Brian Richardson observes, "divergent audiences are regularly addressed in a literary work, and in many cases the disparate groups fail to mesh."<sup>78</sup> Sometimes a novelist writes to more than one audience simultaneously, with a hope of bridging the gap between them. Novelists with a purpose may set out to reach – and change – the attitudes and beliefs of a target audience. This ambition encourages the use of *ambassadorial strategic empathy*. It also directs an emotional transaction through a fictional work aimed at a particular audience, not necessarily including every reader who happens upon the text. Successfully exercised ambassadorial strategic empathy on the part of authors can be a powerful rhetorical tool in reaching and swaying the feelings of audiences. It may teach readers to feel with otherwise alien fictional others. *Ambassadorial strategic empathy addresses chosen others with the aim of cultivating their empathy for the in-group, often to a specific end.* Appeals for justice, recognition, and assistance often employ it. If identity and experience mark the audience of texts employing *bounded* strategic empathy, the relationship between the time of reading and the historical moment of publication delimits *ambassadorial* strategic empathy. Ambassadorial strategic empathy is time sensitive and context and issue dependent, marked by the period when a text's dissemination performs its ambassadorial duty by recruiting particular readers to a present cause through emotional fusion. Accompanying paratextual statements of intention on the part of writers and organizations make the attempt to use ambassadorial strategic empathy legible. A text's reception history, including enthusiastic accounts of rapport and conversion to the cause as well as hostility, also preserves the traces of ambassadorial strategic empathy at work. Polemical, didactic, biased, purposeful: narratives employing ambassadorial strategic empathy in order to reach and even change target audiences also meet resistance.

The judgments of literary merit that critics make about narrative fiction do not reliably correspond with evidence of a text's transaction of strategic empathy from author to target audience(s). Indeed, a narrative's popularity may simultaneously interfere with its reputation among tastemakers and vouch for its empathetic intensity for its readership. Indeed, narratives that deploy *broadcast strategic empathizing* in an attempt to

reach the widest possible audience most often invite derisive judgments from cultural watchdogs. *Broadcast strategic empathy calls upon every reader to feel with members of a group, by emphasizing our common human experiences, feelings, hopes, and vulnerabilities.* Narrative empathy in the form of an author's broadcast strategic empathizing employs a universal tool (language) to reach distant others and transmit the particularities that connect a faraway subject to a feeling reader. While not all novelists seek to influence as many and as various a set of readers as their books can reach, some do, and we reliably find in their fiction opportunities for character identification emphasizing the commonalities of our embodied experiences, our psychological dispositions, and our social circumstances. The fact that many postcolonial novelists aspire to extend readers' sense of our shared humanity suggests that broadcast strategic empathy deserves attention more nuanced than refusal of empathy as an impossible goal of representation.

## Unanswered Questions

In the book from which this chapter is derived, I subject to critical scrutiny the literary version of the empathy-altruism hypothesis, which holds that novel reading, by eliciting empathy, encourages prosocial action and good world citizenship. If indeed such a link could be substantiated (it has not yet been verified), then investigation of the effects of narrative techniques on real readers would have to extend beyond generalizations about character identification and a small subset of narrative situations. To the questions currently under investigation, many more may be added.

What effect (if any) does consonance (relative closeness to the related events) and dissonance (greater distance between the happening and the telling) have on readers of first-person, self-narrated fictions? Does a plural, communal narrative voice, a "we" narration, bring the reader into a perceptive circle where empathetic reactions are more readily available? Does the use of second-person "you" narration enhance the intimacy of the reading experience by drawing the reader and narrator close, or does it emphasize dissonance as it becomes clear that "you" cannot include the reader? In third-person fiction, does the use of a figural reflector, rather than an authorial (omniscient) narrator, make any difference in readers' emotional responsiveness to situations and characters?<sup>79</sup> Does the location of the narrator inside (or outside) the story-world affect readers' reactions to the content of the narration? Does a covert narrator, who scarcely does more than provide cues about characters' movements and speech, disinvite empathy for those characters, or invite readers to see the action with a greater sense of immediacy, as if it were a play, as Bortolussi and Dixon suggest (Bortolussi and Dixon 202)? In the most fully polyphonic novels, in which a single narrative perspective is simply not available to the reader, does readers' empathy increase, dwindle, or vary according to the page they are on?

Finally, to bring the questions back to what happens in actual readers, if a narrative situation devised to evoke empathy fails to do so, does the fault lie in the reader, or in the overestimation of the efficacy of the technique? While I am inclined to agree with Wayne Booth that no one ethical effect inheres in a single narrative device, the commentary on narrative form often asserts (or assumes) that a specific technique inevitably results in particular effects – political, ethical, emotional – in readers. These views, in my opinion, should be subjected to careful empirical testing before any aspect of narrative technique earns the label of "empathic." To persist in the nomination of favored

techniques as empathic without attention to the full range of techniques that may be contributing to empathic effects renders the study of narrative empathy an impressionistic endeavor at best.<sup>80</sup>

## Notes

- 1 On mirror neurons, see Keysers et al., “Demystifying Social Cognition” (501), and Gallese et al., “A Unifying View of the Basis of Social Cognition” (396).
- 2 For an overview of this research in neuroscience, see Gallese, “Being Like Me: Self-Other Identity, Mirror Neurons, and Empathy.”
- 3 On the neural effects of hearing narrative, see Tettamanti et al., “Listening to Action-Related Sentences” (273). Though most neuroscientists working on mirror neurons agree that the effects are strongest in real life, face-to-face interactions, what Gallese calls the “shared manifold for intersubjectivity” still operates when subjects see videos, experience virtual reality through computer interfaces, and simply hear narration about others. See Blakeslee (F1, F4).
- 4 Dr. Christian Keysers, cited in Blakeslee (F1, F4).
- 5 Social and developmental psychologists, philosophers of virtue ethics, feminist advocates of an ethic of caring, and many defenders of the humanities believe that empathic emotion motivates altruistic action, resulting in less aggression, less fickle helping, less blaming of victims for their misfortunes, increased cooperation in conflict situations, and improved actions on behalf of needy individuals and members of stigmatized groups. See Batson et al., “Benefits and Liabilities of Empathy-Induced Altruism” (360–370), for a discussion of the recent research on each of these results of empathy. For a warm, agent-based virtue ethics view of empathy and sympathy, see Slote, *Morals from Motives* (109–110).
- 6 Feeling with fictional others does not guarantee changes in the capacity to feel with real others and does not predict altruistic behavior on real others’ behalf. For my argument that the transposition of the “empathy-altruism” hypothesis to experiences of narrative empathy lacks experimental support, see Keen, *Empathy and the Novel* (90–92, 99, 116, 145).
- 7 On personal distress as aversive and empathy as a precursor to sympathy or empathic concern, see Batson, *The Altruism Question* (56–57), and “Altruism and Prosocial Behavior” (282–316); see also Eisenberg, “Emotion, Regulation, and Moral Development” (671–672), and “The Development of Empathy-Related Responding.”
- 8 Charles Darwin’s treatment of sympathy in *The Expression of the Emotions in Man and Animals* clearly includes empathy, though he does not use the term. Paul Ekman, the leading authority on facial expressions as indicators of universal human emotions, does not treat empathy as a core emotion, but as one of the nine starting points for emotional reactions (when we feel what others feel). See Ekman, *Emotions Revealed* (34, 37). Neuroscientist Jaak Panksepp argues that emotional systems in the brain involve central affective programs comprised of neural anatomy, physiology, and chemicals. Panksepp considers empathy one of the higher sentiments (mixing lower, reflexive affects and higher cognitive processes) emerging out of the recent evolutionary expansion of the forebrain. See “Emotions as Natural Kinds within the Mammalian Brain” (142–143). For philosopher Martha C. Nussbaum, empathy comes into play as a part of compassion, which she treats as a human emotion. See *Upheavals of Thought* (327–335). For John Deigh and those working at the intersection of ethics and cognitive science, empathy is one of the moral emotions.
- 9 For working definitions of different vicariously induced emotional states, see Eisenberg and Fabes, “Children’s Disclosure of Vicariously Induced Emotions” (111). I follow Eisenberg in differentiating empathy, aversive personal distress, and sympathy. Empathic response includes the possibility of personal distress, but personal distress (unlike empathy) is less likely to lead to sympathy, if it proceeds beyond evanescent shared feeling.
- 10 Positive forms of empathy are drastically underemphasized in the literature. See Ainslie and Monterosso, “Hyperbolic Discounting Lets Empathy Be a Motivated Process.”
- 11 See Barthes for the distinction between the relatively easy pleasure of the readerly text and the bliss that comes when the demanding writerly text helps readers break out of their subject positions.

- 12 See for instance the treatment of happiness, joy, and love in Hatfield, Cacioppo, and Rapson, *Emotional Contagion*. Theodor Lipps, an important early theorist of empathy, proposed motor mimicry as an automatic response to another's expression of emotion. See Lipps, "Das Wissen von Fremden Ichern."
- 13 For genetic influences on prosocial acts and empathic concern, see Zahn-Waxler et al., "Empathy and Prosocial Patterns in Young MZ and DZ Twins."
- 14 Cultural differences implicate differences in the nature of emotional experience. Our understanding of what it means to be a person in our cultural context affects the way we experience daily emotions of pleasantness and unpleasantness, or whether we feel entitled as individuals to express a particular emotion. See Shields.
- 15 Oral storytelling is not isolated to preliterate cultures. Children in literate cultures also absorb cultural values and narrative styles through collaborative storytelling. See the comments on rapport and empathy in Minami and McCabe.
- 16 See Titchener, 181–185. See also Lipps, *Zur Einfühlung*.
- 17 See Lee and Anstruther-Thomson for the original journal articles.
- 18 Evaluation of patients who show changes in behavior as a result of brain injuries, ailments, or surgery contributes to the understanding of empathy. See Gratton and Elsinger.
- 19 Physiological measures have the advantage of being unaffected by the subjects' desire to present themselves favorably, as may occur in surveys, interviews, or self-reports. See Eisenberg et al., "Physiological Indices of Empathy." On deceleration of heart rate in response to negative experiences of others, see Craig. On the measurement of palmar skin conductance and heart rate in response to images of people in pain, see R. S. Lazarus et al. For a skin conductance study suggesting that empathetic arousal occurs when subjects believe a person is receiving a painful shock, see Geer and Jarmecky. On facial or gestural responses as indications of empathy, see Marcus. See also Hoffman, "The Measurement of Empathy." On EMG and other physiological measurements of emotional responses, see Cacioppo and Petty, "Just Because You're Imaging the Brain."
- 20 A number of empathy scales developed since the 1950s are still in use by psychologists. The Sherman-Stotland scale includes a factor (VI) measuring "fantasy empathy" for fictional characters in stories, plays, and films. See Stotland (135–156). More recent tests of emotional intelligence include the Balanced Emotional Empathy Scale (BEES) and Davis's Interpersonal Reactivity Index (IRI). On BEES, see Mehrabian. For the IRI, which has subscales in Empathic Concern, Perspective Taking, Fantasy (including narrative empathy), and Personal Distress, see Davis, "A Multidimensional Approach" and "Measuring Individual Differences." Survey methodology has its limitations, as psychologists acknowledge. Eisenberg has repeatedly observed that cultural influences such as sex-role differentiation show up more in the kinds of tests that rely on surveys and interviews and much less (or not at all) in tests using physiological methods. See Lennon and Eisenberg.
- 21 For a salutary caution on the interpretation of these fMRI studies, which feature such dazzling pictures and often receive quite credulous promotion in the press, see Cacioppo and Petty, "Just Because You're Imaging the Brain."
- 22 Singer and her colleagues employed two empathy scales, Mehrabian's Balanced Emotional Empathy Scale and Davis's Empathic Concern Scale ("Empathy for Pain," 1159).
- 23 The amygdala, anterior temporal cortex, and orbital frontal cortex (as well as physiological synchrony of the autonomic nervous system) are probably involved in empathy, as the evidence of emotional impairment in brain-damaged or diseased patients suggests. See Brothers; Levenson and Ruef; and Rosen et al.
- 24 This account is consistent with the emotion theory of neuroscientist Edmund T. Rolls, who hypothesizes that human brain mechanisms provide two routes to action, one a quick, unconscious prompt for a behavioral response (which we share with other mammals) and the other a slower, language mediated, rational planning faculty. The two routes can produce conflicting results.
- 25 Mirror neurons fire not only when carrying out an action but also when observing another carrying out the same action. They provide a basis for understanding primates' mind-reading, and by extension, human empathy. See Gallese et al., "The Mirror Matching System." See also Iacoboni et al.

- 26 See for instance Cosmides and Tooby, “Cognitive Adaptations for Social Exchange.”
- 27 See for instance Antonio Damasio et al., “Somatic Markers and the Guidance of Behavior: Theory and Preliminary Testing.” Damasio’s works for general readers (*Descartes’ Error*, *The Feeling of What Happens*, and *Looking for Spinoza*) have resulted in wide dissemination of his theories.
- 28 See Cosmides and Tooby, “Evolutionary Psychology and the Emotions.”
- 29 Some neuroscientists informally refer to “cognotions” to emphasize the fusion of the two concepts in their research. (My informant is neuroscientist Dr. Tyler S. Lorig.) Nonetheless, many experts in cognition carry out their work without regard to the emotions, and basic textbooks on cognition rarely refer to emotions. See for instance Reed’s introductory college text, *Cognition: Theory and Applications*, 6th ed. Emotional states receive fleeting mention on just three pages of this text. The younger hybrid discipline of Social Cognition is more likely to reflect the understandings of affect and cognition as intertwined. See for instance Forgas.
- 30 The core elements of the modern concept of empathy in aesthetics can legitimately be traced to Lee, who was also a novelist. As with several key dates in psychology, rival claimants to earliest usage appear. Lipps’s 1897 work on *Einfühlung* gets translated in 1909 by experimental psychologist Titchener as *empathy*. Lee drew on Lipps’s work for *The Beautiful*. Freud also had Lipps’s books in his library and adopted the term *Einfühlung*. See Wispé.
- 31 For speculations on the role of aesthetics in human evolution, see Cosmides and Tooby, “Does Beauty Build Adapted Minds?”
- 32 Philosopher Lawrence Blum believes that insofar as emotions of sympathy and empathy promote perspective taking, they may result in better prosocial responses than rationality alone. See Blum (122–139).
- 33 Some studies suggest that people with very empathetic dispositions respond more positively to members of out-groups than less empathetic people do, but, for most people, perceived similarity encourages empathy. For a classic study affirming similarity’s relationship to higher empathy scores, see Krebs. On out-groups, see Sheehan et al. On similarity, see the literature review in Davis, *Empathy* (15, 96–99, 105–106, 109, 116–118).
- 34 On evolutionary bases for empathy for those who are like us, see Kruger; see also Hoffman, *Empathy and Moral Development* (4, 13, 206).
- 35 See the account of empathy’s potential to replace egocentrism with ethnocentrism in Sherman.
- 36 On empathy as a precursor to reading comprehension, see Bourg.
- 37 See Miall and Kuiken, “What Is Literariness?”; see also Miall, “Beyond the Schema Given.”
- 38 For this catalog of helps and impediments to empathetic reading of first-person fiction, I draw upon the in-class essays of the students in English 232, *The Novel*, composed on 20 February 2006, answering this question: “How does your recent reading experience in this course square with the notion that first-person narration is especially productive of empathetic reading? What differences in technique in the variety of first-person narrative situations might alter readers’ responses?”
- 39 Very little empirical research has been attempted to verify the theoretical speculations about aspects of characterization that operate in readers’ character identification. Bortolussi and Dixon’s pioneering study *Psychonarratology* reports their findings that character actions contribute to readers’ assessments of character traits, while self-evaluations provided by the narrator (description) do not. However, the test stories employed first-person narrators, so narrators’ evaluations of characters in third-person fiction cannot be included in this preliminary conclusion (160–165).
- 40 Schneider represents narrative situation as a factor in eliciting readers’ empathy and lack of representation of inner life as a likely inhibitor of it.
- 41 On affective responses to serial fiction, see Warhol (71–72). See also Hakemulder, *Moral Laboratory* (93, 143), drawing on Feshbach’s observations of the effects of repetitive role-taking.
- 42 Nussbaum’s empathy-inducing novels are invariably long. Writing about the character David Copperfield’s reading habits in Dickens’s novel of that name (1849–1850), Nussbaum comments, “He remains with [books] for hours in an intense, intimate, and loving relationship. As he imagines, dreams, and desires in their company, he becomes a certain sort of person.” For Nussbaum the length of the immersion is a vital component of the process, permitting intensity, dreaming, and desiring that develops the reader’s loving heart. See Nussbaum, *Love’s Knowledge* (230–231).

- 43 Canonically, see Jameson. See also Zwaan, who compares readers' behavior when processing texts labeled as "news stories" or "narratives." Bortolussi and Dixon aptly caution that research in discourse processing has focused on broad generic distinctions rather than on narrative fiction's subgenres (253–254). For evidence of emotional responses to fictional subgenres in television, see Bryant and Zillmann, eds. Literary genre critics have been reluctant to adopt findings from mass communications research (to the extent that they are aware of them), perhaps because audiovisual (iconic) representations are assumed to be more emotionally stimulating than the verbal representations of prose narrative fiction. This assumption, however, has not been investigated systematically.
- 44 Feminist criticism often celebrates the power of women's writing's vividly represented spaces and places, in tandem with identity themes, to work out boundary-crossing potentials for connection, communication, and change. See for instance Friedman.
- 45 See the account of Nünning's remarks on empathy-inducing functions of metanarration, in Fludernik, "Metanarrative and Metafictional Commentary" (39).
- 46 Relevant to slower pace as potentially fostering empathy is Zillmann, who hypothesizes that the fast pace of television news stories and dramas may impede empathetic response ("Empathy," 160–161). Miall's work on foregrounding and empathy in literary texts correlates a slower reading pace with enhanced empathy.
- 47 See for instance van Peer's judgment in "Justice in Perspective."
- 48 Character identification thus exemplifies what Bortolussi and Dixon identify as readers' mental constructions, as opposed to textual features (*Psychonarratology* 28). Bortolussi and Dixon systematically measure how particular readers process specific textual features in narratives, but the experimental results bridging disciplines of discourse processing and narrative theory are still quite scanty. On their narratology, see Diengott.
- 49 See Dixon et al. ("Literary Processing," 5–33).
- 50 Writing about identification with dramatic characters, Zillman argues that the audience member's disposition precipitates empathic and counterempathic reactions and suggests that audiences must be made to care about characters one way or another. He believes that enactment of good or evil deeds by protagonists and antagonists, with opportunities for the moral appraisal of their actions, promotes strong emotional reactions. See Zillman, "Mechanisms of Emotional Involvement."
- 51 See Oatley, "A Taxonomy of the Emotions of Literary Response."
- 52 In this respect Miall and Kuiken are in accord with earlier work that demonstrates a relationship between a subject's prior similar experiences and empathy felt for another in the same situation. See Stotland.
- 53 See Miall and Kuiken, "What Is Literariness?" (121–138), and Miall, "Beyond the Schema Given."
- 54 See Kuiken et al., "Locating Self-Modifying Feelings."
- 55 See Louwerse and Kuiken ("Effects of Personal Involvement," 170). Their research confirms some of what Iser proposes about active reading as gap-filling (168–169).
- 56 For critiques of this assumption, see Konijn and Hoorn, from a discourse processing angle; see also Walsh.
- 57 See Klemenz-Belgardt (368); see also Jose and Brewer. Hakemulder reports on recent studies confirming the importance of personal relevance for intensity of reader response. See *Moral Laboratory* (71).
- 58 Wünsch cited in Hakemulder, *Moral Laboratory* (73).
- 59 For this reading-speed research, see Chupchik and Lazló.
- 60 Research into the empathy evoked by various genres of television advertisements suggests that discontinuous, nonlinear "vignette" ads discourage empathy, whereas classical, character-centered dramatic form in ads evokes viewers' empathy. See Stern.
- 61 For a good application of cognitive theory on levels of embedding to readers' capacity to comprehend embedded accounts of characters' mental states, see Zunshine, "Theory of Mind."
- 62 For a subtle treatment of the variety of techniques by which sympathy for characters may be cultivated, see Booth, *Rhetoric of Fiction* (129–133, 243–266, 274–282, 379–391). Ultimately Booth

- prefers the use of an “inside view” for invoking sympathy, but he describes the full range of strategies that authors from the classical period to the modernists actually employ.
- 63 For an excellent description of readers’ imaginative construction of characters, see Cohan.
- 64 See Gerrig, “The Construction of Literary Character.” See also his account of participatory responses to fiction in *Experiencing Narrative Worlds*.
- 65 See Hogan, “The Epilogue of Suffering.” Though this article suggests a preference for the cognitive role-taking Hogan associates with situational empathy, his later very brief treatment of readers’ empathy in *Cognitive Science, Literature, and the Arts* improves on his theory by describing how emotion triggers invoke quick-and-dirty responses, as well as imaginative role-taking, neither of which need be denigrated as egocentric (186–187). For work confirming the role of lived experience in spontaneous situational empathy with characters on film documentaries, see Sapolsky and Zillmann, “Experience and Empathy.” Women who had given birth responded to a medical film of actual childbirth with more intense physiological reactions; otherwise, gender and related experiences had a negligible effect on empathy.
- 66 See Jauss (152–188), especially his summary figure, “Interaction Patterns of Identification with the Hero” (159). See also Hogan on emotions and prototypes in narrative, in *The Mind and Its Stories*.
- 67 For preliminary confirmation from film studies, see Andringa et al. (154–155).
- 68 For narrated monologue, psychonarration, and quoted monologue, see Cohn, *Transparent Minds*.
- 69 See Booth’s discussion of traditional literature’s use of “telling” in *Rhetoric of Fiction* (3–16); see also Cohn on psychonarration in *Transparent Minds*.
- 70 See for instance Palmer, *Fictional Minds*.
- 71 Three good starting points for recent work on the representation of consciousness are Fludernik’s magisterial *The Fictions of Language and the Languages of Fiction*; Zunshine’s *Why We Read Fiction: Theory of Mind and the Novel*; and George Butte’s *I Know That You Know That I Know*.
- 72 Van Peer and Pander Maat designed experiments using five versions of stories, rewritten to test the relationship between positive internal focalization and readers’ allocation of sympathy. See “Perspectivation” (145).
- 73 For a variety of essays verifying human beings’ tendency accurately to identify others’ feelings and states of mind, see Ickes, ed.
- 74 Indeed, human rights are not exempted from criticism. Some regard “the whole idea of ‘universal’ human rights” as a “gigantic fraud, where Western imperialist or excolonial powers try to pass off their own, very specific and localized idea of what ‘rights’ should be as universal, trampling roughly over everyone else’s beliefs and traditions.” See Howe (3).
- 75 See Spivak (214).
- 76 See Rabinowitz, *Before Reading*, and two essays by B. Richardson, “The Other Reader’s Response” and “Singular Text, Multiple Implied Readers.” Rabinowitz and Richardson offer subtle ways of understanding the various audiences narrative fiction may simultaneously address, and the conditions that pertain when we choose to join them.
- 77 See Spivak (214).
- 78 See Richardson, “The Other Reader’s Response” (38).
- 79 Bertolussi and Dixon have done the best work on this subject, though they phrase the question differently: To what degree do readers fuse narrators and characters as a result of perceptual access to a particular character’s perspective, and thus develop a rooting interest in that character and making assumptions about the narrator’s and author’s gender? See *Psychonarratology* (166–199).
- 80 This chapter is a revision of an essay that originally appeared in *Narrative* 14, no. 3 (2006): 207–236. The chapter is reprinted with permission from *Narrative*.

# CHAPTER 4

## Affective Economies

*Sara Ahmed*

Sara Ahmed teaches Gender, Media, and Culture at Goldsmiths College and is the Director of the Centre for Feminist Research. Her books include *The Cultural Politics of Emotion* (2014), *Willful Subjects* (2014), *On Being Included* (2012), *The Promise of Happiness* (2010), and *Queer Phenomenologies* (2006).

*The depths of Love are rooted and very deep in a real white nationalist's soul and spirit, no form of "hate" could even begin to compare. At least not a hate motivated by ungrounded reasoning. It is not hate that makes the average white man look upon a mixed race couple with a scowl on his face and loathing in his heart. It is not hate that makes the white housewife throw down the daily newspaper in repulsion and anger after reading of yet another child molester or rapist sentenced by corrupt courts to a couple of short years in prison or on parole. It is not hate that makes the white workingman curse about the latest boatload of aliens dumped on our shores to be given job preference over the white citizen who built this land. It is not hate that brings rage into the heart of a white Christian farmer when he reads of billions loaned or given away as "aid" to foreigners when he can't get the smallest break from an unmerciful government to save his failing farm. No, it's not hate. It is love!*

—Aryan Nations Web site

How do emotions work to align some subjects with some others and against other others? How do emotions move between bodies? In this essay, I argue that emotions play a crucial role in the “surfacing” of individual and collective bodies through the way in which emotions circulate between bodies and signs. Such an argument clearly challenges any assumption that emotions are a private matter, that they simply belong to individuals, or even that they come from within and *then* move outward toward others. It suggests that emotions are not simply “within” or “without” but that they create the very effect of the surfaces or boundaries of bodies and worlds.

For instance, in the above narrative on the Aryan Nations Web site, the role of emotions, in particular of hate and love, is crucial to the delineation of the bodies of individual subjects and the body of the nation. Here a subject (the white nationalist, the average white

*Original publication details:* Sara Ahmed, “Affective Economies.” *Social Text* 22.2 (Summer 2004), pp. 117–139. Duke University Press, 2004. Reproduced with permission from Duke University Press.

man, the white housewife, the white working man, the white citizen, and the white Christian farmer) is presented as endangered by imagined others whose proximity threatens not only to take something away from the subject (jobs, security, wealth), but to take the place of the subject. In other words, the presence of these others is imagined as a threat to the object of love. The narrative involves a rewriting of history, in which the labor of others (migrants, slaves) is concealed in a fantasy that it is the white subject who “built this land.”<sup>2</sup> The white subjects claim the place of hosts (“our shores”) at the same time as they claim the position of the victim, as the ones who are damaged by an “unmerciful government.” The narrative hence suggests that it is love for the nation that makes the white Aryans hate those whom they recognize as strangers, as the ones who are taking away the nation and the role of the Aryans in its history, as well as their future.

We might note as well that the reading of others as hateful aligns the imagined subject with rights and the imagined nation with ground. This alignment is affected by the representation of both the rights of the subject and the grounds of the nation as already under threat. *It is the emotional reading of hate that works to bind the imagined white subject and nation together.* The average white man feels “fear and loathing”; the white housewife, “repulsion and anger”; the white workingman, “curses”; the white Christian farmer, “rage.” The passion of these negative attachments to others is redefined simultaneously as a positive attachment to the imagined subjects brought together through the repetition of the signifier, “white.” It is the love of white, or those recognizable as white, that supposedly explains this shared “communal” visceral response of hate. *Together we hate, and this hate is what makes us together.*

This narrative is far from extraordinary. Indeed, what it shows us is the production of the ordinary. The ordinary is here fantastic. The ordinary white subject is a fantasy that comes into being through the mobilization of hate, as a passionate attachment tied closely to love. The emotion of hate works to animate the ordinary subject, to bring that fantasy to life, precisely by constituting the ordinary as in crisis, and the ordinary person as the real victim. The ordinary becomes that which is already under threat by imagined others whose proximity becomes a crime against person as well as place. The ordinary or normative subject is reproduced as the injured party: the one “hurt” or even damaged by the “invasion” of others. The bodies of others are hence transformed into “the hated” through a discourse of pain. They are assumed to “cause” injury to the ordinary white subject, such that their proximity is read as the origin of bad feeling; indeed, the implication here is that the white subject’s good feelings (love, care, loyalty) are being “taken” away by the abuse of such feelings by others.

So who is hated in such a narrative of injury? Clearly, hate is distributed across various figures (in this case, the mixed-racial couple, the child molester, the rapist, aliens, and foreigners). These figures come to embody the threat of loss: lost jobs, lost money, lost land. They signify the danger of impurity, or the mixing or taking of blood. They threaten to violate the pure bodies; such bodies can only be imagined as pure by the perpetual restaging of this fantasy of violation. Note the work that is being done through this metonymic slide: mixed-race couplings and immigration become readable as (like) forms of rape or molestation: an invasion of the body of the nation, represented here as the vulnerable and damaged bodies of the white woman and child. The slide between figures constructs a relation of resemblance between the figures: what makes them alike may be their “unlikeness” from “us.” Within the narrative, hate cannot be found in one figure, but works to create the very outline of different figures or objects of hate, a creation that crucially aligns the figures together and constitutes them as a “common” threat. Importantly, then, hate does not reside in a given subject or object. Hate is economic; it circulates between signifiers in relationships of difference and displacement.

In such affective economies, emotions *do things*, and they align individuals with communities – or bodily space with social space – through the very intensity of their attachments. Rather than seeing emotions as psychological dispositions, we need to consider how they work, in concrete and particular ways, to mediate the relationship between the psychic and the social, and between the individual and the collective. In particular, I will show how emotions work by sticking figures together (adherence), a sticking that creates the very effect of a collective (coherence), with reference to the figures of the asylum seeker and the international terrorist. My economic model of emotions suggests that while emotions do not positively reside in a subject or figure, they still work to bind subjects together. Indeed, to put it more strongly, the nonresidence of emotions is what makes them “binding.”

## Economies of Hate

Everyday language certainly constructs emotions as a form of positive residence. So I might say I “have a feeling.” Or I might describe a film as “being sad.” In such ways of speaking, emotions become property; something that belongs to a subject or object, which can take the form of a characteristic or quality. I want to challenge the idea that I have an emotion, or that something or somebody makes me feel a certain way. I am interested in the way emotions *involve* subjects and objects, but without residing positively within them. Indeed, emotions may only seem like a form of residence as an effect of a certain history, a history that may operate by concealing its own traces. Clearly, such an approach borrows from psychoanalysis, which is also a theory of the subject as lacking positive residence, a lack of being most commonly articulated as “the unconscious.” In his essay on the unconscious, Freud introduces the notion of unconscious emotions, where an affective impulse is perceived but misconstrued, and which becomes attached to another idea.<sup>3</sup> What is repressed from consciousness is not the feeling as such, but the idea to which the feeling may have been first (but provisionally) connected. Psychoanalysis allows us to see that emotionality involves movements or associations whereby “feelings” take us across different levels of signification, not all of which can be admitted in the present. This is what I would call the rippling effect of emotions; they move sideways (through “sticky” associations between signs, figures, and objects) as well as backward (repression always leaves its trace in the present – hence “what sticks” is also bound up with the “absent presence” of historicity). In the opening quotation, we can see precisely how hate “slides” sideways between figures, as well as backward, by reopening past associations that allow some bodies to be read as the cause of “our hate,” or as “being” hateful.

Indeed, insofar as psychoanalysis is a theory of the subject as lacking in the present, then it offers a theory of emotion as economy, as *involving relationships of difference and displacement without positive value*. That is, emotions work as a form of capital: affect does not reside positively in the sign or commodity, but is produced only as an effect of its circulation. I am using “the economic” to suggest that emotions circulate and are distributed across a social as well as psychic field. I am borrowing from the Marxian critique of the logic of capital. In *Capital*, Marx discusses how the movement of commodities and money, in the formula *M-C-M* (money to commodity to money), creates surplus value.<sup>4</sup> That is, through circulation and exchange *M* acquires more value. Or as he puts it, “The value originally advanced, therefore, not only remains intact while

in circulation, but increases its magnitude, adds to itself a surplus-value or is valorised. *And this movement converts it into capital.*<sup>5</sup> I am identifying a similar logic: the movement between signs converts into affect. Marx links value with affect through the figures of the capitalist and the miser: “This boundless drive for enrichment, this passionate chase after value, is common to the capitalist, and the miser.”<sup>6</sup> Passion drives the accumulation of capital: the capitalist is not interested in the use value of commodities, but in the “appropriation of ever more wealth.”<sup>7</sup> What I am offering is a theory of passion not as the drive to accumulate (whether it be value, power, or meaning), but as that which is accumulated over time. Affect does not reside in an object or sign, but is an affect of the circulation between objects and signs (= the accumulation of affective value over time). Some signs, that is, increase in affective value as an effect of the movement between signs: the more they circulate, the more affective they become, and the more they appear to “contain” affect. Another way to theorize this process would be to describe “feelings” via an analogy with “commodity fetishism”: feelings appear in objects, or indeed as objects with a life of their own, only by the concealment of how they are shaped by histories, including histories of production (labor and labor time), as well as circulation or exchange.

Of course, such an argument about affect as an economy does not respect the important Marxian distinction between use value and exchange value and hence relies on a limited analogy. In some ways, my approach may have more in common with a psychoanalytic emphasis on difference and displacement as the form or language of the unconscious, described above. Where my approach involves a departure from psychoanalysis is precisely in my refusal to identify this economy as a psychic one (although neither is it *not* a psychic one), that is, to return these relationships of difference and displacement to the signifier of “the subject.” This “return” is not only clear in Freud’s work, but also in Lacan’s positing of “the subject” as the proper scene of absence and loss.<sup>8</sup> As Laplanche and Pontalis argue, if Lacan defines “the subject” as “the locus of the signifier,” then it is in “a theory of the subject that the locus of the signifier settles.”<sup>9</sup> This constitution of the subject as “settlement,” even if what settles is lacking in presence, means that the suspended contexts of the signifier are delimited by the contours of the subject. In contrast, my account of hate as an affective economy shows that emotions do not positively inhabit any-body as well as any-thing, meaning that “the subject” is simply one nodal point in the economy, rather than its origin and destination. This is extremely important: it suggests that the sideways and backward movement of emotions such as hate is not contained within the contours of a subject. The unconscious is hence not the unconscious of a subject, but the failure of presence – or the failure to be present – that constitutes the relationality of subjects and objects (a relationality that works through the circulation of signs). Given this, affective economies need to be seen as social and material, as well as psychic. Indeed, if the movement of affect is crucial to the very making of a difference between “in here” and “out there,” then the psychic and the social cannot be installed as proper objects. Instead, materialization, which Judith Butler describes as “the effect of boundary, fixity and surface,”<sup>10</sup> involves a process of intensification. In other words, the accumulation of affective value shapes the surfaces of bodies and worlds.

We could hence ask how the circulation of signs of affect shapes the materialization of collective bodies, for example the “body of the nation.” We have already seen how hate slides across different figures and constitutes them as a “common threat” in what we can call “hate speech.” But the slippery work of emotion cannot allow us to presume any

opposition between extremist discourses and the “ordinary” work of reproducing the nation. We can take as an example the speeches on asylum seekers by the previous leader of the British Conservative Party, William Hague. Between April and June 2000, other speeches were in circulation that became “stuck” to the “asylum seekers” speech through this temporal proximity, but also through the repetition with a difference, of some *sticky words* and language. In the case of the asylum speeches, Hague’s narrative is somewhat predictable. Words like *flood* and *swamped* are used, which create associations between asylum and the loss of control, as well as *dirt* and *sewage*, and hence work by mobilizing fear, or the anxiety of being “overwhelmed” by the actual or potential proximity of others. These words have recently been repeated by the current British Home Secretary, David Blunkett, who used the word *swamped* to describe the effect that children of asylum seekers would have if they were taught by local schools. When criticized, he replaced the word *swamped* with *overwhelmed*. The assumption here is that *overwhelmed* resolves the implication of *swamped*, but as we can see, it still evokes the sensation of being overtaken or taken over by others. It constructs the nation as if it was a subject, one who “could not cope” with the presence of others. Here words generate effects: they create impressions of others as those who have invaded the space of the nation, threatening its existence.

Typically, Hague in the earlier speeches differentiates between those others who are welcome and those who are not by differentiating between genuine and bogus asylum seekers. Partly, this enables the national subject to imagine its own generosity in welcoming some others. The nation is hospitable, as it allows those genuine ones to stay. And yet at the same time, it constructs some others as already hateful (as bogus) in order to define the limits or the conditions of this hospitality. The construction of the bogus asylum seeker as a figure of hate also involves a narrative of uncertainty and crisis, but an uncertainty and crisis that *make that figure do more work*. How can we tell the difference between a bogus and a genuine asylum seeker? According to the logic of this discourse, it is always possible that we might not be able to tell the difference, and that they may pass into our community. Passing functions here as a technology, which relates physical movement with identity formation: to pass through a space requires passing as a particular kind of subject, one whose difference is unmarked and unremarkable.<sup>11</sup> The double possibility of passing commands the nation’s Right and will to keep looking for signs of difference and justifies violent forms of intrusion into the bodies of others.

Indeed, the possibility that we might not be able to tell the difference swiftly converts into the possibility that any of those incoming bodies may be bogus. In advance of their arrival, they are hence read as the cause of an injury to the national body. Now how does the presentation of asylum as injury work through the proximity between figures of hate? The figure of the bogus asylum seeker may evoke the figure of the “bogeyman,” a figure who stalks the nation and haunts its capacity to secure its borders. The bogeyman could be anywhere and anyone, as a ghostlike figure in the present, who gives us nightmares about the future, as an anticipated future of injury. We see “him” again and again. Such figures of hate circulate, and indeed accumulate affective value, precisely because they do not have a fixed referent. So the figure of the bogus asylum seeker is detached from particular bodies: any incoming bodies could be bogus, such that their “endless” arrival is anticipated as the scene of “our injury.”<sup>12</sup> *The impossibility of reducing hate to a particular body allows hate to circulate in an economic sense, working to differentiate some others from other others, a differentiation that is never “over,” as it awaits for others who have not yet arrived.* Such a discourse of “waiting for the bogus” justifies the repetition of violence against the bodies of others.

Hague's speeches also produced certain effects through temporal proximity to another speech about Tony Martin, a man sentenced to life imprisonment for murdering a sixteen-year-old boy who had attempted to burgle his house in a rural area of England. One sentence of Hague's circulates powerfully. Hague argued (without reference to Martin or asylum seekers) that the law is "more interested in the rights of criminals than the rights of people who are burgled." Such a sentence evokes a history that is not declared (here "what sticks" may also be what resists literalization), and, in doing so, it positions Martin as the victim and not as a criminal. The victim of the murder is now the criminal: the crime that did not happen because of the murder (the burglary) takes the place of the murder as the true crime, and as the real injustice. This reversal of the victim-criminal relationship becomes an implicit defense of the right to kill those who unlawfully enter one's property.

The detachment of the sentence allows two cases to get stuck together: burglary and asylum, which both now become matters of the right to defense. The figure of the asylum seeker hence gets aligned with the figure of the burglar. The alignment does important work: it suggests that the asylum seeker is "stealing" something from the nation. The "characteristics" of one figure get displaced or transferred onto the other. Or we could say that it is through the association between the figures that they acquire "a life of their own," as if they contained affective quality. The burglar became a foreigner, and the asylum seeker becomes a criminal. At the same time, the body of the murderer (who is renamed as the victim)<sup>13</sup> becomes the body of the nation, the one whose property and well-being is under threat by the forced proximity of the other. As such, the alignment of figures works as a narrative of defense: the nation/national subject must defend itself against "invasion" by others. Such a defensive narrative is not explicitly articulated, but rather works through the "movement" between figures. The circulation does its work: it produces a differentiation between "us" and "them," whereby "they" are constituted as the cause or the justification of "our" feeling of hate. Indeed, we can see how attachment involves a sliding between pain and hate: there is a perceived injury in which the other's (burglar/bogus) proximity is felt as the violence of negation against both the body of the individual (here, the farmer) and the body of the nation.

We can see that the affectivity of hate is what makes it difficult to pin down, to locate in a body, object, or figure. This difficulty is what makes emotions such as hate work the way that they do; *it is not the impossibility of hate as such, but the mode of its operation, whereby it surfaces in the world made up of other bodies*. In other words, it is the failure of emotions to be located in a body, object, or figures that allows emotions to (re)produce or generate the effects that they do.

## Fear, Bodies, and Objects

I now want to relate my model of emotion as affective economy specifically, to fear and the materialization of bodies. Significantly, fear is an emotion that is often characterized as being *about* its object and hence would not seem to work in the economic sense I have defined above. Indeed, fear has often been contrasted with anxiety insofar as fear *has* an object. For example, Stanley Rachman argues that anxiety can be described as the "tense anticipation of a threatening but vague event," or a feeling of "uneasy suspense," while fear is described as an emotional reaction "to a threat that is identifiable."<sup>14</sup>

I want to question this model by suggesting that fear is linked to the “passing by” of the object. We can consider, for instance, that the narrative of asylum seekers “swamping” the nation works as a narrative of fear. Fear works to create a sense of being overwhelmed: rather than being contained in an object, fear is intensified by the impossibility of containment. If the others who are feared “pass by,” then the others might pass their way into the community, and could be anywhere and everywhere. Heidegger also suggests that fear is intensified when it ceases to be contained by an object that approaches. He suggests:

That which is detrimental, as something that threatens us, is not yet within striking distance, but it is coming close. ... As it draws close, this “it can, and yet it may not” becomes aggravated. We say, “It is fearsome.” This implies that what is detrimental as coming-close carries with it the patent possibility that it may stay away and pass us by; but instead of lessening or extinguishing our fearing, this enhances it.<sup>15</sup>

Crucially, Heidegger relates fear to that which is not yet in the present, in either the spatial or temporal sense of the here and the now. Fear responds to that which is approaching rather than already here. It is the futurity of fear, which makes it possible that the object of fear, rather than arriving, might pass us by. But the passing by of the object of fear does not mean the overcoming of fear: rather, the possibility of the loss of the object that approaches makes what is fearsome all the more fearsome. If fear has an object, then fear can be contained by the object. When the object of fear threatens to pass by, then fear can no longer be contained by an object. Fear in its very relationship to an object, in the very intensity of its directedness toward that object, is intensified by the loss of its object. We could characterize this absence as about being not quite present rather than, as with anxiety, being nowhere at all. Or anxiety becomes attached to particular objects, which come to life not as the cause of anxiety but as an effect of its travels. In anxiety, one’s thoughts often move quickly between different objects, a movement that works to intensify the sense of anxiety. One thinks of more and more “things” to be anxious about; the detachment from one given object allows anxiety to accumulate. In other words, anxiety tends to stick to objects. Given this, anxiety becomes an approach to objects rather than, as with fear, being produced by an object’s approach. The slide between fear and anxiety is affected precisely by the “passing by” of the object.

Furthermore, fear’s relationship to the potential disappearance of an object is more profound than simply a relationship to the object of fear. In other words, it is not just fear that is at stake in fear. For Freud, fears themselves may function as symptoms, as mechanisms for the defense of the ego against danger. In his essay “Inhibitions, Symptoms, and Anxiety,” Freud returns to the Little Hans case. Hans had a phobic relationship to horses. Freud argues that this fear is itself a symptom that has been “put in the place” of another fear, one that much more profoundly threatens the ego: the fear of castration.<sup>16</sup> Hans can “manage” his fear of horses through avoidance, in a way that he could not manage his fear of the father. We might remember that in Freud’s model of unconscious emotions, the affect itself is not repressed: rather, what is repressed is the idea to which the affect was attached. So the affect of fear is sustained through the displacement between objects.

The displacement between objects works also to link those objects together. Such linkages are not created by fear, but may already be in place within the social imaginary. In the Freudian model, the movement between objects is intrapsychic, and goes backward;

it refers back to the primary fear of castration. Or, to be more specific, the sideways movement between objects (in this case, the horse and the father) is itself explained as determined by a repression of the idea to which the affect was originally attached (the threat of castration).<sup>17</sup> I would suggest that the sideways movement between objects, which works to stick objects together as signs of threat, is shaped by multiple histories. The movement between signs does not have its origin in the psyche, but is a trace of how histories remain alive in the present.

We can consider, for instance, how the language of racism sustains fear through displacement, and how this surfaces through bodies. Take the following quote from Frantz Fanon's *Black Skin, White Masks*:

My body was given back to me sprawled out. Distorted, recolored, clad in mourning in that white winter day. The Negro is an animal, the Negro is bad, the Negro is mean, the Negro is ugly; look, a nigger, it's cold, the nigger is shivering because he is cold, the little boy is trembling because he is afraid of the nigger, the nigger is shivering with cold, that cold that goes through your bones, the handsome little boy is trembling because he thinks that the nigger is quivering with rage, the little white boy throws himself into his mother's arms: Mama, the nigger's going to eat me up.<sup>18</sup>

Here, fear is felt as coldness; it makes bodies shiver with a cold that moves from the surface into the depths of the body, as a cold "that goes through your bones." Fear both envelops the bodies that feel it, as well as constructs those bodies as enveloped, as contained by it, as if it comes from outside and moves inward. In the encounter, fear does not bring the bodies together: it is not a shared feeling, but works to differentiate between white and black bodies. The white child misrecognizes the shivering of the black body as rage, and hence as the "grounds" for its fear. In other words, the other is only read as fearsome through a misrecognition, a reading that is returned by the black other through its response of fear, as a fear of the white subject's fear. This is not to say that the fear comes from the white body, as if it is the origin of that fear (and its author). Rather, fear opens up past histories that stick to the present (in the very rehearsal of childhood fantasies about "being eaten up" that "take on" the value of social norms as "truths" about the other) and allow the white body to be constructed as apart from the black body.

We might note here that fear *does something*; it reestablishes distance between bodies whose difference is read off the surface, as a reading that produces the surface (shivering, recoloring). But what is very clear here is that the object of fear remains the black man, who comes to feel the fear as his own, as threatening his existence. Fear does not come from within the subject, nor does it reside in its object: we are not afraid of others because they are fearsome. Through the circulation of signs of fear, the black other "becomes" fearsome. But doesn't this example show us that fear does get contained by an object, in this case the black man? To some extent this is right: the circulation of signs of fear does lead to containment for some, and movement for others. Here, fear gets contained in a body, which henceforth becomes an object of fear. Indeed, the white child's apparent fear does not lead to containment but an expansion; his embrace of the world is suggested by how he reestablishes himself as being-at-home (the embrace of the mother as a "return home"). It is the black subject, the one who fears the "impact" of the white child's fear, who is crushed by that fear, by being sealed into a body that takes up less space. In other words, fear works to restrict some bodies through the movement or expansion of others.

But this containment is an effect of a movement between signs, as well as bodies. Such movement depends on past histories of association: Negro, animal, bad, mean, ugly. In other words, it is the movement of fear between signs, which allows the object of fear to be generated in the present (the Negro is: an animal, bad, mean, ugly). The movement between signs is what allows others to be attributed with emotional value, in this case, as being fearsome, an attribution that depends on a history that “sticks,” and which does not need to be declared. The containment is provisional: insofar as the black man is the object of fear, then he may pass by. Indeed, the physicality of his “passing by” can be associated with the passing of fear between signs: it is the movement that intensifies affect. The black man becomes even more threatening if he passes by: his proximity is imagined then as the possibility of future injury. As such, the economy of fear works to contain the bodies of others, a containment whose “success” relies on its failure, as it must keep open the very grounds of fear. In this sense, fear works as an affective economy, despite how it seems directed toward an object. Fear does not reside in a particular object or sign, and it is this lack of residence that allows fear to slide across signs, and between bodies. This sliding becomes stuck only temporarily, in the very attachment of a sign to a body, whereby a sign sticks to a body by constituting it as the object of fear, a constitution taken on by the body, encircling it with a fear that becomes its own.

The sideways movement of fear (where we have a metonymic and sticky relation between signs) is also a backward movement: objects of fear become substituted for each other over time. This substitution involves the passing by of the objects from which the subject seems to flee. Fear and anxiety create the very effect of “that which I am not,” through the very affect of turning away from an object, which nevertheless threatens as it passes by or is displaced. To this extent, fear does not involve the defense of borders that already exist; rather, fear makes those borders, by establishing objects from which the subject, in fearing, can stand apart, objects that become “the not” from which the subject appears to flee. Through fear not only is the very border between self and other affected, but the relation between the objects feared (rather than simply the relation between the subject and its objects) is shaped by histories that “stick,” by making some objects more than others seem fearsome.

## Global Economies of Fear

We can think more precisely about the processes through which fear works to secure forms of the collective. My argument is not that there is a psychic economy of fear that then becomes social and collective: rather, the individual subject comes into being through its very alignment with the collective. *It is the very failure of affect to be located in a subject or object that allows it to generate the surfaces of collective bodies.* The complexity of the spatial and bodily politics of fear has perhaps never been so apparent in the global economies of fear since September 11. Fear is, of course, named in the very naming of terrorism: terrorists are immediately identified as agents of extreme fear, that is, those who seek to make others afraid (less mobile or less free to move) as well those who seek to cause death and destruction. As the Australian prime minister, John Howard, put it, bin Laden’s “hated” for the United States and for “a world system built on individual freedom, religious tolerance, democracy, and the international free flow of commerce” means that “he wants to spread fear, create uncertainty and promote instability, hoping

that this will cause communities and countries to turn against each other.”<sup>19</sup> Howard then reads the acts of terror as attacks not only on the mobility of international capital, but also on the mobility of the bodies of Australians, on their right “to move around the world with ease and freedom and without fear.” I would like to offer an alternative reading of what moves and what sticks in fear economies, one that differentiates between forms of mobility as well as different kinds of bodily enclosure, containment, or detainment.

In the first instance, we can examine how the mobility of the bodies of subjects in the West, while presented as threatened, is also defended, along with the implicit defense of the mobility of capital in the global economy (whereby capital is constructed as “clean money” and defined against the “dirty money” of terrorism, which must be frozen or blocked). The most immediate instruction made to subjects and citizens in America, Australia, and Britain was “to go about your daily business,” “to travel,” “to spend or consume,” and so on, as a way of refusing to be a victim of terror. Indeed, in the United States, citizens were, in effect, asked not to fear, and the nation was represented as not being afraid, as a way of showing the failure of the terrorist attacks to destroy the nation. As George W. Bush put it, “It is natural to wonder if America’s future is one of fear. Some speak of an age of terror. I know there are struggles ahead and dangers to face. But this country will define our times, not be defined by them. As long as the United States is determined and strong, this will not be an age of terror.”<sup>20</sup> The nation is constructed as having prevailed through refusing to transform its vulnerability and wounds into fear, a response that would be read, in terms of this narrative, as “determination by terror” rather than self-determination. Bush, then, in an act of self-determination, turns the act of terror into an act of war, which would seek to eliminate the source of fear and transform the world into a place where the mobility of some capital and some bodies becomes the sign of freedom and civilization. This suggests that the affect of terror was not containment, but provided the very grounds for remobilization.

This is not to say, however, that individuals and groups have not experienced fear in response to the events; the affects of fear are clear in, for example, the huge reduction in air travel. However, we need to think about this containment carefully without assuming that fear simply brings people together, or that containment is the only effect of such fear. As I have already noted, following Heidegger, the object of fear may pass by, and this structural possibility is part of the lived experience of fear. While the events did happen and did constitute an object (however much it passed by, a passing by that was already at stake in the living out of the present, given the mediatization of the event *as event*), that fear slid quickly into anxiety, in which what was at stake was not the approach of an object but an approach to an object. The approach to the event – in which it is repeated and transformed into a fetish object – involved forms of alignment, whereby individuals aligned themselves with the nation as being under attack. This, of course, repeats the process of alignment whereby the nation aligned itself with individuals as having been or being attacked.

Now, what is crucial here is not just that this alignment might restrict the mobility of individuals who now feel themselves, in a way that is personal, to be terrorist targets. Rather, given the mediating work of this alignment, experiences of fear became lived as patriotic declarations of love, which allowed home itself to be mobilized as a defense against terror. If subjects stayed at home, then homes became transformed into the symbolic space of the nation through the widespread use of American flags. This is not to say that the meaning of the flags is necessary to its circulation – as if such flags could

only signify national love. Rather, we can consider how the flag is a sticky sign, whereby its stickiness allows it to stick to other “flag signs,” which gives the impression of coherence (the nation as “sticking together”). The flag as a sign that has historically signified territorial conquest as well as love for the nation (patriotism) has effects in terms of the display of “withness” (whereby one is “with others” and “against other others”). George Packer, in an article in the *New York Times Magazine*, expressed this well: “As flags bloomed like flowers, I found they tapped emotion as quickly as pictures of the missing. To me, these flags didn’t represent flabby complacence, but alertness, grief, resolve, even love. They evoked fellow feeling with Americans, for we had been attacked together.”<sup>21</sup> The turning away from the object of fear hence may involve a turning toward home as a “fellow feeling.” That “turning toward” involves the repetition or reiteration of signs of “fellowship.” That turning could even be understood as compulsory: not to display a flag could be read as a sign of a lack of fellowship, or even as the origin of terror (to paraphrase George W. Bush, if you do not show you are “with us,” you would be seen as “against us”).<sup>22</sup>

Fear mediated by love as identification with the nation, which comes to adhere as an effect of signs of love, does not necessarily shrink bodies. The turning away from the object of fear here involves a turning toward home. Fear mediated by this form of love (love as identification) does not necessarily shrink bodies, but may even allow them to occupy more space through the identification with the collective body, which stands in for the individual body and moves on its behalf. In other words, the apparent containment of some bodies in the United States functions as a form of mobilization: staying at home allows the mobilization of bodies through the symbolic identification with the nation at war. In George W. Bush’s State of the Union Address in 2002 the effect of this identification is clear: “It was as if our entire country looked into a mirror and saw our better selves.”<sup>23</sup> Hence, the United States is defined as “caught” by its own reflection in the mirror, a “catching out” that borders on collective narcissism: self-love becomes a national love that legitimates the response to terror as the protection of loved others who are “with me,” whereby “withness” is premised on signs of “likeness” and whereby likeness becomes an imperative or a condition of survival.

So if the event of terror – of seeking to cause fear – leads to a defense of the mobility of capital and the mobilization of some bodies (through both the defense of the home as nation and the identification with the nation), then who is contained through terror? Whose vulnerability is at stake? As has been well documented, the events of September 11 have been used to justify the detention of any bodies suspected of being terrorists. Not only was there immediate detention of suspects in the United States and European countries, but governments in the West have responded to the terror by enacting legislation that increases the governmental rights to detain anybody suspected of being a terrorist. The British Amendment to the Terrorism Act 2000 states that the Secretary of State may issue a certificate if he believes that the person’s presence in the United Kingdom is a risk to national security or he suspects the person is an international terrorist. Here risk assessment becomes a matter of belief, and suspicion itself becomes the grounds for detention. The extension of the powers of detention is not merely symbolic, nor does it merely relate to the detention of terrorists: given the structural possibility that any body could be a terrorist, what we have reinstated and extended is the power of detention, as such.

However, the structural possibility that anyone could be a terrorist does not translate into everybody being affected by the extension of the powers of detention in the same

way. It is well documented that people have been detained because of very weak links between them and terrorist networks, often involving simple links through names, or workplace, or residence. Aristide R. Zolberg considers this process a form of racial profiling, quoting details reported in the *New Yorker*: “Of the 1,147 people detained in the United States between September 11th and November 2001, some were identified on the basis of circumstantial links with the attack, but many ‘were picked up based on tips, or were people of Middle Eastern or South Asian descent who had been stopped for traffic violations or for acting suspiciously.’”<sup>24</sup> As Muneer Ahmad describes, after September 11, there was “an unrelenting, multi-valent assault on the bodies, psyches and rights of Arab, Muslim and South Asian immigrants.”<sup>25</sup> Indeed, Leti Volpp suggests that the responses to September 11 facilitated “a new identity category that groups together people who appear ‘Middle Eastern, Arab or Muslim.’”<sup>26</sup> The recognition of such groups of people as “could be terrorists” depends on stereotypes already in place, at the same time as it generates a distinct category of “the fearsome” in the present. We can recall precisely the repetition of stereotypes about the black man in the encounter described by Frantz Fanon: this repetition works by generating the other as the object of fear, a fear that is then taken on as its own.

Importantly, the word *terrorist* sticks to some bodies as it reopens past histories of naming, just as it slides into other words in the accounts of the wars in Afghanistan and Iraq (such as *fundamentalism, Islam, Arab, repressive, primitive*). Indeed, the slide of metonymy can function as an implicit argument about the causal relations between terms (such as *Islam* and *terrorism*) within the making of truths and worlds, but in such a way that it does not require an explicit statement. The work done by metonymy means that it can remake links – it can stick words like *terrorist* and *Islam* together – even when arguments are made that seem to unmake those links. Utterances like “this is not a war against Islam” coexist with descriptions such as “Islamic terrorists,” which work to restick the words together and constitute their coincidence as more than simply temporal. The sliding between signs also involves “sticking” signs to bodies: the bodies who “could be terrorists” are the ones who might “look Muslim.”

Given that the event became an object that allowed certain forms of violence and detention of others in the name of defense, we need to ask: what role does security play in the affective politics of fear? Importantly, security is bound up with “the not” – what is “not me” or “not us,” as Michael Dillon has suggested.<sup>27</sup> Security is not simply about securing a border that already exists, nor is fear simply a fear of what we are not. As I argued in the previous section, anxiety and fear create the very effect of borders, and the very effect of that which “we are not,” partly through how we turn away from the other, whom we imagine as the cause of our fear. Borders are constructed and indeed policed in the very feeling that they have already been transgressed: the other has to get too close, in order to be recognized as an object of fear, and in order for the object to be displaced. The transgression of the border is required in order for it to be secured as a border in the first place. This is why the politics of fear as well as hate is narrated as a border anxiety: fear speaks the language of “floods” and “swamps,” of being invaded by inappropriate others, against whom the nation must defend itself. We can reflect then on the ontology of insecurity within the constitution of the political: it must be presumed that things are not secure, in and of themselves, in order to justify the imperative to make things secure.

More specifically, it is through announcing a crisis in security that new forms of security, border policing, and surveillance become justified. We only have to think about

how narratives of crisis are used within politics to justify a “return” to values and traditions that are perceived to be under threat. It is not simply that these crises exist, and that fears and anxieties come into being as a necessary effect of that existence. Rather, it is the very production of the crisis that is crucial. To declare a crisis is not “to make something out of nothing”: such declarations often work with real events, facts, or figures (as we can see, for example, in how the rise in divorce rates is used to announce a crisis in marriage and the family). But the declaration of crisis *reads* that fact/figure/event and transforms it into a fetish object that then acquires a life of its own, in other words, that can become the grounds for declarations of war against that which is read as the source of the threat. Through designating something as already under threat in the present, that very thing becomes installed as “the truth,” which we must fight for in the future, a fight that is retrospectively understood to be a matter of life and death.

Indeed, it is fear of death – of the death of oneself, one’s loved ones, one’s community, and one’s people – that is generated by such narratives to preserve or maintain *that which is*. So I might fear for myself, for us, or on behalf of others. Since September 11, the deaths have become symbolic of that which is under threat not only by terrorists (those who take life), but by all that the possibility of terrorism stands for, a possibility linked by some commentators to internal forms of weakness, such as secularization, multiculturalism, and the decline of social and familial ties. For example, Jerry Falwell in the United States argued, “I really believe that the pagans, and the abortionists, and the feminists, and the gays, and lesbians who are actively trying to make an alternative life style … all of them who have tried to secularize America, I point the finger in their face and say ‘you helped this happen.’”<sup>28</sup> In the United Kingdom, the British National Party’s response to September 11 was to posit Islamicization within the United Kingdom rather than the Taliban in Afghanistan as the threat to the moral future of the nation itself: “They can turn Britain into an Islamic Republic by 2025.”<sup>29</sup>

This attribution of the crime of terror to the weakening of religion and community posed by the presence of various others has been, of course, condemned within mainstream politics, although noticeably with less of a “disgust reaction” than how some critics of U.S. foreign policy have been received. However, at the same time, a broader set of assumptions around what would be required to defend the nation and the world (strengthening the will of the community in the face of others) both displaces and reworks the narrative logic. Instead of an internal weakness being posited as responsible for this event, we have an internal strength being posited as responsible for recovery, survival, and moving beyond fear. As George W. Bush put it, “These acts of mass murder were intended to frighten our nation into chaos and retreat. But they have failed; our country is strong.”<sup>30</sup> The response to terror becomes a way to strengthen the bonds of the nation and the global community of free nations: the wound of terror requires “sticking together” (adherence as coherence) and using the values that made America and democracy “strong.”

Indeed, the emphasis on security in George W. Bush’s State of the Union Address in 2002 includes the transformation of democratic citizenship into policing: “And as government works to secure our homeland, America will continue to depend on the eyes and ears of alert citizens.” Citizenship here is translated into a form of Neighborhood Watch; the citizen must “look out for suspicious others.”<sup>31</sup> Citizenship works as a way to police the boundaries of neighborhoods. The role of citizens as police is translated as an imperative to love, in which love becomes the foundation of community, as well as the guarantor of our future: “Our country also needs citizens working to rebuild our

communities. We need mentors to love children.”<sup>32</sup> The definition of values that will allow America to prevail in the face of terror – values that have been named as freedom, love, and compassion – involves the defense of particular institutional and social forms against the danger posed by others. Such values function to define not only ideals that supposedly govern war aims and objectives but democratic norms of behavior and conduct, of what it means to be civil, a civil society, and a legitimate government. To be brought into international civil society – that is, to be not named as a “rogue state” or as part of “the axis of evil” – others must “mimic” these rules of conduct and forms of governance.<sup>33</sup> Henceforth, the emphasis on values, truths, and norms that will allow survival slides easily into the defense of particular social forms or institutions.

We might note here that these social forms become identified as “better” by being defined as open: liberal democracy (and with it a weak model of racial and religious tolerance as well as an apparent liberal support for “feminism”) become defined as what is “good” about the United States, in opposition to the closed and fundamentalist politics of the Islamic other. Hence “respect for women” and “religious tolerance” become defined as two of the values that make America and the free world strong. Such an argument allows the war to be narrated as “saving women from religious fundamentalism”: this is a familiar narrative, and one that has a long imperial history. As many feminist critics have argued, such a narrative overlooks not only the heterogeneity of other cultures – and the existence of women’s resistance, and feminist networks in Islamic worlds, including in Afghanistan – but also the maintenance of gendered as well as other forms of oppression in the United States and the so-called free world.<sup>34</sup> We need to think about the political effects of this hierarchy between open and closed cultures and show how the constitution of open cultures involves the projection of what is closed onto others, and hence the concealment of what is closed and contained “at home.”

Furthermore, the fear of degeneration as a mechanism for preserving social forms becomes associated more with some bodies than others. The threat of such others to social forms (which are the materialization of norms) is represented as the threat of turning away from the values that will guarantee survival. These various others come to embody the failure of the norm to take form; it is the proximity of such other bodies that “causes” the fear that the forms of civilization (the family, the community, the nation, and international civil society) have degenerated. Those who speak out against the “truth” of this world become aligned then with the terrorists as seeking to cause the “ruin” of the world. What is important, then, is that the narratives that seek to preserve the present through working on anxieties of death as the necessary consequence of the demise of social forms also seek to locate that anxiety in some bodies, which then take on fetish qualities as objects of fear. Such bodies engender even more fear, as they cannot be held in place as objects, and threaten to pass by. That is, we may fail to see those forms that have failed to be; it is always possible that we might not be able to tell the difference. The present hence becomes preserved by defending the community against the imagined others, who may take form in ways that cannot be anticipated, a “not-yet-ness” that means the work of defense is never over. Such a defense is generated by anxiety and fear for the future, and justifies the elimination or exclusion of that which fails to materialize in the form of the norm as a struggle for survival. Insofar as we do not know what forms other others may take, those who fail to materialize in the forms that are lived as norms, the policies of continual surveillance of emergent forms is sustained as an ongoing project of survival.

It is here that we can deepen our reflections on the role of the figure of the international terrorist within the economies of fear. Crucially, the narrative that justifies the

expansion of the powers to detain others within the nation and the potential expansion of the war itself to other nations relies on the structural possibility that the terrorist “could be” anyone and anywhere. The narrative of the “could be” terrorist, in which the terrorist is the one who “hides in the shadows,”<sup>35</sup> has a double edge. On the one hand, the figure of the terrorist is detached from particular bodies, as a shadowy figure, “an unspecifiable may-come-to-pass.”<sup>36</sup> But it is this could-be-ness, this detachment, which also allows the restriction on the mobility of those bodies who are read as associated with terrorism: Islam, Arab, Asian, East. Fear sticks to these bodies (and to the bodies of “rogue states”) that “could be” terrorist, where the “could be” opens up the power to detain. Although such fear sticks, it also slides across such bodies; it is the structural possibility that the terrorist may pass us by that justifies the expansion of these forms of intelligence, surveillance, and the rights of detention. Fear works here to expand the mobility of some bodies and contain others precisely insofar as it does not reside positively in any one body. As Samuel Weber puts it, “When *terrorism* is defined as *international* it becomes difficult to locate, situate, personify and identify,”<sup>37</sup> and it is this difficulty that justifies the expansion of the powers of the state.

It is important to recognize that the figure of the international terrorist has been mobilized in close proximity to the figure of the asylum seeker. The slide between these two figures does an enormous amount of work: it assumes that those who seek asylum, who flee from terror and persecution, may be bogus insofar as they could be the very agents of terror and persecution. They, like terrorists, are identified as potential burglars: as unlawful intruders into the nation. In Australia, for example, the refusal to allow the boat *Tampa* into its waters (with its cargo of 433 asylum seekers, many of whom were from Afghanistan) was retrospectively justified on the grounds that those on board *could be* linked to Osama bin Laden. The sticking together of the figure of the asylum seeker and the international terrorist, which already evokes other figures (the burglar, the bogeyman), constructs those who are “without home” as sources of “our fear” and as reasons for new forms of border policing, whereby the future is always a threat posed by others who may pass by and pass their way into the community. The slide of metonymy works to generate or make likeness: the asylum seeker is “like” the terrorist, an agent of fear, who may destroy “our home.” The slide between figures involves the containment of others, who henceforth become the objects of fear.

The containment of the bodies of others affected by this economy of fear is most chillingly and violently revealed in the literal deaths of those seeking asylum in containers, deaths that remain unmourned by the very nations who embody the hope of a future for those seeking asylum. This is a chilling reminder of what is at stake in the affective economies of fear.

## Notes

My thanks to the *Social Text* collective for providing me with such helpful and engaged feedback on an earlier draft of this essay.

- 12 For the British National Party, this model of “any body could be bogus” gets translated into “all” are, or “all” might as well be, bogus: “We will abolish the positive discrimination schemes that have made white Britons second-class citizens. We will also clamp down on the flood of asylum seekers, all of whom are either bogus or can find refuge much nearer their home countries.” See the British National Party Web site, [www.bnpp.org.uk/policies.html#immigration](http://www.bnpp.org.uk/policies.html#immigration) (accessed 30 July 2003).
- 13 Aidan McGurran and Jenny Johnston, “The Homecoming: It’s Too Painful: Martin’s Sad Return to Farm,” *Daily Mirror*, 9 August 2003, 4–5. Tony Martin was released in August 2003 and “his story” was very visible in the popular press in the United Kingdom. Tabloids concentrated very much on Martin as an “ordinary farmer” whose home was ruined. The headline on the front page of the *Mirror* sums it up: “He killed to protect his house ... but now the memories are too much.” The tragedy of the story is not the death of “a teenage burglar” but Martin’s loss of home: “This isn’t a home any more. It’s a shell.” Given the sticky attachment between “burglar” and “bogus asylum seeker” and between “home” and “homeland,” the tragedy of the story becomes linked to the tragedy that asylum seekers represent in their very presence in the United Kingdom for “ordinary subjects” such as “farmers.” In other words, the moral of the story becomes: If we let them in, they will turn the nation into a shell and take the land on which “we have worked.”

- 21 See George Packer, “Recapturing the Flag,” *New York Times Magazine*, 30 September 2001, 15–16. The relationship between grief and love is crucial to this narrative: the community is brought together by how it incorporates the losses. Judith Butler suggested that public responses to the losses of September 11 work to create a distinction between grievable and ungrievable lives (“Violence, Mourning, Politics,” *Feminist Theory* launch, Keynote Address, University College London, London, March 2002). Losses may be publicly mourned if the life that is lost can be recognized as “like me,” whereby likeness is determined as proximity to social norms. David Eng also examines the erasure of non-normative losses in public discourses of mourning: “The rhetoric of loss of ‘fathers and mothers,’ ‘sons and daughters,’ and ‘brothers and sisters’ attempts to trace a smooth alignment between the nation-state and the nuclear family, the symbolics of blood relations and nationalist domesticity” (“The Value of Silence,” *Theatre Journal* 54 [2002]: 90). For an examination of love and grief in relation to the politics of the nation, see “In the Name of Love” and “Queer Feelings” in my *Cultural Politics of Emotion* (Edinburgh: Edinburgh University Press, forthcoming).

- 22 For Arabs, Muslims, and South Asians in the United States, displaying the flag might then be read not only as a form of identification with the nation but as an attempt to “cover” any signs of difference, which might be associated with the origin of terror. Muneer Ahmad examines the “swap” between the flag and the veil in “Homeland Insecurities: Racial Violence the Day after September 11,” *Social Text*, no. 72 (2002): 110.

- 33 We can consider George W. Bush’s powerful utterance “you are either with us or against us” as a demand for mimicry. In this narrative, those who are not “with us” are automatically constructed as against us, whereby “againstness” is aligned with a form of terror or terrorism. That is, anyone who is not “with us” is a terrorist, is a friend of terrorists, or might as well be. To “be with,” one must both give one’s allegiance to the community, but one also must become lovable to that community – which means recognizable as a form of civil life. We would hence argue that the utterance “you are either with us or against us” may work not as a constative or even as a performative, but as an imperative. To be “with us” is an imperative to “be like us”: if others are not to be identified as terrorists or rogue states (an identification that involves the threat of violence, as well as actual violence) they must mimic the forms of civility and supposedly democratic governance that constitute the foundations of this community. We might note here that the root of the word *assimilate* is the Latin for *likeness*. This new international community may be one that is loving, in which the imperative of love is to “make alike”: likeness is not the ground of this community, but an effect. If community binds others together through the demand that others become like us, then the narrative of love converts swiftly into hatred for “unlike others.”

# CHAPTER 5

## Human Nature and Literary Meaning

*Joseph Carroll*

Perhaps the major figure in evolutionary literary theory, Joseph Carroll was instrumental in creating the new field of study, starting with his book, *Evolution and Literary Theory* (1995), and continuing through *Literary Darwinism: Evolution, Human Nature, and Literature* (2004). Carroll's early work in the field consisted of rebutting the arguments of Post-Structuralism; his later work is more concerned with developing a method of Darwinian analysis that focuses on both the universals of human evolutionary nature and the specific inflections of human behavior in historical social contexts. This essay begins with a discussion of debates in evolutionary theory between evolutionary psychologists (who see human behavior as primarily adaptive) and sociobiologists (who see it motivated by a drive to achieve reproductive success so that genes can be transmitted – what is called fitness). Carroll then studies Jane Austen's *Pride and Prejudice* and analyzes how style and perspective function to reinforce evolutionary themes.

### The Challenge to a Darwinian Literary Criticism

The common notion of what Darwinian literary criticism could or should do is that Darwinian critics should first look into evolutionary psychology in order to identify universal, basic forms of human behavior – human universals – and that they should then examine this or that literary text in order to demonstrate that the characters in that text behave in precisely the way that evolutionary psychologists predict people will behave. The method involved in this common notion is naïve and vulnerable to obvious objections. People in reality do not simply exemplify common, universal patterns of behavior. They have individuality that is distinguished by the peculiarities of their individual temperaments, their cultural conditioning, and their individual experiences. Cultures vary widely in the ways that they organize the common elements of the human motivational and cognitive system, and even within any given culture many people deviate drastically both from the behavioral norms that characterize that culture and

*Original publication details:* Joseph Carroll, “Human Nature and Literary Meaning” from *The Literary Animal*, ed. B. Gottschall et al., pp. 76–106. Northwestern University Press, 2005.  
Reprinted with permission from Northwestern University Press.

from the deeper underlying commonalities of human nature. Moreover, characters in literary representations are not real, living people. They are fictive fabrications that reflect the notions and beliefs and purposes of individual authors, and individual authors are themselves constrained by their larger cultural context and by the traditions and conventions of literary representation that are available to them. To treat characters as if they were actual people is to ignore the whole concept of “meaning” in literature, and to ignore meaning in literature is something like ignoring the concept of “energy” in physics or the concept of “life” in biology. It is simply to miss the point.

The deficiencies in the common notion of Darwinian literary study can easily be corrected. There is no necessity that Darwinian literary critics muddle along doing a bad job with a naïve methodology simply because they have no notion of how to do a good job. The concepts necessary for integrating Darwinian psychology and literary criticism are neither hard to understand nor difficult to use. What I propose here is to lay out a necessary minimum of analytic concepts – five in all – that must enter into any reasonably competent literary analysis informed by a Darwinian understanding of human nature. The basic concepts are these: (a) human nature as a structured hierarchy of motives (within which the motive of constructing imaginative representations holds a prominent place); (b) “point of view,” or the location of meaning within three distinct centers of consciousness – that of the author, the characters, and the implied or projected audience; (c) the use of human universals as a common frame of reference in relation to which authors identify their own individual identities and their own distinct structures of meaning; (d) a set of categories for analyzing individual differences in identity; and (e) the distribution of specifically literary meaning into three chief dimensions: (i) theme (conceptual content), (ii) tone (emotional coloring), and (iii) formal organization (a concept that ranges all the way from macrostructures like plot and narrative sequencing to micro-structures like phrasing, word choice, and sequences of sounds).

In the course of laying out these concepts and explaining their relations, I shall also make arguments that should be of some interest to Darwinian social scientists, whether or not they care much about literature and the other arts. I shall argue that Darwinian psychology is on the verge of achieving a paradigm – that is, a consensus about the necessary minimum of conceptual elements that enter into an understanding of “human nature.” This emerging paradigm does not consist merely of a list of common basic motives or “universals.” It consists both of universals, the common human elements, and of the variations among those elements that we describe as “individual differences.” And the paradigm also includes an understanding of how the specifically human pattern of life history – birth, development, reproduction, and death – responds with flexible but integrated strategies to the wide range of physical and cultural conditions in which it is possible for people to subsist. Among Darwinian psychologists, there is still disagreement in all these areas, and the currently dominant school of Darwinian psychology, the school most readily identified as “evolutionary psychology,” has committed itself to dead ends and fallacies in its depreciation of both individual differences and domain-general intelligence. But Darwinian social science as a whole has a diverse array of intellectually independent investigators, from many convergent disciplines – paleoanthropology, life history analysis, behavioral ecology, behavioral genetics, personality theory, and the study of intelligence, among others. Given this array of investigators eager to make advances in their own fields and to integrate those fields within the larger logic of evolutionary theory, claims that are motivated by ideology and that lack both empirical support and internal consistency are not likely to survive for long. The necessary elements for a paradigm in

Darwinian psychology are already virtually in place, and I am fairly confident that the energy of active research will in the near future sweep away the obstructions that have temporarily arisen from the premature consolidation of certain orthodox doctrines.

In order to make an argument about the structure of Darwinian literary criticism, then, I shall first need to make an argument about the current condition and future prospects of Darwinian psychology. I shall sketch out what I take to be the emerging paradigm for human nature, and I shall introduce one concept – the concept of a “cognitive behavioral system” – that is relatively unfamiliar but that is, I shall argue, indispensable to the formation of an adequate paradigm both in psychology and in literary study. Most evolutionary psychologists have paid slight attention to literature and the other arts, and some have argued that the arts have no adaptive function central to human life history goals. (See Miller, 2000a, 2000b; Pinker, 1997, 2002.) Invoking the logic of the emerging paradigm in Darwinian psychology, I shall argue that literature and the other arts do indeed have an adaptive function and that understanding this adaptive function is a prerequisite to understanding our specifically *human* nature. The effort to construct a paradigm for Darwinian literary criticism and the effort to construct a paradigm for the broader field of Darwinian psychology are thus interdependent. They need each other. Fortunately, they are both within reach, and by reaching the one, we shall also reach the other.

The central challenge for a specifically Darwinian form of literary criticism is to connect the highest levels in the organization of human nature with the most detailed and subtle aspects of literary meaning. Can we connect the basic life history goals – survival, growth, and reproduction – with the finest nuances of theme, tone, and style in the organization of literary meaning in specific works? The answer to this question will determine the success or failure of Darwinian literary criticism, and the answer is “yes, we can.” The elementary principles of life history analysis enter into the organization of all literary representations, and the manner in which any given author manages those principles is a defining feature in the character and quality of that author’s work. In order to give a practical illustration of these claims, in the final section of this article, I shall offer a Darwinian critical commentary on a single novel, *Pride and Prejudice*. I have selected this novel because it is one of the most familiar of all novels; it is relatively short and simple; and it is so finely realized, as an artistic construct, that it offers a good test case for the challenge of demonstrating the integral relation between life history analysis and the finest components of literary meaning.

Let me emphasize that this choice of an illustrative text is in one sense arbitrary. Any work of literature, from any period or genre, could be chosen for illustrative purposes. Darwinists have written critiques of folktales, myths, plays, poems, romance novels, realist fiction, science fiction, operas, ballets, and movies. They have written interpretive studies of, among other writers, Homer, Shakespeare, Swift, Wordsworth, Pushkin, Tchaikovsky, Walter Scott, Charlotte Brontë, George Eliot, Hans Christian Andersen, Willa Cather, Walter Pater, Zamyatin, and Dr. Seuss. There is no work of literature written anywhere in the world, at any time, by any author, that is outside the scope of a Darwinian analysis. In order to be susceptible to a Darwinian analysis, an author does not have to be a Darwinian. An author can be a pagan Greek, a Christian, a Moslem, or a Zen Buddhist. He or she can be a Brazilian tribesman, a European lady, a medieval Japanese warrior, or a Tibetan monk. He or she can be heterosexual, homosexual, bisexual, or celibate. He or she need not be average or typical, and he or she need not himself or herself embrace beliefs and attitudes that are similar to those of Darwinian psychologists or Darwinian literary critics. If Darwinism gives a true account of the human mind,

and if the human mind produces all literary texts, all literary texts are susceptible to a Darwinian analysis. They are susceptible, that is, to an analysis of the constraining psychological structures that regulate the production of all imaginative artifacts.

Geneticists have often found fruit flies a convenient species for their experiments. But they do not believe or suggest that genetics applies only to fruit flies. I have written on *Pride and Prejudice* in various places, using it for various illustrative purposes. I want to be clear, then, that I do not consider *Pride and Prejudice* a particularly or specifically Darwinian text. I consider it the literary equivalent of a fruit fly. Various of my colleagues in Darwinian literary study are working on the literary equivalents of mice or nematode worms, but whatever the local subject of study, we are all contributing to the same larger field.

### The Emerging Paradigm in Darwinian Psychology

The argument I shall make for what Darwinian literary critics can and should do will turn on the questions of individual differences and “domain-general” intelligence. The two main orthodox tenets of evolutionary psychology that have so far impeded the full development of a paradigm for Darwinian psychology are the repudiation or depreciation of the significance attaching to domain-general cognitive abilities and individual differences in personality and intelligence. “Evolutionary psychology” as a distinct school – and not just as a general term covering the whole field of Darwinian psychology – gives overwhelming, preponderating weight to “human universals,” and it envisions the mind as consisting almost exclusively of “domain-specific” cognitive mechanisms, that is, “cognitive modules” that have evolved specifically for the purpose of solving adaptive problems within a Paleolithic environment. And that ancient environment is itself conceived as a set of statistically stable physical and social conditions, the “environment of evolutionary adaptedness” (EEA). The central tenets of evolutionary psychology as a distinct school, then, are these: (a) everyone has pretty much the same sort of mind and personality, not only in basic structures but in force or quality; (b) this one universal mind, the mind that is common to all people on earth, is “designed” (= adapted) exclusively to deal with a statistically stable environment that lasted for perhaps two million years but that in good part no longer subsists; and (c) all the significant adaptive features of that mind are “cognitive modules” designed to solve adaptive problems specific to the statistical regularities of this ancient environment; domain-general intelligence is not one of these adaptive cognitive features.

This characterization of evolutionary psychology is stark, stripped of qualifications and equivocations, and it is thus far a “caricature,” but the merit of a caricature is that it brings into sharp relief the signal, defining features of a physiognomy. The oddly misshapen countenance that emerges from these three starkly defined tenets is in its main outlines a true portrait. (See Cosmides and Tooby, 1994; Pinker, 1994, 1995, 1997, 2002; Symons, 1992; Tooby and Cosmides, 1992. Also see the textbooks by Barrett, Dunbar, and Lycett, 2002; Bridgeman, 2003; Buss, 1999; Gaulin and McBurney, 2001; Palmer and Palmer, 2002; Rossano, 2003.)

There are two reasons, I would suggest, that evolutionary psychologists have propounded this peculiarly distorted version of human cognitive evolution. The first reason is that they have been preoccupied with opposing the Standard Social Science Model (SSSM) of the mind as a blank slate or general, all-purpose computer in which all

content is produced by external (social and cultural) influences (Tooby and Cosmides, “Psychological Foundation”). Domain specificity offers an alternative to domain generality. The second reason is that they have been frightened by the association of Darwinian psychology with social Darwinism, eugenics, and the exploration of individual and group differences in behavior (the field known as “behavioral genetics”), and especially differences in intelligence. The radical environmentalism or blank-slate model that dominated the social sciences in the twentieth century was itself largely motivated by the fear or rejection of social Darwinism, eugenics, and racial theory. By emphasizing universals and domain-specific mechanisms the evolutionary psychologists have sought to effect a compromise between Darwinism and the SSSM. They have reintroduced the notion of adaptive cognitive structure into psychology, but have done so without violating the ideological taboos against acknowledging the significance of individual and group differences.

The appeal of these two advantages has been so strong that it has, since the early 1990s, blinded many Darwinian psychologists to the fundamental disadvantages of the concepts that enable the compromise. The disadvantages are that this whole complex of ideas runs counter to gross and obvious features of common experience – to the vital importance both of individual differences and of general intelligence in everyday life – and that it runs counter also to the elementary logic in the theory of natural selection. In that theory, “selection” can only work on variation, that is, “individual differences.” No variation, no selection. No selection, no adaptation, and thus no evolution “by means of natural selection” (Darwin, 2003).

Since the late 1990s, evolutionary psychology has achieved sufficient substance and stability to provide a big market for popular expositions and for textbooks – for summary expositions of common findings. In about the same period – in just the past few years – the psychological ideas that so quickly congealed into a premature orthodoxy have been under increasing pressure from new and genuinely innovative research into the single most important event in human evolutionary history – the “cultural revolution” that took place some 60,000 to 30,000 years ago and that produced the first evidence of complex technology, complex forms of socioeconomic organization, and sophisticated symbolic and artistic activity. This whole research area is fraught with controversy, but there is enough agreement about some basic facts so that a compelling new vision of human evolution has been emerging – a vision that contrasts sharply with the orthodox tenets of evolutionary psychology. In this new vision, the most distinctive feature of the specifically human mind – the feature that distinguishes it most from that of its primate cousins – is the emergence of a flexible general intelligence that enables humans to adapt to variations within an environment that is itself complex and unstable. (See Chiappe, 2000; Chiappe and MacDonald, under submission; Crawford, 1998; Foley, 1996; Geary, 1998; Geary and Huffman, 2002; Irons, 1998; MacDonald, 1990, 1995b, 1997, 1998a, 1998b; Mithen, 1996, 2001; Potts, 1998; Richerson and Boyd, 2000; D. S. Wilson, 1999; E. O. Wilson, 1998.)

It is a simple fact available to common observation that humans have evolved a truly extraordinary capacity to adapt to new and different environments – and to effect these adaptations while undergoing relatively little or no actual change in their anatomical or physiological characteristics. Humans can live everywhere from polar regions to deserts to tropical rain forests; they can organize themselves socially in groups that extend from small hunter-gatherer bands to tribes, hordes, nation-states, empires, and new world orders; and they can adapt to socioeconomic ecologies that stretch from hunting and

gathering to agriculture, market economies, industrial cities, and vast metropolitan regions linked digitally to a total world culture. The one crucial feature of human nature that underwrites this adaptability is domain-general intelligence, and that intelligence, along with all the distinctive features of human temperament and personal character, varies from person to person and group to group. (See Bailey, 1997, 1998; Barash, 1997; Bouchard, 1994, 1997; Buss, 1990, 1995; Eaves, Eysenck and Martin, 1989; Eysenck, 1979, 1980, 1995; Herrnstein and Murray, 1994; Jensen, 1998; MacDonald, 1990, 1995b, 1997, 1998a; Rushton, 1995; Segal, 1997, 1999; Segal and MacDonald, 1998; Seligman, 1992; D. S. Wilson, 1994, 1999.)

In the new, emerging vision of human evolution and human nature, the idea of cognitive domains has not been discarded. It has been assimilated and integrated into the larger general structure of human cognition. Cognitive domains have their place and function; they subserve cognitive activities that track constant features of the environment. The eyesight that tracks the spatio-physical world is a prime example; and language aptitude that tracks the human physical and social environment is another. But these domain-specific aptitudes are only a part of the total human cognitive repertory. Another part is general intelligence, and general intelligence subserves the basic adaptive needs of human beings. The new vision does not fall back to the old blank-slate model. It does not assume that all human motives are simply fabricated by arbitrary cultural conventions. It identifies a distinct structure of human motives and cognitive dispositions that derives from the larger logic of inclusive fitness – the logic that regulates the adaptive structure of all life on earth. The distinct structure of human motives and cognitive dispositions is that which is appropriate to a primate species that is highly social and mildly polygynous, that displays concealed ovulation, continuous female receptivity, and postmenopausal life expectancy corresponding to a uniquely extended period of childhood development, that has extraordinary aptitudes for technology, that has developed language and the capacity for peering into the minds of its conspecifics, and that displays a unique disposition for fabricating and consuming aesthetic and imaginative artifacts. So long as we bear all this in mind, we need have no fear of falling back into the structural vacuum of the blank slate – a vacuum in which the mind evolved, the mind produced culture, and culture gave all content and structure to the mind.

In the 1990s, the most important theoretical conflict within Darwinian psychology itself was the conflict between “sociobiology” on the one side and “evolutionary psychology” on the other. In its simplest terms, this conflict turned on differing views of the human motivational system. Sociobiologists tended to regard humans as “fitness maximizers.” As Irons formulates the idea, “Human beings tend to behave in such a way as to maximize their genetic representation in future generations” (1979, p. 257). In its most extreme form, as in the arguments produced by Betzig, fitness maximization is conceived simply in numerical terms as a matter of leaving the greatest possible number of progeny. Evolutionary psychologists, in contrast, committed themselves to the view that humans do not care particularly about reproductive success. In their view, humans are not “fitness maximizers” but rather “adaptation executors” (Tooby and Cosmides, 1992, p. 54). That is, humans are motivated exclusively by “proximal” motives like the desire for sex. In the EEA, such motives operated reliably to maximize fitness but did not, supposedly, require that reproductive success be an active motive in its own right. In the modern world, the argument goes, birth control neatly severs the link between the proximal motive of sexual desire and the “ultimate” regulative principle of inclusive fitness. People are designed only to push the pleasure buttons in their proximal motives,

not to worry about the ultimate evolutionary or adaptive rationale that produced those buttons. (See Alexander, 1979, 1987, 1990; Barkow, 1990; Betzig, 1986, 1998; Chagnon, 1979; Chagnon and Irons, 1979; Irons, 1990, 1998; MacDonald, 1995a; Symons, 1989, 1992; Turke, 1990.)

In the currently orthodox version of evolutionary psychology, the idea of humans as adaptation executors has gained a decisive victory. In so far as this concept is set in contrast to the notion of counting offspring as a monolithic human motive, the victory has been legitimate, but the idea of pushing pleasure buttons is not in itself a satisfactory account of the human motivational system. We can formulate a better, more comprehensive account of the human motivational system by integrating two concepts: (a) the concept of human life history as a cycle organized around the distribution of effort between “somatic” and “reproductive” activities, and (b) the concept of “behavioral systems.”

The central categories of life history analysis are birth, growth, death, and reproduction. The organisms of all species engage in two fundamental forms of effort – the acquisition of resources (somatic effort) and the expenditure of resources in reproduction. Birth, growth, and death are somatic activities. Mating and parenting are reproductive activities. (Not all individuals of all species engage in reproductive activity, but if reproductive effort were not part of the suite of characteristics in a species, that species would become extinct within a single generation.) All the main activities in the life history of an organism are integrated and interdependent. “What an organism spends in one endeavor cannot be spent in another. Life histories, the patterns of birth, growth, and death that we see, are thus the outcome of competing costs and benefits of different activities at any point in the life cycle” (Low, 1998, p. 131). Life history analysis compares the different ways in which the logic of inclusive fitness – the maximization of reproductive success – has regulated the interplay of these large-scale principles in different species. The organization of life history traits – of size, growth rate, life span, mating behavior, number and pacing of offspring, sex ratios of offspring, and parenting strategies – enters into every aspect of a species’ characteristics: into its physiology, its anatomy, and its behavior. Life history theory can thus be regarded as the overarching theory for both a macroeconomics and a microeconomics of biology. (See Alexander, 1979, p. 25, 1987, pp. 40–41; Geary, 1998, pp. 11, 199; MacDonald, 1997, p. 328; McGuire and Troisi, 1998, pp. 58–59; Low, 1998, pp. 138–40, 2000, p. 92; Ridley, 1999, pp. 12, 127–128; Trivers 1972, pp. 168–174, 1985, pp. 311–314.)

The human species has a distinct form for the organization of its life history, and the logic of this organization enters into every facet of the human behavioral and cognitive order. Humans are highly social animals with pairbonded, semi-monogamous mating systems and extraordinarily high levels of parental investment. They have upright posture, narrowed birth canals, and large brains. As a result, their reproductive economy necessarily involves motivational systems geared toward male-female pair-bonding, sustained family structures, extended kinship systems, and complex social organization. Their large brains entail long development as children so that they can acquire the information and skills necessary for successful life effort. Their long childhood requires intense child-parent attachment, male-female cooperative parenting, and extended kin networks. Their large brains present them with unique adaptive opportunities, both technological and social, and also with challenges and problems other species do not face.

The idea of “behavioral systems” has been formulated as a concept in Darwinian psychiatry, and it has emerged also, implicitly, half-consciously, as an organizing principle

in orthodox versions of evolutionary psychology. In *Darwinian Psychiatry*, McGuire and Troisi define behavioral systems as coordinated suites of behavior subserving specific life goals. “The term *behavior system* refers to *functionally and causally related behavior patterns and the systems responsible for them*” (1998, p. 60). McGuire and Troisi themselves identify four specific systems: survival, reproduction, kin assistance, and reciprocity – with reciprocity serving as a generalized term for social interaction beyond the kin group. In the now numerous textbooks devoted to evolutionary psychology, very similar terms typically serve as the chapter titles for the whole sequence of chapters. For instance, in the first of the textbooks (1999), after introductory chapters on the history, theory, and methodology of evolutionary psychology, Buss has this sequence of main sections: “Problems of Survival,” “Challenges of Sex and Mating,” “Challenges of Parenting and Kinship,” “Problems of Group Living.” The organization of topics in Buss’s textbook set the pattern for the subsequent textbooks, and the pattern itself tacitly underwrites the theory of behavioral systems. (Buss himself is alert to the importance of personality theory and to individual differences, and in a final section of his textbook he discusses this topic but also acknowledges that orthodox evolutionary psychologists have concentrated almost exclusively on human universals.)

By combining the idea of life history analysis with the idea of behavioral systems, we can formulate an alternative to the opposing notions of fitness maximization and adaptation execution. Despite the evidence of a few great sultans, humans are not typically motivated, in any very direct or active way, to maximize the number of their progeny. But neither are they merely puppets adequately fulfilled by the pushing of their pleasure buttons. People are neither fitness maximizers nor adaptation executors. They are highly integrated sets of behavioral systems that have been organized and directed by the logic of the human life history cycle. Human nature is organized in structured sets of behavioral systems, and these systems subserve the goals that are distributed into the basic functions of somatic and reproductive life effort. Fitness maximization is not itself an active motive, but the fundamental somatic impulses (surviving and acquiring resources, both physical and social) and the fundamental reproductive impulses (acquiring mates, having sex, producing and tending children, helping kin) are in fact direct and active motives.

The behavioral systems identified by McGuire and Troisi and by the textbook writers – survival, mating, parenting, kin relations, and social interaction – are built into the human organism. They are mediated by innate structures in the genetically conditioned features of anatomy, physiology, hormones, and neurochemistry. All of these mediating forces manifest themselves psychologically as emotions – the “basic” emotions identified by Ekman and others as universal motivating forces in human psychology (joy, sadness, fear, anger, contempt, disgust, surprise). (See Damasio, 1994; Ekman, 2003; Ekman and Davidson, 1994; Ledoux, 1996; Lewis and Haviland, 2000; MacDonald, 1995b; Panksepp, 1998.) The main behavioral systems that subserve the largest life history goals are sensitive to the appropriate stimuli, but they are latent in all conditions of life. Male sexual desire, for example, is activated by the sight of nubile females, but even a male raised in total isolation by machines would presumably have stirrings of confused sexual interest or sensation – a sense of vague, frustrated longing, accompanied by spontaneous erections and emissions, and I think it safe to predict that the first time any such hypothetically deprived male saw a nubile female, he would have a sudden and instantaneous conviction that THAT was what he had been wanting, had he only known. A woman raised in similar isolation would presumably not think to herself, “I wish to be inseminated,

grow an embryo in my uterus, and produce a child, which I shall then suckle and nurture,” but whatever her thoughts or longings might be, she would still grow breasts and undergo a menstrual cycle, and if she were inseminated by machines in her sleep, the growth and birth of a child, however terrifying to her ignorance, would have in it a certain natural, physical logic, and the effects would carry with them instinctive impulses and sensations. Language is an instinct (Bickerton, 1990; Pinker, 1994), but feral children can never gain fluency in speech. Maternity is an instinct, but female monkeys raised in isolation perform badly as mothers. Normal human development requires socialization, but socialization itself is channeled by innate dispositions. The behavior of a female raised in isolation is disorganized and dysfunctional, but it is not simply blank.

The total anatomical and hormonal organization of women is geared toward the bearing and raising of children. Even the massively conditioned women in Huxley’s *Brave New World* feel a vague longing that can be satisfied only by a full course of hormonally mediated “pregnancy substitute.” In the actual modern world, a world in which people can choose whether or not to reproduce, the overwhelming majority do choose to reproduce. Many couples who for physical reasons cannot have children go to astonishing lengths, in expense and effort, to adopt children. Evolutionary psychologists emphasizing the activation of proximal mechanisms point to the fact that not everybody wants to have children. True enough, but most people are equipped by nature with the physical and psychological attributes that are necessary to the bearing and raising of children, and the majority of people feel at some point a powerful need to activate those attributes and to fulfill the behavioral capacities they feel latent within them. If this were not the case, we would have a hard time explaining adoption and the nearly universal human practice of treating pet animals as surrogate children. (See Alcock, 2001, pp. 35–40.)

Childbearing and child-rearing are only an instance, though an important one. The larger principle is that in most cases people accede to the psychological force of the total set of motivational systems that have been implanted in them by the logic of human life history. More often than not, people have a compelling need to give full and integrated play to the whole suite of their behavioral systems. Exceptions and special cases abound, but it is a broad general truth about human nature that people have a need to activate the latent capacities of the behavioral systems that have shaped the largest features of their bodies and their minds. For most people, achieving satisfaction in life depends on the fulfillment of the emotional needs built into those systems.

## The Cognitive Behavioral System

The textbook versions of evolutionary psychology are a little uncertain about what, if anything, to make of the various specifically cognitive aspects of human nature. Language can usually be inserted somewhere in the sections on social interaction, but it is less clear where one is to locate aptitudes for tool use, cognitive biases for the acquisition of organized information about plants and animals, and the production of cultural artifacts of no apparent utility, especially if these artifacts do not push simple pleasure buttons in the way that pornography does for many people. If we combine the idea of behavioral systems with a recognition of the peculiarly human attribute of domain-general intelligence, we can solve this puzzle. The human mind is an extraordinary, complex organ. It is both highly structured and flexibly responsive to contingent inputs. It solves an immense array of adaptive problems. Some of its processes develop in predictably universal

ways, as in the acquisition of language, of colors, or of botanical and zoological categories. (See Atran, 1990; Brown, 1991; Cosmides and Tooby, 1994; Geary, 1998; Pinker, 1994, 1995, 1997, 2002; Tooby and Cosmides, 1992.) Other processes develop with the combinatorial fluidity that we designate as “creative” or “inventive,” as in the invention of new technologies and new arts, but all new inventions and discoveries work by extending and combining the elemental cognitive components that develop spontaneously and universally in human minds, as the product of an adaptive evolutionary history, and all cultural artifacts, no matter how complex or seemingly arbitrary, are constrained by the limitations of physical nature and are both prompted and constrained by an evolved human psychology. (See Barrow, 1996; Carroll, 1995; Chiappe, 2000; Chiappe and MacDonald, under submission; Darwin, 1871; Geary, 1998; Mithen, 1996; Geary and Huffman, 2002; E. O. Wilson, 1998.)

The mind is a complex and integrated feature of human nature – sufficiently complex, structured, and integrated in its operations so that it answers to the criteria for what McGuire and Troisi identify as a “behavioral system.” If we identify the mind in this way, we are adding it, as a specifically human characteristic, to the set of human behavioral systems. We identify it as having characteristic innate constraints and distinctive latent capacities elicited by appropriate releasers. The mate selection system arouses desire and fulfills it in successful coupling. The parenting system arouses concern for children and achieves fulfillment in the successful rearing of children. The social interaction system arouses desire for forming coalitions and finding a place within a status hierarchy, and achieving those goals offers pleasure and provides a sensation of satisfaction. The cognitive behavioral system arouses a need for conceptual and imaginative order, and that need fulfills itself and provides satisfaction to the mind through the formulation of concepts, the construction of religious, philosophical, or ideological beliefs, the development of scientific knowledge, and the fabrication of aesthetic and imaginative artifacts.

I have already argued that domain-general intelligence has an adaptive function; it facilitates a flexible response to a variable environment. That flexibility gives humans an advantage other animals do not have, and it presents them also with challenges and difficulties unique to the human species. Other species operate mainly by means of instinct, that is, by means of stereotyped behaviors that leave little room for conscious choice. Humans create elaborate mental models of the world and make decisions on the basis of alternative scenarios that present themselves within those models. (See E. O. Wilson, 1998.) The materials available to the mind and imagination are vast, and the combination of those materials virtually infinite. The possibility for error, uncertainty, and confusion is an ever-present fact of human mental life. Because they have an irrepressibly active and unstable mental life, humans have a special need to fabricate mental maps or models that make sense of the world and provide behavioral directives that can take the place of instinctive behavioral patterns. For these mental maps or models to be effective in providing behavioral directives, they must be emotionally saturated, imaginatively vivid. Art and cultural artifacts like religion and ideology meet this demand. They fulfill a necessary adaptive function, that of regulating the human cognitive behavioral system. The arts provide emotionally saturated images and aesthetic constructs that produce a sense of total cognitive order and that help regulate the other behavioral systems. The arts make sense of human needs and motives. They simulate subjective experience, map out social relations, evoke sexual and social interactions, depict the intimate relations of kin, and locate the whole complex and interactive array of human behavioral

systems within models of the total world order. Humans have a universal and irrepressible need to fabricate this sort of order, and satisfying that need provides a distinct form of pleasure and fulfillment. (See Boyd, 1998, 2001; Brown, 1991; Carroll, 1995; Cooke, 1999, 2002; Dissanayake, 1995, 2000, 2003; Fromm, 2003; Love, 2003; Storey, 1993, 1996; Scalise Sugiyama, 2001b; E. O. Wilson, 1998.)

## A Diagram of Human Nature

In order to clarify the hierarchical motivational structure of human nature I have been describing here, I shall construct a diagram, with inclusive fitness at the top, as the ultimate regulative principle (but not as an active and direct motive). Active and direct motive begins at the next level down, with the organization of life effort into somatic and reproductive effort. Through this hierarchical structure, I am suggesting that over and above their specific goals and motives, many people have a generalized but distinct desire to acquire resources and also to achieve successful reproduction. Not all people have an active desire for reproductive success, but such a desire is nonetheless, I would argue, a characteristic of the species as a whole. Young men do not think only, "I want to buy a red convertible so I can attract that girl there and have sex with her." They also often think, "I'd like to become prosperous, and I'd like to get married and have a family." And young women do not think only, "I'm impressed by that guy with the red convertible. I want to arouse his sexual interest and attach him to me." They also think, "I'd like to find a prosperous, reliable man, marry him, have children, and raise a family." It is these latter, generalized inclinations that I am identifying as the somatic and reproductive motives in their own right.

Below the level of generalized desire to acquire resources and succeed in sexual reproduction, I shall place the various behavioral systems that subserve both those general motive dispositions. The specific subordinate systems identified here are systems dedicated to survival, technology, mating, parenting, kin relations, social relations, and cognitive activity. Between the somatic and reproductive levels on the one hand and these specific behavioral systems on the other, I shall place the term "development" to indicate that these various systems are activated and distributed according to the developmental program appropriate to the human species. (The mating and parenting systems operate only at specific times in the life history of a human organism, and social dispositions vary in the course of the life cycle.)

In a box under each behavioral system, I have placed a few motivational goals or directives characteristic of that system. Thus, under "Survival," there is a directive "avoid predators." Under "Mating," there is a directive "avoid incest." Under "Social," a directive "build coalitions," and so on.

In the interest of completeness, I include one behavioral system – that of "technology" – that is not mentioned in the accounts by McGuire and Troisi and the textbook writers. The disposition to construct stone tools is one of the most ancient hominid adaptations, and our modern technology is continuous with the construction of complex, multipart tools that constitutes one of the distinguishing features of the "human revolution" from perhaps 100,000 to 30,000 years ago. In one of the most elaborate efforts so far to mediate between evolutionary psychology and the idea of a domain-general intelligence, Mithen (1996) identifies technology as an integrated area of cognitive activity. He calls it a cognitive domain, but the concept as he describes it is on a structural level equivalent to what I have been calling a behavioral system.

Specific cognitive modules would be activated within the relevant behavioral systems. For instance, the cognitive modules for vision – edge and motion detection, color, depth, etc. – would be activated within the technological behavioral system and the survival system. Kin-recognition modules would be activated within the kinship system. “Face recognition” modules would be activated within all interpersonal behavioral systems (mating, parenting, kin, social interaction). Modules for regulating social exchange or cheater detection would be activated in the mating system and in the social system, and so on. If, as seems likely, the brain has specific modules geared to the construction of narratives and the recognition of aesthetically pleasing verbal patterns, those would be activated within the cognitive behavioral system. (For lists of domain-specific cognitive modules, see Carey and Spelke, 1994, p. 171; Cosmides and Tooby, 1994, p. 103; Mithen, 1996; Pinker, 1994, p. 420, 1995, p. 236, 1997, pp. 128, 315; Sperber, 1994, p. 42; Tooby and Cosmides, 1992, p. 113. For suggestions about cognitive predispositions to certain kinds of aesthetic order, see Barrow, 1996; Eibl-Eibesfeldt, 1989; Frederick Turner, 1992; M. Turner, 1996.)

One final feature of the diagram is that the box in the diagram containing behavioral systems has a list of Ekman’s basic emotions at the bottom of the box, thus signifying that all behavioral systems are activated and mediated by emotion.

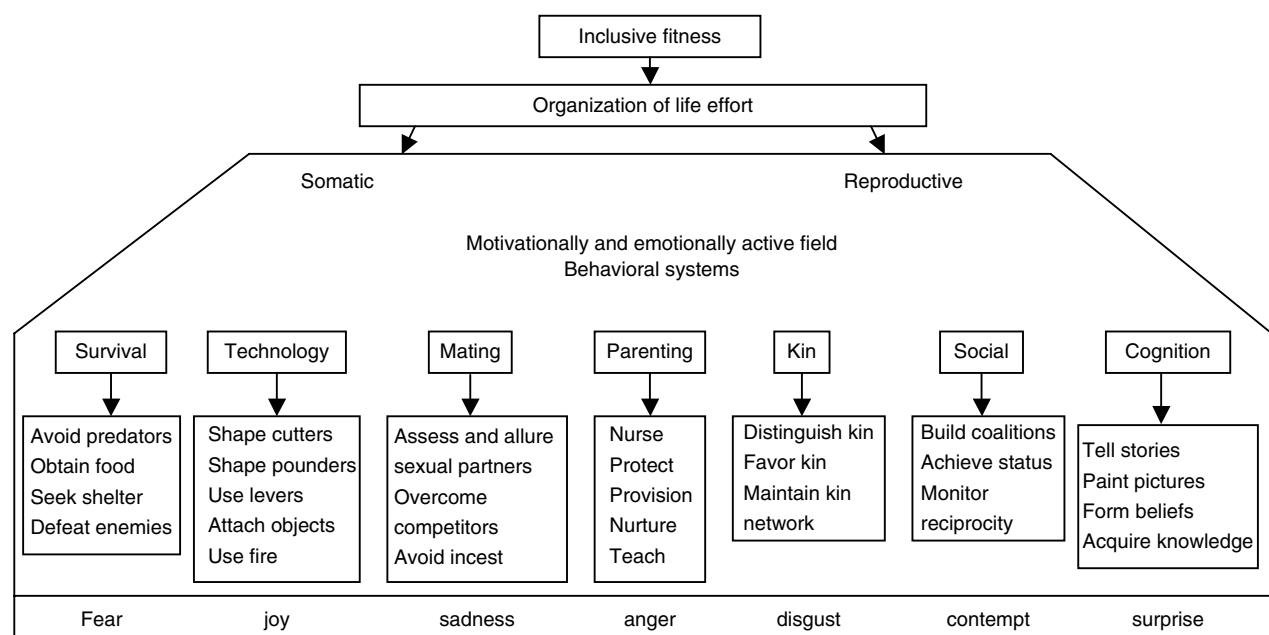

### **Meaning and Point of View in Literary Representations**

Literary representation is first and foremost the representation of human behavior within some surrounding world. Creating such representations is itself a fundamental motive of human nature, and human nature is the fundamental subject of the representations. The “meaning” of a representation does not reside in the represented events. Meaning resides in the *interpretation* of events. And interpretation is always, necessarily, dependent on “point of view.” “Point of view” in literary narrative is not just another technical feature in a catalog of formal literary devices. In its broadest sense, point of view is a term signifying “the locus of consciousness or experience within which any meaning takes place.” Point of view is thus the term we use to designate the primary components in the social interactions constituted in and by a literary representation. There are three components in the social interactions of a literary representation: the author, the represented characters, and the audience. (See Abrams, 1986.) The primary locus of meaning for all literary works is the mind of the author. Whether consciously or unconsciously, the author provides whatever determinate meaning resides in a work, but the author also negotiates among the competing points of view within the characters in the work, and negotiates further with the point of view he or she attributes to an audience.

Authors are people talking to people about people. Most stories are about people seeking resources and reproductive success – fortune and love. But they are also about people seeking to perceive meaning in or impose meaning on the events of their own lives and the lives of every person they know. All authors seek to dominate the meaning of the story they tell, and all the characters in a story have their own version of what happens. As a rule, these versions partially overlap both with one another and with the version presented by the author, but they also often conflict. The author has final say among his or her own characters, but to control the interpretation of the story as it will be registered by the audience, the author can only persuade, manipulate, cajole, wheedle,

intimidate, solicit, insult, flatter, bully, harangue, coax, shame, or otherwise appeal to or provoke the readers. (See Booth, 1996; Leaska, 1996, Scalise Sugiyama, 1996.)

It is important to grasp the foundational significance of this set of simple axioms

**Figure 1** A Diagram of Human Nature.

about point of view. These axioms provide a distinct, finite, and manageable set of analytic categories for the analysis of meaning in a literary representation. There are *three specific components* in the social interactions of a literary representation. There are *always* three components. There are *only* three components. The members of each of these

three categories organize the meaning of represented events in some distinct way. One of the chief analytic procedures a critic needs to perform in assessing any literary representation is to assess the relations between the author's point of view, the point of view of the characters, and the point of view in the audience that is implied or projected by the author. At the highest possible level, the meaning of a literary representation consists in the interaction among the points of view of author, characters, and implied audience. That interaction is largely controlled by one of those three distinct sets, the author.

It might be objected that in this exposition I am thinking only of narrative, not of theatrical representation, and it might be argued that in theatrical representations there is no author but only a transparent and unmediated action taking place on stage. The absence of an author from the stage in a theatrical representation is, I think, altogether an illusion. A play sets into motion an array of forces – of human passions and motives, desires and fears. There is a mind that governs and organizes this array of forces – the mind of the author. The author's mind is the one mind that is most nearly adequate to understanding the full array of forces within the play. A leading character can sometimes approximate to the level of an author's own adequacy of comprehension – as in Hamlet's soliloquies – but it is not possible for an author to depict a character whose comprehension of the total set of forces at work in a representation exceeds the comprehension of the author. Any level of comprehension the author can depict is, by definition, within the scope of the author's own understanding.

### **Human Nature, Human Universals, Culture, and Individual Differences**

Almost all authors explicitly invoke "human nature" as their ultimate referent and the source of their authority. The term "human nature" signifies a set of elemental motives and dispositions – what MacDonald (1990) calls "evolved motive dispositions." The diagram of human nature sketched out above suggests the sorts of motives that are usually contained in the common conception of human nature – motives like self-preservation, sexual desire, jealousy, maternal love, and the desire for social status – and these substantive motives are elaborated by the ideas that enter into the folk understanding of ego psychology: the primacy of self-interest and the prevalence of self-serving delusion, manipulative deceit, vanity, and hypocrisy. Authors understand that each elemental disposition varies in quality and degree from person to person; they know, for instance, that some people are more fearful of death, more sexually passionate, more maternal, or more ambitious than their neighbors. And they understand further that each of these dispositions, variable in itself, can be combined in different ways with the other dispositions so as to produce the distinct configurations of individual identity. A woman might be both terrified of death and intensely protective of her children, but have little sexual desire and little social ambition – or be exactly the reverse, bold and fearless, coldly indifferent to her offspring, sexually ardent, and passionately determined to achieve high social rank. And yet again, she might be fairly bold, typically maternal, moderately amorous, and modestly ambitious.

Human universals or species-typical norms of behavior are merely behavioral patterns so firmly grounded in the logic of human life history that they are characteristic features of all known cultures. For instance, all cultures have marriage, rites of passage, social roles defined by age and sex, religious beliefs, public ceremonies, kin relations, sex

taboos, medical practices, criminal codes, storytelling, jokes, and so on. (See Brown, 1991, 2000.) Universals are made up of motive dispositions that combine in relatively stable and consistent ways. The same motive dispositions can also be elaborated and organized, at higher levels of cultural complexity, in ways that vary widely from culture to culture. For instance, all cultures have marriage, but some cultures are polygynous and some monogamous; some allow divorce, and some do not. All cultures have games, but not all cultures play whist or football. All cultures have language, but not all cultures are literate; not all literate cultures have produced highly developed forms of prose fiction; and not all cultures with highly developed forms of prose fiction have produced stream-of-consciousness narrative styles.

No culture can deviate from human universals (by definition), but many individual people can and do deviate from species-typical norms of behavior. They murder their children, commit incest, fail to develop language, or otherwise behave in anomalous or dysfunctional ways. The behavior that is depicted in literary texts does not necessarily exemplify universal or species-typical behavioral patterns, but species-typical patterns form an indispensable frame of reference for the communication of meaning in literary representations. By appealing to this substratum of common human motives, authors activate a vein of common understanding in their readers. Consider maternal care and incest. Maternal care of infants is a “universal” feature of human nature, but all cultures make some provision for population control, and in cultures that do not have access to birth control and abortion, population control necessarily involves infanticide. (See Daly and Wilson, 1988; Low, 2000; Symons, 1979.) Literary authors can nonetheless depend on readers to feel the weight and value of maternal care. This is part of the common frame of reference, not just for any particular culture but for all cultures. Medea murders her own children, and Euripides can safely anticipate that the audience will react with instinctive shock and horror to the murder. So also, incest avoidance is a human universal. Different cultures define the details of incest in different ways, but certain kinds of incest are universally prohibited. No culture permits mother-son incest, and Sophocles can safely anticipate that his audience will instinctively sympathize with the revulsion of feeling that leads Oedipus to gouge out his own eyes. (See Daly and Wilson, 1990; Low, 2000; Scalise Sugiyama, 2001a.)

In the same way that each author has a unique fingerprint, he or she has also some unique configuration of identity – some individual variation of personality and experiential conditioning – and that identity defines itself in relation both to the cultural norms within which the author lives and also to the common elements of human nature. Individual identity is the basis for an author’s point of view, and more often than not an author presents his or her own distinct point of view as a normative standard – as an ideal against which to judge other identities, other points of view. By appealing to “human nature,” literary authors can ground their own values within what they take to be elemental realities. Sometimes, but not always, they contrast these elemental realities with the conventions of their own culture, suggesting that the conventions are shallow, perverse, artificial, unhealthy, or otherwise undesirable. (See Carroll, 1995; Jobling, 2001a, 2001b; Nesse, 1995; Nordlund, 2002.)

Some distinctions of individual difference are obvious and available to untutored common sense – for instance, distinctions of age, sex, health, attractiveness, social affiliation, social status, vocational occupation, intelligence, and honesty. (The now pat triad of class, gender, and race – the standard topics of politicized literary criticism – is an arbitrary subset of these useful categories.) Such terms, available to common sense, are

also necessary to a life history analysis of the human species. The common understanding operates as an intuitive or “folk” version of life history analysis. In addition to the distinctions from this range of analysis, all critics have access to the common vocabulary for assessing temperament and personality. Differences in personality are part of the adaptive environment among which individual humans make the choices that enable them to succeed in meeting the needs of their evolved motive dispositions. In traditional, belle-lettistic or impressionistic literary criticism, differences in the quality of critical perceptions depend in good part on the acuity any given critic displays in accessing this common vocabulary. Modern personality theory has now distilled, codified, and elaborated the common vocabulary of temperament and personality, and it is very much in a literary critic’s interest to become familiar with this body of empirical research. At present, the best available theory is that of the five-factor system (extraversion, neuroticism, conscientiousness, agreeableness, and imaginative and intellectual “openness”). Since this system was drawn, in the first place, from the common lexicon, it is not surprising that its categories correlate well, as a first approximation, to the depiction of characters in fiction. In order to identify the relations of authors to their own characters, the use of this common vocabulary provides an invaluable tool for a shared and delimited analytic vocabulary. (See Bouchard, 1994, 1997; Buss, 1990, 1995; Costa and Widiger, 1994; Digman, 1990; Eysenck and Eysenck, 1985; McCrae, 1992; MacDonald, 1995b, 1998b; Pervin, 1990, 2003; Pervin and John, 1999; Segal and MacDonald, 1998; Wiggins, 1996.)

The fifth factor in the five-factor personality system – imaginative or intellectual openness to experience – is the factor most closely associated with domain-general intelligence, and it is itself roughly concordant with the cognitive behavioral system. MacDonald explains, “The Openness to Experience factor taps variation in intelligence and what one might term optimal Piagetian learning – intrinsically motivated curiosity and interest in intellectual and aesthetic experience combined with imagination and creativity in these areas” (1998b, p. 126). In virtually all literature, distinctions of wit or intelligence or imaginative vitality form a central distinguishing point of reference in the discrimination among characters and in the formation of a normative or dominant authorial point of view. Authors by nature have strong cognitive behavioral systems – they would be positioned at the far end of the right tail of the bell curve distribution measuring the fifth factor – and they tend strongly to value this same quality in their characters. They tend also to invite their audiences to share in their own normative approbation of this quality.

The primary purpose of literary criticism, as an objective pursuit of true knowledge about its subject, is to identify the specific configuration of meaning in any given text or set of texts. In order to make that identification, it is necessary for the critic to have three conceptual models or templates at his or her disposal: (a) a concept of human nature (like that in the diagram earlier); (b) a concept of the cultural ecology within which any given text has been constructed; and (c) a set of categories for analyzing individual differences. In order to make analytic use of these three templates, the critic must also assess the author’s own understanding of human nature, identify the author’s own stance toward the cultural context, and identify the distinctive characteristics of the author’s individual identity.

## Life History Analysis and Cognitive Style in *Pride and Prejudice*

Before commenting on the relation of style to life history analysis in *Pride and Prejudice*, I shall take a moment to summarize the novel, as concisely as possible, for the benefit of any reader who has not read it, or who has not read it recently. The protagonist, Elizabeth Bennet, is twenty years old and the second of five daughters. Her father is a gentleman who married somewhat beneath his own social class and chose a wife for her physical charm. His wife's foolishness and vulgarity have alienated him, and he habitually engages in whimsical mockery of her. His estate is entailed to a cousin, a clergyman named Mr. Collins. When Mr. Bennet dies, Mr. Collins will inherit his estate, and Mr. Bennet's wife and five daughters will be left destitute. His wife is thus quite desperate to find rich husbands for her daughters. A wealthy and unmarried young man, Mr. Bingley, rents an estate in the Bennets' neighborhood, and his entourage includes two sisters and a friend, Mr. Darcy, who is also single and even more wealthy than Bingley. In short order, Bingley falls in love with Elizabeth Bennet's older sister, Jane, but Darcy discourages the match and persuades Bingley to leave the neighborhood. Darcy disapproves of the vulgarity of Elizabeth's mother and of her younger sisters, but he is himself nonetheless attracted to Elizabeth, whose wit and vivacity arouse his admiration. Mr. Collins, a monstrously foolish man, proposes to Elizabeth, and when she rejects him, he marries Elizabeth's best friend, Charlotte Lucas, who has little value on the marriage market and seeks only a comfortable establishment. Mr. Collins lives close to a wealthy, arrogant woman, Lady Catherine de Bourgh, who appointed him to his clerical living. Lady Catherine also happens to be Darcy's aunt, and when Elizabeth goes for an extended visit at Charlotte's new home, she again meets Darcy. He proposes to her, but does so in an insulting way, expressing his vivid sense of her social inferiority, and she angrily rejects him. In explaining her rejection, she accuses him of interfering in her sister's marriage prospects, and accuses him also of failing to meet his obligation to provide support for the son of his father's steward, Mr. Wickham, a man who grew up with Darcy. Wickham had recently been stationed with his regiment near Elizabeth's home, had become friendly with her, and had divulged his supposed mistreatment at Darcy's hands. In order to vindicate himself, Darcy writes a letter in which he explains that his own conduct to Wickham has been honorable and that Wickham is in fact a scoundrel and a prevaricator. His evidence is compelling, and Elizabeth realizes she has misjudged him. Her aunt and uncle invite her to accompany them on a vacation tour that leads them into the vicinity of Darcy's estate. They meet Darcy by accident, and his manners undergo a major change. He ceases being haughty and reserved and seeks to ingratiate himself with Elizabeth and her relatives. Elizabeth's views have also changed, and she is receptive to his address, but then she gets a letter from her sister Jane telling her that a younger sister, Lydia, has run off with Wickham, thus bringing disgrace on the whole family. Elizabeth returns home, and unbeknownst to her, Darcy finds Wickham and Lydia and bribes Wickham to marry Lydia. Elizabeth discovers this secret, and is duly grateful. When Bingley and Darcy return to Elizabeth's neighborhood, Bingley proposes to Jane and Darcy proposes, again, to Elizabeth. Both women accept the proposals, and the epilogue informs us that these two main couples live happily ever after.

*Pride and Prejudice* is universally recognized as a classic, and specifically as a classic distinguished by the economy of its narrative and the elegance of its style. That economy and elegance depend in large part on one central tension in the narrator's own

point of view, a tension between two poles: at one pole, the tough-minded recognition of the fundamental realities of human life history, the primacy of resource acquisition and reproductive activity; and at the other pole, the determination to value individual qualities of mind and character. Austen herself grasps with a singular acuity the governing power of the somatic and reproductive foundation of human action, but virtually every character in the novel is assessed also on the basis of the quality of his or her mind. If you will refer again to the diagram of human nature, you can envision the novel as working itself out through a tension between the highest level of conscious human organization – the recognition of the primary need to acquire resources and to mate successfully – and the cognitive behavioral system. Everyone wants to marry well within the terms that are common knowledge among evolutionary sexual theorists – the women want wealth and status in their men, and the men want youth and beauty in their women. But the single most important criterion for registering personal quality in the novel is the degree to which both men and women rise above this basic standard and require also qualities of excellence in character and in mind.

The realization of character – and especially of conscientiousness – is best seen in action, in what the characters actually do. But the realization of mind is best revealed in their style – in what they say, and even more importantly, in how they say it. Austen's own style is “elegant” not in the sense of betraying effeminate delicacy or softness. It is elegant in the sense of being supple, sharp, quick, and crystal clear. It has less the quality of a brush held by a lady's gentle touch than of a finely tempered blade wielded by a hand that is strong, deft, and aggressive. The two chief characters, Elizabeth and Darcy, come to admire and love each other in good part because they share Austen's cognitive and stylistic powers. They select themselves out from the babble of folly, nonsense, and polite fatuities that make up the stylistic world of their associates, and they come to admire one another for qualities of wit and judgment that unfold themselves in sharp and serious dialogue on subjects of character, tone, and point of view. Darcy first offends Elizabeth, when they meet, by uttering some arrogant and defensive rationalizations for his own stiff behavior at a ball. (He is introverted and not very likable, but he is ultra-high on conscientiousness. Wickham, his chief rival for Elizabeth's romantic interest, is extraverted and charming but deceitful and utterly unreliable. As in many novels, one main plot line involves the long-term discrimination among superficially attractive qualities and the qualities that will wear well – a difference relevant to the basic distinction between short-term and long-term mating strategies.) Darcy first fundamentally changes Elizabeth's view of him in the letter he writes to her, after she rejects his proposal, explaining his conduct with respect to her sister's marriage prospects and his treatment of Wickham. Given the fact that he is an introvert and an intellectual, it is not surprising that he should present himself better in a letter than in a personal interview. The letter, which Austen transcribes in full, is the longest utterance he or anyone makes in the course of the novel, and if it does not display Austen's own humor – the subjects are somber, and Darcy is in no joking mood – it does display all of the precision, inciseness, and acuity of her style. This style is itself a constant norm for the reader, and that same norm serves for all the main protagonistic characters as a measure of quality.

To take just one more of many possible examples for the signal importance of style as a measure of personal quality, Mr. Collins first introduces himself to the Bennet household in a letter that Mr. Bennet reads aloud to his family. The letter is an absolute marvel of fatuity and of pompous self-importance, and the way in which the individual family members respond to the letter reveals the quality of their own minds. Mary, the dull,

plain younger sister who tries to build a niche for herself by diligent but uninspired study, thinks Mr. Collins's style rather good. Mrs. Bennet is as always simply indifferent to any quality of character or style and responds to all occasions solely on the basis of opportunistic interests. Elizabeth and her father alone register that the letter is a work of clownish absurdity. "Can he be a sensible man, sir?" "No, my dear; I think not." (vol.1, chapter 13) In that exchange, Austen reveals the foundation of the singular affinity that Elizabeth and her father feel for one another, and the reason that they have formed an inner circle of companionship separated from all the rest of the family. Elizabeth is fond of her older sister Jane, and Jane is not vulgar, but she is so excessively sweet-tempered, so almost pathologically high on the scale of likableness, that she is incapable of any negative judgment, and thus fails to see at least half of what passes in front of her. She is, for instance, merely puzzled by the nonsense in Mr. Collins's letter, but inclined to give him full credit for good intentions.

Elizabeth and her father form an inner circle of wit and judgment, and the central figure within that circle is Austen herself. She fashions the point of view as a field of intelligence, and within this field she creates a topography in which she locates all the characters and her audience. To get a sense for how this process works, consider the famous opening sentence of the novel: "It is a truth universally acknowledged, that a single man in possession of a good fortune, must be in want of a wife." There has been considerable difference of opinion over whether that sentence is meant to be taken ironically. The issue can be resolved by reference to the modifying effect of the sentence that follows the first sentence: "However little known the feelings or views of such a man may be on his first entering a neighborhood; this truth is so well fixed in the minds of the surrounding families, that he is considered as the rightful property of some one or other of their daughters." The first sentence is a good-humored affirmation of the rules of the game. Austen identifies the basic elements that are in play in social interactions (property and mating), and she acknowledges that the configuration of elements implied in her remarks constitutes a universal pattern of human behavior: men seek to acquire resources and to use them to acquire mates, and women seek mates who are in possession of resources. But the second sentence establishes a distance between the narrator and the common view she describes. She admits of anomalies, of individual differences. The "surrounding families" operate only on the basis of generalities, and they operate without regard to the inner lives of other people. They regard the man moving into the neighborhood not as a center of consciousness – a point of view – in his own right, but rather as their own property. This is a simple and elementary failure in "theory of mind" – a failure to recognize that other people have inner lives of their own. Failures of this nature inform much of Austen's satire, and indeed of all satire. It is one of the central principles of satire. People are preoccupied with their own needs, and they treat other people as props or furniture in the self-absorbed narratives they construct about themselves. (Mrs. Bennet and Darcy's aunt, Lady Catherine de Bourgh, are signal cases in point, and chief targets of the satire.)

As it happens, in this case, the common view holds good. Bingley is in fact in want of a wife. It is nonetheless the case that in the space of two sentences Austen has established a fundamental tension between her own perspective – a perspective that takes account both of point of view and of individual differences – and the common perspective of the neighborhood. That common perspective is also the perspective of the common world outside the novel. In the course of the novel, an inner core of protagonists, civilized, cultivated, and capable of making stylistic distinctions, will ultimately constitute a small

in-group that distinguishes itself from the common world of their own community. Elizabeth's aunt and uncle Gardiner belong to this inner group, and it is one of the triumphs for the ethos advanced by the novel that their cultivation and gentility of manner take precedence over their lower socioeconomic status (Mr. Gardiner is "in trade"). Austen's own point of view defines and dominates this inner group – she is its normative mind – and she tacitly invites receptive readers also to join this group. The criterion that permits a reader to join the group is the ability to read and judge the letters and conversational style of Darcy, Mr. Collins, Lady Catherine, and all the rest. Readers who pass this test of literacy succeed in segregating themselves from the common world that operates exclusively at the level of the lowest common denominators of life history analysis – the reduction of other people to general cases – and the identification of people exclusively in terms of "property."

Note that what has happened in the course of two sentences is that the author has established a set of relations among three points of view: her own, that of her characters, and that of her audience. This set of relations is not peripheral to the "meaning" of the story. By creating these relations, Austen creates an active field of communicative interaction. That is what hooks the reader, brings the reader in, rivets the reader's attention. All this happens before a single event has transpired, and before a single specific character has been introduced. To notice this is to realize that we cannot reduce the "meaning" of a story to the represented events. And even the very content of the two sentences admonishes us that if we reduce the events of the story to an exemplification of "human universals" or "species-typical behaviors," we shall have missed at least half the story. We shall in fact be on precisely the same level as the "surrounding families" personified for us, in the subsequent scene, by Mrs. Bennet. We shall be among the dullards and vulgarians who operate only on general rules and neglect to notice that every single character has a distinct center of consciousness.

Mrs. Bennet has access to a big chunk of the truth. Resources and mating do in fact form elementary building blocks in the human relations that provide the basis for stories. But in grasping this elemental reality, Mrs. Bennet neglects all other considerations of mind and character. She neglects the minds of other people, and she thus demonstrates the poverty of her own mind. The successful protagonists fully acknowledge the hard and sometimes harsh logic in the human reproductive economy, but they do so without neglecting the significance of the human mind and individual differences in identity.

Mate selection is the central behavioral system activated in this novel. That is a distinguishing, defining feature of the literary genre it exemplifies, the genre of "romantic comedy." (This genre probably provides at least half the literary biomass for the sum total of narratives in the world.) In its simplest designation, a romantic comedy is a love story that concludes in a happy marriage. Usually such stories are light in tone or enlivened with humor. But as it applies to Austen, the connotation of the words "romantic" and "comedy" could be a little misleading. There are many comical scenes, but the humor of the novel is often harsh, and the mating game is fierce and determined. Mr. Bingley's sister wants Darcy for herself and snipes incessantly, cattily, ineffectually at Elizabeth, denigrating her appearance, her temperament, her mind, and most of all her family and her social status. Miss Bingley also wants Darcy's younger sister, Georgiana, for her own brother – a liaison that would enhance her own social standing – and she thus conspires with Darcy to detach Bingley from Jane Bennet. She at first expresses the warmest friendship to Jane, activating Jane's own affectionate disposition, and then coldly cuts her. Lady Catherine wants Darcy to marry her own daughter, his

cousin, but her daughter is sickly and peevish, and no one but her own mother and her governess pays her any regard at all. Austen's treatment of this girl betrays a certain streak of brutality. She sacrifices Miss de Bourgh on the altar of a ruthless principle of fitness, and the only sensation Elizabeth or Austen herself express toward this poor sick girl is that of vindictive contempt; there is no hint of pity. (To get an even better feel for this streak of brutality, one should read Austen's "juvenilia," the stories she wrote as a teenager. The stories consist of a rapid series of violent and grotesque events, many of them involving characters of certifiably psychopathic disposition.) Elizabeth's own chances of successful mating are seriously endangered when her sister Lydia runs off with Wickham, thus lowering the social standing of the whole family even further. There is a real possibility that by an inevitable progression Lydia would eventually be abandoned by Wickham and would "come on the town," living as a prostitute and in all likelihood dying early of disease and abuse. This doesn't happen because Darcy is determined in his choice of Elizabeth as a mate, and he exploits for his own purposes the opportunity Lydia's folly presents to him. By bribing Wickham to marry Lydia, Darcy does Elizabeth the greatest and most intimate service he could possibly do for her, and at the same time he decisively demonstrates the firmness of his commitment to her. He demonstrates that his preference for her outweighs even the disgrace of a marital association with a sluttish sister married to a reprobate of inferior birth.

The very nature of Wickham's disrepute signals the way in which resources and reproduction constitute the fundamental categories of human behavior in the novel – as they do in actual life. Wickham's evil-doing consists in two main forms of malfeasance: he leaves unpaid debts behind him, and he engages in illicit sexual liaisons with the daughters of the tradesmen and farmers in the neighborhoods he frequents. Before arriving in Elizabeth's neighborhood, he had even had the audacity to try running off with Darcy's sister. If he had succeeded, he would have damaged Darcy in his family pride and in his tenderest family feeling. He would have gained a fortune, advanced in status, and triumphed over a rival male. Darcy has good reason to resent Wickham, and this resentment renders his act of conciliation with Wickham all the more signal an instance of the self-sacrificing chivalry he displays in his commitment to Elizabeth.

Property and rank for men, and youth and beauty for women, count for much. They count almost more than anything, but within the normative perspective of the novel, they must at every point along the way be weighed in the balance of the total set of values that can be integrated within a well-proportioned economy of human life – the kind of economy that leads to the "rational" sort of happiness that Austen and Elizabeth both identify as their own central criterion of value. The total set of values that have to be given their due proportions to bring about rational happiness is not amorphous and unbounded. Sex and property, family or kin relations, parenting, social relations, and cognitive power – those are the central concerns of the book.

Next to sex and property, fidelity to kin presents itself as an urgent motivational force. Within the normative structure of values constituted by Austen's own point of view, even when family members are disgraceful and ridiculous, remaining loyal to them is a fundamental criterion of personal merit. Mr. Collins's baseness displays itself when he advises Mr. Bennet to abandon Lydia altogether after she runs off with Wickham, and Elizabeth displays her strength of character, in the epilogue, by effecting a rapprochement between Darcy and the alienated Lady Catherine, despite the insults Lady Catherine has heaped on Elizabeth herself.

The issue of parenting bulks large in the concerns of the book. The main background marriages – the marriages that serve as models or as warnings for the protagonists – are bad, either in their personal relations (as with Mr. and Mrs. Bennet) or in their parenting functions – as with both Darcy's and Elizabeth's parents. Elizabeth's mother is coarse, stupid, and frivolous, and her father is remote and detached. The situation of the family is bad, not just because of the entail but because he made a bad marriage, neglected to make the economies necessary to provide for his family after his death, neglected the discipline and education of his daughters, and failed to maintain the decorum of marital civility. (Jane and Elizabeth have educated themselves, but one chief attraction that Darcy holds for Elizabeth is that he is himself educated and holds out the promise for her of helping her to continue cultivating her own mind. Much is made of the magnificent library in his possession at his family estate.) Darcy's own parents, he says, were excellent people, but they neglected to form his temper, and they get the blame for the arrogance that first offends Elizabeth and that comes close to spoiling Darcy's ability to attract her to him, despite his wealth and rank. Mr. Collins is an oddity in part because he is a fool, a man of weak understanding, but the other half of the causal explanation is that he was raised by “an illiterate and miserly father” (vol. 1, chapter 15).

All the most intimate relations of sex, marriage, and family embed themselves within a larger social context. For this novel, one central plot question is whether Elizabeth will be accepted into the dominant social group. Her rivals hope she will not. Austen herself disparages their brittle snobbery (they laugh witlessly over the fact that she has an uncle in trade and another uncle who is a country attorney), but she also wishes for Elizabeth to gain access to the highest social level. She defines that level not only by wealth and status but by dignity and authority. One can be born into wealth and rank, but dignity and authority have to be earned by personal merit. Lady Catherine offers a self-parody of upper-class authority. Darcy is the real thing. When Elizabeth first sees Darcy's great estate, and hears his housekeeper praise his integrity and beneficence, she thinks to herself, “What praise is more valuable than the praise of an intelligent servant? As a brother, a landlord, a master, she considered how many people's happiness were in his guardianship! – How much of pleasure or pain it was in his power to bestow! – How much of good or evil must be done by him!” (vol. 3, chapter 1). Austen mocks false status – rank and wealth unsupported by education, wit, manners, and character – but she ultimately affirms the authority of legitimate social status as that is represented by the normative couple, Elizabeth and Darcy.

The chief social dynamic in the novel, the underlying social narrative, is that of a process in which dominant males marry down, selecting women of lower social rank but of superior personal quality. Conversely, women of high quality from a lower rank marry up into the higher gentry and thus integrate the standard of personal quality with the values of wealth and rank. Even Mr. Bennet, unhappily married though he is, has contributed to this process. He married a beautiful though silly woman from a social rank lower than his own. Two of his daughters are both beautiful and intelligent, and one (Elizabeth) is genuinely clever. And the two beautiful, intelligent girls both marry well, extremely well. Even Mrs. Bennet must be gratified with the results, though she understands so little of the process that produces those results.

And finally, again, in all the behavioral systems that have to be balanced in the economy of values in the novel, the cognitive system holds a place of predominating value. Mrs. Bennet contributes some heritable physical attractiveness, a matter not negligible in the total mix, but she contributes nothing of wit, and she is left almost wholly outside

the scope of the inner social circle that constitutes the normative group at the end of the novel. “I wish I could say, for the sake of her family, that the accomplishment of her earnest desire in the establishment of so many of her children, produced so happy an effect as to make her a sensible, amiable, well-informed woman for the rest of her life; though perhaps it was lucky for her husband, who might not have relished domestic felicity in so unusual a form, that she was still occasionally nervous and invariably silly.”

### The Value of a Darwinian Literary Criticism

Previous criticism of Austen can be divided roughly into two bodies of work: (a) the traditional, common-language criticism that dominated academic literary study until the middle of the 1970s, and (b) the various forms of theory-driven criticism that emerged under the umbrella of postmodernism in the past three decades or so. The traditional criticism operates at the level of Austen’s own lexicon. At its best, it makes alert observations about theme, tone, and formal organization, but its insights are impressionistic, opportunistic, and adventitious; it seeks no systematic reduction to simple principles that have large general validity. (See Bradley, 1929; C. L. Johnson, 1988; Lewes, 1859; Litz, 1965; Tanner, 1986; Van Ghent, 1953; Woolf, 1953.) At less than its best, traditional criticism consists only in otiose summary and formalistic elaboration punctuated by the occasional exercise in cranky emotional posturing. (See Butler, 1975; Duckworth, 1971; Halliday, 1960; Harding, 1940; Langland, 1984; Morgan, 1980; Mudrick, 1952; Phelan, 1989.) The positive rationale behind the revolution in theory-driven criticism is the recognition that all narratives have a surface-depth structure. Beneath the surface of local incident and occasional commentary in a narrative, there is a simpler, more basic structure of elemental motives and organizing principles. These motives and principles are the skeletal structure of the work. The business of interpretive criticism is to probe beneath the surface of common-language exposition and to find the skeletal structure. Theory-driven interpretation seeks to cut literary meaning at its joints.

The turn to theory-driven criticism answered to a manifest need, but the theoretical models that have been used, up to now, have been painfully inadequate. Deconstruction, Marxism, Freudianism, and Foucauldian political criticism have all presupposed ideas about human nature that conflict sharply with the Darwinian conception. The other main school, feminism, is less a single, coherent theory than a preoccupation about a specific subject matter – the condition of women – but the notions that cluster around this preoccupation often entail false ideas about human nature, and most feminist critics over the past thirty years have affiliated themselves with one or another of the dominant theoretical schools. All of the schools, as subsidiaries of postmodern theory, have fundamentally repudiated the idea of an innate, biologically constrained structure in the human motivational and cognitive system. Postmodern critics have sought the elemental forces of human experience in terms such as “semiosis,” “textuality,” “class struggle,” “the Phallus,” “bourgeois ideology,” “desire,” “discourse,” “power,” “gender,” “dialogism,” “heterosexism,” “the Other,” and “patriarchy,” and they have contended that such terms reveal the underlying, governing forces in all literary production. In the degree to which they have succeeded in avoiding the passively reflexive character of traditional criticism, theory-driven criticism has offered distorted, skewed, and strained accounts of the elemental motives and governing principles in literary texts.

Literary criticism is both analytical and evaluative. Literary critics commit themselves to distinct concepts and to definite values. The values that animate postmodern theoretical criticism are emphatically radical, and the political critics incline either to disparage authors for their putative complicity with oppressive epistemes or, more frequently, to invest authors with their own characteristic attitudes of resentment, ideological indignation, and subversive animosity. Both the conceptual content and the political attitudes of the radical criticism are deeply alien to Austen. The conceptual content is alien to the elemental simplicity of her good sense, and the political attitudes are alien to the conservative temper of her wisdom. Many of the postmodern critics have nonetheless made some effort to assimilate Austen to an ethos of epistemological indeterminacy and political radicalism. They have sought to identify various “gaps” or “contradictions” between her overt meanings and this or that supposedly subversive implication in her style or tone. In Austen’s case, particularly, these routine invocations of deconstructive formulas often appear half-hearted. The more sensitive postmodern critics evidently feel a certain queasy diffidence about pressing a case that can be made only by fabricating interpretive theses that run so clearly counter to Austen’s own determinate meanings. Despite the obligatory invocation of deconstructive formulas, the bulk of commentary in the postmodern critiques blends insensibly into the thematic, tonal, and formal analyses of the traditional criticism. (See Ahearn, 1987; I. Armstrong, 1990; N. Armstrong, 1981, 1987; Auerbach, 1978; Belsey, 2002; Brownstein, 1988; Fraiman, 1989; Handler and Segal, 1990; Litvak, 1992; Newman, 1983; Newton, 1981; Poovey, 1984; Smith, 1993, 2000; Wylie, 2000.)

Darwinian literary criticism is grounded in the large facts of human evolution and human biology, facts much larger and more robust than the conceptions that characterize the various branches of postmodern theory. (See Boyd, 1998; Carroll, 1995; Dissanayake, 1995; Storey, 1996.) Darwinian psychology provides a scientifically grounded and systematic account of human nature. This is the first time in our intellectual history that we have had such a theory, but the subject of this theory – human nature itself – is the very same nature that has always animated writers and readers. Most writers historically have not had access to the evolutionary explanation for how human nature came to be what it is, but they have nonetheless had a deep intuitive understanding of human motives and human feelings. What a Darwinian social science can now do for literary criticism is to give us conscious theoretical access to the elemental forces that have impelled all human beings throughout time and that have fundamentally informed the observations and reflections of all writers and all readers. Darwinian criticism can lift us above the superficial paraphrases of traditional criticism without forcing us into the often false reductions in the postmodern conceptions of human nature. It can help us to understand the source and subject of all literary representation, and it can help us to identify the sources of exceptional power in great literary works like *Pride and Prejudice*.

## The Whole Story

More could be said, in detail, about *Pride and Prejudice* – much more. I hope I have said enough to give some indication of what I have in mind by insisting that to construct an even minimally adequate account of any literary representation, we have to set up a polar tension between the highest level of reduction in life history analysis – the level of the somatic and reproductive organization of life effort – and the most fine-grained analysis of formal organization: of theme, tone, and style. I hope to have convinced you that point of view is the central locus of literary meaning because it is the dimension

within which people have mental experiences. The only people who can be involved in a literary social interaction are the author, the characters, and the audience, and those three sets of people *are* involved – all three sets – always. Delineating the dynamics of that specific set of social interactions – dynamics that vary from author to author and book to book – is a fundamental and indispensable procedure in literary criticism. Darwinian literary critics who ignore this dimension of analysis might be Darwinians, but they are not literary critics, and even as Darwinians, they are missing a major part of the story.

Many Darwinian psychologists and anthropologists have been missing a major part of the larger human story – that whole part of the story that concerns itself with the evolution of the cognitive behavioral system: the fifth personality factor, “g,” domain-general intelligence. They have told us a good deal about life in a supposedly stable and homogeneous EEA, but they have neglected to tell us much about the evolution and adaptive functions of the distinctively human mind. A number of Darwinian anthropologists and psychologists are now correcting that signal omission, and Darwinian literary critics should rejoice that the development of the whole field is now producing a model of human nature that converges with their needs and interests as literary critics. The benefits can be reciprocal. Darwinian psychologists and Darwinian anthropologists take human nature as their field of study. Literature can provide important information on that topic, and Darwinian literary critics can help them to gain access to that information. Practitioners on both sides will need to make some allowances for differences of idiom and method. If they make these allowances, they will benefit not just in the gain of useful information but also in a closer acquaintance with the skills and cognitive habits that constitute the characteristic strengths in each discipline.

# CHAPTER 6

## Literary Brains: Neuroscience, Criticism, and Theory

*Patrick Colm Hogan*

Patrick Colm Hogan teaches in the English Department at the University of Connecticut. His books include *The Politics of Interpretation* (1990), *On Interpretation* (1996, 2008), *Cognitive Science, Literature, and the Arts* (2003), and *The Mind and Its Stories* (2003).

In recent years, there has been growing interest in neuroscientific approaches to literary and other forms of humanistic study. To this point, concrete work in neurohumanities has been limited. Thus, Paul Armstrong chides literary researchers – including cognitive literary critics – for their lack of “serious engagement with neurobiology” (xiii). Much of the work that has been done falls into the broad category of what we might call “correlational criticism,” which is often the initial phase of a new theoretical approach to literary analysis. In correlational criticism, the critic takes some theory – whether deconstruction or neuroscience – and finds parallels for its elements and principles in literature (e.g., Proust’s treatment of memory might be seen as anticipating that of some neuroscientists, as in Lehrer’s widely read book). Nonetheless, it seems clear that there are many promising research programs opening up in neurohumanities that go well beyond correlational criticism. These will undoubtedly develop much further in the coming years. The following essay aims to introduce some of these openings.

Before going on to discuss the relations between neuroscience and the humanities, however, we need to be familiar with some basic principles of neuroscience. Thus, the first section of the following essay sets out to orient readers with respect to the anatomy and function of the human brain. Such an orientation is necessarily highly selective. I have chosen those aspects of neuroanatomy and cerebral function that bear particularly on the following discussions of literature. The second section addresses specific areas of literary study that currently are benefiting from neuroscience or that promise to do so,

*Original publication details:* Patrick Colm Hogan, “Literary Brains: Neuroscience, Criticism, and Theory” from *Literature Compass* 11.4. John Wiley & Sons, 2014. Reproduced with permission from John Wiley & Sons.

illustrating some of these points with examples from Shakespeare. The final section addresses the practical issue of the extent to which literary critics should or should not try to become neuroscientists of literature.

### Some Notes on the Brain

The brain is part of the central nervous system. In a preliminary way, it may be thought of as the organ that integrates experience and produces action. There are different ways of understanding brain organization. As the name suggests, functional neuroanatomy isolates brain regions according to what they do (their functions). Simplifying a great deal, we may first separate “sub-neocortical” (or, more briefly, “subcortical”) from “neocortical” areas. The “neocortex” is the outermost region of the brain and the most recently developed in evolution. Roughly speaking, the subcortex has motivational and homeostatic functions (e.g., governing thirst). Thus, emotions such as anger are largely a function of subcortical regions. The neocortex is responsible for perception and motion, as well as the integration of information from different sense modalities. The isolation of emotional and information processing functions has fairly obvious importance for literature and the arts. (On the less evident issue of movement and aesthetic response, the reader may wish to consult Holland.)

Both the subcortex and neocortex may be further divided, first according to physical structure. Physical divisions are often roughly correlated with functional divisions; however, they are not identical. The neocortex, for example, is divided into four “lobes” – occipital (at the back), parietal (at the top), temporal (near the temples), and frontal (at the front). Visual cortex is in the occipital lobe; auditory cortex is temporal; somatosensory cortex is parietal; motor cortex is frontal.

Not all types of brain function are as intuitively obvious as those of sensory modalities. For example, there appear to be two distinct systems for spatial mapping. One system is “objective,” bearing on objects’ relations to one another. This is closely connected with the hippocampus (see Clark, Boutros, and Mendez 43), a subcortical structure that is very important for episodic (or autobiographical) memory. The other system is “egocentric.” It organizes space in relation to the subjective situation of the perceiver, stressing particularly “peripersonal” space, the space of one’s immediate vicinity (see Iacoboni 16). This may be identified as largely parietal (see Clark, Boutros, and Mendez 43; on some complications of the distributed system of peripersonal space in humans, see Schicke and citations). As we will see, recognizing these two space systems may have significant consequences for our understanding of space in literary imagination.

Some areas of the brain have what might be called “meta-functions.” For example, the anterior (or forward) section of one part of the brain – called “cingulate cortex” – in effect monitors other parts of the brain for task contradictions (see Carter and colleagues). Thus, it becomes active when there is some conflict. This, in turn, motivates some attempt to resolve the conflict. One suggestion of this may be that contradictory activities or orientations (e.g., wanting to be a fashion model and wanting to eat lots of cake) must be simultaneously active in order to provoke a motivation to do something about this contradiction. In some cases, conflicts arise due to simultaneous processing of the same input in different areas of the brain. For example, sensory experiences are sent simultaneously to subcortical and neocortical areas (see LeDoux *Emotional*, 161–165). Emotional processing of the former is parallel with, though faster than, the fuller

perceptual processing of the latter. Thus, the former may produce a quick fear response, while the latter determines whether or not the fear was justified (“Did I just see a snake or was it only a stick?”). In connection with this sort of contradiction, the neocortical processing may lead to *modulation* of the subcortical response (e.g., reduction of initial fear). Task contradictions and complex interactions between neocortical and subcortical responses are pervasive in literary response. Understanding them should further our understanding of literary reception.

Other divisions include that between the hemispheres. The two hemispheres of the brain are most often closely integrated, linked as they are by the *corpus callosum*. However, when the corpus callosum is severed, the hemispheres may operate separately. Even when integrated, there are some broad differences between them. Though these are usually overstated in popular accounts, they can be significant in particular areas. Rather than thinking of the right hemisphere as doing one sort of thing and the left hemisphere as doing something else, it is more productive and more accurate to think of the right hemisphere as tending to do one sort of thing in a particular functional domain and the left hemisphere as tending to do something partially different in that functional domain. For example, there are hemispheric differences in just what aspects of language are processed and how they are processed. Among other things, the right hemisphere activates a broader range of contextually irrelevant meanings for a given discourse (see Chiarello 145). In consequence, jokes that rely on puns involve right hemisphere processing such that people with right hemisphere brain damage in relevant areas may be inhibited in their ability to respond to jokes relying on puns (see Chiarello and Beeman 248). As the reference to puns suggests, at least some aspects of our verbal processing of literature rely on hemispheric differences and may be better understood in relation to those differences.

These large physical and functional regions are, of course, not solid masses. Rather, at a more fine-grained level of description, the brain comprises networks of interconnected cells. The cells themselves have their own specializations. For example, cells in visual cortex are sensitive to particular visual features, such that one cell will be activated for one type of feature (e.g., a line with a horizontal orientation), whereas another cell will be activated for another type of feature (e.g., a line with a vertical orientation). The connections between cells may be either excitatory or inhibitory. In a particular “circuit,” a series of cells will activate in sequence, often inhibiting related cells that may, so to speak, “compete” with the activated cells. This simple point about the duality of neuronal operation – the fact that there are both excitatory and inhibitory connections – may have significant consequences for our conception of mental operation in literary creation, representation, and response.

Circuit activation is enabled by neurochemistry. Specifically, circuits operate by one cell communicating activation to the next cell in the circuit. That activation is generally a chemical process, and it requires neurochemical “transmitters” to proceed. Different neurochemicals have excitatory or inhibitory effects on different systems. For example, what is called the “reward system” operates through the neurotransmitter dopamine. While there are, of course, neuroanatomical components to the reward system, it is perhaps better characterized through neurochemical functionality. In phenomenological terms, the function of the “dopaminergic” reward system is the anticipatory pursuit of pleasure (see chapter three of Panksepp and Biven; Panksepp and Biven refer to this as the “SEEKING” system, rather than the “reward system”), or perhaps the anticipatory pursuit of emotional need satisfaction. The reward system is a key component of aesthetic response.

In cognitive science generally, it is common to distinguish structures, processes, and contents. Structures are the large categories or types of mental function. Processes are the operations that occur within these structures. Contents are the items on which processes operate. Thus, “memory” would be a structure (or, rather, several structures; for an overview of current understandings of memory, see Baddeley, Eysenck, and Anderson). “Storage” and “retrieval” (commitment to memory and recollection from memory) would be processes of memory. Finally, specific images or other representations (e.g., regarding what you had for lunch today) would be the contents.

In speaking of these components of *mental* architecture, we commonly have certain presuppositions about their nature. Those presuppositions may be challenged by neuroscientific research. For example, our knowledge of the way neural circuits operate affects our understanding of memory contents. Among other things, the precise configuration of a circuit may change over time; it may be affected by other circuits through activation or inhibition. Along with other research, this suggests that memory contents are not firmly fixed pictures of the past but much more malleable or less stable complexes of activation and inhibition (see Panksepp and Biven 220), changing in different circumstances. The malleable and interactive nature of memory has consequences for many aspects of literature – from creation, to representation, to response.

Moreover, research indicates that, contrary to what one might anticipate, some processes and structures, such as various emotion systems, are not fixed entirely by genetic determinants. Rather, they are significantly shaped by experience, if usually within certain limits. More precisely, there are genetic, developmental, and later, more diffuse experiential effects on structures and processes. The developmental effects are often a function of “critical period” events. These are events that occur at a pivotal point in a system’s development, usually in early childhood. For example, the attachment system (the system of emotional bonding, first of all between parents and small children) is shaped by both innate propensities and by early childhood experiences. The interaction of genetics and critical period events leads to a limited range of possible outcomes – prominently differences in the degree to which one feels secure in attachment relations and the degree to which one’s attachment relations are pervaded by distrust. These differences carry over into later life (see Waters, Weinfield, and Hamilton). For literary critics, it may be particularly noteworthy that critical period experiences are not wholly idiosyncratic but may manifest cultural or historical patterns.

At a methodological level, it is important to note that there are two distinct orientations in neuroscience today and cognitive science more generally. The first is the “classical” approach, which stresses abstraction and rules or recurrent patterns. The second, referred to as “situated cognition,” stresses the ongoing processes of interaction with the world. Simplifying, we might say that the former focuses on constancy, while the latter emphasizes contingency and change. For example, in semantics, the former school would stress the storage of meanings in relatively stable concepts, whereas the situated approach would focus on the ways in which meanings undergo continual alterations in context (for the different case of perception, see O’Callaghan 83–86). Though often presented as alternative theories, it is perhaps best to see these as simply different interests. Classic cognitive science is like physics, interested in isolating general principles. Situated cognition is like engineering, interested in practical implementation. Both are valuable but in different ways and in different contexts. Theories of situated cognition may be particularly valuable in studying alterations of literary response, whether historical and cultural, or biographical, as a given reader’s emotional reactions to literary works and cognitive understandings of those works change in the course of time.

Finally, it is important to say something about means of studying the brain. Until recent decades, the main method was “lesion study.” When the brain is damaged, one may see what functions are impaired or altered. In animals, this is done systematically, with lesions induced surgically. In humans, the process is necessarily more haphazard. Someone would have a stroke or suffer some other brain injury, but then partially recover. Researchers would observe the cognitive or other alterations then correlate those alterations with neural damage identified during an autopsy after the person has died. These methods obviously left a great deal to be desired. Setting aside ethical issues, the animal studies were, of course, on nonhuman animals. In consequence, their extension to humans was often problematic. The study of stroke or brain injury did treat humans, but with messy lesions, rarely neatly confined to a single area. (On the issue of brain damage and its relation to artistic production, see for example Zaidel.)

The recent explosion of neuroscience – including the use of empirical neuroscience in the study of art and literature – is due largely to the development of non-invasive brain scanning methods. There are different methods available (for an overview, see Bookheimer). We might briefly consider two: electroencephalography (EEG) and functional magnetic resonance imaging (fMRI). EEGs measure electrical impulses. They are valuable for their fine temporal resolution (i.e., they can measure the timing of electrical changes in the brain quite well). However, they are problematic on spatial resolution (i.e., it is difficult to differentiate precise regions of change). In contrast, fMRI measures blood oxygen levels in parts of the brain. For the neocortex, it has good spatial resolution (i.e., it isolates regions of change well). However, it is less good at subcortical measures (see Panksepp and Biven 29–30), and its temporal resolution is not very fine. Other methods, such as the manipulation of neurochemicals in the brain, have other problems (e.g., localizing the effects of the neurochemicals or even getting accurate measurements of their presence in the brain [see, for example, Heinrichs 519]).

In short, while newer methods solve some problems, they commonly have their own drawbacks. Moreover, even when technical problems are resolved, it is not always clear what the results of scans mean. Consider a result from social neuroscience. Faced with an image of an out-group member (e.g., someone from another racial group), a test subject will have activation in occipital cortex, much as he or she has in seeing an image of an in-group member. However, there might also be increased activation in the insula (see Fiske, Harris, and Cuddy). What does this mean? In addition, there might be unusually low activation in medial prefrontal cortex (see Gazzaniga 204). What does that mean? The results of brain scans are not simply self-evident. They require interpretation, and the interpretation is never certain. In these cases, convergent evidence from other sources indicates that the first case is probably a response of disgust to the out-group member, and the second case is probably a lack of ordinary response to another mind. These are plausible and well-supported interpretations, but they are interpretations nonetheless, not direct observations.

## **The Goals of Literary Criticism and Theory and Their Relation to Neuroscience**

It may seem that everyone is so fully aware of the goals of literary study that there is no point in mentioning them. However, students of literature often assume that the purpose of literary criticism and theory is simply to produce new readings of works. Things are, in fact, more complex. Clearly, interpretation is a central part of what we do in literary

study. But it is not all we do. We might isolate four main purposes of literary theory and criticism: (i) aesthetic evaluation of works and the establishment of principles for such evaluation; (ii) ethical and political evaluation of works and the establishment of principles for such evaluation; (iii) isolation of broad patterns across works and explanation of those patterns; and (iv) interpretation of particular works and the establishment of principles for such interpretation.

Historically, aesthetic evaluation was perhaps the most important task on this list, though it has suffered neglect in recent years. While neuroscience has little to tell us about what the norms should be in aesthetics, it can tell us a good deal about what our tacit norms actually are. Indeed, aesthetic preference is one of the most advanced fields in neurohumanities, with research indicating that aesthetic pleasure involves both cognitive and affective components. Cognitive factors include the isolation of non-habitual patterns and approximation to category-defined prototypes or, roughly, average cases (e.g., the most beautiful face is the most average face [Langlois and Roggman]). Affective components include the reward system and perhaps the attachment system (for an overview of this research, see Hogan “Literary Aesthetics”). These findings are preliminary and clearly require elaboration and clarification. Nonetheless, they indicate that neuro-humanities study in aesthetics has already developed a valuable research program. It is worth noting that this research program not only treats reception but production as well (see, for example, Zeki and Turner on creativity).

In recent decades, ethical and political evaluations have been more prominent in mainstream literary study. Literary critics and theorists are deeply concerned with the ethico-political motivations and impact of literary works, as well as the ethical and political themes developed in the works themselves. Social neuroscience is the area of research most obviously relevant to this topic. Social neuroscience, and related fields such as social psychology, may contribute to ethical and political literary study in at least two ways. First, they may alter our understanding of familiar ethical and political concepts. Second, they may introduce new concepts that alter our analyses.

Consider, for example, racism. Social neuroscience treats racism extensively. However, the neuroscientific concept of racism is somewhat different from our ordinary language notion. At a general, taxonomic level, it categorizes racism as a form of in-group/out-group definition, a broad psychological tendency that entails a range of cognitive biases and motivational preferences (for an overview of identity group definition and its consequences, see Duckitt). Second, at an operational level, it treats racism as at least in part an emotional response to individuals that need not in any way involve self-conscious, cognitive generalizations. Putting these two points together, it is perfectly possible – indeed, it is probably quite common – for a White person to have insular activation in response to a Black person and to treat him or her in a cognitively and motivationally biased way (e.g., preferring to see some White person win a particular competition) without having self-conscious beliefs or attitudes regarding Black people in general. The point has consequences for literary response to characters, to authors (thus, to aesthetic evaluation and canonization), to the reception of criticism, and other matters. Of course, racism is not the only ethical or political topic that may benefit from social neuroscience. It is simply one of many possible examples of a research program in this field. (For examples of social neuroscience and social psychology used to treat ethical and political literary analysis, see for example Aldama, Bracher, and Weik von Mossner.)

The isolation and explanation of patterns (purpose number three in the preceding list) has already made an appearance in both of the preceding categories (aesthetic and

ethico-political evaluation). This is because pattern isolation and explanation are key features of neuroscience and cognitive and affective science more broadly. Indeed, one might argue that these are the most important contributions of neuroscience to literary study. This does not necessarily mean that the phenomena being explained need to have been previously unnoticed. Neuroscience may serve to explain patterns that were already familiar, but not well accounted for. For example, Hans Robert Jauss recognized that it is important for aesthetic response that a work be novel, that it deviate some from expectations, but that it not deviate too severely. Neuroscientific research on aesthetic response does not deny or radically alter this observation. Rather, it begins to explain it. For evolutionary reasons, we experience reward system activation with pattern isolation (see Vuust and Kringelbach 256 and 266, treating reward and “anticipation/prediction”). However, also for evolutionary reasons, neural activation in response to stimuli declines as experiences are repeated, becoming predictable or expected (see, for example, LeDoux *Synaptic*, 138). Moreover, the pursuit of pattern recognition without success is likely to give rise to aversive feelings, perhaps through anterior cingulate cortex activation. The interaction of these various factors predicts the phenomenon isolated by Jauss – preference for moderately novel but isolable patterns. This is not to say that neuroscientific research can in no way alter or extend Jauss’s observations. To the contrary, it may further the analysis Jauss began. For example, we would expect the precise emotion systems involved and the modulation of those systems by neocortex to introduce variants and complications. Thus, high authorial reputation may lead readers to engage in processes that alter an initially negative response – for task contradiction reasons, thus in specific contexts where the different tasks (e.g., responding to the work and conforming to prestige standards) are simultaneously active.

Someone might reasonably object here that a neuroscientific account of Jauss’s “aesthetic distance” (25) is not and cannot be a full explanation. It predicts only the general pattern not the details. It does not tell us why a particular author has been more or less appreciated at particular times and places. This is a perfectly reasonable comment. There are two things to say in response. First, this is where situated cognition enters. The preceding account is “classical” in the sense that it bears on recurring features of cognitive operation. The question of specific response moves us, so to speak, from physics to engineering. Writers in situated cognition stress three features of being situated: cognition is embedded, embodied, and distributed (see Robbins and Aydede). To say that cognition is embedded is to say that it is always involved with ongoing activities that are particular and contextualized. To say that it is embodied is to say that it is physically located and active, specifically active through the body. To say that it is distributed is to say that it includes interaction with a range of other people, with their particular embedding and embodiment. Clearly, any attempt at accounting for the broad social reception of a work would need to take up not only the abstract issues but also the situated cognition. (For literary study stressing embodiment and cognition, see, for example, Wehrs; for distributed cognition and literature, see Tribble.)

This brings us to the second point raised by a neuroscientific account of Jaussian aesthetic distance. A neuroscientific account cannot explain everything about any cultural phenomenon, literary or otherwise. Even an analysis in terms of situated cognition needs to take up historical, cultural, or biographical elements, the “contents” and even the shaping, critical period experiences that are not simply given in neuroscientific analysis. For example, shifting from audience reception to authorial production, no amount of fMRI scanning would tell us about the crucial early experiences of Shakespeare that

contributed to his theatrical imagination. (This would be true even if Shakespeare were around and available for an fMRI scan.) Rather, these early experiences can only be inferred through cultural and biographical study, as, for example, that undertaken by Greenblatt.

At the same time, the explanations of historians and biographers themselves seem incomplete without general explanatory principles, such as those provided by neuroscience in combination with related research and theory. For example, Greenblatt stresses Shakespeare's "dream of restoration" (see particularly 81–86) in various forms, including the reunion of separated families. Greenblatt connects restoration with painful experiences in Shakespeare's own life, experiences that give Shakespeare's works "the touch of the real" (13), in Greenblatt's phrase. Greenblatt's analysis is clearly important here. However, it is just as clearly incomplete. The touch of the real is likely to reach viewers only if there is some sort of congruence with their own sense of the real. This is one reason why it is important to recognize other patterns here, patterns that go beyond Shakespeare – for example, cross-cultural patterns in genre. One of these is the genre of parent/child separation and reunion (see Hogan *Affective*, 199–209). That genre is itself explained primarily by the neural system of attachment. Whatever one's degree of attachment security or insecurity, childhood development involves some critical period experiences of separation and reunion with caregivers. Those experiences are crucial to one's later emotional engagements with love, anxiety, and grief. (See chapter nine of Panksepp and Biven on the relation of anxiety and grief to attachment; there are different varieties of anxiety and not all are, as one might initially think, a function of the fear system [see 339–341].) Put differently, if we want to explain Shakespeare's success in family separation and reunion stories, such as *The Comedy of Errors* or *King Lear*, we need to understand the particularities of Shakespeare's experiences – for example, his own separation from his wife and children in coming to Stratford – and perhaps broad patterns in 16th century English childrearing practices. But we also need to understand the more general patterns that enable Shakespeare's experiences to resonate with those of his viewers – not only in his own time and place but in ours as well. Those patterns include both the literary genre and the (neural) emotion system that largely accounts for the genre. The recognition of the importance of interweaving cognitive and historical materials has led to the development of "cognitive historicism," one of the most prominent forms of literary study drawing on neuroscience (see, for example, Richardson and Stiles).

Finally, there is literary interpretation, the main focus of most efforts by students and professors of literature. The most obvious way of expanding interpretation is by altering the sorts of themes one may isolate in interpretation. For example, Christianity brings certain possible meanings to literary interpretation – a particular character may represent Jesus; an event may suggest resurrection. We find the same thing with psychoanalysis, where the interaction of three characters may point toward an Oedipal scenario. This "thematic innovation" is to some extent found in neuroscientific literary study as well. For example, simply by giving a non-intuitive analysis of racism, social neuroscience alters what we are likely to find in interpreting literary works. It introduces such themes as disgust-related dehumanization (where disgust limits medial prefrontal cortical response to human targets). We see this, for example, in extreme forms of misogyny and related violence. To take a literary case, it is presumably not accidental that Othello thinks of Desdemona in terms of "the slime / That sticks on filthy deeds" (V.ii.151–152) and "a cistern for foul toads" (IV.ii.61). His murder is enabled – and rendered more intuitively plausible for the audience's tacit simulation – as much by disgust as by anger, perhaps particularly disgust at female sexuality.

No less importantly, alterations in interpretation may result from how we select and organize textual information. Even such a simple matter as recognizing two spatial mapping systems may lead us to see different features of a text, thus select different phrases or scenes for interpretation. For instance, in *King Lear*, there is a strange disjunction in the forms of space implied in Lear's reunion with Cordelia. Broadly speaking, we may link the parietal system with a sense of intimacy, for it is the space of possible connectedness, of touching and being touched. The hippocampal system, in contrast, is objective and not intimate, not a matter of touching. In the context of a reunion, one would expect attachment bonds to highlight the parietal system. We find that with Cordelia. But something is amiss with Lear. The doctor asks Cordelia to "draw near" (IV.vii.23; here and below, citations of *King Lear* refer to the Quarto text), suggesting parietal space, defined by near and far, not an objective grid. Cordelia draws this space closer through the "medicine on [her] lips" that she delivers with "this kiss" (IV.vii.24–25). Her cherishing of her reunion with her father is all a matter of peripersonal space – close, even intimate contact.

Cordelia goes on to imagine and worry that he had to "hovel ... with swine" (IV.vii.37). Here, the space she imagines is specifically a substitute for home. This introduces another aspect of the neural organization of space, for home is a space of attachment bonds (on "place attachment," see Panksepp 407n.93). This suggests one fundamental, emotional organization of space, a division into the attachment-based home, on the one hand, and places of more or less intense insecurity, on the other (see Hogan *Affective* 29–31). To "hovel" is precisely the opposite of going home. Moreover, the implied disgust of hovelling "with swine" is itself the product of an emotion system directly opposed to attachment. Technically, disgust and attachment are systems with complex inhibitory relations (see Hogan *What* 45 and citations). The revulsion is salient in part because, in the hovel, there is no attachment object to inhibit disgust.

Lear's first words after waking concern being in a grave and are consistent with either a parietal or hippocampal spatial mapping. But he soon characterizes Cordelia as in Heaven and himself as in Hell – cosmological, rather than intimate or personal spaces. Cordelia aptly remarks that he is "far wide" (IV.Vii.48), a comment that now can be seen to retain its spatial meaning as well as its implications about his wandering mind. When he is somewhat recovered, he asks if he is in France (IV.vii.73), now shifting from cosmology to the equally impersonal geographical space. Perhaps the most striking expression of his alienation from the experiential space of intimacy comes when he considers his hands, the means of touching, the hands that Cordelia asks him to "hold ... in benediction o'er me" (IV.vii.56). Lear is not simply disoriented; he actually cannot experience the intimacy of contact with the space around him – so much so that he even wonders whether or not "these are my hands" (IV.vii.53). It is almost as if he had no peripersonal space at all, here suggesting a radical disturbance in attachment relations.

Part of what is going on in this scene is that Lear is having difficulty understanding what is in Cordelia's mind. Just at the moment when she is filled with tenderness and empathic feeling, he is convinced "you do not love me" (IV.vii.70). Indeed, the entire tragedy is in some ways the result of failed inter-subjective understanding, what is called "Theory of Mind." There are two sorts of Theory of Mind understanding (or misunderstanding). One is inferential; the other is a matter of "simulation" or imagining oneself in the other person's place. Simulation itself may be spontaneous or effortful (i.e., the result of a self-conscious attempt to imagine oneself in the other person's place). Perhaps because his position of authority has never required him to engage in effortful simulation

and the associated empathy, Lear seems particularly unskilled at it. Nor does he seem much better at Theory of Mind inference – concluding, as he does, that Cordelia must not love him because she has “some cause” (IV.vii.72). Cordelia contrasts strikingly with Lear in this respect. In the opening act she no more engages in effortful simulation and empathy than does Lear, perhaps because of her age and circumstances. By the end of the play, however, she has developed those capacities. We see this in her profoundly empathic response to her father, and her forgiveness of him – indeed, her claim that there is nothing to forgive (IV.vii.73).

In a case such as the examination of Theory of Mind in *King Lear*, we see altered themes for interpretation along with an altered “encoding” of the text (i.e., an altered selection and organization of elements from the text). This suggests the literary value of Theory of Mind and empathy as developed in neuroscience and related fields. (For an overview of the neuroscience of empathy, see Klimecki and Singer; on Theory of Mind, see Doherty.) In keeping with this, they are two of the most influential concepts in literary neurocriticism. We see this, for example, in work by Lisa Zunshine and Suzanne Keen.

Of course, Theory of Mind does not explain everything about Lear’s reunion with Cordelia. For instance, his uncertainties in this scene are bound up with another important topic of neuroscientific research, memory. Specifically, his episodic or autobiographical memory is disturbed – and it is disturbed precisely by his uncertain relation to the present. Not recognizing the place where he is or the clothes in which he finds himself, he is also uncertain that he is rightly recognizing Cordelia. The scene makes sense when we recall the importance of current experience in reconstructing past experience, that is, the contingency of memory on the conditions that evoke the memory (see Schacter 104–113). The scene may make little sense if we take memory to be a constant and precise representation, rather than a changeable neural pattern.

No less importantly, neurological research indicates that “memory” is not a single system but a number of distinct systems. Perhaps the most important of these is *emotional memory* (see LeDoux *Emotional*, 182). This is a system of “implicit” memories that, when activated, do not bring to mind explicit recollections of a past event but rather inspire an emotional response. We can infer that, even before he explicitly recognizes her, Lear’s emotional memories of Cordelia have been activated. These activations produce his initial response. Placing Cordelia in Heaven is a matter of idealizing her – as one would expect from an attachment bond (which tends to foster idealization). Placing himself in Hell is an expression of his feeling of guilt – a feeling that is presumably intensified by the attachment. As these points suggest, research on memory, too, has potentially significant implications for literary study. In keeping with this, cognitive memory research has inspired literary analysis (see, for example, Rubin and Nalbantian; for a treatment of memory and literature in relation to evolutionary thought – an influential branch of cognitive and neurocognitive literary study – see chapter ten of Boyd).

Finally, in addition to changes in themes and encoding, our interpretations may be altered by just what we count as part of the text. Clearly, we do not confine ourselves to the words as printed on the page. At the very least, we incorporate a wide range of meanings, historical references, and general knowledge. In a famous essay, Stanley Fish urged, among other things, that we do and should incorporate aspects of response, including temporal changes in expectation. One may or may not accept Fish’s specific claims. But his argument does indicate that it is not unreasonable to broaden one’s understanding of a text beyond the context-constrained meanings. Neuroscience may be seen as giving some support to this view. Specifically, right hemisphere activations of syntactically irrelevant

meanings are part of our experience of literary works. They are even to some extent a predictable part of that experience. If they were not predictable, no one would ever be able to make a successful joke based on a pun. In fact, we have just considered a case of this sort – Cordelia’s “far wide” (IV.vii.48). There are complex issues here as to just how these right hemisphere associations should be incorporated into the interpretation of a work or into explanations of response to works. These issues too might benefit from neuroscientific research. In any case, the literary relevance of broad, associative networks has been stressed by cognitive scientists such as Keith Oatley, as well as literary critics such as Julie Kane.

### A Concluding Note on the Distinctness of Literary Study

The preceding discussion begins from the standard goals and procedures of literary study, integrating neuroscience into these. This does not mean that the contributions all go in one direction. It seems clear that literary study – like the study of other arts – can contribute to knowledge about the human mind. (I have argued for the point at length in *What Literature Teaches Us About Emotion*.) But this does not mean that literary contributions will be made in the form of neuroscience and according to the disciplinary procedures of the latter. Rather, it seems likely that the major contributions from literary study will be made by literary critics and theorists concentrating on what they know and do well – nuanced interpretation and evaluation of particular works, the isolation of patterns across the domain they have studied (i.e., literature), the exploration of social and historical complexities, and so on.

Among cognitivist literary critics, there is currently great enthusiasm for teaming up with neuroscientists and getting hold of fMRI equipment to run brain scans. It is undoubtedly the case that literary critics and theorists may contribute valuably to some sorts of empirical research. However, the kinds of complex interpretive issues that interest students of literature are currently not amenable to fMRI research. More generally, the enthusiasm for that research risks failing to recognize the limitations of neuroimaging and the ambiguity of its results. Certainly, we want neuroimaging research to continue and advance in literary study. Moreover, it can be valuable to add some literary scholars to the neuroscientists conducting that work (see, for example, Young and Saver for a productive collaboration; see also Starr, who admirably committed herself to learning fMRI procedures). But the brain imaging of literary response is a neuroscientific pursuit, even if it is one that takes literature as its object. Put simply, it is and will be done in neuroscience departments, not in literature departments. This article has been concerned with pursuits that remain fundamentally literary – pursuits engaged in by literary scholars in literature departments – even if those pursuits incorporate the findings of neuroscience into their theoretical principles and critical practices.

On a personal note, despite my enthusiasm for neuroscientific and related research, I feel it would be a great mistake if students of literature – even that subset of such students who are cognitive literary critics and theorists – were to abandon the distinctive qualities and purposes of literary study to imitate (probably badly) the more prestigious activities and interests of empirical scientists. In other words, neuroscience can help us do what we do better. Part of what we do is to contribute to the understanding of the human mind and human society. To continue and extend these contributions, the neurohumanities do not have to stop being humanities. Indeed, if they stop being humanities, anything distinctive in their contribution will stop as well.

# CHAPTER 7

## Digital Humanities: Theorizing Research Practices

*Ted Underwood*

Digital research offers scholars of literature the possibility of grounding claims in textual evidence in new ways as a result of the digitalization of texts, Ted Underwood argues. Using data mining, scholars can now chart the use of certain words across a range of texts. Such mining can demonstrate changes in the use of certain words or word themes over time, and it can give access to commonalities across texts that would have been difficult to determine using non-digital, pencil-and-paper research.

Humanists are gearing up to have a conversation about digital research methods that will be interesting for many reasons – not least because it’s oddly belated. Algorithmic mining of large electronic databases has been quietly central to the humanities for two decades. We call this practice “search,” but “search” is a deceptively modest name for a complex technology that has come to play an evidentiary role in scholarship. Many of the features that seem new to us about data mining (its “bigness” or quantitative character, for instance) have been invisibly naturalized in our disciplines since humanists started using full-text search in the 1990s. Although data mining is widely framed as a novel technology now being imported to the humanities, I’ll argue that it is better understood as a philosophical discourse that can help humanists think more rigorously and deliberately about existing practices of algorithmic research.

First, what does it mean to say that search plays an “evidentiary role in scholarship”? The appearance of paradox here is partly produced by the word “search” itself, which blurs boundaries between distinct technologies. Bibliographic search can be little more than an aid to memory – for instance, if a scholar is recovering the call number for a known title. Full-text search looks similar: we may even enter search terms in the same box where we would have entered a title. But the underlying technology, and its scholarly applications, are different.

*Original publication details:* Ted Underwood, “Digital Humanities: Theorizing Research Practices We Forgot to Theorize Twenty Years Ago.” *Representations* 127.1 (Summer 2014), pp. 64–72. University of California, 2014. Reproduced with permission from University of California Press.

In practice, a full-text search is often a Boolean fishing expedition for a set of documents that may or may not exist. For instance, if I suspect that blushes are symbols of moral consciousness in nineteenth-century poetry, I can go to a database of primary sources and search for poems that contain both “blush” and “conscious.” If I find enough examples, I flesh out an article. If not, I usually keep trying until I succeed. Perhaps “blush” and “shame” would work better? Here search is not just a finding aid; it’s analogous to experiment – although, to be sure, there’s something a bit dubious about experiments that get repeated until they produce a desired result. The search terms I have chosen encode a tacit hypothesis about the literary significance of a symbol, and I feel my hypothesis is confirmed when I get enough hits. It’s possible that the article I finally write will discuss only a few of these sources, because I may not believe that the problem requires “big data.” But in fact I’ve used algorithms to explore a big dataset, and the search process may well have shaped my way of framing the subject, or my intuitions about the representativeness of sources.

The internal mathematics of full-text search also has more in common with data mining than with bibliographic retrieval. If I do a title search for *Moby-Dick*, the results are easy to scan. But in full-text search, there are often too many matches for the user to see them all. Instead, the algorithm has to sort them according to some measure of relevance. Relevance metrics are often mathematically complex; researchers don’t generally know which metric they’re using; in the case of web search, the metric may be proprietary.

In short, full-text search is not a finding aid analogous to a card catalog. It’s a name for a large family of algorithms that humanists have been using for several decades to test hypotheses and sort documents by relevance to their hypothesis. Simple forms of full-text search were already available in the 1970s (Lexis was an early example), but CD-ROM databases of historical sources weren’t widely distributed until the 1990s. Even today, the technology may not have permeated the discipline of history as deeply as it has literary studies, since historians rely more heavily on unpublished sources. One recent study suggests, however, that humanists across a range of disciplines rely heavily on search engines, and use them for research in ways that are not very different from the way the general public uses them. (Like everyone else, we begin with Google.)<sup>1</sup> The scholarly consequences of search practices are difficult to assess, since scholars tend to suppress description of their own discovery process in published work.<sup>2</sup> But as someone who began a dissertation just before full-text databases became available, I remember that I seemed to be finishing it in a different world.

The most obvious effect of the new technology was that, like many other literary scholars in the ’90s, I found myself writing about a wider range of primary sources. But I suspect that the questions scholars posed also changed to exploit the affordances of full-text search. Before 1990, narrowly defined themes were difficult to mine: there was no Library of Congress subject heading for “descriptions of work as ‘energy’ in British Romantic-era writing.” Full-text search made that kind of topic ridiculously easy to explore. If you could associate a theme with a set of verbal tics, you could suddenly turn up dozens of citations not mentioned in existing scholarship and discover something that was easy to call “a discourse.”

I remember feeling uneasy about this. The rules of the research game seemed to have changed in a way that made it impossible to lose. After all, how many sources do you need to establish the importance of a theme? Twenty? When searches were limited by networks of previous citations, that was a meaningfully high bar. But in a database

containing millions of sentences, full-text search can turn up twenty examples of anything. Even at the time, it was clear that this might strengthen confirmation bias.

In hindsight, I underestimated the scope of the problem. It's true that full-text search can confirm almost any thesis you bring to it, but that may not be its most dangerous feature. The deeper problem is that sorting sources in order of relevance to your query also tends to filter out all the alternative theses you didn't bring. Search is a form of data mining, but a strangely focused form that only shows you what you already know to expect. This limitation would be a problem in any domain, but it's particularly acute in historical research, since other periods don't always organize their knowledge in ways we find intuitive. Our guesses about search terms may well project contemporary associations and occlude unfamiliar patterns of thought.

Humanists didn't spend a lot of time debating this problem in the 1990s, because search engines were usually our only mode of access to large digital collections. But in recent years, research practices have diversified, and the hermeneutic limitations of search are becoming obvious. In computer science, the subfields of data mining and machine learning have specialized in the problem of extracting knowledge from large collections.<sup>3</sup> They've developed a range of alternatives to search based on a more self-conscious, philosophically rigorous account of interpretation.

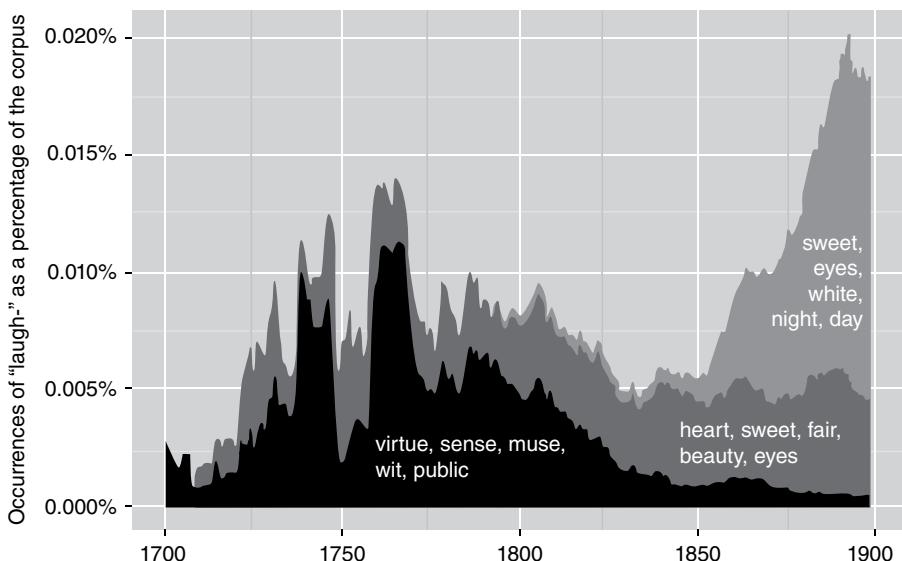

I realize that last sentence may be an eye-opener. Humanists tend to think of computer science as an instrumental rather than philosophical discourse. The term "data mining" makes it easy to envision the field as a collection of mining "tools." But that's not an accurate picture. The underlying language of data mining – Bayesian statistics – is a way of reasoning about interpretation that can help us approach large collections in a more principled way.<sup>4</sup> In particular, it emphasizes a hermeneutic spiral that will be familiar to humanists, acknowledging that we approach every question with some previous assumptions (called "prior probabilities"), as well as particular kinds of uncertainty. When we encounter new evidence, our interpretation is at once shaped by existing assumptions and (possibly) capable of reshaping them. This hermeneutic cycle is intuitive enough when we're talking about a single text; the task of data mining is to explain how it can work at the level of a collection too large to be surveyed by a single reader. All mapping strategies are going to make some assumptions about the patterns we expect to find. But some strategies are also able to reveal evidence that challenges prior assumptions.

For instance, literary scholars' habit of using keyword search to probe for intersections of themes (like "blush/shame" or "work/energy") is tacitly based on an assumption that the co-occurrence of words will reveal a connection between their meanings. This assumption is related to a model of meaning that linguists call the "distributional hypothesis," which postulates that the meaning of a word is related to its distribution across contexts.<sup>5</sup> This may not be a perfect model, but it has proven to be a useful one in computer science as well as literary study, and if we want to continue using it as a heuristic, there are more flexible ways to use it than iteratively guessing particular pairs of words. Algorithms based on distributional assumptions can map the language that was in practice associated with any term in a given period.<sup>6</sup> For instance, the word most commonly associated with "blush" in a collection of 4,820 eighteenth- and nineteenth-century volumes turns out to be not "shame" but "artless" – a detail that might interestingly complicate a scholar's assumptions about moral consciousness, if they use an exploratory strategy flexible enough to reveal it.<sup>7</sup> Mapping strategies like this won't replace keyword search for all purposes. When you already know what you're looking for,

a search engine is the appropriate tool. But in historical scholarship, there are times when we don't know what we're looking for as well as we think.

In fact, perhaps it's already hasty to assume that the topic I'm exploring can be associated with a single word like "blush." Maybe a different term, that I can't begin to guess, was more important in this period, or maybe the social phenomena relevant to my question take shape at the intersection of many different terms. If we want a more open-ended strategy, we can map the print record by allowing an algorithm to organize the language of a collection into clusters of terms that tend to occur in the same contexts. This strategy (known as "topic modeling") is capable of revealing discursive patterns that the researcher didn't necessarily go looking for.<sup>8</sup>

Because topic modeling allows a word to belong to more than one "topic," it can reveal patterns of association that shift across time. Figure 1, for instance, plots occurrences of "laugh" (and words derived from that root) in eighteenth- and nineteenth-century poetry, dividing the occurrences by their association with three different algorithmically created topics.<sup>9</sup> It would be possible to consider each topic separately – in fact, that's how topic modeling is commonly used – but here I've added an additional twist by showing how references to laughter are so to speak passed from one topic to another over time. (The algorithm also created 117 other topics; these are only the three where "laugh–" occurred most often.) Each topic is labeled with its most common words, giving us a sense of the changing contexts where poets mention laughter. A contrast is visible between the public, satirical function of "laughter" in much eighteenth-century poetry and a different pair of contexts where laughter is associated with personal description of a sentimental or amatory kind ("sweet," "fair," "eyes"). This use of laughter for characterization is already present in the eighteenth century, but becomes more prominent as the association of laughter with public wit fades.

**Figure 1** Occurrences of "laugh," "laughter," etc. in a collection of 13,789 volumes of poetry, divided by the topic to which each occurrence was assigned. Among 120 topics, I have plotted the three where "laugh–" occurs most often; each topic is labeled with its most frequent words.

I don't mean to imply a causal connection between these changes (for one thing, there are many other topics in the model; these three don't constitute a closed system). The illustration is only meant to show how topic modeling can generate suggestive leads. But pursued in more depth, leads become results. Matthew Jockers has used topic modeling to map nineteenth-century novels; Robert K. Nelson has used it to correlate thematic emphases in a Civil War-era newspaper with the changing fortunes of the war. Andrew Goldstone and I have used the technique to chart the rise and fall of different critical vocabularies in twentieth-century literary study.<sup>10</sup>

Instead of dwelling specifically on topic modeling, I want to consider the way innovations of this kind are prompting a belated conversation about algorithmic exploration in general. Topic modeling will be and should be controversial – as full-text search, actually, should have been controversial twenty years ago. Researchers can never afford to treat algorithms as black boxes that generate mysterious authority. If we're going to use algorithms in our research, we have to crack them open and find out how they work. Topic modeling, fortunately, is not proprietary, like many algorithms behind web search. Topic modeling algorithms are public, and humanists have proven to be quite capable of understanding them and changing them to fit humanistic goals.

To understand the interpretive limitations of an algorithm, one needs to understand its mathematical basis. For instance, in the most common form of topic modeling, the number of topics to be produced is one of the initial assumptions brought to the modeling process. As a consequence, the algorithm can't provide authoritative answers about the unity of any discourse, or about its boundaries. It's always possible to model the same collection with a larger or smaller number of topics, which would lump or split results differently. On the other hand, the algorithm is quite good at revealing patterns of association we might otherwise overlook.

Using algorithms for discovery raises an interesting but unfamiliar set of philosophical questions. Humanists are still more comfortable with quantitative methods when they can be presented in their familiar role as instruments of verification in the late stages of research. Using an algorithm as a source of initial leads seems perilously close to pulling a rabbit out of a hat (in spite of the fact that we've been doing this with search engines for several decades). In a recent issue of *PMLA*, for instance, Alan Liu wonders whether topic modelers aspire to the goal of "tabula rasa interpretation – the initiation of interpretation through the hypothesis-free discovery of phenomena."<sup>11</sup>

If this were true, it would create a real philosophical impasse. And one can certainly find technophilic rhapsodies in *Wired* magazine suggesting that we have reached that impasse: an endgame where "data" finally displaces all "theory."<sup>12</sup> But those rhapsodies are not well informed about the statistical models involved in data mining. It isn't the case that topic modeling (or any other data mining algorithm) pretends to be truly "hypothesis-free." A model is an abstraction created by human beings, and computer scientists have long acknowledged this.<sup>13</sup> The Bayesian probabilistic models now common in the discipline are especially meticulous about specifying initial interpretive assumptions.

A researcher who wants to fit a topic model to a collection of documents has to start by specifying, for instance, the number of topics she expects to find and the degree of blurriness she expects those topics to possess. In the modeling process, the computer doesn't generate insights from nothing; its calculations are rather a way of harmonizing these initial human assumptions with the complex evidence presented by the documents themselves. (To use a term of art, the computer helps us "fit" a model to the evidence.)

This mode of exploration can be more open-ended than keyword search, since assumptions about degrees of blurriness are more flexible than a specific assumption that, say, blushes will symbolize shame. But the interpretive process is still shaped and initiated by human assumptions.

I haven't had room here to make a detailed argument about the humanistic value of quantitative methods.<sup>14</sup> But doing that would be almost beside the point, since humanists are already mining large datasets quantitatively every time we use a web browser. The problem is that we are using search algorithms we have never theorized, and arguably using them in a strongly projective way that is at odds with historicism. Although the statistical language of computer science may seem alien to our disciplinary tradition, I think the paradoxical truth is that humanists will need to understand that language in order to design research practices that allow us to work in large collections while remaining true to our own hermeneutic principles.

This is admittedly a new kind of interdisciplinary conversation for humanists, and we may initially have a lot to learn. But we also have a lot to contribute. I've suggested that quantitative disciplines have their own useful version of hermeneutic theory, but they aren't without blind spots. The difficulty of modeling historical change, for instance, is not well understood outside the humanities. Scientists who try to model the print record over a significant time span often make assumptions about continuity that humanists would recognize as confining.<sup>15</sup> On this topic, and many others, a rare opportunity is emerging for a genuinely productive exchange between scientific methodology and humanistic theory.

- 7 I produced this result by measuring the "cosine similarity" of word distributions over a collection of 4,820 volumes that Jordan Sellers and I assembled, with assistance from TCP-ECCO (Text Creation Partnership-Eighteenth Century Collections Online) and the Brown University Women Writers Project. Measuring cosine similarity is a simple approach; there are more sophisticated ways of using a distributional model to assess similarity between terms. (See Turney and Pantel, "From Frequency to Meaning.") Of course no single collection of volumes is perfectly representative of print culture; in practice, the best way to address questions of representativeness is often to pose the same question in multiple collections that have been selected in different ways.

- 8 “Topic modeling” is a name for a large family of algorithms, but the algorithm most commonly used by humanists is latent Dirichlet allocation (LDA). For an accessible humanistic introduction, see Ted Underwood, “Topic Modeling Made Just Simple Enough,” *The Stone and the Shell*, April 7, 2012, <http://tedunderwood.com/2012/04/07/topic-modeling-made-just-simple-enough/>. For a more technical account, see David Blei, “Probabilistic Topic Models,” *Communications of the ACM* 55 (2012): 77–84.
- 9 These 13,798 volumes of poetry were selected from a larger set of 469,000 eighteenth- and nineteenth-century volumes in the HathiTrust Digital Library. To identify the poetry in this large collection, I used tools for genre mapping described in Ted Underwood et al., “Mapping Mutable Genres in Structurally Complex Volumes,” *2013 IEEE International Conference on Big Data*, 95–103, arXiv.org, Cornell University Library, <http://arxiv.org/abs/1309.3323>.

- 13 “Fundamentally, computer science is a science of *abstraction* – creating the right model for thinking about a problem.” Alfred Aho and Jeff Ullman, *Foundations of Computer Science* (New York, 1994), 1.
- 14 For more examples of topic modeling, see a special issue of *Poetics* on “Topic Models and the Cultural Sciences” 41, no. 6 (2013). See also Lisa M. Rhody, “Topic Modeling and Figurative Language,” *JDH: Journal of Digital Humanities* 2, no. 1 (2012), <http://journalofdigitalhumanities.org/2-1/topic-modeling-and-figurative-language-by-lisa-m-rhody/>.
- 15 Attempts to frame explicitly diachronic versions of topic modeling (like dynamic topic modeling and “topics over time”) have tended to invoke dubious assumptions about historical continuity. Historians are probably better advised to rely on a simpler algorithm like generic LDA, which remains blissfully ignorant of dates and yet in practice tends to produce coherent diachronic patterns. See the appendix to Benjamin M. Schmidt, “Words Alone: Dismantling Topic Models in the Humanities,” *JDH: Journal of Digital Humanities* 2, no. 1 (2012), <http://journalofdigitalhumanities.org/2-1/words-alone-by-benjamin-m-schmidt/>, also Xuerui Wang and Andrew McCallum, “Topics over Time: A Non-Markov Continuous-Time Model of Topical Trends,” in *Proceedings of the Twelfth ACM SIGKDD International Conference on Knowledge Discovery and Data Mining* (New York, 2006), 424–33.

# CHAPTER 8

## Planet Hollywood

*Franco Moretti*

Franco Moretti, a scholar of the novel and a professor at Stanford University in the US, argues that quantitative methods can illuminate aspects of global culture such as the way Hollywood films are received and consumed around the world. Some films, Moretti finds, "play well" in certain geographic regions and less well in others.

Some time ago, while working on nineteenth-century literary markets, I was struck by how thoroughly British and French novels managed to streamline European cultural consumption: hundreds of thousands of people reading more or less the same books, and at the same time. This looked so much like the beginning of the culture industry that it suggested a little follow-up experiment – on film markets, this time. I began with the records published in *Variety*, and listed the 5 most successful American films for every year between 1986 and 1995; then I turned to non-American markets, in order to assess the extent of Hollywood's planetary diffusion. Here, the sources (*Variety International*, *Screen International*, and various related yearbooks) turned out to be extremely patchy, and I decided to map only those countries for which at least two years were fully documented; this made the sample a little more reliable, but unfortunately much more unbalanced: of 46 countries with 'enough' data, 25 are in Europe; Africa is almost entirely absent, as are many Asian and Latin American countries, and the demographic giants of India, China and Russia.

Big blanks. Since, however, some interesting patterns emerge, I am writing these pages anyway. Take them for what they are: initial hypotheses that should be tested against a larger, more precise set of data.

### I

Figure 1: the sheer power of Hollywood. In 24 countries (the black triangles), American films make up between 75 and 90 per cent of the decade's top hits; in another 13 (the black stars) the percentage climbs above 90; in 5 cases it reaches 100. (While spending

Fewest American hits (white circles):						
★ 90–100% American films	Hong Kong	6%	France	58%	South Korea	67%
▲ 75–89% American films	Serbia	33%	Bulgaria	62%	Sweden	68%
○ less than 75% American films	Malaysia	44%	Czech Republic	67%	Denmark	73%

**Figure 1** US films as a percentage of top five box-office hits, 1986–95.

a year in Berlin, every now and then I checked the top ten hits of the week; always at least 9 American films, if not 10.) ‘When one talks of cinema’, wrote the Brazilian avant-garde director Glauber Rocha in the 1960s, ‘one talks of American cinema … Every discussion of cinema made outside Hollywood must begin with Hollywood’. Indeed.

But first, a few words on those nations (the white circles) where Hollywood encounters an obstacle, and falls below 75 per cent of box-office hits. Sweden and Denmark are the core nations of Scandinavia: an area, as a dissertation by Leyvoy Joensen has shown, with a very strong regional identity, where not just Danish or Swedish novels, but Icelandic and Faroese ones had quite a criss-cross circulation. As for the Czech Republic, Serbia and Bulgaria, they are the tip of the – melting – East European iceberg: in the Czech Republic, American films accounted for less than 30 per cent of box-office hits before 1989; afterwards, they reached 76 per cent. And the same trend is visible in Slovakia and Poland (and Estonia, Romania, Slovenia: but their data were too erratic, so they don't appear in the map).

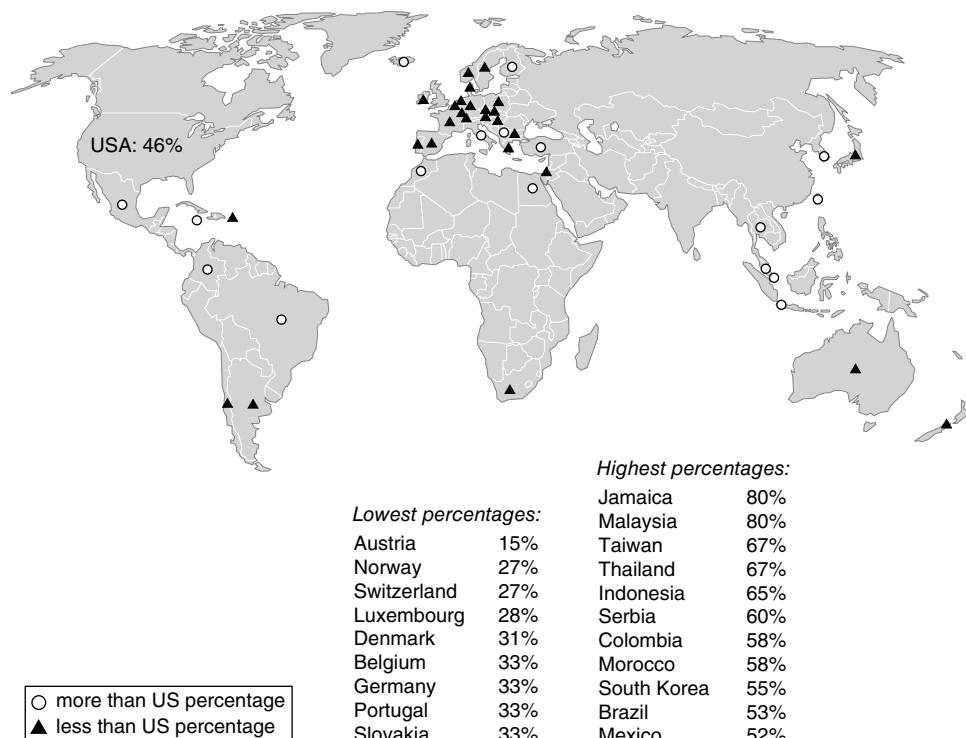

Then, France. Where the story is different; Paris was the Hollywood of the nineteenth century, its novels were read and imitated everywhere – they even invented cinema there! No wonder they hate the other Hollywood, no one likes to give up symbolic hegemony; but no one keeps it by mere force of will either, and although France knows how to protect its own market (which was twice inundated by foreign films, in the 1920s and 1940s, and twice bounced back), there is no question of its competing with Hollywood abroad. Between 1986 and 1995, only four non-American films enjoyed a large international success: *A Fish called Wanda*, *Four Weddings and a Funeral*, *Crocodile Dundee*, *The Last Emperor*: two British comedies, an Australian comedy, an American–Italian melodrama. None of them was French. In fact, none was any different from the usual Hollywood fare ...

## II

Scandinavia, Eastern Europe, France: all ‘residual’ sub-systems, that don’t threaten Hollywood’s hegemony. The true rival is in Asia: Hong Kong. (As I already said, I could not find enough data for the other obvious candidate, India.) In the sample decade, only *Jurassic Park* and *Speed* made it into the Hong Kong list; all other hits were local products. And Hong Kong has also its regional sphere of influence: Malaysia, Taiwan, partly Thailand, probably Pakistan and Bangladesh and China (whose insufficient data don’t appear in the map).

Of course, the future of the Hong Kong film industry is not clear: it may be stunted by the incorporation into the People’s Republic of China – or the exact opposite: the larger market may be a boost to production and inventiveness. Be that as it may, in the last generation or so (from Bruce Lee to Jackie Chan and beyond) Hong Kong films have very efficiently caught the wake of Hollywood’s greatest export staple: the films of action and adventure charted in Figure 2.<sup>1</sup> With its many fuzzy internal divisions, but quite clear external borders, this is by far the most successful form both inside the US and abroad (with the exception of Europe, about which more later). South and East Asia are these films’ favourite destination: they account for 50 per cent of the decade’s hits in Singapore, 55 in South Korea, 65 in Indonesia, 67 in Taiwan and Thailand, 80 in Malaysia (and the sporadic data for Pakistan, India and Bangladesh confirm this pattern).

Behind this diffusion is at work one of the constants of cultural geography: stories travel well – better than other genres, anyway. It was true centuries ago, when Indian and Arab tales crossed the Mediterranean, and transformed European storytelling; it is true

**Figure 2** Action films as a percentage of top five box-office hits, 1986–95.

today, for these concatenations of striking events and hyperbolic actions (and tomorrow, with videogames: stories that never stand still, where the only thing that matters is what happens next ...). And stories travel well because they are largely *independent of language*. Within a narrative text, style and plot constitute discrete layers, and the latter can usually be translated (literally: carried across) independently from the former. (A favourite example of narrative theorists used to be, ‘one can take a novel, and turn the plot into a ballet’: just what happens in so many Hong Kong films.) This relative autonomy of the story-line explains the ease with which action films dispense with words, replacing them with sheer noise (explosions, crashes, gunshots, screams ...); while this brisk dismissal of language, in turn, facilitates their international diffusion. Significantly enough, in the 1920s American films were already enjoying a worldwide hegemony: what brought it to a halt was the invention of sound, which elevated language into a powerful barrier, supporting the quick take-off of the various national film industries. The abrogation of language in action films is a powerful factor in turning the tide around.

### III

Next map: comedies (Figure 3). In the US, they account for 20 per cent of box-office hits; elsewhere they are usually much less successful—look at East Asia, the Mediterranean, or at the percentages indicated in the map. By contrast, even in those countries (the white circles) where Hollywood comedies are relatively more successful, the difference with the US is often insignificant.

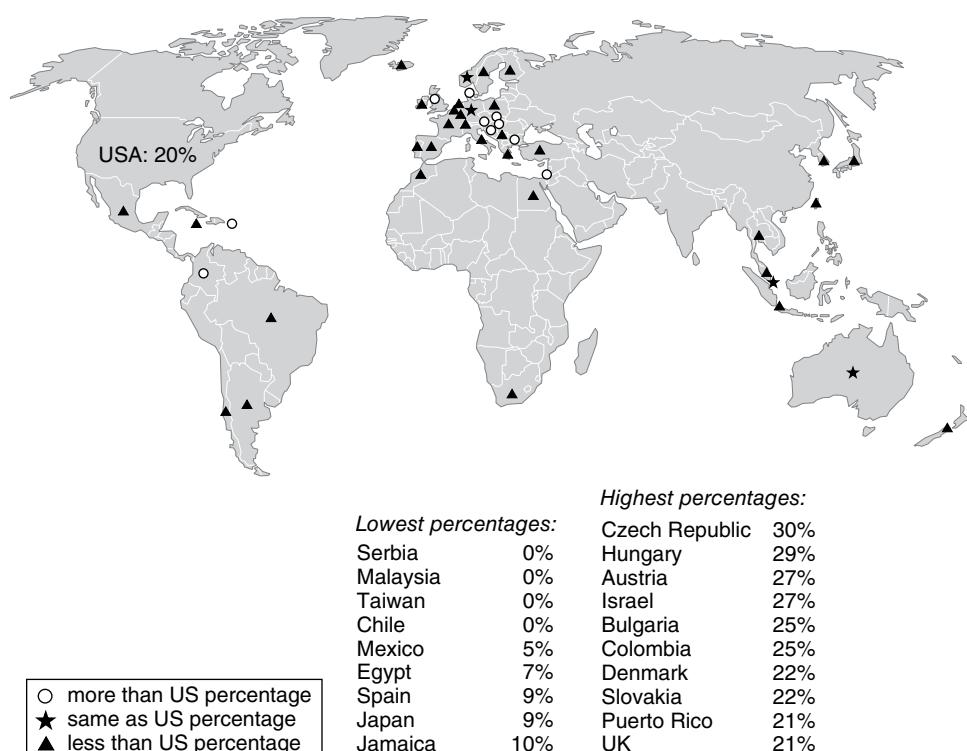

Figure 3 Comedies as a percentage of top five box-office hits, 1986–95.

Another rule of cultural geography: relatively speaking, comedies do *not* travel well. Compared to other French genres, the enormously popular comic novel of early nineteenth-century France, the *roman gai*, had a rather modest European diffusion. In a neat reversal of what we just saw, the main reason for this inertia is almost certainly language: since jokes and many other ingredients of comedy rely heavily on short circuits between signifier and signified, they are weakened by translation – and indeed comic films reached the apex of their world diffusion long ago, before the age of sound. Just as significant as language, however, is the fact that laughter arises out of unspoken assumptions that are buried very deep in a culture's history: and if these are not *your* assumptions, the automatic component so essential to laughter disappears. Which is interesting, we usually associate the national spirit with the sublime (*et pour cause*: unknown soldiers, torn flags, battlefields, martyrs ...) yet, what makes a nation laugh turns out to be just as distinctive as what makes it cry. If not *more* distinctive, in fact: the same sublime objects reappear relentlessly from one culture to another, whereas the targets of comic aggression seem to be much more idiosyncratic, more variable. All sublime nations resemble each other, we could paraphrase *Anna Karenina*, but when they start laughing, they all do so in their own unique way.

The international weakness of Hollywood comedies, then, has much to do with their being American; or perhaps, better, with their being non-Brazilian, non-Finnish, etc. In many cases – Brazil, Argentina, Mexico, Sweden, Finland, Britain, Australia, Hong Kong – market records suggest a genuine passion for national comedies which becomes spectacular in Italy, where *every* single national hit of the sample decade was a comedy (as would be, a few years later, the biggest Italian success of all times, *Life is Beautiful*). This fixation – which began in the sixties, and apparently will never end – must have something to do with that mix of aggression and anxiety that psychoanalysis has recognized in laughter, and that is so typical of the emotional cosmos of the *commedia all'italiana*. It's the grimace of a culture structurally unsure about its position in the world: the last of the 'advanced' countries, arrogantly showing its teeth to what is left of the past – or the first of the 'backward' ones, populistically bent on 'decrowning' those placed above it?

## IV

Figure 4: children's films. In the US, 25 per cent of box-office hits; in most other countries, much less – at times almost nothing (and I will come to that in a moment). But the American results are arresting in themselves. One in every four box-office hits aimed at children? This seemed so odd that I checked the statistics for the years of my own childhood, and in the pages of *Variety* for 1955 and 56 and 57 I found what I remembered so well: there were so *few* children's films then! A cartoon in the top ten around Christmas – for a couple of weeks, in a couple of places; period. (I say a couple of places because, then, the American market was still so uneven that the top ten changed a lot from town to town; today, the very idea seems quaint.) In the mid-fifties, not a *single* film for children made *Variety*'s top twenty for the year, with the only possible exceptions of *20,000 Leagues Under the Sea* and *Around the World in 80 Days*: both children's films in a very dubious sense (and both drawn from nineteenth-century French novels, by the way).

Today, the top twenty routinely includes four or five children's films, and the reason, I suspect, is quite simple: money. These films are more successful because much more money is spent on children's entertainment. But this extra income is not available everywhere, and the result is the skewed distribution of Figure 4, where the (relative) absence

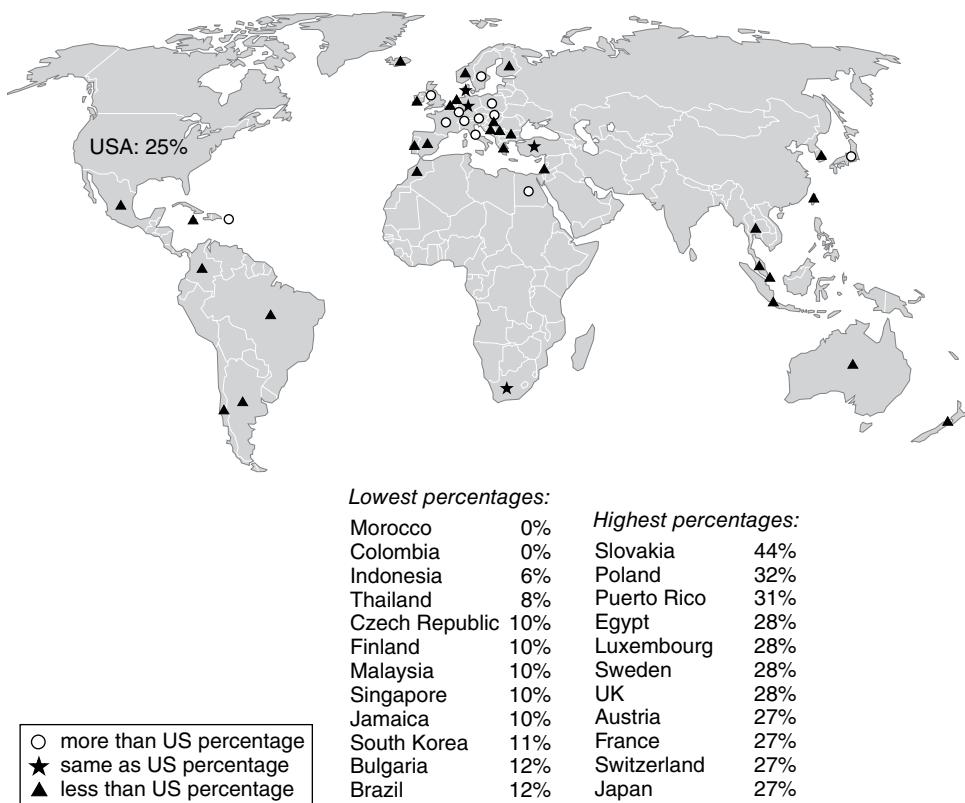

Figure 4 Children's films as a percentage of box-office top five, 1986-95.

of the genre tends to overlap with the poverty of each given country. The correlation is not perfect, they never are (look at the data for Egypt, or Puerto Rico, or Singapore), but it seems real enough, and, incidentally, it also works *inside* the United States: studying New York videotores, my students and I discovered that the presence of children's films in Harlem and the Bronx ranged between 3 and 8 per cent; in the Upper West Side and Upper East Side, between 10 and 19 per cent. Three times higher.

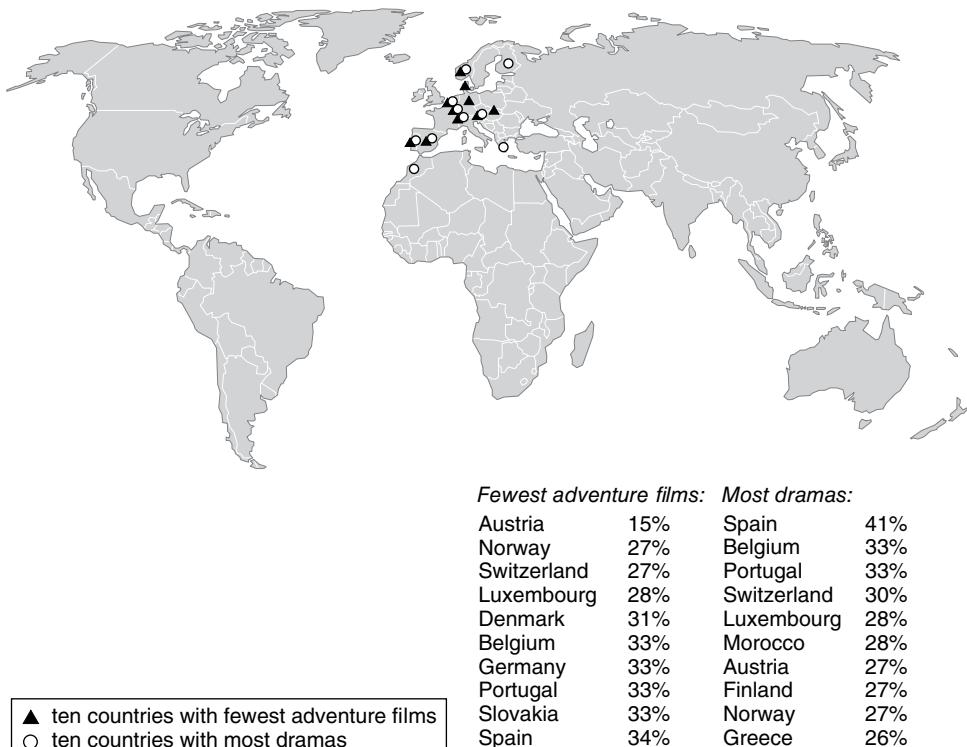

'Children's films' is a sloppy definition, of course: it points to the audience, not the film – and to an audience which is moreover quite problematic. Children, after all, don't usually go to the movies by themselves and, as adults must take them, a little generic paradox ensues: whom should the film be for – the adult, or the child? Faced with this problem, the fifties offered either straightforward fairy tales (for the child: *Cinderella*, *Snow White*, even *Fantasia*), or those Jules Verne novels I mentioned earlier (which were much more successful than the fairy tales: another sign of a market directed at the adult). But today the two forms have converged, blending into a hybrid which appeals to children and adults alike: *E. T.*, *Roger Rabbit*, *Back to the Future*, the various *Star Wars* and *Indiana Jones* – these are stories designed for a new human species of savvy children and silly grown-ups (*Homo puerilis*). Their god is Steven Spielberg (and Benigni is his prophet: *Life is Beautiful* – what a childish adult wants a child to know about Auschwitz).

In one film after another (*Jaws*, *Close Encounters*, *Indiana Jones and the Temple of Doom*, *Jurassic Park*; even the uncanny detail of the girl in red, in *Schindler's List*), Spielberg has not only chosen stories in which children and adults are somehow involved

together, but where the ambiguities so typical of (adult) life are defused by the (child's) desire for polarization so well described by Bruno Bettelheim. The best example is Schindler himself; this Third Reich shark turned benefactor, who offered an incredible chance to study the contradictions of historical existence. But Spielberg is not interested in understanding complicated things, and in his hands this figure out of Dostoevsky, or Brecht becomes – nothing.

## V

So. The diffusion of American comedies is low almost everywhere, children's films tend to prefer wealthy areas, action films South and East Asia ... Each genre has its favourite space, its different diffusion pattern, and it's precisely this difference that makes cultural geography useful (if all films were evenly distributed everywhere, these maps would be pointless: maps need unevenness, they signify through unevenness). And the unevenness is there because each region of the world functions like a cultural ecosystem: it tends to select one genre – and to reject another. It selects one genre *because* it rejects the other: setting side by side the maps of children's and action films, a striking coincidence emerges between the strength of the latter and the weakness of the former: Colombia, Jamaica, Morocco, Thailand, Malaysia, Indonesia and South Korea are all present in the tables charting the ten countries with most action films and fewest children's films. Same message from Figure 5, which charts the ten countries with *fewest* action films and most dramas: seven European countries (Portugal, Spain, Switzerland, Austria, Belgium,

**Figure 5** Countries with fewest adventure films and most dramas.

Luxembourg and Norway) are present in both lists – while five of the remaining six countries are also in Europe.<sup>2</sup>

We see here the Darwinian side of cultural geography: forms that *fight for space*. They fight for the limited resources of the market, and if one manages to successfully occupy one space, other forms will encounter all sorts of obstacles. In trying to explain large geographical patterns, then, the isolated case is seldom enough: the strength (or weakness) of one form can only be explained by looking at the whole system of variables at play. And with this, I turn to my last point.

## VI

The nineteenth century saw a European diffusion of Anglo-French novels; the twentieth century, a planetary diffusion of American film. And the reactions to this centralized global market? Every discussion of cinema made outside Hollywood must begin with Hollywood, said Glauber Rocha. Must it also *end* with Hollywood?

Here, the history of the novel offers an interesting precedent. In his work on Brazilian novels, Roberto Schwarz has shown that the power of metropolitan models has a twofold effect on cultures of the periphery. First of all, it generates a ‘disagreement between the form [which is foreign] and the material [which is local]’: ‘nothing is more Brazilian than these half-baked novels’, he goes on, so full of ‘dissonance’ and ‘compositional defects’. ‘An impossible programme’, says Masao Miyoshi of the modern Japanese novel; and similar things have been independently said just about everywhere.<sup>3</sup> In the case of less powerful literatures, then – which means: almost *all* literatures, inside and outside Europe – the import of foreign novels doesn’t just mean that people read a lot of foreign books; it also means that local writers become uncertain of how to write *their own* novels. Market forces shape consumption *and* production too: they exert a pressure on the very form of the novel, giving rise to a genuine morphology of underdevelopment.

But this is not the whole story. Every now and then, one of those ‘impossible programmes’ *works*. Machado de Assis takes the ‘compositional defects’ of Brazilian novels, and turns them into an incredibly original narrative style. Elsewhere, the clash with the symbolic power of Western Europe produces major paradigm shifts, like the Russian novels of ideas, or Latin American magical realism (or the slightly different case of the Kafka–Joyce generation). Although these remain *exceptions*, they occur often enough to show a counter-force at work within the world literary system. The morphology of underdevelopment is not without its surprises.

And in film? Here, reversing the tide is probably more difficult, given the stronger economic constraints (production costs, distribution monopolies, dumping practices ...), but hardly impossible. A critical reconstruction of the history of film, and of its present, will eventually offer an answer. From the viewpoint of method, however, the crucial point is the one made by Christopher Prendergast in his review of Pascale Casanova’s *République mondiale des lettres*: when trying to understand the world system of culture, ‘a single, generalizing description misses too much and is destined to do so, if it is offered as *the description*'.<sup>4</sup> This, of course, is just as true for the quantitative evidence I have used as for the study of individual directors, or film genres: the solution lies in multiple layers of description and explanation, linked together by a chain of successfully analysed ‘details’ (Prendergast again). God lies in the detail – perhaps. Our understanding of culture certainly does.

## Notes

- 1 This map, and those that follow, will make use of film genres – a controversial point, given that some critics believe in the existence of genres, and others don't. Without getting into the general argument, I will just say that I belong to the first group, even more stubbornly in the case of film: if you look at a newspaper, or walk into a videotape store, the reality of film genres literally leaps at you, as each film is being sold *as something*: a comedy, a film noir, science-fiction, whatever. Taxonomy here is not a scholastic pastime, it's a product of the film industry itself, which makes it easier to recognize the film, and to buy the ticket.

As for the categories I will use, I borrowed them from one section of the film industry itself – videotape stores. I chose an independent store in Greenwich Village, a Blockbuster store, and the *Theater for the Living Arts* catalogue, reduced their (largely coincident) categories to four large ones (Action; Comedies; Children; Dramas), and applied them to my sample.

- 2 'Drama' is not a very good label, I know, it sounds like a passe-partout notion designed to catch all those films that cannot fit elsewhere, but there is one sense in which it is actually appropriate: dramas have a very strong theatrical component (that's probably why they do so well in Europe, where the theatre is still a major cultural presence): the setting is often circumscribed, like the theatre – even, say, in *Forrest Gump*, where the protagonist moves around a lot, but the film is symbolically dominated by his monologue on the bus bench. Like the theatre, 'dramas' focus on language, and on its problems: *Forrest Gump* again, *Ghost*, *Rain Man*, *Dances with Wolves* (the last two titles both being translations from a different linguistic universe).

# CHAPTER 9

## Theory in Practice *According to My Bond: King Lear and Re-Cognition*

*Donald C. Freeman*

In this essay, Donald C. Freeman, who teaches English at the University of Southern California, argues that *King Lear* should be considered from the perspective of Lakoff and Johnson's theory of embodied knowledge and cognitive metaphor. The king understands the world using a cognitive scheme of accounting and balance, but he is confronted by another cognitive metaphor – one that understands family relations as links.

An emerging theory of cognitive metaphor provides a promising basis for analysing figurative language in literary works.<sup>1</sup> In particular, cognitive metaphor provides accounts of language patterns that are isomorphic with larger imaginative literary structures, as well as particular interpretations that are more explicit and falsifiable than existing interpretations founded upon the language of literary works. I want to demonstrate this theory in a reading of *King Lear* that focuses on its opening scene, where metaphorical structures arise from a competition between the framing bodily experiences of balance and linking that define ways of understanding crucial to the larger patterns of the play.

### 1 Metaphor and Schematised Bodily Experience

The salient features of earlier research in the theory of metaphor are epitomised in the work of Samuel R. Levin, who argued in a seminal essay that, for example, to interpret a metaphor like 'a grief ago' we in effect import the semantic feature [+Time] from 'grief's' syntactic frame into the word itself; the phrase is to that extent a 'confrontation' (Levin 1964: 314) between ordinary and metaphoric language. Metaphor thus is part of a figurative language that contrasts with a 'literal', non-figurative language. According to

*Original publication details:* Donald C. Freeman, "According to My Bond: King Lear and Re-cognition" from *Language and Literature* 2, pp. 1–19. Sage, 1993. Reproduced with permission from Sage and Donald C. Freeman.

this theory, ‘literal’ language, including ‘dead’ (but not literary) metaphors, is unmarked and ordinary, but figurative language, including literary (but not dead) metaphors, is deviant, foregrounded, highlighted, made strange. The ‘deviance’ is with respect to a language-universal set of semantic features and combinatorial rules external to individual cognition. Lakoff (1987: 157–84) has characterised this view as the Objectivist position. Classically, metaphor is seen – and not only in linguistically based theories – as a deviant and parasitic structure; we characterise metaphors in terms of their deviance from ordinary non-metaphorical language.<sup>2</sup>

Precisely these two characterisations of metaphor – that it is a structure parasitic upon ordinary language structure and that it can be explained in terms of its deviance from semantic interpretations of ordinary, non-metaphorical language interpretable by a compositional semantics – are explicitly rejected by cognitive metaphor. The cognitive view arises from the Experientialist position (as articulated, for example, in Lakoff 1987: xv) on semantic theory. The Experientialist position claims that we create metaphor by projecting onto an abstract *target domain* the entities and structure of a concrete *source domain*, a schematised real or vicarious bodily experience. Metaphor arises from, in Johnson’s (1987: xv) cogent formulation, ‘embodied human understanding’. As human beings we share a range of physical experiences that take on structure and coherence from the non-propositional schemata we extract from them. Our propensity to extract these schemata is a fundamental property of mind. We project elements of the structure and components of our physical experience onto our non-physical, abstract experience. Precisely this sense of projection from schematised bodily experience constitutes the claim for metaphor as embodied human understanding.

Consider, for example, the famous line from *King Lear*, ‘I am a man / More sinn’d against than sinning’ (III.ii.59–60). The context, justice, makes it clear that this line epitomises Lear’s sense of a higher justice, that in a truly just universe he would be no more sinned against than he had sinned, that if there were justice, Lear’s sins would balance his sufferings. This notion of balance is fundamental to our idea of justice: we understand the abstraction of justice in terms of bodily balance. The concept of horizontal balance dominates both our non-verbal and verbal language about justice. Our courts decide civil lawsuits according to ‘the preponderance’, or greater weight, ‘of the evidence’. A witness’s testimony can be said to be ‘biased’. Our icon for justice is a blindfolded woman holding a two-pan scale. All of these metaphors, and many more besides, having to do with such seemingly disparate notions as mathematical equality, patterns in visual art, and certain kinds of musical progression are projected from a non-verbal, non-propositional, non-representational schema of BALANCE (for general discussion of schema theory, see Johnson 1987: 18–40 and the references he cites; for discussion of musical progression and the BALANCE schema, see Freeman 1991: 153). The theory of cognitive metaphor claims that we project the elements of this schema – entities (the items that balance) and the relationships among those entities (counteraction or equality) – onto elements of our more abstract experience.

Such an explanation of ‘justice’ as deriving ultimately from our embodied human understanding of balance explains ‘I am a man / More sinn’d against than sinning’. But the BALANCE schema also captures lines like Edgar’s, ‘He childed as I father’d’ (III.vi.108), in which Lear’s sufferings at the hands of his daughters are balanced by Edgar’s sufferings at the hands of his father Gloucester (and the balance between the plot and major subplot of the play is epitomised); it captures Lear’s misunderstanding of the

father–child relationship, which persists even to the end, when, awakened from his sleep after he has been brought in from the heath, he implores Cordelia:

LEAR	If you have poison for me, I will drink it. I know you do not love me; for your sisters Have, as I do remember, done me wrong: You have some cause, they have not.
CORDELIA	No cause, no cause. (IV.vii.72–5)

Lear persists in understanding the parent–child relationship in terms of the BALANCE schema, even as Cordelia reaches beyond it. But children need no cause to wrong parents; conversely and more importantly, a child whom a parent has wronged need not balance that wrong by committing another. By no means all of the metaphors I have cited are metaphors of justice. But they do derive from a common source, the embodied, culturally reinforced experience of balance.

That source, the schema of BALANCE, underlies a richer, more important, and previously unexplained structure of metaphor in the play: that of financial accounting.<sup>3</sup> Terms and phrases like ‘divest’, ‘prize me at her worth’, and ‘comes too short’ (I.i.48, 69, 71) partake of the BALANCE schema, but they are not metaphors of justice. They can be better explained in the more densely structured, balance-based scenario<sup>4</sup> of financial accounting.

A second rich source of metaphor in *King Lear* is the equally simple LINKS schema, which consists of two entities joined by a bonding element. These three aspects of the LINKS schema’s structure, like those of the BALANCE schema, are mapped onto a wide array of non-physical human experiences. The source of the LINKS schema arises from our literal, physical link to our biological mothers. We then proceed to, for example, a ‘bonding’ with our parents, our relatives, and our friends. Marriages are often celebrated with the proverb ‘blest be the tie that binds,’ and sometimes include the Biblical admonition, ‘What therefore God hath joined, let no man put asunder’ (*Matthew* 19, verse 6). People without a romantic interest are ‘unattached’, or free of ‘entanglements’. When one event consistently follows another, we hypothesise that the two events are linked by causation. Links of divine ordination and divine love join the elements of the Great Chain which, shorn of its theology, is alive and well today (see Lakoff and Turner 1989: 160–213). The lion is still the king of the beasts, and gold is still the premier investment commodity, whereas platinum, rarer and more expensive, is merely an industrial commodity.

These two powerful perceptual structures give a local habitation and a name to previously unjustified and unrelated critical commonplaces. For example, it is a staple of Shakespearean criticism to say that in the opening scene the playwright establishes the atmosphere of a play’s world. What are established, in fact, are the play’s dominating schemata. In *King Lear*, Gloucester’s cynical account to Kent of his sons’ parentage establishes the play’s competing schemata of BALANCE and LINKS. Gloucester demonstrates that like Lear, he understands parental relationships through the CHILDREN ARE FINANCIAL ASSETS metaphor, one that the audience is shortly to see played out fully in the ritual of Lear’s retirement.

His [Edmund’s] breeding, Sir, hath been at my charge:

...

But I have a son [Edgar], Sir, by order of law, some year elder than this, who yet is no dearer to my account:

(I.i.8, 18–19)

The ‘charge’ that Edmund’s breeding constitutes for Gloucester is an analogy from estate accounting, which used the so-called ‘Charge and Discharge’ method, in which, Green (1930: 47) writes, ‘the executor “charged” himself with the estate and “discharged” himself of disbursements properly chargeable to the estate’. Edmund, a bastard, is not a financial asset but a cost item that it has embarrassed Gloucester to acknowledge; Edgar, though not an embarrassment (a cost to Gloucester’s reputation) is no more highly valued in the balance sheet of his father’s affections. From the start of the play, familial LINKS are debased; children are bastards or ‘by order of law’; the relationship of child to father, an important source of LINK metaphors in the play, begins with what will result in Edmund’s perversion of his filial duty. Charges and accounts, sons and daughters, bastards and legal progeny (and what ought to be but are not the same thing, natural and unnatural children) – these seemingly unrelated facts of language and plot spring from the same impulses: the BALANCE and LINKS schemata.

These competing schemata structure a significant portion of the play’s metaphors that traditional accounts of the play’s language leave unrelated. More significantly, they and the analyses they make possible, constitute previously undiscovered empirical evidence for relating the play’s figurative language to such other structural elements as narrative, plot, and particular constellations of characters. For example, many critics have found parallel structure or balance in the fact that while in the sub-plot Edmund gouges out Gloucester’s eyes but Edgar redeems him to a new life, in the main plot Goneril and Regan strip Lear of his retainers but Cordelia awakens him to a restoration, however temporary, of his health, fatherhood, and kingship. But I know of nothing written about *King Lear* that uses one theoretical apparatus to *explain* this balance, the patterns of metaphor I describe, and the relationships among these levels. It is this greater explanatory power that is the major contribution to literary theory of cognitive metaphor.

## 2 The King’s Account-books

Most accounts of *King Lear*’s opening scene treat it as a trial or a love-test. Yet curiously the scene lacks elements crucial in any trial: an offence, a judge, advocates, juries, opposing parties. It is no sense an adversarial proceeding. Lear has divided his kingdom before the scene begins.<sup>5</sup> We find none of the legal vocabulary that Shakespeare uses so profusely in the mock trial scene (III.vi.35–83) and elsewhere in those of the sonnets and plays containing unambiguous references to trials.

Rather than a trial, what we have in the first scene of *King Lear* is a semantic frame (in the sense of Fillmore (1982)) that depends upon the structure of a quasi-legal proceeding, the auditing of financial record-books, and a more general scenario of financial accounting (the substantial evidence that Shakespeare was familiar with this subject matter is summarised in Knight 1973: 248). In financial accounting obligations are recorded both to and from the entity keeping the books. Within this scenario, centrally for Lear and less importantly for other characters, the generative metaphor (in the sense of Schön 1979: 264) that controls the scene’s ‘story’ is CHILDREN ARE FINANCIAL ASSETS. Lear understands his daughters in the same way that he understands wealth, real property, assets, and debts. Financial assets are expected to provide a return on capital to their owners (here, their fathers). Hence an important metaphor within this framework is FILIAL LOVE IS INTEREST. Financial assets and organisations are periodically audited to see

whether they are providing an adequate return, and how the return from one asset compares with that from another, so that, if need be, the investment strategy can be revised. Assets that provide better returns can be the objects of further capital investment. Assets that do not perform well are disposed of, and the money provided by the sale is re-deployed to those assets that do perform well.

Although the fundamental principles of financial accounting are the same today as they were in Shakespeare's time, some details are quite different. First, although balance sheets of a kind were kept, they were balanced out only 'when some special circumstances required the formal closing of the books' (Yamey 1949: 106). Second, audits of financial records were oral (indeed, the term 'audit' comes from the Latin *audire*, 'to hear') because when the financial audit in more or less its modern form came into existence in England in the fourteenth century, most of the participants were illiterate. The steward of another's capital recited, or 'spoke' the accounts, in the customary language, and the auditor 'heard' them. Many early account books contain notations such as the following, describing the appointment in 1456 of two auditors for the accounts of the City of Dublin: ... ther schold be from that tym forward two Audytores assignet upon the tresowrerys saud cytte, to hyr har acownt yerly ...'.<sup>6</sup>

The model for financial accounting and auditing with which Shakespeare and his audience probably would have been most familiar, if only by report, was the semi-annual settling of the Crown's accounts with the sheriff of every county for subventions from the Crown to the county and revenue from the county due the Crown. At this proceeding, according to a standard history:

the treasurer representing the Exchequer read from his copy of the Great Pipe Roll [a document amounting to a national ledger] the amount due the crown from the sheriff. The Exchequer attendants placed on the checkered cloth [of the table used for the ceremony] dummy counters representing the amounts due the crown. On the near side of the checkered cloth was the sheriff. As the treasurer called the amounts the sheriff placed in the appropriate columns his tally stick, crown vouchers and money or jewels to balance the dummy counters. This settled the yearly account between the crown and sheriff.

So rich in tradition was this ceremony that it continued from the early Norman period well into the nineteenth century. Even in Shakespeare's time, this event would have been seen not merely as a settling of accounts, but a ceremony in its own right.

Just this ceremony, the hearing, or audit, of state accounts, more satisfactorily explains the curiously ritualistic character of this first major scene of the play. Much of the language crucial to Lear's expression of his 'fast intent' can be simultaneously interpreted in the semantic frames of financial accounting and of statecraft. He wishes to 'divest' himself of rule, of 'interest of territory'. He calls upon his daughters to 'tell' (i.e. count out, as well as relate) which of them 'shall we say doth love us most' so that he may invest<sup>7</sup> more parental love, which the frame asks us to understand as capital investment, according to the return on each of the three investments represented in his daughters. Each daughter is enjoined to 'speak' or 'say'. Lear will listen, or audit, as each speaks her account, and 'extend ... [his] largest bounty' where nature, natural affection, filial love, challenges, lays claim to that bounty (which again has a financial, though not an accounting, sense) with merit, with the greatest deserving. Future investment will balance past performance – as Lear perceives that performance.

Goneril is in no doubt how to demonstrate that ‘merit’. Like her father, she couches the language of her declaration in financial terms. The love she bears her father is ‘dearer’, a word with a financial as well as an affectionate sense; that love is ‘beyond what can be valued’ as more conventional financial assets are appraised; it ‘makes breath poor’. Regan’s accounting is more concrete. She is made, she asserts, of the same ‘metal’ (in Shakespearean usage, normally gold metal) as her sister, and appraises herself equally (‘and prize me at her worth’). But Goneril, Regan claims, ‘comes too short’, an idiom directly from the contemporary language of financial accounting.<sup>8</sup> Regan’s reckoning is even more unrealistically extravagant: she professes to find happiness only in her father’s love.

Underlying all of this, again, is the schema of BALANCE. Lear seeks to balance his ‘bounty’ against the love his daughters say they have for him; his new investment in them must balance the return he has received on his previous investments. Goneril in turn, seeks to demonstrate a highly valued love (in order to receive a highly valued piece of kingdom); Regan values herself at her sister’s worth, but insists that Goneril is short in her accounts. Lear abundantly demonstrates a trait of character to which we will return: an obsession with what Johnson (1987: 95) calls ‘moral mathematics’ – here, the notion that the emotional costs of child-rearing can be quantified, and ought to be balanced by equally quantifiable expressions of love in a verifiable balance sheet of accounts.

Lear’s version of the BALANCE schema forces Cordelia from the start into an unpalatable choice:

Then poor Cordelia!  
And yet not so; since I am sure my love’s  
More ponderous than my tongue.  
(I.i.75–7)

Compared with Regan, who ‘prize[s] [herself] at [Goneril’s] worth’, Cordelia is both pitifully and financially poor – but she immediately rejects the financial metaphor in favour of her own version of the BALANCE schema, in which the spiritual weighs more, is more ponderous (and hence more valuable), than its literal expression. She must mediate between her father’s intense desire for her to express her love in ways that allow him to maintain his account-books of filial devotion, while remaining true to her ‘spiritual’ notion of love. In her very first words in the play, Cordelia shows the relative value she places on feelings and words: ‘What shall Cordelia speak? Love, and be silent’. For her, feelings will always outweigh words; the two can never balance; she refuses to *speak*, a word associated with the financial audit scenario, what is in effect her accounting of filial love and paternal love returned.

Hence when Lear asks Cordelia, who is the object of a financial claim<sup>9</sup> by her two suitors, what she can ‘say to draw<sup>10</sup> / A third more opulent than [her] sisters? Speak’ (I.i.84–5), Cordelia gives the only response possible for one who thus weighs words and feelings. She rejects the notion that a paternal gift should be ‘drawn’ like a salary, a usage current in Shakespeare’s time. All she can *say* – all she can speak – is ‘Nothing’. What counts for her is what she feels, but feelings have no place in financial audits. Understood in terms of the accounting framework that dominates this scene, Cordelia’s famous silence is quite unremarkable. Cordelia’s ‘nothing’ is understood by her father only as a number, as his bewildered response makes clear: ‘Nothing will come of nothing’ (I.i.89).

At this point the process of frame competition begins that undermines Lear's ceremony and results in Cordelia's being disinherited. For the BALANCE schema underlying Lear's scenario of financial accounting, Cordelia seeks to substitute a schema of LINKS. She seeks to redefine her father's understanding of family relationships as items in an accounting balance sheet into an understanding characterised in the generative metaphor FAMILY RELATIONSHIPS ARE LINKS. She begins this process with the polysemous word 'bond', which exists in both competing frames, financial and kinship:

I love your Majesty  
According to my bond; no more nor less.  
(I.i.91–2)

From the beginning, Cordelia makes clear that she understands 'bond' in terms of her father's financial accounting scenario. In Shakespeare's time, a bond, the financial instrument, was what Shylock (*The Merchant of Venice*, I.iii.144) called a 'single bond'. It was a financial or other obligation undertaken solely on the basis of the borrower's credit, without collateral. The obligation memorialised in a single bond is not, in legal language, defeasible (performance of the obligation is the only way the debtor can discharge it; see *Black's Law Dictionary* 1981: 163). One performs under a single bond or one does not. Performance under a single bond is, in two words that come to dominate *King Lear*, all or nothing. For Cordelia, to love her father 'according to [her] bond' is to love him completely; that love can be no more (more complete than complete) nor less (partial) because of the nature of financial single bonds.

But for Cordelia the same all-or-nothing property holds of filial bonds, when this term is defined within the LINKS schema through the metaphor FILIAL RELATIONSHIPS ARE PHYSICAL LINKS. I have sketched out how the same metaphor governs our understanding of phrases like 'family ties' and 'parental bonding'. Lear cannot share the richness of Cordelia's metaphorical understanding, and replies in solely financial terms:

Mend your speech a little,  
Lest you may mar your fortunes.  
(I.i.93–4)

Cordelia's reply partakes once again of both schemata, BALANCE and LINKS:

Good my Lord,  
You have begot me, bred me, lov'd me: I  
Return those duties back as are right fit,  
Obey you, love you, and most honour you.  
Why have my sisters husbands, if they say  
They love you all? Happily, when I shall wed,  
That lord whose hand must take my plight shall carry  
Half my love with him, half my care and duty:  
Sure I shall never marry like my sisters,  
To love my father all.

(I.i.94–103)

Cordelia focuses first on the physical closeness of her filial relationship with Lear, and then relates this closeness to the financial accounting frame with a verb, 'return', that can

be interpreted in both frames. Links are by nature biconditional – A is linked to B if and only if B is linked to A. Within the accounting frame we speak of an investment that ‘returns’ such-and-such per cent. What Cordelia will ‘return’, she characterises as ‘duties’, a term that resonates in both the accounting and the links frames. That ‘return’ is commensurate with both the intensity of filial relationships and the balanced nature of accounts: here the most fundamental of human ties, blood relationships of begetting, breeding, loving, are expressed in the language of the wedding ceremony: obedience, love, and honour (see Rosinger 1974).

Yet the explicitly financial character of the accounting metaphor is still kept in play. For Cordelia, marriage as a bond (a human relationship) involves a ‘plight’ or pledge, another word interpretable within both frames, that necessarily, by the laws of both financial accounting and human development, diminishes the line of credit underlying the ‘bond’ of daughter to father. If a wedded daughter still loves only her father, she has falsely plighted her troth, for she has no credit left for the bond with her husband – and for Cordelia, nothing truly can come from nothing. The protestations of Goneril and Regan that they ‘love [their] father all’ are thus false in the same ways that Cordelia’s is true – within both the accounting and the links scenarios. Lear’s daughters cannot plight the half of their love that their husbands deserve without defaulting upon the bonds calling for them to ‘love [Lear] all’. In both scenarios, Cordelia is ‘So young, my Lord, and true’ (I.i.106): i.e. both truthful, bearing a higher loyalty to her filial bond with her father, and true in the sense of having opposed to her sisters’ false accounts (their ‘bonds’ are simultaneously pledged to two different creditors) her own true reckoning under the obligations of her financial and filial bond. In both senses, Cordelia is her family’s best auditor.<sup>11</sup>

Characteristically, Lear interprets Cordelia’s ‘true’ only within the financial accounting frame: ‘Let it be so; thy truth then be thy dower’ (I.i.107). Likewise, Burgundy expresses in financial terms the bargain he now seeks to strike for Cordelia’s hand:

BURGUNDY	Most royal Majesty
	I crave no more than hath your Highness offer’d
	Nor will you tender <sup>12</sup> less.
LEAR	Right noble Burgundy
	When she was dear to us, we did hold her so
	But now her price is fallen.

(I.i.192–6)

France, however, shares Cordelia’s view that love cannot be understood as a set of accounts. After Lear offers Cordelia to Burgundy one last time, as ‘herself a dowry’, only to have Cordelia point up the irreconcilable conflict between balance and link: ‘Since that respects and fortunes are his [Burgundy’s] love, I shall not be his wife’ (I.i.247–8), France, terming Cordelia ‘unprized’, makes clear that he loves her precisely because she does not fit Lear’s balance-sheet vision, harking back to Regan’s use of ‘prize’ as ‘appraise’:

Fairest Cordelia, that art most rich, being poor;  
 Most choice, forsaken; and most lov’d, despis’d!  
 Thee and thy virtues here I seize upon: ...  
 Not all the dukes of wat’rish Burgundy  
 Can buy this unpriz’d precious maid of me.  
 (I.i.249–51, 257–8)

Thus in this opening scene, Shakespeare embeds the play's major themes in the framing scenario of a financial audit, one that depends on the schema of BALANCE. Lear himself sees statecraft and fatherhood in exclusively abstract, numerical terms; Goneril and Regan give an account of their filial love in language dominated by accounting metaphors that derive from the BALANCE schema<sup>13</sup>; the same metaphors dominate the case pleaded unsuccessfully by Burgundy. Cordelia refutes the balance schema in its own terms; she would substitute an understanding of family relationships as arising from a schema of LINKS. For her, to say 'nothing' does not deny a daughter's love but exalts its inexpressibility; for Lear, 'nothing' is merely a nought, a book-keeping entry.

This word resonates more ambiguously for Lear as the Fool redefines it for him during his visit to Goneril:

KENT This is nothing fool.

FOOL Then 'tis like the breath of an unfee'd lawyer, you gave me nothing for't.

Can you make no use of nothing, Nuncle?

LEAR Why no, boy; nothing can be made out of nothing.

FOOL [to Kent] Prithee tell him, so much the rent of his land comes to: he will not believe a Fool.

(I.iv.126–32)

The linguistically nimble Fool entraps Lear with a specifically financial phrase, and reminds his king of the deeper sense of the 'nothing' he now has. Lear, the great valuer, is now without value, an '0', a zero, 'without a figure' (I.iv.189–90), a king with no kingdom, a father with no daughters, a man with no standing, a cipher without a number to give it value, to whom the Fool applies Lear's own principle of accounting: 'I am better than thou art now: I am a fool, thou art nothing' (I.iv.190–1). The currency in which Lear will repay his older daughters' professions of love comes at a much higher rate of exchange than he anticipated:

FOOL But for all this, thou shalt have as many dolours for thy daughters as thou canst tell in a year.

(II.iv.52–3)

Lear's world is destroyed in the same terms of balance and numbers in which he sought to build it, as Goneril and Regan strip him of the numbers of his retainers:

REGAN

... I have hope

You [Lear] less know how to value her [Goneril's] desert  
Than she to scant her duty ...  
I cannot think my sister in the least  
Would fail her obligation.

(II.iv.135–9)

Goneril and Regan, however, indeed know how to value their father's desert; they know just the issue that will torment him most – the number of his followers. As his daughters reduce his retainers – and with them, his humanity – from the *number* one hundred to the *number* zero, it dawns on Lear that in family relationships, a deal is not necessarily a

deal, irrespective of what the account-books say or what reservations are spelled out in contractual visiting arrangements:

I gave you all –  
 ...  
 Made you my guardians my depositaries,  
 But kept a reservation<sup>14</sup> to be follow'd  
 With such a number.

(II.iv.248, 249–51)

We recall that the Fool has already told Lear that he is ‘an 0 without a figure’; now, Lear begins to realise that the ‘all’ he has given Regan and Goneril is being balanced – if that is the word – by nothing at all (and will come to know that Cordelia’s ‘nothing’ is everything). With his daughters’ final and specifically numerical slashes at his selfhood, ‘What need you five-and-twenty? ten? or five? ... What need one?’ Lear begins to see the human condition as going beyond what ‘moral mathematics’ or the balance sheet will justify:

O! reason not the need; Our basest beggars  
 Are in the poorest thing superfluous:  
 Allow not nature more than nature needs,  
 Man's life is cheap as beast's. Thou art a lady;  
 If only to go warm were gorgeous,  
 Why, nature needs not what thou gorgeous wear'st,  
 Which scarcely keeps thee warm. But, for true need, –  
 You Heavens, give me that patience, patience I need! –

(II.iv.262–9)

Like Cordelia’s use of ‘bond’ in Act I scene i, Lear’s agonised ‘O! reason not the need’ epitomises the competition between the financial accounting and links metaphors crucial to the play’s conceptual structure. Historically, ‘reason’ had as one of its nominal meanings a monetary reckoning.<sup>15</sup> The term ‘need’ bespeaks a link of desperate desire between Lear and ‘th’ name and addition of a king’, represented for *this* king by the number of his retainers, which defines for Lear the nature of kingship beyond what a debit-credit, accounts-book, cost-benefit analysis would show, and represented for human beings by more than the entitlement of their mere physical requirements. For the first time, Lear begins to weigh the links of humanity more than account balances. ‘True need’ cannot be reasoned, accounted for, reckoned up.

### 3 The LINKS Schema

Early in the play, the links-based metaphors involving Lear have to do more with breaking links than with creating them. From his first entrance, Lear sees only the financial side of Cordelia’s rich-languaged assertion of the ‘bond’ between them, and ignores her attempt to couch the father–daughter link in language that he will understand (‘I return those duties back as are right fit’). Instead, Lear both physically and spiritually breaks the filial bond and denies the bonding structures of both ownership and family:

Here I disclaim all my paternal care,  
 Propinquity and property of blood,

And as a stranger to my heart and me  
Hold thee from this for ever.  
(I.i.112–15)

Later, when Goneril begins the process of stripping him of his retainers, Lear seeks to destroy not only the father–daughter link, but the link of common membership in the human race – ‘degenerate bastard’ – and to extend this curse into the next generation, so that Goneril either may have the mother–child link denied her or have the parental link become for her an instrument of exquisite torture. Lear prays that the gods may give his own daughter a ‘child of spleen’ who will be ‘thwart disnatured torment’ to her, yet linked to her by the very constitutive linking structures that she has denied her father: nature, honour, pains and benefits, and thanks.

This severing of links is carried even further in Act II: Lear threatens to deny the bond of marriage with Regan’s mother and thus his bond of fatherhood to Regan, and turns this destruction of human bonds upon himself. Lear converts his physical links of flesh and blood to Goneril to highly particularised, loathsome diseases of that same flesh and blood. The bonds that link Lear with Goneril now are only those of ‘disease’, ‘plague’, and ‘corrupted blood’ (II.iv.220, 222, 223). Finally, in the midst of the storm, Lear would shatter the links that hold together the world, the bonds of nature and the human race, the very ‘germaine’ or gene-pool of life itself. He stands alone, ‘the pattern of all patience’, divested of links of any kind, to his daughters, to his household, to his kingdom, to the elements of the created world. Lear does not ‘tax [the] elements with unkindness’ (III.ii.16) because they are not of Lear’s kind, they are not linked to him as his daughters should be, by gratitude, by blood, by the duty of subjects to their king.

As Lear’s reintegration with the human condition begins, we likewise understand that reintegration through the schema of LINKS. As the nature of the metaphors based upon that schema begins to change, Lear first identifies himself with the Fool through shared physical needs of warmth and safety, and sees himself as linked to the Fool in suffering and sympathy:

Come on, my boy. How dost, my boy? Art cold?  
I am cold myself. Where is this straw, my fellow?  
The art of our necessities is strange,  
And can make vile things precious. Come, your hovel.  
Poor Fool and knave, I have one part in my heart  
That’s sorry yet for thee.

(III.ii.68–73)

Lear demonstrates this same pattern – from physical sensation to mental feeling, from concrete to abstract, from his own physical suffering to a spiritual empathy with the suffering of another – as he begins to reverse the operative definition of kingship that has so far dominated the play: a status in which the links between a king and his subjects (and a father and his daughters) are constituted by the abstractions of courtly ceremony, of debits and credits. Lear seeks the ground of human community and kingship in the concrete links of shared physical suffering in the storm, between his nakedness and his subjects’ ‘loop’d and window’d raggedness’ (III.iv.31), between man and man, and between a King and his subjects. When he strips off his garments in the play’s climactic scene and stands naked against the elements, he is clothed in his solidarity with the

physical nakedness of Tom o'Bedlam, linked to him in spiritual nakedness and vulnerability of 'unaccommodated man' before the random cruelties of the gods.

The progression is crucial. When Lear's understanding of the world in terms of the empty abstractions of the balance sheet and kingly ceremony fails him, he progressively denies first the abstract and then the physical links of fatherhood, his own marriage, his ungrateful daughters' legitimacy, their humanity and their progeny, and finally the linking structures of the created world and the human species. He then re-cognises and rebuilds his place in that world in terms of these links, bonding himself first with physical feeling (cold), then with spiritual feeling (empathy), then with individuals (the Fool), then with the rags and hunger of his kingdom's subjects ('the poor naked wretches' with 'houseless heads and unfed sides' (III.iv.28, 30)), and finally with the irreducibly human, unaccommodated, primal human condition figured in Mad Tom. This condition and bond are epitomised in Lear's 'We came crying hither' and in that 'very foolish fond old man' of Act IV, linked to Cordelia now in human mortality and imperfection.

#### **4 On Description and Explanation**

Few of the critical analyses in the foregoing are startling; indeed, Lear's restoration to humanity is an important part of any discussion of the play. Some of the financial language in *King Lear* (although not its critical significance) has been described before, as have the play's larger structural entities and the relationships between them. But to describe the play's financial language is merely that: description. What I would claim for this article as an analysis from the standpoint of cognitive metaphor is that this theory enables us not merely to describe, but to *explain* patterns of this kind, and to explain them and their interconnections at different structural levels of the play using the same theoretical apparatus. The analyses produced by a cognitive-metaphoric approach are, moreover, better grounded than earlier purely critical work.

As to the first of these assertions, cognitive metaphor proceeds on the hypothesis that '... metaphor is not just a matter of language, but of thought and reason' (Lakoff 1993: 13). The same concept, or 'activated pattern inhering in thought' (Turner 1991: 45), underlies both the dozens of examples in *King Lear* of metaphors of financial accounting that instantiate the BALANCE schema and many larger structures in the play. These would include, by way of example, the Gloucester–Edmund–Edgar subplot balanced against the main plot, and the play's balanced sets of characters: the 'unnatural' children – Edmund on one side, Goneril and Regan on the other; the rejected, despised, and then redeemed fathers – Gloucester and Lear; the 'natural' children – Edgar and Cordelia; and the good and bad servants – the Fool and Oswald. The connection between these entities and the balance-based metaphors in the text is not accidental, fortuitous, or the product of what Fish (1980: 251) criticises as responsive only to 'the pressure of the question "how do they relate?" and a relation will always be found'. The connection results from the same process, metaphoric projection from the BALANCE schema, into many distinct domains of the play: into the abstractions of Lear's idea of paternal love, and the ways in which his daughters' responses play into and resist it; into the abstractions of plot-construction, character relations, and narrative sequence; into psychological and social settings, and into many other structural elements (for discussion of these elements and cognitive-metaphoric analysis, see Wye 1992 chapters 3 and 4).

The second part of my claim for cognitive metaphor is perhaps more important. The metaphoric impulse is grounded not in intellectual abstractions but in the body that

is in the mind. Because cognitive-metaphoric analysis proceeds from the elements and structure of schematised bodily experience to their projection into such abstractions as (for *King Lear*) family relationships and parental and filial love, these analytical claims can be confirmed or disconfirmed according to the accuracy with which those elements and structure and their projection are articulated. The same falsifiability applies, *mutatis mutandis*, to claims made for metaphoric projection into larger abstract structural units. In short, this analysis can be falsified if its topological analysis proves to be wrong. It can be invalidated if the patterns it posits exist only at the level of text and not in larger structural units, or if a competing candidate source domain and metaphoric projection better explains these patterns at all levels of the literary work.<sup>16</sup>

On this second point, we can, for example, trace a pattern of textual metaphors in *King Lear* that depend on the core metaphor LIFE IS A JOURNEY, which is based on the PATH schema: ‘we came crying hither’ (IV.vi.176); ‘I have no way, and therefore want no eyes; I stumbled when I saw’ (IV.i.18–19); ‘she’s [Cordelia] gone for ever … Thou’lt come no more’ (V.iii.258, 306), and many others. But very little connects this pattern of metaphoric projection in the text with larger structural elements in the play. The PATH schema entails such salient aspects as starting and terminal points and a sequence of locations that connect the beginning and the end (for discussion, see Johnson 1987: 113–17). The lives of all of *King Lear*’s major characters have terminal points: most of them die. But we see little of the source points of these paths, the beginning of these journeys. A contrasting example, *Macbeth*, is not only replete with textual metaphors based on the PATH schema, but the LIFE IS A JOURNEY metaphoric projection dominates the play’s plot and characters (the extreme case is Macduff, who begins the journey of his life by an alternate route to the conventional birth canal – for discussion, see D.C. Freeman forthcoming). Thus for *King Lear* we can make a principled argument for two candidate source domains, BALANCE and LINKS (they exist independently and the play manifests both a pattern of projections from them at the textual level and an equally rich pattern of the same projections at different levels) and against a third, the PATH (the play manifests a pattern of projections from it at the same level, but few if any at different levels), as the defining ‘conceptual universe’ (M.H. Freeman forthcoming) of the play.

Of course the choice of dominant source domains and hence of the abstract entities into which they are projected is interpretive, even if we grant the currently all-encompassing sense of that term (see Fish 1989: 320). These choices can change over time: for me, they have changed in 35 years of watching, reading and teaching *King Lear* from the SCALE schema (‘Thy life’s a miracle. Speak yet again … Do but look up’ [IV.vi.55, 59], and ‘The worst is not / So long as we can say “This is the worst”’ [IV.i.27–8], both instances of the orientational metaphors GOOD IS UP, BAD IS DOWN) to the PATH schema (in particular, the LIFE IS A JOURNEY metaphor), instantiated in the lines cited above. These changes arise from autobiography, from deepening insight, from changing views that arise from many causes. I have ‘re-cognised’ *King Lear* several times, and I probably will do so again. But these progressive acts of ‘interpretation’, acts of choice, are far from being unconstrained. My choice of source domains is limited to those that are independently motivated. BALANCE, LINKS, PATH, and SCALE all lead richly documented lives as image-schemata underlying similar source domains outside *King Lear*. My choice of target domains into which a candidate source domain is projected must be consistent in form with that source domain (the source domain for ‘I love you according to my bond’ cannot arise from a CONTAINER schema because we do not conceive of ‘bond’ as having the shape of a container).

On the theory of cognitive metaphor, both my changed ‘interpretations’ over time and the very different ‘interpretive’ choices that might be made within a different interpretive community from mine are situated in the body and in bodily experience. Interpretations that depend on evidence from cognitive-metaphoric analysis are constrained both by that experience and by the requirement that the topology of that schematised experience in a metaphoric source domain be mapped into the topology of the target domain. The relative validity of particular source domains and metaphoric projection can be assessed with reference to their independent motivation and internal consistency. Of course there is no one valid God’s-eye interpretation of a literary work, whether the evidence for such a claim arises from cognitive metaphor or anything else. But there is a range of plausible interpretations and a scale of valid ones. Cognitive metaphor constrains the interpretive community to the body of the embodied imagination.

## Notes

- 1 Research for this article was conducted at the Institute of Cognitive Studies, University of California, Berkeley, while I was on sabbatical leave from the University of Southern California. I am grateful to both institutions for their support of this work, part of a longer study of cognitive metaphor in Shakespeare’s major plays. Quotations from *King Lear* are taken from the Arden Shakespeare edition of the play (Muir 1985).
- 2 The body of recent literature on metaphor is enormous. A brief summary of this field as of a decade ago may be found in Levinson (1983: 147–62). An unsurprisingly partisan account of more recent work may be found in Lakoff forthcoming.
- 3 The play’s financial language was noted as long ago as 1928 by Fr. Gundolf (*Shakespeare, Sein Wesen und Werk*), cited in Clemen (1951: 135), and most recently and felicitously in Colie (1974: 185–219). But these studies fail to capture two systematic relationships: first, between that language’s source domain in financial accounting and the schema of BALANCE; second, between this source domain and the schema of LINKS.
- 4 Throughout what follows I use the term ‘scenario’ for what cognitive grammarians usually call a ‘frame’ or ‘cognitive model’ or ‘idealised cognitive model’, a way of understanding a concept or scene that structures our thinking about it.
- 5 Frost (1958) perceives that predictable outcomes such as the already determined awards of territory are the nature of rituals like this scene. Cordelia thus not only disrupts the ritual but, more seriously, disrupts the participants’ (and the audience’s) settled expectation of its outcome.
- 6 Reported in Brown (1905: 78).
- 7 Lear is to use precisely this word to describe his actions to Cornwall and Albany after he has disinherited Cordelia:

I do invest you jointly with my power,  
Pre-eminence, and all the large effects  
That troop with majesty.

(I.i.129–31)

- 8 See *OED*. s.v. short, III.C.8.c., 1579: ‘They will all come to short in their reckoning.’
- 9 Cordelia is one

to whose young love  
The vines of France and milk of Burgundy  
Strive to be interess’d;

(I.i.82–4)

'Interested' is glossed in the *OED* (1) as 'To have a right or share.' It is cognate with a noun that captures the modern sense of 'interest' as 'legal concern.'

- 10 A word that in Shakespeare's time also collocated with 'payment' or 'salary', just as it does today; this passage is cited in *OED* (B.I.45) for the 'payment' sense.
- 11 But she remains her father's daughter. When Cordelia wields executive authority late in the play she displays some of Lear's bad habits. To any of her retainers who will help the mad Lear she offers 'all [her] outward worth', (IV.iv.10) when by the link of service they should help their mistress's father (who remains, in Cordelia's view, their king as well) gratis. She seeks to balance Kent's service to her with good works of her own, a world-view he rejects with dignified irony:

CORDELIA O thou good Kent! how shall I live and work  
 To match thy goodness? My life will be too short  
 And every measure fail me.  
 KENT To be acknowledg'd, Madam, is o'er-paid.  
 (IV.vii.1–4)

- 12 A specifically financial sense, meaning in Shakespeare's time as well as ours 'to offer (money, etc.) in discharge of a debt or liability, especially in exact fulfilment of the requirements of the law and of the obligation'. *OED*. s.v. tender, v, 1.
- 13 They pledge to Lear as consideration for their inheritances a bond that Cordelia demonstrates is already half-encumbered. Cordelia's 'audit' of Lear's balance sheet demonstrates that his assets are subject to an old adage of financial audits: the troubles are usually found in the receivables.
- 14 A term in English property law conferring a residual right in land, such as an easement, that can have a monetary value (*Black's Law Dictionary* 1981: 1175).
- 15 *OED* 2c. The only citations are late fourteenth century. The same sense is not recorded for the verb, but the functional shift, from noun to verb, is one of the most general in English.
- 16 I am often taxed on this point with being 'totalising' or 'essentialist'. Guilty as charged. I take these terms to mean 'general, ignoring particulars that do not fit the theory.' Noam Chomsky's early work in linguistic theory is often held up to me as an example of this 'fault' (e.g. Chomsky 1957; I blush at the comparison), where he focuses on syntax and gives short shrift to semantics and pragmatics. Chomsky took the strongest position consistent with the reliable facts that he had. Subsequent research produced more, and more reliable, facts, better theoretical accounts of areas of linguistic structure that his early work ignored, etc. But the theory of government and binding, a more recent incarnation (see Chomsky 1981), bears a recognisable resemblance to its 1957 ancestor, as does a libraryful of books and articles produced in the intervening three decades. None of these developments would have been possible, in my view, had not Chomsky been an unrepentant 'totaliser' from the start. Any theory of anything worth anything begins as totalising, essentialist, and universalist, and progressively qualifies its claims as research proceeds. Among the many problems of contemporary literary 'theory' is that in seeking to keep in play exceptions and purported anomalies it explains nothing, and is less 'theory' than 'general talk'.

# CHAPTER 10

## Theory in Practice *Skinned: Taxidermy and Pedophilia in Munro's "Vandals"*

*Carrie Dawson*

Alice Munro, one of the most complex of modern writers, manages in her story "Vandals," according to Carrie Dawson, to complicate our understanding of the boundary between culture and nature. Children with memories of pedophile assault recall their experiences being abused by a taxidermist and ultimately take revenge. Munro uses the metaphor of the stuffed animal to think about how humans abuse nature – both human and ambient physical. Carrie Dawson teaches English at Dalhousie University, where she is editor of *The Dalhousie Review*. She works on literary representations of migration and citizenship.

*Nature hides.*  
– Heraclitus

Taxidermy is a narrative art. Whether the animal's body is part of a diorama containing an overabundance of figures arranged to suggest interspecies communion, or whether its glass eyes gaze directly out of a head hanging on a rumpus room wall, taxidermy tells a story about human-animal interactions. But a taxidermic diorama can also tell a different kind of story. In Alice Munro's "Vandals," a taxidermic display arranged to present a narrative about the innocence of nature in fact reveals another, more disturbing one. Because the strangely denatured taxidermic diorama in "Vandals" features idealized displays of animal life that are predicated on the slaughtering, skinning, and stuffing of their animal subjects but are nevertheless received as icons of the natural, it emphasizes our tendency to see nature as a "naïve reality" that is self-evident and not in need of explanation.<sup>1</sup> The perception of the outdoor diorama as a haven of intra- and interspecies communion works to disguise both the violence on which it is premised and the violence that takes place on its

*Original publication details:* Carrie Dawson, "Skinned: Taxidermy and Pedophilia in Alice Munro's "Vandals." *Canadian Literature* 184, pp. 69–83. University of British Columbia Press, 2015. Reprinted with permission from Canadian Literature.

grounds; the diorama reminds us of the consequences of failing to scrutinize the “natural.” Thus, the diorama, as a simulation of a natural environment, provides fertile ground in which to explore the willing self-deception at the centre of this complex, chilling story.

“Vandals” opens with a letter that Bea Doud composes to Liza, the young woman whom she remembers as one of two “pretty sunburned children” who grew up across the street from “Dismal,” the property that Bea shared with her recently deceased partner, Ladner (305). Bea means to thank Liza for checking on the property while Bea cared for Ladner in the hospital, but the letter never gets sent. Instead, Bea retreats into a period of slightly drunken musing that provides the material for much of the first part of the story. Among other things, Bea remembers the second time she visited Ladner at Dismal: “I expect you’d like a tour,’ Ladner said” (316), before leading her on a strenuous walk along the trails criss-crossing the property, Bea recalls that “[s]he couldn’t keep track of their direction or get any idea of the layout of the property” (317), but it soon becomes evident that the heavy foliage is not the only cause of her confusion. Bea sees live animals moving among “stuffed and lifelike” ones (317): for example, mating swans let out “bitter squawks” beside “a glass-fronted case containing a stuffed golden eagle with its wings spread, a gray owl, and a snow owl” (316), and real birds flit in and out of a group of stuffed birds that are positioned beside signs inscribed with “tight, accurate, complicated information” about their habitats, food preferences, and Latin names (317).

The stuffed animals belong to indigenous species, so Ladner’s carefully crafted taxidermic garden could be construed as a simulacrum of the Ontario countryside in which it is located. The presence of a fridge, detailed signs, and inert, reconstructed animals in a garden that also contains living ones seems to create a dialectical context for thinking about the relations between nature and culture, and between the natural and the simulated. But Ladner’s garden deflects this line of questioning that it seems to invite. In addition to the species identification signs, Ladner has posted quotations in his garden:

Nature does nothing uselessly.

— Aristotle

Nature never deceives us; it is always we who deceive ourselves.

— Rousseau (317)

On one hand, the signs direct visitors to see nature in general and this garden in particular as a sanctuary from human pomp and pretense, a haven from deceit. On the other hand, the “stuffed and lifelike” animal bodies encourage visitors to suspend disbelief and thus deceive themselves. But Bea appears not to see this contradiction. Although she remembers the scene in front of her as “complicated,” Bea perceives the taxidermic specimens as frozen in mid-motion – “a wolf stood poised to howl, and a black bear had just managed to lift its big soft head” (317) – suggesting her willingness to partake of the fantasy established by the diorama. Given that the story is also concerned with Bea’s refusal to admit – to others and, perhaps, even to herself – that Ladner was a pedophile, his diorama functions as a symbol of the often complex relationships between ways of knowing and of not knowing, of preserving disbelief in the face of knowledge too horrible to contemplate.

James Kincaid argues that “what passes for knowledge” about pedophilia “is really ‘knowingness’, a pact that authorizes us to treat our ignorance as wisdom and to make that ignorance the basis for action” (3). To the best of my knowledge, Munro has not explicitly addressed the particular challenges of writing about pedophilia, but her

characterization of *Open Secrets* (the collection in which "Vandals" appears), suggests a shared interest in the dynamic that Kincaid calls knowingness: it is, she says, an attempt to "challenge what people want to know. Or expect to know. Or anticipate knowing" ("National Treasure" 227). In "Vandals," Munro uses the contradictions and violence inherent in the taxidermic garden to "challenge what people want to know" about pedophilia.

In *Child Loving: The Erotic Child and Victorian Culture*, Kincaid emphasizes the extent to which Victorian and, to a lesser extent, contemporary constructions of pedophiles have been used to shore up dominant ideals of the natural. If pedophiles are perverse animals who violate the order of nature, then the "rest of us" can be civilized, socialized, and controlled. Kincaid's idea of the natural is understandably restricted to the historical dissociation of child and adult, asexuality and sexuality, innocence and experience. Munro also addresses this dissociation, but she does so by using "nature" – in the commonplace sense of the great outdoors – to make us examine the "natural" in the context of human behaviour. Put differently, Munro uses the events that take place in Ladner's garden to demonstrate the consequences of our failure to scrutinize the "natural." The "shame in the grass" (341) at Dismal goes undetected or at least unreported, in part because it is disguised by its setting and by the perception of its setting. When, for example, Ladner takes Bea on her first tour of Dismal, Bea, who is wearing high heels and nursing a vague plan to seduce him, thinks, "this tour, so strenuous physically and mentally, might be a joke on her, a punishment for being, after all, such a tiresome vamp and a fraud" (318). Whether or not Ladner intends the tour as a rebuke, Bea believes that the time spent in the bush is designed to be corrective. While Bea's response to the tour draws on a long-standing discourse about nature as the source of health and purity and as a model for social relations, nature does not – as she later recognizes – work this way at Dismal. Bea notes that the physical exertion of the hike has caused her lust to evaporate. However, Munro subtly suggests that Bea's sexual energy is not lost at all, but redirected onto the nonhuman world: "By this time lust was lost to her altogether, though the smell of the hawthorn blossoms seemed to her an intimate one, musty or yeasty" (318). Thus at the same time that Bea figures the nonhuman world as a haven from or curative for human deceit and desire, Munro shows that we experience and represent that nonhuman world – in this case, the hawthorn blossoms – through our own human predilections.

As a taxidermist, Ladner is skilled in the art of deception. But because taxidermy is such a realistic art form it has, as Donna Haraway argues, been traditionally understood to be peculiarly "capable of embodying truth" in the bodies of its lifelike subjects ("Teddy Bear" 254). In a discussion of Carl Akeley's contribution to the field of taxidermy, Haraway explains the relationship between taxidermy and truth-telling;

Taxidermy became the art most suited to the epistemological and aesthetic stance of realism. The power of this stance is in its magical effects: what is so painfully constructed appears effortlessly, spontaneously found, discovered, simply there if one will look. Realism does not appear to be a point of view, but appears as a 'peephole into the jungle' where peace may be witnessed. ("Teddy Bear" 254)

Ladner's attempt to "tell the truth of nature" (257) with his taxidermic garden is, of course, enhanced by the outdoor setting. And because the garden purports to "tell the truth of nature," it disguises the violations that take place on its grounds: where the truth is "effortlessly, spontaneously found," one need not look very hard.

Given Munro's stated desire in *Open Secrets* to "challenge what people want to know" and "to record how women adapt to protect men" ("A National Treasure" 227), we can assume that "Vandals" is centrally concerned with the question or possibility of what Bea knows. The assumption that Bea does know what goes on in the garden is supported by Liza's expectation that "Bea could spread safety, if she wanted to" (343). When, for example, Liza finds Bea sitting contentedly under a plum tree drinking wine with Ladner shortly after Liza has witnessed him contemptuously mimicking Bea, she thinks that Bea had "forgiven Ladner, after all, or made a bargain not to remember" (343). It seems that the incident for which Ladner is ostensibly forgiven is his imitation of Bea, but maybe Bea has agreed to forgive and forget a great deal more. Similarly, Bea's characterization of herself as a "fake" whose voice is memorable for its "artificiality" (337, 336), combined with her suggestion that she has come to terms with "what [Ladner] would say and wouldn't say" (320), intimates that she may indeed know more than she is willing or able to say.<sup>2</sup> In "Carried Away," another story in *Open Secrets*, Bea acknowledges her tendency to edit or selectively "forget" the truth where "it would have made the story less amusing" (29).

Bea's "knowingness" is encoded in her references to nature (in all the many senses of the word). For example, on the topic of self-deception, Bea thinks, "such was not her nature. Even after years of good behavior, it was not her nature" (313). In the context of a story in which the nonhuman world is denaturalized and rendered deceptive by a taxidermic diorama, Bea's repetition of "nature," combined with the repeated evidence that she might well be given to self-deception, suggests her inclination to use the ostensibly self-evident "natural" to justify her self-deception. In an attempt to characterize Ladner's brusque and heavily ironic manner of treating her, Bea describes herself as "*slit top to bottom with jokes*" (315). This image aligns Bea with the animals whose skins have been slit; it also indicates Ladner's capacity for violence. Moreover "slit," a derogatory term for female genitalia, might also suggest that sex and violence are linked in Bea's mind.

The connection between Bea's apparent naivete and her invocation of the natural world is also evident in her metaphorical connection of teenagers and "savage beasts." In the letter that Bea writes to Liza, she thanks Liza for boarding up the windows of her home, and thus protecting the house from "savage beasts," which, as a subsequent comment makes clear, means teenagers. The house is in fact raided by people in their late teens or early twenties: Liza and her husband Warren. When Liza returns to Dismal at Bea's bidding, she does not check the pipes as asked. Instead, she goes on a rampage, breaking furniture and glass, and throwing stuffed animal specimens to the floor. As she prepares to leave, Warren reminds her that they need to smash a hole in a window – "Big enough so a kid could get in" (344) – so that Bea will not know that the vandals were key-holders. After breaking the window, Warren nails a board over the smashed pane, saying, "Otherwise animals could get in" (344). That Bea's allusion to teenagers as beasts so closely resembles Warren's comment suggests that she knows what happened at the house, even though the tone and content of the letter do not reveal this. Bea's comment that the vandalized house "looked natural" and that it "seemed almost the right way for things to be" (306) can be read as her tacit recognition of the violence that has taken place just outside its doors.

William Cronon argues that "the time has come to rethink wilderness," to rethink our conception of wilderness as an "antidote to our human selves" and "the one place we can turn to escape from our own too-muchness" ("Trouble" 69). Munro makes a similar argument in "Vandals." Both authors suggest that our tendency to see the nonhuman world as "an antidote to our human selves" means that we fail to

see "our own unexamined longings and desires" reflected there (Cronon, "Trouble" 70). We may also fail to see our deepest fears. Bea's many references to "nature" seem premised on a belief that the nonhuman world is the site or repository of authenticity and truth. This view inhibits Bea from looking more closely at what went on in the garden. If she had looked more closely, she might have been able to meet Liza's expectation that she would "spread safety" at Dismal (343).

If pedophilia is an "open secret" in "Vandals," it is the taxidermic diorama that makes it so. Although Ladner's garden – like so many taxidermic displays – sets out to celebrate individual communion with nature, what the mute and inert animal bodies demonstrate is the painfully reconstructed nature of the scene. The taxidermic display can be read as a story about the violation and manipulation of bodies, and about man's domination of nature. In "Vandals," the taxidermist's aesthetic arrangement of bodies and his choice of ideal(ized) specimens, frozen in a state of arrested development, hints at a very particular kind of bodily violation.<sup>3</sup> In the second half of the story, Liza remembers what happened while she was swimming in the pond at Dismal. Ladner attempted to grab her between her legs, and she escaped his clutches by clambering through the diorama: "She splashed her way out and heavily climbed the bank. She passed the owls and the eagle staring from behind the glass. The 'Nature does nothing uselessly' sign" (338). Liza is unable to articulate the trauma of Ladner's assault, but her position among the animals is telling. The image of the violated girl child among the dead birds recalls the myth of Philomela, the rape victim turned tongue-tied bird. Because Liza is seen against the backdrop of the diorama but does not appear to look at any of the birds, she does not exercise the transcendence implied by the taxidermic gaze; she is not constituted as a viewer of displayed animal bodies but is implicitly compared to the birds, whose silent and violated bodies are on display.

While Ladner's diorama tells the story of pedophilia, it is difficult to interpret because the heavily forested landscape at Dismal is, as both Bea and Liza acknowledge, confusing and difficult to read.<sup>4</sup> But readerly difficulty also arises at Dismal because meaning in Ladner's taxidermic garden is very unstable and changes according to his whim. For instance, Liza recalls the time when she first showed Bea the initials "P.D.P." carved into a tree:

In the middle of the path was a beech tree you had to go around, and there were initials carved in the smooth bark. One "L" for Ladner, another for Liza, a "K" for Kenny. A foot or so below were the letters "P.D.P." When Liza had first shown Bea the initials, Kenny had banged his fist against P.D.P. "Pull down pants!" he shouted, hopping up and down. Ladner gave him a serious pretend-rap on the head. "Proceed down path," he said, and pointed out the arrow scratched in the bark, curving around the trunk. "Pay no attention to the dirty-minded juveniles," he said to Bea. (338)

Given that the children are sexually abused in the garden, we can assume that Kenny has been led to believe that "P.D.P." sometimes does mean, "Pull down pants." This reading is also suggested by the context in which the phrase "P.D.P." subsequently appears:

Here are the places of serious instruction where Ladner taught them how to tell a hickory tree from a butternut.... And places where Liza thinks there is a bruise on the ground, a tickling and shame in the grass.

P.D.P.  
Squeegey-boy.  
Rub a dub-dub. (341)

The message carved into the tree shows Ladner's ability to make meanings shift according to his desires, and his garden demonstrates his desire to control his surroundings. In an essay about Scottish poet Ian Hamilton Finlay's garden, Susan Stewart argues that “[I]n making a garden one composes with living things, intervening in and contextualising, and thus changing, their form.... The garden is thereby linked to other means of ordering life: codifying and ritualizing social time and space, creating political orders and social hierarchies” (111). Because Ladner's garden is composed, in part, of dead things, it “orders” life not by ritualizing time, but by freezing it in an image of “taxidermic timelessness” (Simpson 94).<sup>5</sup> And, because Ladner is ultimately powerless to prevent the growth and eventual departure of the children, his taxidermic garden can be understood as an attempt to preserve a fantasy of intra- as well as inter-species control and communion. It should not be surprising, then, that the animals in Ladner's “remarkable sort of nature preserve” (311) are arranged in groups that tell a nostalgic story about man's God-given dominion over nature and about Edenic unity and plenitude. For example, the careful arrangement of a “dainty family of skunks” simulates a congenial community, and, in an image reminiscent of the lion lying down with the lamb, a porcupine is positioned beside a fisher, which, says Ladner, “was intrepid enough to kill porcupines” (317).

There is a long tradition of taxidermists who have attempted to recreate a Canadian Eden. As George Colpitts demonstrates, taxidermists played an important part in producing images of Edenic natural abundance that were used to attract immigrants between 1890 and 1914. Wildlife specimens were installed in provincial and municipal natural history museums across the country, and they were also sent to international exhibitions in the USA and Europe. For example, the federal superintendent of immigration shipped crates of birds and a large buffalo to various European offices as evidence of “what could be got in Canada” (qtd. in Colpitts 106). And yet, given the fate that befell the Canadian buffalo in the last decades of the nineteenth century, the buffalo was an ironic but not inappropriate choice for a symbol of Canadian wildlife: as Colpitts points out, the taxidermic images of Canadian over-abundance belied the fact that Western Canadians had faced a meat crisis and general food shortages as recently as the mid-1870s.

Colpitts's argument identifies antecedents for Ladner's efforts to recreate Eden in spite of the evidence that “should have countered” the formation of that image of Canada (Colpitts 113). But it is Robert Lecker's reading of another story in *Open Secrets* that is most useful in demonstrating the perversity of Ladner's nostalgic garden of Dismal. Drawing extensively on Leo Marx's *Machine in the Garden: Technology and the Pastoral Ideal in America*, Lecker argues that “Carried Away” documents the “postwar, postindustrial fall that is identified with the commodification of all forms of human activity” and with the perceived “loss of nature” (103). Although “Carried Away” is centrally concerned with the postwar loss of a sense of community and an unspoiled rural landscape, the dream of what Leo Marx calls an “undefiled green republic” (qtd. in Lecker 104) still exists in the character of Patrick Agnew, a gardener who spends his free time in the countryside and who fishes for his supper or dines on the fruit of wild apple trees. But some fifty years later,<sup>6</sup> the over-abundance of animals, the happy juxtaposition of enemy species, and the implicit communion between man and animal in the garden of Dismal constitute a perversion of the “vanishing pastoral ideal” represented by Patrick Agnew. In the “green republic” of Dismal, neither the land nor its inhabitants are “undefiled”: children are raped; animals are perceived as commodities that bring “a good price”; and the ground itself is “bruise[d]” and “shame[d]” (341).

Ladner's idea of Dismal as a prelapsarian and, by implication, pre-industrial landscape is also deeply ironic because the garden itself is full of thinly veiled manufactured things.

Ladner fitted the skin around a body in which nothing was real. A bird's body could be all of one piece, carved of wood, but an animal's larger body was a wonderful construction of wires and burlap and glue and mashed-up paper and clay. (334)

Drawing on Donna Haraway's argument about the enduring dualism that pervades discussions of nature and culture, it might be said that Munro represents the "stuffed and lifelike" animals as cyborgs, "beings that are simultaneously animal and machine who populate worlds ambiguously natural and crafted" (*Simians* 149). Because a "cyborg body is not innocent" and "was not born in a garden" (*Simians* 180), its presence constitutes a reminder of the extent to which nature is imagined as the absence of and antidote to technology. Ladner employs the cyborg-animals to affirm a vision of nature and technology as separate. But Munro ensures that we see how human beings inevitably construct the nonhuman world in their own image: whether or not our construction of our natural environment involves "wires and burlap and glue and mashed-up paper and clay," it is, she suggests, a construction nevertheless.

Presented in the context of a narrative about an altogether different kind of assault on bodily integrity, and added to the image of Ladner scraping animal skulls and skins, Munro's ironically rendered image of the taxidermic specimens as "wonderful constructions" repudiates Ladner's nostalgic rendering of a thoroughly pastoral, prelapsarian Dismal.<sup>7</sup> At the same time, it also repudiates an enduring tendency to see animal bodies as self-evident and utterly literal. Jane Desmond points out the particular symbolic power of animal bodies:

Animals' identities as authentic representatives of the natural are ultimately presumed to reside in their bodies, in their physical difference from humans. Their division from us articulates the Cartesian and Christian mind-body or body-spirit split. Even when these conceptual boundaries are smudged, animals are seen as fundamentally more embodied than humans, that is, as more determined by their bodily aspects. (149)

If, on the one hand, the taxidermic garden encourages this view of animal bodies by presenting animals as "aestheticized bodies" whose "stasis ... heightens their objectness and allows for [the] leisurely contemplation of discrete bodily details" and the affirmation of bodily difference (Desmond 149–50), Munro's emphasis on scraped skins, "guts that looked like plastic tubing," and eyeballs "squished ... to jelly" (334) demands a meditation on the processes by which that "objectness" is established and, more importantly, on the ends it serves.

In *Picturing the Beast: Animals, Identity, and Representation*, Steve Baker argues that the animal body needs to be taken out of nature and "rendered unstable as a sign" in order that we might understand what it is that we have invested in the animal and what is occluded in our tendency to rely unthinkingly on animals as a prime symbolic site (223). Munro advances a similar view by emphasizing how Ladner has made the animals in his garden. Animal bodies are also destabilized in "Vandals" through the use of animal imagery to describe the human characters. When, for example, Bea arrives at Dismal and asks Liza and her brother, Kenny, "what kind of animals they'd like to be" (332),

she reminds the reader of the extent to which they are ready to become animal victims like those whose “skinned bodies” are manipulated by Ladner (334). The connection between the children’s bodies and the animals’ bodies is reinforced in a number of other passages: Liza “cluck[s]” and makes “croaking noises” (326, 332); she is possessed by a “slithery spirit” (328); and she claims to have been “wild” as a child (329). Given the sexual abuse perpetrated in the garden, Liza’s father’s warning that she “better not cross [Ladner] or he’ll skin you alive.... [I]ike he does with his other stuff” (334), further aligns her with the animals. She and Kenny quickly learn “not to talk so much about all [they] knew” (335); they are silent like the animal specimens. But the equation of the violated children with the stuffed animals is complicated by Munro’s description of Ladner in animal images. When Bea first meets Ladner, she mistakenly thinks that he is accompanied by a fierce dog, but later decides that he is “his own fierce dog” (312). As an adult, Liza remembers a time when Ladner raped her and then “collapsed heavily, like the pelt of an animal flung loose from its flesh and bones” (341): as he collected himself, he “clucked his tongue faintly, and his eyes shone out of ambush, hard and round as the animals’ glass eyes” (342). Although Munro repeatedly invites the reader to compare Ladner’s treatment of childish bodies with his treatment of the animals he stuffs, the fact that Ladner is also likened to an animal ultimately prevents easy correlations. Moreover, by comparing Ladner to a taxidermic animal (“glass eyes” and a disconnected “pelt”), perhaps Munro is also pointing to the tendency to figure pedophiles as animals: if Ladner is an animal, he is one that is painstakingly constructed as such by humans.

James Kincaid argues that the steadfast reluctance to talk about childhood sexuality allows pedophilia to flourish.<sup>8</sup> He goes on to suggest that the contemporary disavowal of childhood sexuality is a hangover from the Romantic era, when a wide range of poets, prose writers, and philosophers constructed the innocent child in nature as an ideal with which to counter the grim reality of the working conditions of child labourers during the Industrial Revolution. Although William Cronon does not address the implications of longstanding ideas about the child in nature, his general discussion of discourses of nature helps to explain how an appeal to “the natural” can deflect critical discussions of childhood sexuality:

The great attraction of nature for those who wish to ground their moral vision in external reality is precisely its capacity to take disputed values and make them seem innate, essential, eternal, nonnegotiable. When we speak of “the natural way of doing things,” we implicitly suggest that there can be no other way, and that all alternatives, being unnatural, should have no claim on our sympathies. (“Introduction” 36)

The essentialism to which Cronon refers helps us understand why “Vandals” is so disturbing: Munro not only brings the pedophile out from the trees and takes nature out of the animal, she also takes the child out of nature. Put differently, Munro’s children, like her animals, are not “innocent” and are “not born in a garden” (Haraway, *Simians* 180).

Munro does not suggest that the children sexually desire Ladner, but she does represent them as sexual beings whose behaviours and motivations are as complex and conditioned as those of adults. For example, Liza gives a rhinestone earring to Bea as an acknowledgement of and apology for Ladner’s cruel imitation of her: when Bea asks if the earring belonged to Liza’s mother – who is dead – Liza lies and says yes, all the while aware that her gift “might be seen as childish and pathetic – perhaps intentionally pathetic” (342).

And, in a move that further repudiates the vision of the child as innocent and natural, Munro has Liza – who lives in a house painted “glaring pink, like lipstick,” on a property on which there is “not one tree” (340) – project her own sexual urges onto the natural world. After characterizing Ladner’s abuse as a situation she “couldn’t get out of ..., or even want to” (339, emphasis added), Liza describes the allure of Ladner’s property:

Then the pine plantation ... with its high boughs and needled carpet, inducing whispering. And the dark rooms under downswung branches of the cedars – entirely shaded and secret rooms with a bare earth floor.... In some places the air is thick and private, and in other places you feel an energetic breeze. (341)

In an ironic rejoinder to the image of the Romantic child at home in nature, Munro has Liza figure the natural realm as a domicile – a place with “rooms,” a “floor,” “carpet,” and culture. Not only does Munro refuse to polarize child and adult, human and animal, nature and culture, but she also shows us what we risk by doing so. She shows us that the tendency to posit the natural and the cultural as distinctive spheres allows for what Desmond calls “the naturalization of the cultural” (192): it allows the category of the natural to function as a “rudder,” steering us away from destabilizing questions and bringing us back, time and again, “to biology as if it were a neutral, natural, originary category” (192). Likewise, Munro shows us that by imagining childhood innocence in opposition to adult sexuality, and by using pedophilia to shore up our ideas of what is natural, we “find ourselves sacrificing the bodies of children” (Kincaid 6).

“Do you care if he croaks?” (332). In answer to the question that Warren puts to Liza while she sets about destroying Ladner and Bea’s property, Liza makes “croaking noises to stop him being thoughtful” (332). Moments earlier she makes “a funny noise – an admiring cluck of her tongue” while dumping the contents of desk drawers on the floor (326). After raping Liza, Ladner also “clucked his tongue” (342). The echoing “cluck” is important because it establishes Liza’s violent behaviour as a direct response to Ladner’s abuse of her, while also suggesting her tendency to emulate Ladner and identify with him. As Nathalie Foy argues, Liza “recuperates the good in Ladner” by recalling and taking on his role as instructor (159):

“Can you tell what the trees are by their bark?” she said.

Warren said that he couldn’t even tell from their leaves. “Well, maples,” he said. “Maples and pines.”

“Cedar,” said Liza. “You’ve got to know cedar. There’s a cedar.... And that one with the bark like gray skin? That’s a beech. See, it had letters carved on it, but they’ve spread out, they just look like any old blotches now.”

Warren wasn’t interested. He only wanted to get home. It wasn’t much after three o’clock, but you could feel the darkness collecting, rising among the trees, like cold smoke coming off the snow. (344)

At the end of the story, the reader also feels a “darkness collecting,” for the pedophile has been rendered more fearful for his lack of monstrosity, for the very ordinariness of his desire to teach children and his ability to elicit their trust and respect. Although I do not share Nathalie Foy’s sense that the blurred letters in the beech tree, rediscovered in the wake of Liza’s cathartic act of vandalism, indicate that she has succeeded in “dispell[ing]” the darkness that has haunted her (159), I do think that the act of reading

the natural world is represented as a means of staving off that darkness. The first meeting between Ladner and the children contains a specific injunction:

The first time that Liza and Kenny had ever been on Ladner's property, they had sneaked in under a fence, as all the signs and their own father had warned them not to do. When they had got so far into the trees that Liza was not sure of the way out, they heard a sharp whistle.

Ladner called them: "You two!" He came out like a murderer on television, with a little axe, from behind a tree. "Can you two read?"

They were about six and seven at this time. Liza said, "Yes."

"So did you read my signs?" (333)

The context suggests that the signs to which Ladner refers are the "No Trespassing," "No Hunting," and "Keep Out" signs that line his property (325), but there are, as I have already indicated, numerous other signs in Dismal. Some of them contain scientific information, but others present quotations:

Nature does nothing uselessly.

— Aristotle

Nature never deceives us; it is always we who deceive ourselves.

— Rousseau

These signs – set off from the text and presented in italics – contain a direct challenge to the reader. Aristotle's dictum, "Nature does nothing uselessly," demands that we reflect critically on the uses – both material and metaphorical – to which nature is put. The Rousseau quotation, displayed in the midst of a "lifelike" simulation of the natural, challenges us to consider how we deceive ourselves by clinging to the idea that the "natural" world is a repository of truth – as indeed both Bea and Ladner do. Bea's references to nature and the natural inhibit her own critical faculties; Ladner uses the nonhuman world to stage his own Edenic dream of timelessness and communion. If, like Bea and Ladner, we fail to heed the challenges implicit in these two signs, presented in a story concerned with the abuse of both the "natural" and the human, then we, too, are mired in – and even complicit in – the darkness collecting at the story's end. But to accept this challenge, and to remember, for example, Heraclitus' dictum that "Nature hides," is to begin to shed light on the ways that we think, or refuse to think, about pedophilia. "So did you read my signs?" asks Munro.<sup>9</sup>

## Notes

- 1 In the "Introduction" to *UnCommon Ground*, William Cronon describes the perception of "nature as naïve reality" this way: "It is in fact one of the oldest meanings that the word 'nature' carries in the English language: the sense that when we speak of the nature of something, we are describing its fundamental essence, what it really and truly is. Indispensable as the usage may be, it is dangerous for what it tempts us to assume: the very thing it seeks to label is too often obscured beneath the presumption of naturalness" (34).
- 2 Natalie Foy disagrees, arguing that Bea's "ignorance" of the abuse is "complete" (151). However, Foy's otherwise very strong argument is undermined by her own acknowledgement that "[w]e know that Bea is capable of forgetting unpleasant associations" (151) and, more generally, by

Munro's determination to preserve and to emphasise a degree of ambiguity. As a further argument for the possibility of Bea's "knowingness," consider the extent to which the following passage invites us to question her motivation for sending Liza to college: "It was her gave me some money." Liza continued, as if it was something he ought to know, "To go to college. I never asked her. She just phones up out of the blue and says she wants to" (322). Also consider Bea's recognition of Ladner's "insanity" and of own very complicated desire for a man capable of offering her an insanity that she could "liv[e] inside" (314).

- 3 For a discussion of the taxidermist's interest in ideal(ised) animal bodies, see "Teddy Bear Patriarchy," where Haraway discusses Carl Akeley's relentless search for "the unblemished type specimen" (254).
- 4 See Bea's description of the property on 317, Liza's description of the property on 333, and Liza's description of the attraction that Dismal held for her as a child on 340–41.
- 5 Simpson's "Immaculate Trophies" does a good job of exploring the contradictions and ironies of the "frozen liveness of wild nature" (92).
- 6 The central event in "Carried Away" is the factory accident that results in the beheading of Jack Agnew in 1924. At that time Bea, who also makes an appearance in the story, is 13. When Bea sits down to write Liza a letter in the opening paragraph of "Vandals," more than 50 years have passed. No dates are given in "Vandals," but Bea's indication that Ladner was a Vietnam veteran when she first met him, and the fact that reruns of "I Dream of Jeannie" are playing on the television suggest that "Vandals" is set in the early to mid 1980s.
- 7 See Redekop's argument that Munro frequently constructs the nostalgic as grotesque in order to repudiate it.
- 8 Also see Levine and Steed.
- 9 Thanks to Susan Fisher, Susie O'Brien, Pat Saunders-Evans, and Andy Wainwright, who generously read and commented on earlier versions of this paper.

# CHAPTER 1

## Introduction *Matters Pertinent to a Theory of Human Existence*

*Julie Rivkin and Michael Ryan*

The social, political, and cultural sciences are increasingly approximating literature. In a story by a good fiction writer such as Alice Munro, we see, feel, and experience how life works. We are close to the life experience of characters as it happens. That experience is in motion; it is not a statue or a photograph, something fixed in time and limited and clearly defined by a spatial frame or bodily contours. Social scientists talk about the same stuff, but they have tended to use a vocabulary such as “system,” “structure,” and “ideology” that described abstract aspects of reality or that were quite distant from lived experience, from how life works or how it takes place. More and more, they are diminishing the distance. They are finding new ways of talking about life that gets closer to how fiction writers write. Cultural anthropologist Kathleen Stewart, for example, writes quasi-fictional prose pieces as she records and re-creates the life of the people of Appalachia. This new approach to knowledge is the result of a major change underway in the social sciences and in science more generally.

Until recently, the project of human knowledge assumed that the world was an object opposite our human subject, and we know it using the concepts and methods of the humanities and social sciences. Our mental representations mapped the world and made it knowable. The world remained out there and our knowledge was in here. All fine and good except that we ourselves are part of the material world and the world itself often possesses subjectivity. From bacteria to our fellow animals, it is animate. Moreover, the boundaries that kept realms separate in our minds rarely exist in reality. A Beyoncé concert may be a cultural event, but it is also a translation of affective experience and erotic passion. It is physical stuff – chemical action – in another form – sound, movement, image. Similarly, when we know the world, it is a mental representation, true, but it is also a biological action, one often charged, if one pays close attention to literary theory discussions, with aggression and the acting out of postures charged with narcissistic energy designed to have material effects that often take the form of emotional affects such as *Schadenfreude* (or pleasure in another’s downfall).

By dislocating the human subject of knowledge from its location opposite the object world and by immersing it in the matter of the world (like an ice cube melting in a bath

of warm water), recent post-humanist and new materialist theory has also troubled boundary distinctions that accompanied the old subject–object dualism such as society and science, culture and nature, technology and physicality, human and animal, representation and matter, and so on. A crucial term in this new way of conceiving of human knowledge is relation. Things exist in relation to one another. The simple idea in twentieth-century Structuralism that bits of language are given their identity by their differences from one another first migrated into philosophy (and gave rise to deconstruction) and now has migrated into the social and physical sciences. Things are now seen increasingly in terms of relations (in space between each other and in time as in movement from a past into a future). Another important term is network. Increasingly, we are coming to de-isolate objects and events and to see them as parts of temporal processes and of material fields spread out in space. Things translate and change forms, have effects and generate new configurations. Nature and matter are dynamic, and single objects can only be isolated for study at a loss.

Philosophy since the revival of Aristotelianism during the Renaissance has assumed the mind's separateness from the material world and the world's stability, its capacity to assume the form of a simple object. There was and is, however, an alternative tradition in philosophy, and with time, a matching line of theory and inquiry has developed in science, mathematics, and other fields that addresses and adumbrates its concerns. The alternative tradition of philosophers such as Democritus, Lucretius, and Heraclitus noticed that the physical world is dynamic and complex; it does not consist of flat things or of boxed entities. What appear to be separate objects exist in movement; they change and transform; they embody forces that course through them; they belong to fields and networks of which they are apart and from which they are inseparable; they manifest levels of physical existence that are not visible and cannot be visible; they are temporary stabilizations of matter, events rather than states, becoming rather than being; eventually they dissolve and assume other forms. Given how long the matter that constitutes our bodies and our brains has been around and will be around after our passing, it might make more sense to speak of our deaths rather than of our lives. The labors and travails of that flicker of awareness that is our mind is a matter of transcendental indifference to all the matter in us and around us.

The emphasis on change and instability in the alternative materialist philosophic tradition from Lucretius to Deleuze has gained support from recent scientific work in non-linear biology and complexity theory. Complexity theory notices how the physical world is dynamic and emergent. New combinations of matter allow new states to emerge, to bear out their virtual potential – as the color of a flower, for example, is created by thousands of components none of which is itself that color. Ten people standing in a city square might be a family gathering; a million makes it a political movement. Quantity, as Hegel noted, changes quality. All the mitochondria in our brain cells amounts to a pile of matter until it is gathered together in a higher form of organization where it ignites into consciousness.

An entity like the literary canon, as Martin Meadows notes, is a system of complex relations mapped by multiple axes (history, culture, aesthetics) whose ongoing form is difficult to predict. It evolves over time dynamically, reorganizing itself anew every few years in new historical and cultural contexts. An author like Alice Munro emerges with time as a canonical figure because aesthetic categories evolve, her troubling descriptions of raw physicality become more acceptable, an incremental awareness of knowledge of her work emerges, and at a certain point, a change happens that could not easily have been predicted or modeled in advance and that moves her from margin to mainstream.

Biology has also disturbed our sense of the singularity of organisms and the linearity of organic life. The boundaries of organisms are uncertain because their existence depends on an environment with which their bodily existence meshes as ingestion, excretion, respiration, and even cognition. Identity, from a biological perspective, is necessarily ecological and symbiotic. We are in a condition of ongoing symbiosis with the bacteria around and within us. In addition, the components of any organism are themselves inorganic and lifeless. Life emerges from lifeless ingredients. We consist of matter that is lent to us and that is not "us" in that it is impersonal and non-subjective. As a result, it is impossible to separate culture from nature, thought from matter. One cannot say "we" are determined because there is no difference between "we" and what determines.

A major area of concern of the new focus on matter in the cultural and physical sciences is the boundary between humans and other life forms such as animals. From a material perspective, humans are not distinct in any significant way from other beings. By dissolving the human into the common materiality of which it is composed with other life forms, new materialist theorists like Giorgio Agamben, Bruno Latour, and Donna Haraway seek to bring about a new "post-humanist" understanding of what it means for humans to exist in nature. Humanism separated human life from nature and posited nature as a difficult, troubling other that needed to be managed if civil existence was to be maintained through the discipline that gave rise to virtue. The new materialists, in contrast, argue it is better to see humans and nature as one, as part of an interconnected material network. Very different ethics in regard to our own regulated behavior as, for example, sexual beings as well as in regard to other beings such as animals and even bacteria emerge from such a reconceptualization.

A substantial body of critical work has come into being around these ideas, and animals especially have come to the fore as a topic of critical concern. Some of the examples are obvious – Melville's *Moby Dick* – but other writers whose work had been well mined for a host of issues and concerns, from psychology to language to gender – writers such as Virginia Woolf, for example – have proven helpful for examining human relations with animals. The presence of animals in *Mrs. Dalloway*, for example, is, according to Vicki Tromanhauser, not adventitious. When the sympathetically portrayed Septimus Smith sees the world from the perspective of a dog at one point or hears birds singing in Greek as he descends into madness and eventual suicide, he is stepping outside the regime of harsh positivist scientific knowledge associated with the doctor who drives him to kill himself. The doctor represents the humanist laboratory of objective science at its extreme. It kills what it analyzes. In contrast, Woolf's alternative ethic of sympathy and empathy dissolves the boundary that separates humans from the world around them.

Another way to rethink the meaning of the human as a category and as an ideal is to consider it from the perspective of the notions of bodily and cognitive normality that prevail in human culture. Those norms have promoted practices of exclusion and non-accommodation in regard to those with physical and cognitive impairments, everything from speech disabilities or cognitive processing syndromes such as autism to ambulatory limitations and mental illness. A range of critical and theoretical concerns have focused debate in Disability Studies. Some see both ability and disability as constructed norms or concepts that align with other social mechanisms for sorting populations into those considered normal and those considered less worthy. Physical description, when valorized or medicalized, has often served the interest of value judgments that emerge within discourses of racial superiority. The Nazi experience in Germany between World War I

and the end of World War II was especially noteworthy for projecting norms of physical beauty that marginalized and subordinated entire sub-populations of physically impaired people. Ideals and norms of ableism have therefore come into focus as objects of critical attention. Other disability theorists focus on the experience of the disabled and on increasing their rights and the medical treatments available to them. The medical humanities seeks to bring medical discourse into literary critical discussions. Other theorists seek to use the idea of disability to displace the distinction between the abled and the disabled. From a purely material perspective, there are no norms; there are only possibilities, different creative iterations of evolutionary nature some of which conform to current majoritarian standards, some of which point towards alternatives. From an evolutionary perspective, we are all mutants. There are no genetic norms – just hesitant, fragile, temporary arrangements of genetic material in a variety of shapes and forms.

When we die, we become our environment, merging with the earth around us. Throughout life, however, we are subject to a humanist illusion that makes us think we are separate from earthly matter. In the 1960s, environmentalists began to challenge that limited humanist perspective and to ask that attention be devoted, for the sake of humanity and the earth's survival, to the larger material world in which *H. sapiens* dwells. By the 1970s, Sharon Glotfelty, Harold Fromm, and others had begun to introduce environmental concerns into literary study. Initially, the ecocritical movement focused on the land and the way land or landscape was represented in literature. More recent bioregional scholars have studied the way physical region and economic region overlap, so that social class and geographic location become equally important aspects of literature, often meshing and being indistinguishable in the portrayal of human lives. For example, Willa Cather's *My Antonia* sets the lives of immigrants in an exacting but supportive landscape already layered and legible with signs of previous habitation. Some of them live in the earth, making a home in burrows not unlike those made by adjacent animal species. As their lives move forward, some are drawn to the town and the city and are changed by their new environments, becoming more preoccupied by the mediated access to survival that money provides. The character of Antonia is in some ways portrayed as a beautiful animal herself, and she is contrasted with the town girls who accommodate themselves to the quest for money as a means of survival.

One consequence of the new materialism and the new emphasis on bioculture is that culture and nature appear to us now to be inseparable. Science bears out the materiality of culture. The study of discourse demonstrates that words have a physical effect on the brain, and different brain regions activate differently in response to different kinds of words. The distinction between discourse and matter or discourse and the body is suggestively undermined by such findings. But equally, the physical matter of the brain is dependent on culture to achieve its full development. The brain has evolved in such a way that without proper nurturing in the form of semiological prompts from its cultural environment, it will not mature to its full capacities. Evolution has contrived to make social learning an essential feature of biological life.

# CHAPTER 2

## Non-Representational Theory *Life, But Not as We Know It*

*Nigel Thrift*

Nigel Thrift is a leading figure in human geography studies. He coined the phrase "soft capitalism" and developed "non-representational theory." In this selection from that latter work, he summarizes recent changes in how we conceptualize human life, moving away from the idea of the right concept or category and moving closer to lived experience itself. His books include *Non-Representational Theory* (2007), *Spatial Formations* (1996), and *Arts of the Political* (2013).

*When it was enthusiastically pointed out within memory of our present Academy that race or gender or nation ... were so many social constructions, inventions, and representations, a window was opened, an invitation to begin the critical process of analysis and cultural reconstruction was offered.... The brilliance of the pronouncement was blinding. Nobody was asking what's the next step? What do we do with this old insight? If life is constructed, how come it appears so immutable? How come culture appears so natural?*

(Taussig 1993: xvi)

*'production,' then, is used according to the meaning of its etymological root (i.e. Latin producere) that refers to the act of 'bringing forth' an object in space.*

(Gumbrecht 2004: xiii)

*a knowledge of arrangement or disposition is, of all others, the most useful.*

(Humphrey Repton 1803, cited in Wall 2006: 6)

*But can we really assume that the reading of such texts is a reading exclusively concentrated on meaning? Do we not sing these texts? Should the process by which a poem speaks be only carried by a meaning intention? Is there not, at the same time, a truth that lies in its performance? This, I think, is the task with which the poem confronts us.*

(Gadamer 2000, cited in Gumbrecht 2004: 64)

*Original publication details:* Nigel Thrift, "Life But Not As We Know It" from *Non-Representational Theory*, pp. 1–26. Routledge, 2008. Reproduced with permission from Taylor & Francis Books UK.

*we can and we may, as it were, jump with both feet off the ground into or towards a world of which we trust the other parts to meet our jump.*

(James 1999 [1911]: 230)

## Introduction

Since the early 1990s I have been engaged in an attempt to develop what I call non-representational theory. The chapters in this book are some of the later results of that project, following on in a direct line from *Spatial Formations* (Thrift 1996) and *Knowing Capitalism* (Thrift 2005a). Indeed, the three books should be considered together: they are all part and parcel of the same economic-cum-cultural-cum-political venture.

How to characterize this particular book's contents, then? Stripped to its bare essentials, this is a book about *the geography of what happens*. In large part, it is therefore a work of description of the bare bones of actual occasions but it does not, I hope, adopt a passive stance to its object of enquiry: what is present in experience. And not just because – as I have tried to make clear here and elsewhere – the content of what is present in experience has changed radically. For this is also a book about how these actual occasions, howsoever they may have been altered, might be enlivened – made more responsive and more active – by the application of a series of procedures and techniques of expression. In other words, it is intended as the beginning of an outline of the art of producing a permanent supplement to the ordinary, a sacrament for the everyday, a hymn to the superfluous.<sup>1</sup>

If that sounds too tentative, a little bit tortuous, or even rather portentous, then I am afraid that that is how it will have to be. This is a tentative book because it is not entirely clear what a politics of what happens might look like – indeed, given that so much of what I want to outline is avowedly experimental, perhaps too much in the way of clarity should not necessarily be counted as a good thing<sup>2</sup> (although straightaway I can hear the criticisms from those who believe that theory should slide home like a bolt). It is a little bit tortuous because there is a lot of ground-clearing to do, a lot of hacking back of the theoretical undergrowth in order to get to the nub of the matter. And it is portentous because it involves taking some of the small signs of everyday life for wonders and this involves all manner of risks, and not least pretentiousness. All I can say is that I think that the risk is worth it in order to achieve a diagnosis of the present which is simultaneously a carrier wave for new ways of doing things.

Certainly, in order to achieve its goals, this book has to be three things at once. First, it has to be a work of social and cultural theory.<sup>3</sup> The book builds on a series of cognate traditions in order to construct what I hope is a convincing account of how the worlds<sup>4</sup> are, given that encounters are all there is, and their results cannot be pre-given (although they can, of course, be pre-treated). Complex trajectories rather than blurred genres, as Strathern (1999: 25) puts it. But, second, the book also has to be a diagnostic tool. It is intended to be a work that takes some of the specificities of the present moment and weaves them into what might be called a speculative topography. The contours and content of what happens constantly change: for example, there is no stable 'human' experience because the human sensorium is constantly being re-invented as the body continually adds parts in to itself; therefore how and what is experienced as experience is itself variable.<sup>5</sup> Then, third and finally, the book is intended as a political contribution to the task of reconsidering our hopes for ourselves. This is, after all, a time in which the

invention of new ‘everyday’ forms of democracy has become a part of the political ambition of many people, in which the ‘local’ and the ‘global’ have become increasingly awkward political terms but no satisfactory alternative to the connected separation they imply seems to exist, and in which ‘what each of us feels capable of’ (Ginsborg 2005: 7) is perceived as a vital political issue. The small offering that this book attempts to make to these three debates, and especially to the last one, is an opening up of new political domains which it is then possible to make a corresponding political rumpus about. The book is, most especially then, an attempt to produce an art of the invention of political invention by putting hard questions to the given in experience, the overall intent being to call new publics into existence who will pose questions to politics which are not yet of politics (Rajchman 1998) – whilst recognizing that this questioning can never be more than an inexact science<sup>6</sup> (Stengers 2002a). Bloch (2000 [1923]) called this ‘building into the blue’. That is not a bad description for the kind of resource I am trying to construct.

But I need to severely qualify each of these goals. To qualify the first, like many, I think that, in certain senses at least, the social sciences and humanities suffer from a certain kind of over-theoretization at present. There are too many theories, all of them seemingly speaking on behalf of those whose lives have been damaged by the official structures of power.<sup>7</sup> A cynic might think that the profusion of ‘fast’ theories created by academics is simply a mirror of the rise of brainy classes, who are able to live a life of permanent theoretical revolution whilst everyone else does the dirty work. That would be too harsh. But the criticism is not therefore without any force at all (Rabinow 2006). It seems to me, to qualify the second goal, that this task is a necessary one in a time in which a globalized capitalism based on the rise of the brainy classes has become ever more pervasive, and democracy is in danger of becoming something of a sham, enacted as part of what Sloterdijk (2005c) calls an authoritarian capitalism.

The mass of the population is periodically doused with the rhetoric of democracy and assured that it lives in a democratic society and that democracy is the condition to which all progressive-minded societies should aspire. Yet that democracy is not meant to realise the demos but to constrain and neutralize it by the arts of electoral engineering and opinion management. It is, necessarily, regressive. Democracy is embalmed in public rhetoric precisely in order to memorialize its loss of substance. Substantive democracy – equalizing, participatory, commonalizing – is antithetical to everything that a high reward meritocratic society stands for. At the same moment that advanced societies have identified their progressive character with perpetual technological innovation they have defined themselves through policies that are regressive in many of their effects. Democracy is where these effects are registered. By virtually every important official norm – efficiency, incentives to unequal rewards, hierarchical principles of authority, expertise – it appears anachronistic, dysynchronous. The crux of the problem is that high-technology, globalized capitalism is radically incongruent with democracy. (Wolin 2000: 20)

What seems to me more valuable, to qualify the third goal, would be to try to construct *practices* of vocation<sup>8</sup> that can begin to address the deficit of felt powerlessness and to chip away at ‘our capacity to interiorize power relations, to delimit by ourselves the realm of the possible’ (Ginsborg 2005: 20). These practices would not be permanent solutions. Rather, they would be oriented to escape attempts, some of which would take root: a series of fireworks inserted into everyday life which could confront or sidestep

the ‘behavioural codes that are not unilateral or totalitarian or especially disciplinarian, and which furthermore appear to offer great freedom of choice, but which none the less convey us effortlessly into a life of normalcy and convention’ (Ginsborg 2005: 20). At this point, I am often stuck for words to describe what I mean, so let me take someone else’s instead – Greil Marcus’s homily on Robert Johnson as a force, and not just a mirror:

At the highest point of his music each note that is played implies another that isn’t, each emotion expressed hints at what can’t be said. For all of its elegance and craft the music is unstable at its core – each song is at once an attempt to escape from the world as everyone around the singer believes it to be, and a dream that the world is not a prison but a homecoming . . . Johnson is momentarily in the air, flying just as one does in a dream, looking down in wonder at where you are, then soaring as if it’s the most natural thing in the world. (Marcus 2005: 103)

Now I am well aware that the cultivation of this form of knowledge may be interpreted as an irredeemably middle-class pre-occupation, the equivalent in theory of Bromell’s (2000) characterization of white middle-class teenagers as insiders who long to be outsiders, the kind of consciousness of the world that too quickly falls into a call for ‘a quick revolutionary fix that will please everyone and just reinforce a cosy feeling of powerlessness’ (Lotringer 2004: 18).<sup>9</sup> But I think there is more to it than that, much more. For it suggests that there may be a more general means of opening up an allusive field in which ‘the listener’s attention is seized and dropped and held and released by possibilities of meaning that amuse and interest but do not quite come into being’ (Bromell 2000: 133). This is what I mean by a politics of hope,<sup>10</sup> the prospect of constructing a machine for ‘sustaining affirmation’ (White 2000), of launching an additional source of political nourishment and responsiveness and imagination in a time when so many forces militate against it, of locating and warming up the technology of questioning and non-questioning ‘by which attention forms and experience crystallizes’ (Connolly 2005: 166). In other words, I want to try and add a distinct cooperative-cum-experimental sensibility in to the mix of the world that will help us ‘engage the strangeness of the late modern world more receptively’ (White 2000: 153). In turn, we could perhaps live in a less ‘stingy’ (as Connolly (2005) puts it) and more playful way, overcoming or at least bypassing some of the cringes that have been sewn into the fibres of our being as we have learnt how to be embodied. The net outcome would be that the texture of the feel and outcome of the everyday could be reworked as traditional forms of expression were slowly but surely breathed differently (Abrahams 2005).

What is then at issue is what form these practices would take. There is nothing that automatically leads them towards such forms of generosity, after all. In a sense, answering this quest/question about questioning is precisely what the rest of this book attempts to do.

In the remaining pages of this introductory chapter, I will introduce some of the main themes that will be taken up in the chapters of this book. I will begin by briefly outlining some of the main characteristics of non-representational theory and some of the key contemporary issues that non-representational theory highlights. Next, I will consider some of the theoretical and practical issues that the book throws up. Then, finally, I will parse each of the individual chapters, bringing out some of their common problematics.

## Non-Representational Theory

This is a book based on the leitmotif of movement in its many forms. Thus, to begin with, it would be possible to argue that human life is based on and in movement. Indeed, it might be argued that it is the human capacity for such complex movements and the accompanying evolution of movement as an enhanced attractor<sup>11</sup> that has produced the reason for much of our rhizomatic, acentred brain. Then, movement captures the animic flux of life and especially an ontogenesis<sup>12</sup> which undoes a dependence on the preformed subject; ‘every creature, as it “issues forth” and trails behind, moves in its characteristic way’ (Ingold 2006: 15). Then again, movement captures the joy – I will not say simple – of living as a succession of luminous or mundane instants. Though it is possible, even easy, to get carried away by an emphasis on presence, closeness, and tangibility, and by a corresponding desire to do more than simply squeeze meaning from the world, still we can think of the leitmotif of movement as a desire for a presence which escapes a consciousness-centred core of self-reference;<sup>13</sup> ‘Rather than have to think, always and endlessly, what else there could be, we sometimes seem to connect with a layer in our existence that simply wants the things of the world close to our skin’ (Gumbrecht 2004: 106). And, finally and relatedly, movement captures a certain attitude to life as potential; ‘to pose the problem is to invent and not only to dis-cover; it is to create, in the same movement, both the problem and its solution’ (Alliez 2004b: 113).

Non-representational theory takes the leitmotif of movement and works with it as a means of going beyond constructivism. As a way of summarizing its now increasingly diverse character,<sup>14</sup> I will point to seven of its main tenets. First, non-representational theory tries to capture the ‘onflow’,<sup>15</sup> as Ralph Pred (2005) calls it, of everyday life. It therefore follows the anti-substantialist ambition of philosophies of becoming and philosophies of vitalist intuition equally – and their constant war on frozen states.<sup>16</sup> That means that it has a lot of forebears, of course. These forebears hardly agreed on everything, to put it but mildly, and not least on the status of intention and intentionality. So I will need to take a little time to more carefully specify what I mean. I think that this can be boiled down to three propositions. One is that the most effective approach will be one that is faithful to a radical empiricism that differs – radically – from a sense-perception or observation-based empiricism. As must be clear, that means that although I respect Humean models of empiricism, I find them too austere. I prefer the lineage of interrelation that runs from James through Whitehead which is not willing to completely jettison the phenomenological (the lived immediacy of actual experience, before any reflection on it)<sup>17</sup> and the consequent neglect of the transitive. At the same time, I want to temper what seem to me to be the more extreme manifestations of this lineage, which can end up by positing a continuity of and to experience about which I am sceptical, by employing an ethological notion of the pre-individual field in which the event holds sway and which leads to ‘buds’ or ‘pulses’ of thought-formation/perception in which ‘thought is never an object in its own hands’ (James 1960 [1890]: 522). This approach seems to me to be very much in line with Whitehead’s monistic way of thinking about the world. As Pred puts it:

Whitehead extends the scope of radical empiricism and, in effect, points to a way to overcome the limitations inherent in the spatiotemporal and sensory (visual, aural, tactile) metaphor of the stream [of consciousness]. Instead of merely taking a ‘general view of the wonderful stream of our consciousness’, Whitehead goes ‘into’ the moment. He refuses to

abstract from the moment, any moment, understood as an act of experience issuing from and into other experiences, as an act occurring within the constraints of inheritance from all that is encompassed within the experient's past and with the onflow of experiences. By bringing philosophical analysis into the bud, Whitehead secures access to a post-Cartesian/Humean basis for ontology, and can characterize momentary consciousness as it arises from pre-conscious moments of synthesis within a broader stream ... of activity.

Whitehead applies the notion of buds not only to human moments of experience but also, more broadly, to actual entities or occasions – ‘the final real things of which the world is made up’. He elaborates the notions of actual entities and concrescence with rigor and thoroughness, ‘with the purpose of obtaining a one-substance cosmology’. (Pred 2005: 11)

Another proposition, which follows on naturally from these thoughts, is that the most effective approach values the pre-cognitive as something more than an addendum to the cognitive. What is called consciousness is such a narrow window of perception that it could be argued that it could not be otherwise. As Donald (2001) makes clear, defined in a narrow way, consciousness seems to be a very poor thing indeed, a window of time – fifteen seconds at most – in which just a few things (normally no more than six or seven) can be addressed, which is opaque to introspection and which is easily distracted. Indeed, consciousness can be depicted as though it hardly existed, as an emergent derivative of an unconscious. Yet it is clearly dangerous to make too little of cognition, as I perhaps did in some of my early papers. Because it is so weak (though hardly as weak as some commentators have depicted it), it has enrolled powerful allies which can focus and extend conscious awareness – various configurations of bodies and things which, knitted together as routinized environments, enable a range of different technologies for more thinking to be constructed. But, at the same time, the logical corollary of these thoughts is that we should also pay more attention to the pre-cognitive. This roiling mass of nerve volleys prepare the body for action in such a way that intentions or decisions are made before the conscious self is even aware of them. In turn, the many automatisms<sup>18</sup> of ‘bare life’ or ‘creaturely life’ mark out not only eminent biopolitical domains<sup>19</sup> but also a series of key theoretical conundrums about what constitutes life itself, such as the nature of ‘the open’ and motility, animality and undeadness, instinct and drive, poverty in world and what it means to be captivated by an environment in a world marked by all kinds of literal and metaphorical dislocations (Agamben 2004; Santner 2006).

The last proposition follows on again. It is that it is important to specify what unit is being addressed. Nearly all action is reaction to joint action, to being-as-a pair, to the digestion<sup>20</sup> of the intricacies of talk, body language, even an ambient sense of the situation to hand, and this unremitting work of active reaction imposes enormous evaluative demands, equally enormous demands on intermediate memory, and similarly large demands on the general management of attention. Indeed, many now conclude that the idea of cognition as simply a minor placeholder is an artefact of tests carried out in a highly restricted environment – the laboratory (Despret 2004) – in which consciousness shows up as short-term because of the artificiality of the situation demanded by the researcher. Rather, cognition should be seen as an emergent outcome of strategic joint action for which it acts as a guidance function, monitoring and interpreting the situation as found, and, in particular, as a key ability to theorize others' states, as a kind of ‘mind-reading’ that is the result of the human ability to theorize others' states without having full-blown beliefs about those states (Levinson 2003; Sterelny 2003).<sup>21</sup> And, most of the time, this social awareness – involving high-level cognitive abilities like imitation, learning

about learning, and an ability to carry meaning in a whole series of registers (not only language but also gesture) (McNeill 2005) and the manipulation of time and space – predominates over sensory awareness: 'our normal focus is social and social awareness is highly conscious, that is; it heavily engages our conscious activity' (Donald 2001: 68). In other words, cognition has not only a performative aspect but a 'theoretical' aspect too (the two being related) and these aspects are a key to what is often called 'imagination'.<sup>22</sup> This is why non-representational theory privileges play: play is understood as a perpetual human activity with immense affective significance, by no means confined to just early childhood, in which many basic ethical dilemmas (such as fairness) are worked through in ways which are both performative and theoretical.

Second, as must by now be clear, non-representational theory is resolutely anti-biographical and pre-individual. It trades in modes of perception which are not subject-based. Like Freud, I am deeply suspicious of, even inimical to, autobiography or biography as modes of proceeding. One seems to me to provide a spurious sense of oneness. The other seems to me to provide a suspect intimacy with the dead. As Phillips (1999: 74) puts it, 'Biography, for Freud, was a monument to the belief that lives were there to be known and understood, rather than endlessly redescribed. Biography did to the dead what Freud feared that psychoanalysis might do to the living'. Instead I want to substitute a *material schematism* in which the world is made up of all kinds of things brought in to relation with one another by many and various spaces through a continuous and largely involuntary process of encounter, and the violent training that such encounter forces. This is an approach that has had some forebears in the social sciences. I think of Gabriel Tarde's micrometaphysics, Pitirim Sorokin's forays into socio-cultural causality, Torsten Hägerstrand's time-geography, or Anthony Giddens's expeditions around social theory in the late 1970s and early 1980s, as well as my own hesitant attempts to time space and space time dating from the late 1970s (Parkes and Thrift 1980). It has achieved more grip of late because of theoretical developments like actor-network theory, and the consequent rediscovery of authors like Tarde and Whitehead, as well as the influence of the writings of authors like Deleuze and Guattari on assemblages. As, and probably more importantly, a whole series of fields have been constructed out of the resurgence of what Paul Carter (2002) calls 'material thinking', the 'performative' working methods and procedures of writings (and, very importantly, other methods of exposition) that emphasize how the whole business of praxis and poiesis is wrapped up in the stubborn plainness of a field of things. These fields must necessarily emphasize the materiality of thinking, and include the study of material culture, the sociology of science, performance studies, from dance to poetry, installation and site-based art, elements of architecture, some of the excursions in to interaction design (such as trying to formulate living information), various aspects of archaeology and museum studies, and the range of developments taking place in parts of cultural geography.

Third, non-representational theory concentrates, therefore, on *practices*, understood as material bodies of work or styles that have gained enough stability over time, through, for example, the establishment of corporeal routines and specialized devices, to reproduce themselves (Vendler 1995). In particular, these bodies' stability is a result of schooling in these practices, of each actor holding the others to them, and of the brute 'natural' fact that the default is to continue on in most situations.<sup>23</sup> These material bodies are continually being rewritten as unusual circumstances arise, and new bodies are continually making an entrance but, if we are looking for something that approximates to a stable feature of a world that is continually in meltdown, that is continually bringing forth new

hybrids, then I take the practice to be it. Practices are productive concatenations that have been constructed out of all manner of resources and which provide the basic intelligibility of the world: they are not therefore the properties of actors but of the practices themselves (Schatzki 2002). Actions presuppose practices and not vice versa.

However, what I am espousing is no naïve practice theory. For example, as practices lose their place in a historical form of life, they may leave abandoned wreckage behind them which can then take on new life, generating new hybrids or simply leavings which still have resonance. Take the example of things. These may have been vital parts of particular networks of practice, only to fall out of use as these networks metamorphose. Consequently their meanings may become hollowed out but may still retain a presence as enigmatic signifiers (Santner 2006). Or they may find new uses in other networks. Or they may linger on as denaturalized reminders of past events and practices, purposely memorialized in various ways or simply present as ruins, as melancholy rem(a)inders. In other words, things can have a potent afterlife.

The mention of things brings us to the fourth tenet. The constitution of non-representational theory has always given equal weight to the vast spillage of *things*. In particular, it takes the energy of the sense-catching forms of things seriously (Critchley 2005) – rather than seeing things as mere cladding.<sup>24</sup> Things answer back; ‘not only does our existence articulate that of an object through the language of our perceptions, the object calls out that language from us, and with it our own sense of embodied experience’ (Schwenger 2006: 3). But how to describe what Walter Benjamin called the ‘petrified unrest’ of things? Three main moves seem particularly apposite. To begin with, things become part of hybrid assemblages: concretions, settings and flows. In this approach, things are given *equal* weight, and I do mean equal.<sup>25</sup> Thus things are not just bound by their brute efficacy to the visible termini of humans in some form of latent subjectivism such as ‘concern’ or ‘care’, however comforting their presence may sometimes be as mundane familiars. That would be to smuggle ‘from the realm of common sense the notion that humans are very different from knives or paper’ (Harman 2002: 30). Rather,

the tool itself is bound up in a specific empire of functions, a system that takes its meaning from some particular projection, some final reference. Admittedly, the meaning of equipment is determined by that for the sake of which it acts. But I flatly contest the view that this *Worumwillen* is necessarily human. Tools execute their being ‘for the sake of a reference, not because people run across them but because they are utterly determinate in their referential function – that is, because they already stand at the mercy of innumerable points of meaning. (Harman 2002: 29)

Then, it is important to understand the way in which things have another genetic disposition that needs to be mentioned at this point. That is what Simondon (1989) calls their ‘technicity’, their actual collective character as a ‘technology’ (the word being placed in scare quotes precisely because we cannot be sure exactly what constitutes a technology). The technicity of something like a hand tool which forms a relatively isolated technical element<sup>26</sup> can be isolated from its context. Indeed, it may have sufficient material character to be given a proper name: Toledo steel or Murano glass, for example (Mackenzie 2002). But the more effective and ubiquitous a technology becomes, the less likely this is to be the case. Portability comes about because of the ramification of a larger and larger infrastructure which means that the technology becomes increasingly a part

of an empire of functions encumbered by a network of supportive elements, each of which relies on the other. ‘A mobile phone or wireless appliance could be understood from this perspective as a massively encumbered object. Its physical portability comes at the expense of an increased ramification and layering of communication infrastructure’ (Mackenzie 2002: 12).

To summarize the argument so far, things form not so much a technological unconscious as a technological anteconscious; a ‘spreading so extensive that it can come to the surface in lives entirely different from the one beneath which it is currently sensed’ (Schwenger 2006: 4), a warp and weft of inhuman traffic with its own indifferent geographies. But I want to see things as having one more disposition. That is, the way in which the human *body* interacts with other things. I do not want to count the body as separate from the thing world. Indeed, I think it could be argued that the human body is what it is because of its unparalleled ability to co-evolve with things, taking them in and adding them to different parts of the biological body to produce something which, if we could but see it, would resemble a constantly evolving distribution of different hybrids with different reaches. Indeed, the evidence suggests that organs like the hand, the gut, and various other muscle and nerve complexes which have evolved in part in response to the requirements of tools have subsequently produced changes in the brain. The human body is a tool-being. This is, I think, an important point. Of late, there has been a large literature generated on corporeality, most particularly by feminist theorists, which often seems to want to endow the flesh with some form of primordial distinction: goo is good, so to speak.<sup>27</sup> But, whilst it would be profoundly unwise to ignore the special characteristics of flesh,<sup>28</sup> it would be equally unwise to think that the make-up of the human body stopped there, or that it produced an ineffable perceptual membrane. It does not. There is a sense of touch in all parts of the extended physiognomy of the material body.<sup>29</sup> At the same time, it is important to enter a note of caution which has been generated, at least in part, by feminist theorists. Too often, the recent turn to corporeality has also allowed a series of assumptions to be smuggled in about the active, synthetic and purposive role of embodiment which need closer examination. In particular, it is assumed that bodies are bodies-in-action, able to exhibit a kind of continuous intentionality, able to be constantly enrolled into activity.<sup>30</sup> Every occasion seems to be willed, cultivated or at least honed. My own work has been periodically guilty of this sin, I am sure. But the experience of embodiment is not like that at all; not everything is focused intensity. Embodiment includes tripping, falling over, and a whole host of other such mistakes. It includes vulnerability, passivity, suffering, even simple hunger. It includes episodes of insomnia, weariness and exhaustion, a sense of insignificance and even sheer indifference to the world. In other words, bodies can and do become overwhelmed. The unchosen and unforeseen exceed the ability of the body to contain or absorb. And this is not an abnormal condition: it is a part of being as flesh. It may be that it is only ‘because the self is sensible, open to the pangs of hunger and eros, that it is worthy of ethics’ (Critchley 2002: 21).<sup>31</sup>

All that said, this emphasis on things questions the solidity of the world, since so much of it is ultimately mutable, working according to a spectrum of different time scales (Grosz 2005). Increasingly, many human activities seem to realize this. Indeed, it is a point that has been brilliantly made by Kwinter (2001). Thus Kwinter points to the rise of a whole series of sports that depend on an artful shaping of the different time scales of the environment for sustenance, tracking and tracing flows and perturbations

in order to produce e/affects. Kwinter mentions paragliding, surfing, snowboarding and rock-climbing as sports of falling<sup>32</sup> that extend a streaming ethos to landscapes, understood as ‘motorfields of solids’ (2001: 29). In their current manifestation, these sports have increasingly understood the environment as exemplifying fluidity of movement, intuition and invention. Take the case of rock-climbing.<sup>33</sup>

[Climbers] must flow up the mountain, flow or tack against the downward gradient of gravity – but also must become hypersensitive tamers and channelers of the gravitational sink, masters at storing it in their muscles or making it flow through certain parts of the pelvis, thighs, palms, and this only at certain times; they must know how to accelerate the flow into a quick transfer that could mean the difference between triumph and disaster, to mix and remix dynamic and static elements in endless variation – for it is not enough to prevail against gravity but rather to be able to make it stream continuously through one, and especially to be able to generalize this knowledge to every part of the body without allowing it to regroup at any time – transcendent and unitary – as a spatialized figure in the head. (Kwinter 2001: 29–30)

But note here how the mountain also plays its part:

The mineral shelf represents a flow whose timescale is nearly unfathomable from the scale of duration represented by the electrolytic and metabolic processes of muscle and nerves – but even at this timescale – nanometric in relation to the millennia that measure geological flows – singularities abound: a three millimeter-wide fissure just wide enough to allow the placement of one finger, and anchored by sufficiently solid earth to permit but eighty pounds of pressure for, say, three seconds but no longer; an infinitesimally graded basin of sedimentary rock whose erratically ribbed surface (weathered unevenly by flows of wind and rain) offers enough friction to a spread palm to allow strategic placement of the other palm on an igneous ledge half a meter above. This very rock face, until recently considered virtually slick and featureless – an uninflected glacis even to classical pick and patio climbers – now swarms with individualized points, inhomogeneities, trajectories, complex relations ... the climber’s task is less to ‘master’ in the macho, form-imposing sense than to forge a morphogenetic figure in time, to insert himself into a seamless, streaming space and to become soft and fluid himself, which means momentarily to recover real time, and to engage the universe’s wild and free unfolding through the morphogenetic capacities of the singularity. (Kwinter 2001: 31)

Thus we arrive at a notion of ‘site’, as an active and always incomplete incarnation of events, an actualization of times and spaces that uses the fluctuating conditions to assemble itself (Kwon 2004). Site is not so much a result of punctual, external causes, therefore, as it is an insertion in to one or more flows.<sup>34</sup>

Fifth, non-representational theory is experimental. I make no apologies for this. After all, ‘no battle has ever been won without resorting to new combinations and surprising events’ (Latour 2005: 252). In particular, I want to pull the energy of the performing arts into the social sciences in order to make it easier to ‘crawl out to the edge of the cliff of the conceptual’ (Vendler 1995: 79). To see what will happen. To let the event sing you. To some this will appear a retrograde step: hasn’t the history of the social sciences been about attaining the kind of rigour that the performing arts supposedly lack? My answers are fourfold. First, I believe that the performing arts can have as much rigour as any other experimental setup, once it is understood that the laboratory, and all the models

that have resulted from it, provide much too narrow a metaphor to be able to capture the richness of the worlds (Despret 2004). Consider just the rehearsal: would anyone seriously say that it is not a rigorous entity? Second, because once it is understood how many entities there are in the world, of which we are able to name but a few, then capturing the traces of these entities, even for a brief moment, will clearly involve unconventional means, a kind of poetics of the release of energy that might be thought to resemble play. After all, who knows what entities and processes lurk in the under- (or should it be over-) growth, just getting on with it? Third, because the performing arts may help us to inject a note of wonder back into a social science which, too often, assumes that it must explain everything. I am often bemused by the degree to which scientific and artistic works are allowed to evince wonder (Fisher 2002). Yet it often seems as if the extraordinary emergences of the ‘social’ world have to be treated in a different register, as stumbling, inertial and ‘mundane’ (Abrahams 2005). But any glance at the kinds of columns that tend to appear in newspapers and magazines under bylines such as ‘odd world’, ‘strange world’, ‘this world’, ‘funny old world’, and so on, show the essential ebullience of that world and the way in which it can never be truly kept within theoretical tramlines. Social imaginaries are just that: they cannot be contained. Thus ‘retracing the iron ties of necessity is not sufficient to explore what is possible’ (Latour 2005: 261). Instead, social science needs to take on the quality of renewal that it can see all around it as new collectives constantly come into existence: ‘for a social science to become relevant, it has to have the capacity to renew itself – a quality impossible if a society is supposed to be “behind” political action’ (Latour 2005: 261). Finally, because it is imperative to understand the virtual as multiple registers of sensation operating beyond the reach of the reading techniques on which the social sciences are founded. Culture is, in this sense, an ‘involuntary adventure’ (Toscano 2004) in which, in a Whiteheadian vein, thought is the operation that constitutes the thinker (who is constituted in the occasion), rather than vice versa (Alliez 2004a). This brings me directly to the topic of affect.

Thus, sixth, I want to get in touch with the full range of registers of thought by stressing affect and sensation. These are concept-percepts that are fully as important as signs and significations but that only recently have begun to receive their due. Recently, like a number of authors, I have taken an affective turn with this work, drawing on a combination of Spinoza, Freud, Tomkins, Ekman, Massumi, and a host of feminist theorists, as well as biological traditions including evolutionary theory and ethology, in order to understand affect as the way in which each ‘thing’ in acting, living, and striving to preserve its own being is ‘nothing but the actual essence of the thing’ (Spinoza *et al.* 1997). Thus,

There is no longer a subject, but only individuating affective states of an anonymous force. The plane is concerned only with movements and rests, with dynamic affective charges: the plane will be perceived with whatever it makes us perceive, and then only bit by bit. Our ways of living, thinking or writing change according to the plane upon which we find ourselves. (Spinoza, cited in Alliez 2004b: 27)

All of this said, I do want to retain a certain minimal humanism. Whilst refusing to grant reflexive consciousness and its pretensions to invariance the privilege of occupying the centre of the stage, dropping the human subject entirely seems to me to be a step too far. I have done much to rid myself of an object that often seems to me to be a user-illusion – in

my writings, there is ‘no longer such a thing as a relatively fixed and consistent person – a person with a recognizable identity – confronting a potentially predictable world but rather two turbulences enmeshed with each other’ (Phillips 1999: 20). Still, I am uncomfortably aware that, taken to extremes, a resolutely anti-humanist position parodies the degenerative path taken in the nineteenth century from Rousseau through Balzac to Bergson, from ‘an ideal of an immanent community, the subsequent emergence of a strictly codified bourgeois subject capable of constructing and manifesting itself “aesthetically” through gesture and the eventual somatization of that individual body to a condition of mere potentiality’ (Hewitt 2005: 103). This degeneration can be seen equally as a movement from intention to automation as the industrial systems of that century took hold. Whatever the case, I want to keep hold of a humanist ledge on the machinic cliff face. I hold to a sense of *personal authorship*,<sup>35</sup> no matter that the trace is very faint and no matter that the brain is a society, different parts of which are dynamically and differentially connected to all manner of environments. And the reason? Because how things seem is often more important than what they are.

The fact is that it seems to each of us that we have conscious will. It seems we have selves. It seems we have minds. It seems we are agents. It seems we cause what we do. Although it is sobering and ultimately accurate to call this an illusion, it is a mistake to think the illusory is trivial. (Wegner 2002: 341–342)

Further, this conscious will is bolstered in at least three ways. To begin with there is the special constitutional significance of joint action and its particular way of understanding the worlds (Levinson 2003). Then there is the consequent ability of joint action periodically to work across different social fields, refusing to respect boundaries. And finally there is the ‘adaptive unconscious’ (Wilson 2002) working ceaselessly and nonconsciously to interpolate/interpellate the world. These are not insignificant qualities and they give a significant role to style, a particular way of practising joint action that can be equated to agency in this book.

My stamping ground for these kinds of thoughts has often been dance, but it could just as well have been building or music, two other baseline human activities which, so far as I am aware, are found in all societies, including those of the greatest antiquity. For my purposes, dance is important: it engages the whole of the senses in bending time and space into new kinaesthetic shapes, taps into the long and variegated history of the unleashing of performance,<sup>36</sup> leads us to understand movement as a potential,<sup>37</sup> challenges the privileging of meaning (especially by understanding the body as being expressive without being a signifier; see Langer 2005; Dunagan 2005; Gumbrecht 2004), gives weight to intuition as thinking-in-movement, foregrounds the ‘underlanguage’ of gesture<sup>38</sup> and kinetic semantics in general (Sheets-Johnstone 2005), teaches us anew about evolution (for example by demonstrating the crucial role of bipedality), and is able to point to key cognitive processes like imitation and suggestion which are now understood to be pivotal to any understanding of understanding (Hurley and Chater 2005) and, indeed, desire.<sup>39</sup>

The foregoing paragraphs allow me to say something, finally, about ethics.<sup>40</sup> I have been painting a very faint view of human agency, to put it mildly. The classical human subject which is transparent, rational and continuous no longer pertains. Classical ethical questions like ‘What have I done?’ and ‘What ought I to do?’ become much more difficult when the ‘I’ in these questions is so faint, when self-transparency and narratability are

such transient features. Similarly, more modern ethical questions like what it means to be genuinely open to another human being or culture take on added layers of complexity. Clearly, becoming ethical now means becoming critical of norms under which we are asked to act but which we cannot fully choose (Butler 2005) and taking responsibility – in a sense to be specified – for the dilemmas that subsequently arise. But this hardly counts as a revelation.

What I will want to argue for, in concert with Santner (2001: 6), is a generalized ethic of out-of-jointness within which ‘every familiar is ultimately strange and ..., indeed, I am even in a crucial sense a stranger to myself’. But, rather than see this form of answerability as a problem, it can as well be thought of as an opportunity to build new forms of life in which ‘strangeness itself [is] the locus of new forms of neighborliness and community’ (Santner 2001: 6). In turn, this ethic of novelty can be connected to the general theme of ‘more life’, for it suggests a particular form of boosting aliveness, one that opens us to our being in the midst of life through a thoroughly ontological involvement.<sup>41</sup> For, what is clear is that all too often in our everyday life we are *not* open to that pressure and do not inhabit the midst of life, and thus live everyday life as, well, everyday life, clipping our own wings because we inhabit cringes that limit our field of action.

Everyday life includes possibilities for withdrawing from, defending against, its own aliveness to the world, possibilities of, as it were, not really being there, of dying to the other’s presence. The energies that constitute our aliveness to the world are, in other words, subject to multiple modifications and transformations. (Santner 2001: 9)

Some commentators would, I think, like to understand boosting this out-of-jointness as part of a more general rediscovery of piety – or even epiphany – often heralded as part of a move to a ‘post-secular spirituality’ (e.g. Goodchild 2002; Gumbrecht 2004; Braidotti 2006). Sometimes following on from Deleuze’s thoughts on ‘becoming-imperceptible’ in which extinguishing the self allows all kinds of unexpected futures to be opened up and drawn strength from. This is ‘reversing the subject to face the outside’ (Braidotti 2006: 262), thus boosting *potential*: in Jamesian terms it is the jump towards another world. Whilst, hardly surprisingly, I am sympathetic to the general direction of travel, this is too grand and seductive a vision for me. I would prefer to see a multiple set of projects concerned with the construction of an orientation to the future, the development of ‘an anxiety about the future which is analogous to Orwell’s anxiety about the loss of the past and of memory and childhood’ (Jameson 2005: 23), which is, at the same time, the development of a method of hope (Miyazaki 2004, 2006). In more conventional philosophical terms, this might, I suppose, be thought of as a flourishing of potential in act,<sup>42</sup> not in the sense of the realization of some proper form, but rather as a departure from what is – a potentiality that is brought into being only as it acts or exists in the interstices of interaction. But I would also prefer to see it in another way, as an attempt to re-gather the ethic of *craftsmanship*, a means of composition and channelling which involves bringing together discipline and concentration, understanding and inspiration, in order to bring out potential: a different model of *homo faber*, if you like, working both for its own sake and as part of a community of ability.<sup>43</sup> At the same time, this ethic, following on from a long line of thinking which has tried to overcome nihilism and determine the conditions for an affirmation of life, can be seen as a means of celebrating the joyous, even transcendent, confusion of life itself (Reginster 2006).

Isn't this something to have faith in? The stuff of life, the astonishing, resilient, inventiveness of it all? The extravagant iridescence in the wings of butterflies. The minute convolutions of Henle's loop in the human kidney, 'like the meanders in a creek'. The song of the Albert's lyrebird, which takes it six years to learn and segues the phrasing of every other bird in the Queensland bush. At times, the gratuitousness of creation, its sheer wild playfulness, can only be understood as a kind of unscripted comedy. (Mabey 2006: 197)

Finally, I want to broach the topic of space again. For substantive rather than narrow disciplinary reasons, space looms large in what follows. That said, I start from an 'instinctive' understanding of space shared by all the 'field' disciplines – anthropology, archaeology, architecture, geography and large parts of performance studies. This is a sense of the concreteness and materiality of the situation which is hard to put into words, a need to capture being there which is not just a report back – a finding which is also a leaving. Straightaway, I hasten to add that this is not just an excuse for the random empiricism of which such disciplines are sometimes accused. But it has certainly complicated the use of categories which are often assumed to in some way motivate social change (society, class, gender, ethnicity, and so on) because it places variation on an equal footing. And it also complicates what is assumed to be a simple empirical fact, not just because all of these disciplines try to deepen those facts by drawing on all kinds of representational and non-representational registers (digs, ethnographies, various maps and diagrams, buildings, software, performances) but also because they simultaneously explore how particular spaces resonate, obtain their particular 'atmosphere' (Brennan 2004; Sloterdijk 2005a, 2005b), so that the whole is more than the sum of the parts.

I hope that this makes it clear that space is not a metaphysics, nor is it a transcendental principle of space in general (the phenomenological idea of consciousness as the fount of all space, produced by a finite being who constitutes 'his' world), nor is it simply a series of local determinations of a repeating theme. In each of these cases, we can see that the very style of thought is 'oriented by spatial relations, the way in which we imagine what to think' (Colebrook 2005a: 190).<sup>44</sup> Rather, it is three different qualities in one. First, it is a practical set of configurations that mix in a variety of assemblages thereby producing new senses of space<sup>45</sup> and:

By confronting all those events from which thought emerges, by thinking how there can be perceptions of spaces, we no longer presuppose an infinity to be represented; nor a finite being who constitutes 'his' human world (as in phenomenology) but an 'unlimited infinity'. Each located observer is the opening of a fold, a world folded around its contemplations and rhythms. There are as many space and folds as there are styles of perception. If a fold is the way perceptions 'curve around' or are oriented according to an active body, the thought of these curves produces a life that can think not just its own human world – the space of man – but the sense of space as such. (Colebrook 2005a: 190)

Second, it also forms, therefore, a poetics of the unthought, of what Vesely (2004) calls the latent world, a well-structured pre-reflective world which, just because it lacks explicit articulation, is not therefore without grip. Third, it is indicative of the substance of the new era of the inhabitable map in which space has more active qualities designed into its becoming – a tracery of cognitive and pre-cognitive assists threading their way

through each and every moment of the being-at-work of presentation – which make it into a very different ground from the one that Heidegger imagined as presence.

So far as space is concerned, what I have been most concerned with is banishing nearness as the measure of all things (Thrift 2006b). It is a staple of the literature that a drive towards nearness is regarded as having an intrinsic value. For example, think of all the terms that imply nearness in the philosophical tradition: present-at-hand, flesh, thrownness. In part, this terminological profusion arises from the idea that closeness to the body is the main geometer of the world (Ginzburg 2001b). But this is to take the biological body as an interpellated centre (Gil 1998) with a definable fleshy inside. But even an organ like the gut can as well be thought of as an outside as an inside (Probyn 2005), as a logistics of the movement of things which can be mapped on to the world.<sup>46</sup> And this is without going into the obvious political dangers of identifying the body as a preformed entity. At the same time I do not want to stray into the ambient pieties of some parts of the phenomenological tradition or their collapse into an absolute alterity<sup>47</sup> or a spiritualist immanence<sup>48</sup> (Toscano 2004). Instead I want to substitute *distribution* for nearness or ambience. Why? Well, to begin with, because the paradox of space is that we all know that space is something lived in and through in the most mundane of ways – from the bordering provided by the womb, through the location of the coffee cup on our desk that is just out of reach, through the memories of buildings and landscapes which intertwine with our bodies and provide a kind of poetics of space, through the ways in which vast political and commercial empires – and the resultant wealth and misery – can be fashioned from the mundane comings and goings of ships and trains and now planes, through to the invisible messages that inhabit the radio spectrum in their billions and etch another dimension to life. Then, because there is no need to reduce such complexity to a problematic of ‘scale’, a still too common move. Actors continually change size. A multiplicity of ‘scales’ is always present in interactions; the putatively large is of the same kind as the small, but amplified to generate a different order of effects (Strathern 1999; Tarde 2000). Then, because we now understand that the spaces and rhythms of the everyday, everydayness and everyday life (Seigworth 2000) are not just a filigree bolstering an underlying social machine but a series of pre-individual ethologies that incessantly rehearse a materialism in which matter turns into a sensed-sensing energy with multiple centres. Then, again, because increasingly what counts as a ‘we’ is being redefined by a range of transhuman approaches. These approaches have not just, in what has now become an increasingly hackneyed move, undone the dependence of the point of view on a preformed subject. They have also increased the number of actors’ spaces that can be recognized and worked with. Consequently, they have begun to redefine what counts as an actor, most especially through an understanding of the actor as an artefact of different territories of ‘thought’, conceived as the operations that constitute the thinker.<sup>49</sup> This ‘onto-ethological’ move can be made precisely because actors can now be seen to not just occupy but to be made up of all kinds of intermediary spaces which cannot be tied down to just one and simultaneously participate with each other. The world, in other words, is jam-packed with entities. Finally, because more and more of the sensory registers in which spaces make their marks as spaces seem to be being recognized,<sup>50</sup> no doubt in part because these registers are continuously expanding but also in part because the sheer cultural diversity of how space appears is increasingly being recognized as more than culture or body (e.g. Levinson 2003; Wilson 2004).

## The Book

Having outlined some of the main tenets of non-representational theory, let me now move to the book itself. This book is motivated by a heterogeneous series of inspirations, rather than just one. I will point to a theoretical agenda first. I do not subscribe to the spirit guide approach to social science. Thus, for example, though I take Deleuze's work on topics like the gap between sensation and perception, the difference between possibility and virtuality, the heterogenesis of both material density and subjective action from a pre-individual field, and the different time images of repetition and recurrence, to be important, I am afraid that this has not produced a total makeover of my work in a way that has now become quite common in some quarters, a makeover that sometimes seems to resemble a religious conversion. There are elements of Deleuze's work that I remain out of sorts with<sup>51</sup> and, in any case, I do not think that it is the function of a social scientist to simply apply the work of philosophers (as in a Deleuzian approach, a Foucauldian approach, an Agambenian approach, and so on). It seems to me to be a highly questionable assumption that modern social science stands in this kind of subordinate relationship to a set of themes from Western philosophy<sup>52</sup> or should see its task as simply echoing the assumptions those themes may make. So far as I am concerned, social scientists are there to hear the world and to make sure that it can speak back just as much as they are there to produce wild ideas – and then out of this interaction they may be able to produce something that is itself equally new. But they must share with philosophers like Deleuze one ambition at least and that is to render the world problematic by elaborating questions. To simply offer solutions is not enough.<sup>53</sup>

At the same time, in recent years, there has been an equal tendency to argue that social science must be more practical, policy-oriented, and so on, a tendency which risks losing touch with wild ideas completely; it is the kind of social science that does not understand the basic point that it is producing a form of intelligibility which 'can only confirm the prevailing views within those institutions that generated the data' (Rawls 2002: 54) and in fetishizing the values of methodological rigour seems to me to miss a large part of the point of social science by purposefully going about deadening itself (Law 2004) when that is both pointless and unnecessary.<sup>54</sup>

Instead of all that, this book is about new kinds of practice which are compelled by their own demonstrations and therefore leave room for values like messiness, and operators like the mistake, the stumble and the stutter (Law 2004). To some these practices will appear to be just idle chatter but I prefer to see them as vehicles for bringing into view the conditions of meaning, not so much a means of going further as a technology for tackling inconceivability (Fenves 1993). After all, and this point is crucial, it seems to me to be of the greatest methodological importance to knowledge that this is a world which we can only partially understand. Not only is it the case that many things are inherently unknowable but also, as Latour (2005) has pointed out, there is every reason to believe that we are surrounded by innumerable hybrids, only a few of which we have named and even fewer of which we can claim to understand. For example, who can truly say that they fully understand the forces we tag as 'affect'? The fact that we (itself a difficult category) must live surrounded by an ocean of hybrids whose nature we do not know or at best imperfectly understand because we bleed into them in so many odd ways means that all kinds of things just seem to show up because we are unable to trace their genealogy or all the forces that trigger how they participate in an event. Some see this as a problem. But I see it as an opportunity, and as a demonstration that there will always be more to do – which brings me to my next point.

Practically, the book arises from a number of political imperatives. The first is the growing realization that there are landscapes of space, time and experience that have been ceded too readily to powerful naturalizing forces which erase the prospect of political action even before it starts by producing *backgrounds*, latent worlds that, by virtue of their routinized, ‘unrememberable but unforgettable’ (Gerhardt 2004) natures, make certain aspects of the events we constantly come across not so much hard to question as hard to even think of as containing questions at all. In the past, there have, of course, been various politics of ordinary moments which have attempted to show that what might seem like supposedly trivial everyday affairs can have import once the misplaced concreteness of social categories is factored out; wilful acts of political mis-perception and re-perception, if you like. I think here of aspects of surrealism, the fall-out from situationism, some forms of psychoanalytic and psychological therapy, the kinds of political theory that have recently grouped around the banner of a politics of the ordinary, the concrete empirical details of interaction to be found in ethnomethodology, certain kinds of architecture and site-specific installation, and so on. It also draws on those considerable parts of the arts and humanities, and especially art and poetry and dance, that call to the practices of everyday life. What I have tried to do here is to show that these traditions form a living whole with many of the same goals and projects in mind, a poetics of mundane space and time which can teach us to ourselves in better ways, that is ways which will allow peoples to survive their own environing (Wagner 2001) by creating more rather than fewer worlds. Such a poetics of the ways in which witnessable coherence is continually produced requires four things. First it requires a better sense of the future (Bloch 1986 [1959]) built up out of a forward-looking ethics of the moment which is not concerned with outright adjudication but instead tries to work with the affects/percepts/concepts of ‘stance’ or ‘style’. Second it requires serious attention to the spaces of the empirical moment that is built up out of examining the ways in which the spaces of situations are extruded. That may result in a poetics of the spaces of dreams and improvisations, of what Vesely (2004) calls ‘rich articulations’, that arise out of a deep respect for situations and which manifests itself in continually attempting to go beyond them. Third it requires attempting to let loose a certain kind of wild conceptuality which is attuned to the moment but always goes beyond it, which always works against cultural gravity, so to speak. This improvisatory virtuality provides an opportunity for an unsettled politics of advocacy which ‘watch[es] the world, listening for what escapes explanation by science, law, and other established discourses. Accounting for what established systems discounted as noise’ (Fortun 2001: 351). Fourth it requires a much better sense of the ways in which practices need objects against which to react and from which to learn, but these objects may have many versions (Despret 2004), many ‘offers of appropriateness’, to use a Latourian phrase. To summarize, what is being sought for is what might be described as an ethological ethic which is *gratuitously* benign. What I am aiming for is to produce a supplement to the ordinary labour of everyday life which is both a valediction and a sacrament, though I am sure that sounds entirely too grand. If I had to choose an analogy, it might be with Darwin’s furtive earthworms which, through continuous ingestion, work a good part of the world into existence. In Darwin’s later thought they stand for a lowly kind of secular creation myth; ‘something [is being said] about resilience and beneficial accidents; that it may be more marvellous when the world happens to work for us, than to believe it was designed to do so’ (Phillips 1999: 58).

Lest I be misunderstood (and this is a point on which there is a lot of misunderstanding, most of it wilful, it has to be said), I am *not* arguing that the back and forth of what we

currently call politics should be shut down. I do not think that the constant testing of the limits of what counts as the political implied by this project means that it is either a substitute for other forms of politics of the governed or even the invention of a determinate new political form (Amin and Thrift 2005; Chatterjee 2004). Rather, it is a halting means of producing more interest, identifying swells and overflows, and generating new forms of energy. ‘Modest’ has become an overused word, of late. But non-representational theory is genuinely intended to be a modest supplement.

Finally, this book is therefore self-consciously interdisciplinary. I have tried to avoid any particular disciplinary tradition in the arts and humanities and social sciences and to take inspiration from them all – or at least a good many of them. There is an important sense in which any politics of ordinary moments is bound to transgress these disciplinary boundaries since it involves so many different elements of discipline and indiscipline, imagination and narrative, sense and nonsense.... But each of these disciplines can be bent towards my overall goal: to produce a politics of opening the event to more, more; more action, more imagination, more light, more fun, even. This is not, I should hasten to add, meant to be a romantic or quixotic quest. It is meant to be in-your-face politics. Currently, many people are forced to live their lives in cramped worlds which offer them little or no imaginative relief because of the crushing weight of economic circumstance, the narrow margins of what they are allowed to think by what they have been taught and what lies bleeding around them and the consequently almost routine harrowing of their confidence that the world can ever be for them (Chakrabarty 2002; Chatterjee 2004). Yet, all that said, very many struggle to express something more than just resignation and inconsolability, often against themselves. They may value a certain conviviality, demonstrate hope, resolution, and a kind of dignity, even in the midst of melancholy. That is surely something remarkable, given most people’s restricted circumstances and prospects – and it must surely be something worth nurturing. Indeed, some do go further still. And in that process, they may strike out on to new practical-imaginative territories. Of course, these continuous rites of spring hardly mean that all is well in the world. But they do show that life pretty well always exceeds its own terms and conditions: it is not always captured by the small print of the social contract. There is hope that, in amongst the poisons of prejudice and general paranoia, some small beginnings can be made, summonings of what is not that can leap up and hear themselves, that are able to ‘seek the true, the real where the merely factual disappears’ (Bloch 2000 [1923]: 3).

## The Chapters

The rest of this book consists of a set of chapters which come from the project that I have been pursuing in various guises since the early 1980s under the banner of ‘non-representational theory’. The project was originally an attempt to take practices seriously against the background of a (thoroughly modernist, I should add) emphasis on unknowing (Weinstein 2005) but it has moved on from there, I like to think. For in studying practices in detail, it became clear to me that what was missing from too many accounts was a sense of mutability; of the moments of inspired improvisation, conflicting but still fertile mimesis, rivalrous desires, creative forms of symbiosis, and simple transcription errors which make each moment a new starting point. Whether studying the history of clocks, which is scattered with the unknown foot soldiers of innovation – tinkerers making myriad small adjustments which lead on to ‘bigger’ things (Glennie and Thrift

2007) – or the way in which styles of financial dealing transmute into new financial instruments (Leyshon and Thrift 1997), or the vagaries of all kinds of artistic performance (Thrift 2001), or the remorseless work of repair and maintenance (Graham and Thrift 2007), what I was increasingly concerned to underline was the ceaseless work of transmutation which drives the ‘social’. The social is in scare quotes here because I want to emphasize a set of associationist working assumptions that are in contradistinction to the views of ‘sociologists of the social’, by drawing (selectively) on the work of Tarde (2000) to produce a means of associating entities. First assumption: everything can be regarded as a society. Consequently, at a minimum, ‘there are many other ways to retrace the entire social world than the narrow definition provided by standardized social ties’ or, more generally, ‘social is not a place, a thing, a domain or a kind of stuff but a provisional movement of new associations’ (Latour 2005: 238). Thus, as Latour (2005: 239) nicely puts it, space can be made for ‘landing strips for other entities’ that have never been followed before, for emergent forms of life (Fischer 2003), or simply forms of life that have never come to notice before. Second assumption: always be suspicious that the difference between ‘large’ and ‘small’, ‘macro’ and ‘micro’, ‘general’ and ‘specific’ is necessarily significant. I am particularly sceptical of any explanation that appeals to scale. Third assumption: keep difference at the core of explanation.

To summarize my summary, non-representational theory asks three main questions. First it questions the divide between theoretical and practical work by ceding certain theoretical conundrums to practice. Second, by questioning what is in the world, it exposes a whole new frontier of inhuman endeavour, what might be called the construction of new matterings, along with their typical attachments, their passions, strengths and weaknesses, their differences and indifferences. Third, by intensifying the intensity of being, it is able to question the load of precognitive conditionings that make up most of what it is to be human. In other words, or so I will argue, it is possible to boost the content of bare life, making it more responsive, more inventive and more open to ethical interventions.

Insofar as it has a political agenda, then, this book is about the construction of new counterpublics through the assembling of more performative political ecologies. At its heart, in other words, is a pressing task of political experiment and invention, a work of ‘ensoulment’<sup>55</sup> (Santner 2006), aimed at making more room in the world for new political forms, which, at the same time, produces new excitations of power; ‘those enigmatic bits of address and interpellation that disturb the social space – and bodies – of ... protagonists’ (Santner 2006: 24). This is a task that seems vital in an age when politics too often ends up in declarative cul-de-sacs.<sup>56</sup> Further, this politics of effective togethernesses (Stengers 2006) is, so I believe, currently breaking out all over. The numbers of experiments currently taking place with new political forms of effective togetherness are legion, and I cannot list them all here. But, for example, there are the many attempts to forge a new urban politics which can comprehend and work with belonging-in-transience (Amin and Thrift 2005a and b). Then there are all the experiments aimed at disrupting given spatial and temporal arrangements in an age when ‘the speed at which new products appear and reconfigurations of technological systems take place precludes the possibility of ever becoming familiar with a given arrangement’ (Crary 2004: 9). How is it possible, in other words, to group around states that are neither dependent on lasting objects nor on fixed locations? Then, there are the myriad experiments that set out to invent flexible models of imagination and narrative outside the enforced routines of consumption. And, finally, there are all the experiments that want to understand and work

with the ‘animality’ of bare life, both as a means of understanding what elements of being are included but do not count and as a means of tapping that vital force.

The subsequent chapters in this book are inter-connected. They were often written with one another in mind. Sometimes they purposely follow on one from the other. They make their way as follows. The first four chapters of the book, which form its first section, act as an extended prologue by offering a tentative description of how the world is now. The first chapter attempts to give a description of some of the main contours of experience that currently exist in the West by concentrating on the business of commodity production. My intention is to show how the forces of business are reshaping the world we live in, reworking what we call experience along the way. I do not want to claim any particular power of insight here. The tendencies that I will describe have been extant in prototype form for a number of years now, and in some cases their origins can be traced even earlier. It would also be possible to argue that they have been prefigured in a number of places by authors who want to give up on the land of remorselessly monopolist accounts of capitalism that act as a kind of intellectual and political bulldozer (Amin and Thrift 2005b).<sup>57</sup> I think of Michel Callon’s work on an economy of qualities, Luc Boltanski and Eve Chiapello’s work on new forms of economic justification, Edward Lipuma and Benjamin Lee’s work on circulating capitalism, Celia Lury’s work on brands, Lev Manovich’s work on new media, the work of Paolo Virno and Maurizio Lazzarato on intellectual labour and ‘immaterial’ capitalism, the allied work of Moulier Boutang and others on cognitive capitalism, or even, to travel farther back in time, Alvin Toffler’s coining of the term ‘prosumerism’. Put baldly, I want to point to three formative tendencies that now structure – and rule – experience in capitalist economic formations: prospecting across the whole of bodily experience, but most especially in the ‘anteconscious’, thus reworking what is regarded as labour, class, invention and, indeed, much of what was traditionally regarded as political economy; attempting to produce instant communities, worlds gathered around products and production processes which themselves become a vital part of what is regarded as product and production process;<sup>58</sup> reworking space and time so that they fit this new kind of life, most especially by producing new prostheses which are also additions to cognition and precognition.

Most importantly I want to zero in on this latter process. It is possible to argue that the most important reworking of experience that is currently taking place is the production of new kinds of not just attentive and responsive but formative spaces which act as a generalized form of writing on to and in to the world, working especially at the level of bare life. This mass ‘production of worlds’, as Lazzarato (2004) would put it, consists not just of a multiplication of saleable ways of living, but also the symbolic indexing of these spaces so that they can continually generate what would have been thought of as ‘decisive moments’ with the result that these spaces can be constantly refreshed and so remain absorbing (see Thrift 2006b). If one of the most important cognitive leaps of the last few hundred years was the growth of writing in its many forms, now, or so I argue, a similar change in the structure of cognition is occurring but as a general process of the purposeful production of semiosis, in which space is both template and font. This is, in other words, the age of the inhabitable map (Fawcett-Tang 2005; Abrams and Hall 2006), an age intent on producing various new kinds of captivation through the cultivation of *atmosphere* or *presence* or *touch* (see Sloterdijk 2005a, 2005b; Zumthor 2006).<sup>59</sup> So, for example, when Wheeler (2006) points to a world perfused with signs, privileges emergence, and underlines the importance of responsiveness, I take this stance to be not just an outline of the lineaments of a new kind of political project but also a symptomatic

observation concerning a world in which spaces are taking on many of the characteristics of life. The trick, or so it seems to me, is to work with this emerging spatial grain, in the full understanding that it is both a part of a series of means of opening up new opportunities for the exercise of power and profit *and* a new palette of possibilities.

The three subsequent chapters fill out how the background of experience is changing in response to these three insistent imperatives. In essence, they are an attempt to move on from Deleuze and Guattari's famous aphorism from *Anti-Oedipus*, 'The unconscious is not a theatre, but a factory', by documenting how the unconscious has become both together, as the factory and the theatre have blended into each other. Thus 'Still life in nearly present time' considers the ways in which modern societies are experimenting with 'neutral' material backgrounds for commercial gain, burrowing into bare life in order to come up with the goods. I associate bare life with that small space of time between action and cognition and show the way firms have become ever more expert in operating on this new territory for commercial gain. It was one of my first attempts to show up how the backgrounds through which we live are changing as new disciplines have their say. '*Driving* in the city' is intended to demonstrate just how radically bodies are changing as they are augmented and extended by these backgrounds, as they subtly redefine what counts as experience. The chapter argues that de Certeau's understanding of walking as the archetypal transhuman practice of making the city habitable cannot hold in a post-human world. By concentrating on the practices of driving, I argue that other experiences of the city now have an equal validity. In other words, de Certeau's work on everyday life in the city needs to be reworked in order to take into account the rise of automobility. The bulk of the chapter is devoted to exploring how that goal might be achieved, concentrating in particular on how new knowledges like software and ergonomics have become responsible for a large-scale spatial reordering of the city which presages an important change in what counts as making the city habitable. 'Movement-space' takes a slightly different tack by arguing that the background of experience is being changed irrevocably by means of mass calculation which is, perhaps, better described as 'qualculation' with the result that every event turns up digitally pre-disposed, so to speak. The chapter then moves on to consider how this qualculative background is producing new apprehensions of space and time before ending by considering how new kinds of sensorium may now be becoming possible. I illustrate this argument by considering the changing presence of the hand, coordinate systems, and language, thereby attempting to conjure up the lineaments of a new kind of movement-space.

The second section attempts to articulate some of the political stakes that arise from non-representational theory. Written in the late 1990s the single chapter in this section forms a kind of pivot. 'Afterwords', was an attempt to make a definitive statement about non-representational theory by focusing particularly on the motif of performance as the key to a politics of experiment. It is intended as a message of hope, of a longing for a future of stutter and clutter that can produce new places within which more interesting practices are able to produce more habitable worlds (Miyazaki 2006).

Having sketched in a background, I can then move on to some more recent work. Non-representational theory has been interpreted by some as being simply a political message of unbridled optimism. That is not the case. As if to prove it, the book ends on a darker note, emphasizing that the quest for a new kind of political that I want to follow may try to multiply positive apprehensions, but that it is not therefore a quixotic quest for the new moral styles we so desperately need (Appadurai 2006). Indeed, I hold to a tragic view of human life insofar as I believe that history is one long stumble into the unknown,

and it cannot be tied down and ordered in the way that too many social theorists imply with their too neat theories. Most particularly, it would be foolish to deny some of the more unsavoury facts of existence. Nature is both astonishingly prolific, able to produce infinite variation and exquisite adaptation, and abundantly and unremittingly cruel. Nature does not take sides. The cost of what Nietzsche called ‘more life’ is depredation on a scale we can hardly comprehend: who could sum the number of violent deaths that casually occur around the world every second or claim to understand this sublime destructiveness?

Human being does not stand outside nature. It is full of all kinds of impulses which are outside its comprehension and are the other (I will not say negative) side of this equation, impulses that can be likened to Freud’s death instinct in their capacity to undo connections and destroy life. In the last section of the book, I start to address some of these issues, and, most particularly, the issues of anger, rage and humiliation, by concentrating on the issue of affect, for what it seems important to underline is that a clarion call for ‘more life’ is disingenuous, even misleading, without some understanding of the surpluses of anger, rage and humiliation that have been unleashed as a result of the ‘predatory narcissisms’ (Appadurai 2006) that characterize too much of the modern world.

The last four chapters in the book which form its final section point to the need to think about affect as a key element of a politics that will supplement the ordinary. What is certain is that understanding affect requires some sense of the role of biology, however understood. The first chapter, ‘From born to made’, is an attempt to come to terms with that legacy of thought and practice by taking up some of the themes from the first part of the book and pulling them into the third. It is particularly concerned with forging new links between biology and technology by delivering a set of shocks to the meaning of accepted categories like ‘nature’ and ‘technology’, especially by relying on the Whiteheadian dictum that ‘nature is a theatre for the interrelation of activities’ (Whitehead 1978: 140). To achieve these dual aims, the chapter double clicks on the icon ‘intelligence’. ‘Intelligence’ prioritizes the *active shaping of environments*. It thereby allows space for the spaces of the world to themselves become a part of intelligibility and intellect as elements of distributed cognition and distributed pre-cognition. The chapter argues that such a conception of sentience can provide a series of new perspectives, as well as a pressing ethical challenge. I then move to a consideration of the political stakes that the deployment of affect entails against the background of the active engineering of pre-cognition. In the chapter ‘Spatialities of feeling’ I outline what a politics of affect might look like and especially the more explicit politics of hope that is currently struggling to be born out of an analysis of the affective swirl that characterizes modern societies. However, I take seriously the criticism of this kind of work, that it has tended to neglect the many forms of violence and repression that infest the worlds and knock it around. Thus I try to counterbalance the politics of hope that I espouse with some sober reflections on the affective substrate in which it is embedded and from which it cannot be simply divided. Thus the chapter ‘But malice aforethought’ considers the affective life that is to be found in modern cities, concentrating on the idea that sociality does not have to mean that citizens automatically like each other. Indeed, modern cities are drenched in dislike and even hatred, and I argue that this misanthropic fact needs to be taken fully into account in any narrative and politics of affect. Finally, ‘Turbulent passions’ considers how we might better understand the realm of political feeling by concentrating on the affective technologies through which masses of people become primed to act. I argue that this is a pressing political task, given that the systematic

manipulation of ‘motivational propensity’ has become a key political technology. But in order to arrive at a diagnosis of the affective swash of the present, I argue that social science needs to draw on approaches that are willing to countenance a formative role for the biological. I therefore turn to two strands of work, one that directly revalues the biological, the other that calls on ethological models and analogies. Using these different but connected strands of work, I am able to move to such a diagnosis. My argument is that a series of affective technologies that were previously used mainly in the corporate sphere to work on consumer anxiety, obsession and compulsion are now being moved over into the political sphere with mainly deleterious consequences. However, this process of transmission also suggests some interesting counter-politics based on the cultivation of contrary affective motion, not what Appadurai (2006) calls the ‘runaway acts of mutual stimulation’ which are so prevalent in a media-saturated age but something much more interesting.

## Notes

- 1 I had originally considered calling this introductory chapter ‘Sacraments of expression’ after Whitehead but Whitehead means something rather different and there seems no point in confusing the issue. The reference to the superfluous intentionally echoes Voltaire’s famous dictum.
- 2 I agree with Connolly (2005: 166) that ‘running the experiment may be the best way to test the claims’.
- 3 I understand social theory as an art of controlled speculation, not as a faithful rendition of what may be going on, as if that were indeed possible.
- 4 Throughout the introduction, I use the plural term ‘the worlds’ in preference to the ‘the world’ in order to signify that I am trying to describe a set of different but attuned worlds rather than just one order of being, a move prompted by traditions as diverse as von Uexküll’s discussion of *umwelten* and contemporary discussions of postcolonialism.
- 5 It follows that I do not believe that experience has in some way been radically downgraded or made problematic in the contemporary world, in the style of Benjamin or Agamben (see Docherty 2006). There is, in my opinion, no general crisis of modernity: there are plenty of crises to be going on with.
- 6 Most especially, because publics, as peoples to come, are a conjunction of forces which will always exceed any given human intention.
- 7 I am uncomfortably aware of the complicated theoretical apparatus that I have myself used to reach these conclusions.
- 8 It is worth recalling that, according to the *Oxford English Dictionary*, ‘vocation’ originated in the Latin noun of action, *vocare*, meaning to call or summon. This meaning fits my purposes well.
- 9 Lotringer is reproaching Hardt and Negri, justifiably so far as I am concerned.
- 10 This phrase has become associated with the work of Ernst Bloch and I would want to affirm Bloch’s general direction whilst dissociating it from his theory of history.
- 11 As in rhythm, play, and kinetic markers such as running, chasing, fleeing, jumping, falling, and so on (Sheets-Johnstone 2005).
- 12 That is, following being in its genesis, by accomplishing the genesis of thought in parallel with the object. So far as I am aware, the term was first used by Simondon.
- 13 I have not used the word experience because so many philosophical traditions associate that word with interpretation, that is with acts of the attribution of meaning.
- 14 In particular, I would point to the important work being done in human geography by Ben Anderson, J.D. Dewsbury, Paul Harrison, Eric Laurier, Derek McCormack, John Wylie, and others.
- 15 Pred’s is a useful term because it does not presuppose a specific *spatial location* (such as the biological body) or any necessary sensory modalities.

- 16 For a very clear introduction to this line of thought and its implications, see Middleton and Brown (2006),
- 17 This is one of my main objections to actor-network theory: its curiously flat tone arises from the filters it puts up on what can be included in the world, in a way that, for example, Whitehead's philosophy – which includes feelings as 'concrete elements in the nature of actual entities' – does not.
- 18 This is a word that needs to be used with care, given its history (Wegner 2002). But I also think that the word's brutal edge is important in pointing to the way in which instinct is laid down. I take the unconscious as normally understood to be one part of bare or creaturely life, a specific mode of expressivity.
- 19 Though I am extremely sceptical of the current tendency to mark out pretty well anything with a bio prefix.
- 20 Donald (2001) suggests that the analogy of computation as a means of describing cognition is inaccurate. A better analogy would be digestion.
- 21 In other words, being human involves the evolution of the capacity to have beliefs about beliefs, the evolution, in other words, from behaviour readers to mind readers (Sterelny 2003).
- 22 The crucial role of language as affect should be noted here; see Riley (2005).
- 23 Echoing Wittgenstein's observation that what underlies a number of features of language-games, including the following of rules, is the brute 'natural' fact that people just do continue in certain ways in certain situations.
- 24 Objects are often thought of as interpretable, in that they demand an unreciprocated affection which is a part of person-making. In other words, 'there are no interpretable objects or intentional objects, only what counts as an interpretable object or, better, groups of people who count as interpretable and who, accordingly, deal with certain objects in recognizable ways' (Tamen 2001: 3).
- 25 This is actor-network theory's presupposition of symmetry formalized.
- 26 Which still implies intensive corporeal organization.
- 27 But there is another feminist tradition, of course; see, for example, Parisi (2004).
- 28 A point that Donna Haraway makes well in her critique of actor-network theory.
- 29 In any case, flesh, under the imperatives of bioscience, is itself rapidly becoming the subject and object of numerous technological ensembles which are rapidly making it portable, and which, in certain accounts, are extending the imperatives of farming to the human world (Sloterdijk 2006).
- 30 This is why I am suspicious of making too easy links between labour and existence, a point often made by Lévinas.
- 31 Many of the same points can apply to occasions of humour or embarrassment; see Billig (2005).
- 32 See, especially, the book by Soden (2003) on falling.
- 33 Kwinter stresses the tool-less nature of this activity but this aesthetic is relative, to put it mildly.
- 34 We should not make too much of this, of course. At different times in history, various means of producing continuously bounded sites have been invented that have stabilized sites over long periods of time. A good example is barbed wire (see Netz 2004).
- 35 What exactly I mean by this is outlined in some detail in Chapter 6 of this book.
- 36 And not in some naïve way in which the history of dance as complicit with social structuring.
- 37 Most particularly, dance provides an understanding of style as a particular way of doing body; 'dance would be the style not as that which is added on to a body in creation itself: style not as that technique through which creation takes place but as pure creativity with no end or ground outside itself' (Colebrook 2005b: 8). The body is neither a norm towards which bodies ought to strive nor a mere existing that expresses some prior norm of human creativity. However, I retain some scepticism about the residual romanticism I find in this quasi-Deleuzian point of view which is why I finally prefer Deleuze and Guattari's later work on territorialization.
- 38 See McNeill (2005). I have tried to take in the whole spectrum of senses since my early work. See, for example, my writing on smell and on vision. I am particularly impressed by the histories of the senses currently coming out of North America (see Rath 2003).
- 39 Thus I have become very interested in the possibilities of transposing imitative theories like that of Tarde with the kinds of conflictual mimesis championed by Girard (cf. Fleming 2004).
- 40 I should add that I start out from the assumption that

there is no essence, no historical or spiritual vocation, no biological destiny that humans must enact or realize. That is the only reason why something like an ethics can exist because it is clear that if humans were or had to be this or that substance, this or that destiny, no ethical experience would be possible, there would only be tasks to be done. (Agamben 1993: 43)

- 41 Thus, 'God is above all the name for the pressure to be alive in the world, to open to the too much of pressure generated in large measure by the uncanny presence of my neighbour' (Santner 2001: 9). Or, as Latour (2002: 7) puts it, in a thoroughly Whiteheadian vein, 'God is the feeling for positive, instead of negative prehensions'.
- 42 In Aristotelian terms, as *energeia*. It is worth remembering that in past times art and craft were much more closely bound together: indeed the word for craft used to be 'art'. This is an occlusion that I want to see revived as a politics. Additionally I would want to see the meaning of craft broadened out to cover activities such as teaching and the like, which are too often excluded from its orbit.
- 43 The metaphor of craftsmanship has other benefits too, for example, a willingness to explore ambiguity, a commitment to the task for its own sake, and its often tacit nature.
- 44 That does not just mean the spatialization of experience as an always having been possible (see Middleton and Brown 2006) but also the way in which spaces feel.
- 45 This very perception may itself be historically specific, of course. See Wall (2006).
- 46 Given the size of the gut – its surface area would cover a small room if laid out flat – this really would be a geography.
- 47 As in the work of Emmanuel Lévinas.
- 48 As in the work of Michel Henry.
- 49 A restatement of the classic point that thought cannot be divorced from its object, understood now as meaning that 'the ontology of the sensible is not separable from the constitution of material assemblages and processes themselves' (Toscano 2004a: xxi).
- 50 See, in particular, work on the spaces of sound and especially the efforts to reconstruct historical soundscapes (e.g. B.R. Smith 1999; Rath 2003; Sterne 2003).
- 51 For example, I believe that Deleuze and Guattari's work suffers from a residual structuralism (see Schatzki 2002) and too great an emphasis on an unalloyed 'bliss action' (Deleuze 1988b: 28).
- 52 Indeed, I am highly sceptical that the history of Western thought could ever be written as if it were simply the history of a set of philosophical excursions.
- 53 'In fact, a philosophical theory is an elaborately developed question, and nothing else; by itself and in itself, it is not the resolution to a problem, but the elaboration, to the very end, of the necessary implications of a formulated question' (Deleuze 1991: 116).
- 54 I should add that I think this manuscript is amongst the last that will take on such a dreary form. It seems clear to me that to do justice to the ambitions of much of what I am writing about requires a new cursive register, one that mixes all manner of media and presentational styles in order to achieve its goals, that can roll out at different *speeds* and that, as a result, can really perform.
- 55 Conceived of as if by Malebranche, as the natural prayer of the soul, an attentiveness to all living creatures.
- 56 It is, of course, possible to take the theoretical technology wielded in this book too seriously. As Gombrowicz put it with reference to existentialism:

It seems impossible to meet the demands of Dasein and simultaneously have coffee and croissants for an evening snack. To fear nothingness but to fear the dentist more. To be consciousness, which walks around in pants and talks on the telephone. To be responsibility, which runs little shopping errands downtown. To bear the weight of significant being, to install the world with meaning and then return the change from ten pesos. (cited in Simic 2006: 22)

- 57 Eagleton (2006: 26) puts it nicely in describing Jameson's style: 'it rolls its way across an intellectual landscape which it levels beneath it, emulsifying everything until connections become more insistent than conflicts'.
- 58 The evolution of new protocols carries on apace. Thus, since I wrote the first chapter, co-production with the consumer has become a new orthodoxy, signalled by its arrival in the pages of *Harvard Business Review*.

- 59 The reference to atmospheres consciously summons up the work of Peter Sloterdijk, whose work on spaces is, I think, the closest to what I am trying to achieve (see Sloterdijk 2005a, 2005b).

# CHAPTER 3

## Complexity

*John Urry*

In this essay, John Urry explains the science behind the idea of complexity. He is Professor of Sociology at Lancaster University. He has recently published *The Tourist Gaze* (2002), *Global Complexity* (2003), *Performing Tourist Places* (2004), *Tourism Mobilities* (2004) and *Automobilities* (2005).

### Introduction

The term ‘complexity’ has recently sprung into the physical and social sciences, humanities and semi-popular writings. Describing what it is and how it is organized is difficult since it is ‘present’ within very many scientific, social scientific and semi-popular discourses and practices. *Inter alia* these include alternative healing, architecture, consultancy, consumer design, economics, defence studies, fiction, garden design, geography, history, literary theory, management education, New Age, organizational studies, philosophy, post-structuralism, sociology, stock car racing, town planning, as well as most of the ‘physical sciences’ over the past two or so decades (Thrift, 1999).

In some ways it has become a global phenomenon and this makes it hard to disentangle its various components. ‘Complexity’ practices are constituted as something of a self-organizing global network that is spreading ‘complexity’ notions around the globe. Complexity researchers deploy the techniques of PR and branding, international meetings with ‘star’ speakers, guru worship, the use of global media and publishing, and networking, especially centred on nodes such as Santa Fe in New Mexico or the various research institutes named after the late Nobel prizewinner Ilya Prigogine (Waldrop, 1994).

There is a new ‘structure of feeling’ that complexity approaches both signify and enhance. Such an emergent structure of feeling involves a greater sense of contingent openness to people, corporations and societies, of the unpredictability of outcomes in time–space, of a charity towards objects and nature, of the diverse and non-linear changes in relationships, households and persons, and of the sheer increase in the hyper-complexity of products, technologies and socialities (Capra, 1996, 2001).

*Original publication details:* John Urry, “Complexity.” *Theory, Culture, & Society* 23, pp. 111–117. Sage, 2006. Reproduced with permission from Sage and J. Urry.

Thus economic and technological studies show there has been a huge increase in the number of components within products (Urry, 2003). The Eli Whitney musket of around 1800 had 51 components while the space shuttle of the late 20th century contained 10 million. Further, there are increases in the cybernetic contribution performed by architectures that integrate components through feedback loops. In 1970 the most valuable products in world trade were simple products produced by simple processes; a quarter-of-a-century later, nearly two-thirds of the products in world trade involve complex processes *and* complex products, with vast numbers of components, cybernetic architectures and socio-technical systems. This is linked with self-organizing and computerized networks that are continuously self-reproducing themselves across the globe, developing skills and structures necessary to innovate technologies to overcome obstacles or create new pathways.

A complexity structure of feeling brings out the paradoxes implicated in many contemporary processes. Thus the preservation of ‘nature’ seems to destroy many of the very things that nature lovers claim to value (Davis, 2000). There is no such thing as ‘nature’s balance’, no real or primordial nature that would be in equilibrium if only humans had not intruded. The effects of humans are subtly and irreversibly woven into the very evolution of landscape. And any ecological system is immensely complex so that there are never straightforward policies that simply restore nature’s balance, such as fish populations in the seas or rivers. Indeed many ecological systems themselves depend not upon stable relationships but upon massive intrusions of flows of species from other parts of the globe and of fire, lightning, hurricanes, high winds, ice storms, flash floods, frosts, earthquakes and so on. The ‘normal’ state of nature is not one of balance and repose. Such developments can only be seen over very lengthy periods of time, much longer than the lives of particular researchers or of research programmes. Moreover, populations of most species demonstrate extreme unevenness, with populations often rising rapidly when introduced into an area and then almost as rapidly collapsing. Extreme events demonstrate complexity where small changes in driving variables or inputs – magnified by feedback – can produce disproportionate outcomes.

There is no silent, docile ‘nature’, especially when confronted by new forms of ‘culture’. The contemporary complex world seems to involve highly adaptable viruses, such as Aids and ebola, new superbugs, newly lethal pathogens such as prions, and the reappearance of TB, cholera and the bubonic plague. Such a medicalized apocalypse appears to stem from new patterns of global travel and trade, the heightened ineffectiveness of antibiotics that encounter increased ‘resistance’, and the development of new powerful risk cultures beyond and within ‘medicine’ (Van Loon, 2002).

These and other developments seem to herald a relatively new set of hybrid systems neither natural nor social; neither ordered nor anarchic – that display high levels of complexity. A complexity structure of feeling is underpinned by an apparent lack of proportionality between ‘causes’ and ‘effects’. That we think of these hybrid systems as complex has stemmed from an array of developments within 20th-century science.

## Time and Space

Science, in the 20th century, dismantled elements of Newtonian science and this prepared the way for the complexity turn (Capra, 1996). Pre-20th century science operated with a view of time as Newtonian: invariant, infinitely divisible into space-like units,

measurable in length, expressible as a number and reversible. It is time seen essentially as a kind of Cartesian space comprising invariant measurable lengths to be moved along, forwards *and* backwards. Objects are viewed as contained within such boundaries of absolute time and space.

The sciences dismantled such a notion (Coveney and Highfield, 1990). Einstein showed that there is no fixed or absolute time independent of the system to which it is refers. Time is a local, internal feature of any system of observation and measurement. It varies as to where and how it is measured. It can be stretched and shrunk. Further, Einstein demonstrated that time and space are not separate from each other but are fused into a four-dimensional time-space curved under the influence of mass. Time and space are ‘internal’ to the processes by which the physical and social worlds themselves operate, helping to constitute their powers.

Space and time are now seen as dynamic qualities: when a body moves, or a force acts, it affects the curvature of space and time, and in turn the structure of space-time affects the way in which bodies move and forces act. The beginning of the universe occurred without a pre-existing cause, and its very happening created in that moment both space and time. There is no ‘time’ before the big bang, and if the universe ends in another singular event time (and space) will cease. Space and time have been spontaneously created, part of the systemic nature of the universe. They are switched on.

Quantum theory generally describes a virtual state in which electrons try out instantaneously all possible futures before settling into particular patterns. Quantum behaviour is instantaneous, simultaneous and unpredictable. The interactions between the parts are far more fundamental than the parts themselves. Bohm refers to this as the occurrence of a dance without dancers.

Thermodynamics shows that there is an irreversible flow of time (Prigogine, 1997). Rather than there being time-symmetry and indeed a reversibility of time as postulated in classical physics, a clear distinction is drawn between what has passed and what lies in the future. An arrow of time results in loss of organization and an increase in randomness or disorder over time within open systems. This accumulation of disorder or positive entropy results from the Second Law of Thermodynamics. However, there is not a simple growth of disorder. Prigogine shows how new order arises but is far from equilibrium. There are what he terms dissipative structures, islands of new order within a sea of disorder, maintaining or even increasing their order at the expense of greater overall entropy. Prigogine describes how such localized order ‘floats in disorder’.

The irreversibility of time can be seen in the expansion of the universe following the singular event of the ‘big bang’ 15 billion or so years ago. The scientific discovery of the big bang cannot be reconciled with laws of the physical world that presumes time is reversible, deterministic and involving ‘classes of phenomena’. The big bang is a one-off phenomenon like nothing else ever to occur within the known universe. Laws of nature are thus historical and not universal (and hence much more like the laws of society).

The arrow or flow of time results in futures that are unstable, relatively unpredictable and characterized by various possibilities. Time is both multiple and unpredictable. Prigogine (1997) talks of the ‘end of certainty’ as the complexity sciences overcome what he calls the alienating images of a deterministic world and an arbitrary world of pure chance. Complexity repudiates the dichotomies of determinism and chance, as well as nature and society, being and becoming, stasis and change. Systems are thus seen as being ‘on the edge of chaos’. Order and chaos are in a kind of balance where the components are neither fully locked into place but yet do not fully dissolve into

anarchy. Chaos is not complete anarchic randomness but there is a kind of ‘orderly disorder’ present within all such systems.

Time flows with minor changes in the past being able to produce potentially massive effects in the present or future. Such small events are not ‘forgotten’. Chaos theory in particular rejects the commonsensical notion that only large changes in causes produce large changes in effects. Following a perfectly deterministic set of rules, unpredictable yet patterned results can be generated, with small causes on occasions producing large effects and vice versa. The classic example is the butterfly effect accidentally discovered by Lorenz in 1961. It was shown that minuscule changes at one location can produce, if modelled by three coupled non-linear equations, very large weather effects very distant from the original site.

## Emergence

Central to dynamic systems analysis is the idea of emergence. It is not that the sum is greater than the size of its parts but that there are system effects that are different from its parts. Complexity examines how components of a system through their interaction ‘spontaneously’ develop collective properties or patterns, even simple properties such as colour, that do not seem implicit within, or at least not implicit in the same way, within individual components. The flavour of sugar is not present in the carbon, hydrogen and oxygen atoms that comprise it. These are non-linear consequences that are not present within, or reducible to, the very many individual components that comprise such activities.

Such large-scale patterns or characteristics emerge from, but are not reducible to, the micro-dynamics of the phenomenon in question. Thus gases are not uniform entities but comprise a seething confusion of atoms obeying the laws of quantum mechanics. The laws governing gases derive not from the behaviour of each individual atom but from their statistical patterning. Also if a system passes a particular threshold with minor changes in the controlling variables, switches occur such that a liquid turns into a gas or relatively warm weather suddenly turns into an ice age. This can give rise to unexpected structures and events whose properties can be quite different from those of the underlying elementary laws.

In particular, the emergence of patterning within a given system results from ‘attractors’. If a dynamic system does not move over time through all possible parts of a phase space but instead occupies a restricted part of it, then this is said to result from attractors. The simplest attractor is a point, as with the unforced swinging of a pendulum. Everything reaches the single equilibrium point. A somewhat more complex example is a domestic central heating/air conditioning system where the attractor consists, not of a single point, but of a specified range of temperatures. The relationship is not linear but involves a negative feedback mechanism that minimizes deviance. This is a self-regulating and bounded system. In certain systems there are ‘strange attractors’, unstable spaces to which the trajectory of dynamical systems is attracted through billions of iterations and positive feedback occurring over long periods of time. Such a space may be either indeterminate within the boundaries or there may be various sets of boundaries, as with the butterfly shaped Lorenz attractor. Such attractors are immensely sensitive in the effects that they generate to slight variations in their initial conditions. Much science has been concerned to characterize the topology of such strange attractors.

## Systems and Feedback

Early cybernetic research under the auspices of the Macy conferences in the post Second World War period emphasized the importance of negative feedback loops that restored the homeostatic functioning of whatever system was under examination (Hayles, 1999). Such systems of circular causality involved the processing of information that resulted in re-establishing equilibrium and stability through negative feedback (a view that much influenced Talcott Parsons).

However, in later systems formulations, of complexity or the non-linear, positive feedback loops are examined. These are viewed as exacerbating initial stresses in the system, so rendering it unable to absorb shocks and re-establishing the original equilibrium. Very strong interactions occur between the parts of a system and there is an absence of a central hierarchical structure able to 'govern' outcomes. Positive feedback occurs when a change tendency is reinforced rather than damped down as occurs with the negative feedback.

Such positive feedback is involved in analyses of the increasing returns that generate the path dependency found in the history of various economic-technological systems (such as the VHS video system replacing the technologically superior Betamax). Such irreversible path dependence occurs when contingent events set into motion institutional patterns or event chains over time that have deterministic properties through what Brian Arthur (1994) examines as 'lock-ins'.

More generally, complexity science investigates systems that can adapt and evolve as they self-organize through time. Such complex social interactions have been likened to walking through a maze, the walls of which rearrange as one walks. New steps have then to be taken in order to adjust to the walls of the maze that are adapting to one's movement through the maze. Complexity thus investigates emergent, dynamic and self-organizing systems that coevolve and adapt in ways that heavily influence the probabilities of later events.

Autopoiesis, as explained by Maturana and Varela, involves a process of self-making between the processes of production *of* those components that make up a system (Maturana, 1981). These continuously regenerate the processes of production through various feedback mechanisms so to maintain the organization per se, although the structure may change. Autopoiesis is to be seen in non-linear laser theory where the co-ordination of the required emissions is carried out by the laser light itself through processes of self-organization. Autopoiesis is also shown in the nature of urban growth where small local preferences mildly expressed in the concerns of individuals, such as wanting to live with those who are ethnically similar, can lead to massively segregated neighbourhoods characteristic of large American cities (Krugman, 1996).

## Complex Systems

Capra (1996) argues that nature turns out to be more like human nature – unpredictable, sensitive to the surrounding world, influenced by small fluctuations. This suggests enormous interdependencies, parallels, overlaps and convergences between analyses of physical *and* social worlds. Indeed the very division between the 'physical' and the 'social' is itself a socio-historical product and one that is in part dissolving under the sway of the complexity turn.

The complexity sciences seem to provide the means to overcome such divisions between nature *and* society and between the natural/physical sciences *and* the social sciences. That systems seem to behave similarly whether they are economic populations, fruit flies, international terrorists, river basins or weather systems has colluded to spread complexity analyses around the world in a period that seems both post-human and post-nature (Hayles, 1999). Each hybrid system seems to exhibit similar non-linear, networked properties often moving unpredictably and irreversibly away from points of equilibrium, as Capra (2001) argues. And complexity is itself a global system, adapting and co-evolving to other powerful global hybrids that are also roaming the world and changing the very environment within which it operates (see Urry, 2003, on global complexity).

# CHAPTER 4

## On Actor Network Theory *A Few Clarifications*

*Bruno Latour*

Bruno Latour's work in science studies has been very influential in a number of disciplines. Latour began his career by studying how meshed in social relations scientific research was. In his more recent work, he has argued for a new constitution, a parliament of things that would respect objects as well as non-human actors in the project of human knowledge. His books include *We Have Never Been Modern* (1993), *Laboratory Life* (1986), and *Science in Action* (1988).

### I

Exploring the properties of actor-networks is the task that the Paris group of science and technology studies has set itself to tackle since the beginning of the 1980s (Callon/Law/Rip 1986). However, this theory has often been misunderstood and hence much abused. In this paper I would like to list some of the interesting properties of networks and explain some of the misunderstandings that have arisen. I will not concern myself here with the quantitative studies, especially the so-called "co-word analysis", since they are themselves misunderstood because of the difficulty of exactly grasping the social theory and quaint ontology entailed by actor-network (but see Callon/Courtial/Lavergne 1989a; b).

Three misunderstandings are due to common usages of the word network itself and the connotations they imply.

The first mistake would be to give it a common *technical* meaning in the sense of a sewage, or train, or subway, or telephone "network". Recent technologies often have the character of a network, that is, of exclusively related yet very distant elements with the circulation between nodes being made compulsory through a set of rigorous paths giving to a few nodes a strategic character. Nothing is more intensely connected, more distant, more compulsory, and more strategically organized than a computer network. Such is

*Original publication details:* Bruno Latour, "On Actor Network Theory: A Few Clarifications." *Soziale Welt* 47. Jahrg., H. 4 (1996), pp. 369–381. Reproduced with permission from Nomos.

*Literary Theory: An Anthology*, Third Edition. Edited by Julie Rivkin and Michael Ryan.

not however the basic metaphor of an actor-network. A technical network in the engineer's sense is only one of the possible *final* and *stabilized* states of an actor-network. An actor-network may lack all the characteristics of a technical network – it may be local, it may have no compulsory paths, no strategically positioned nodes. Tom Hughes's "networks of power" (1983), to give a historical example, are actor-networks at the beginning of the story, and only some of their stabilized elements end up being networks in the engineer's sense, that is the electrical grid. Even at this later stage the engineering definition of networks is still a partial projection of an actor-network.

The second misunderstanding is easy to lift: the actor-network theory (hence ANT) has very little to do with the study of social networks. These studies, no matter how interesting, concern themselves with the *social* relations of *individual human* actors – their frequency, distribution, homogeneity, proximity. It was devised as a reaction to the often too global concepts like those of institutions, organizations, states and nations, adding to them a more realistic and smaller set of associations. Although ANT shares this distrust for such vague all-encompassing sociological terms, it also aims at describing the very nature of societies. But to do so it does not limit itself to human individual actors, but extends the word actor – or actant – to *non-human, non-individual* entities. Whereas social network adds information on the relations of humans in a social and natural world which is left untouched by the analysis, ANT aims at accounting for the very essence of societies and natures. It does not wish to add social networks to social theory, but to rebuild social theory out of networks. It is as much an ontology or a metaphysics as a sociology (Mol/Law 1994). Social networks will of course be included in the description, but they will have no privilege nor prominence (and very few of their quantitative tools have been deemed reusable).

Why then use the word network, since it is open to such misunderstandings? The use of the word comes from Diderot. The word "réseau" was used from the beginning by Diderot to describe matter and bodies in order to avoid the Cartesian divide between matter and spirit. Thus, the word has had a strong ontological component from the beginning (Anderson 1990). Put too simply, ANT is a change of metaphors to describe essences: instead of surfaces one gets filaments (or rhizomes in Deleuze's parlance Deleuze/Guattari 1980). More precisely it is a change of topology. Instead of thinking in terms of surfaces – two dimensions – or spheres – three dimensions – one is asked to think in terms of nodes that have *as many dimensions* as they have connections. As a first approximation, ANT claims that modern societies cannot be described without recognizing them as having a fibrous, thread-like, wiry, stringy, ropy, capillary character that is never captured by the notions of levels, layers, territories, spheres, categories, structures, systems. It aims at explaining the *effects* accounted for by those traditional words without having to buy the ontology, topology and politics that go with them. ANT has been developed by students of science and technology, and its claim is that it is utterly impossible to understand what holds society together without reinjecting in its fabric the facts manufactured by natural and social sciences and the artefacts designed by engineers. As a second approximation, ANT is thus the claim that the only way to achieve this reinjection of things into our understanding of social fabrics is through a network-like ontology and social theory.

To remain at this very intuitive level, ANT is a simple material resistance argument. Strength does not come from concentration, purity and unity, but from dissemination, heterogeneity and the careful plaiting of weak ties. This feeling that resistance, obduracy and sturdiness are more easily achieved through netting, lacing, weaving, twisting of ties

that are weak by themselves, and that each tie, no matter how strong, is itself woven out of still weaker threads, permeates for instance Foucault's analysis of micro-powers as well as recent sociology of technology. But the less intuitive philosophical basis for accepting ANT is a background/foreground reversal: instead of starting from universal laws – social or natural – and taking local contingencies as so many queer particularities that should be either eliminated or protected, it starts from irreducible, incommensurable, unconnected localities which then, at a great price, sometimes end into provisionally commensurable connections. Through this foreground/background reversal ANT has some affinity with the order out of disorder or chaos philosophy (Serres 1983; Prigogine/Stengers 1979) and many practical links with ethnomethodology (Garfinkel and Lynch's principle in Lynch 1985). Universality or order are not the rule but the exceptions that have to be accounted for. Loci, contingencies or clusters are more like archipelagos on a sea than like lakes dotting a solid land. Less metaphorically, whereas universalists have to *fill in* the whole surface either with order or with contingencies, ANT does not attempt to fill in what is *in between* local pockets of orders or *in between* the filaments relating these contingencies.

This is the most counter-intuitive aspect of ANT. Literally there is nothing but networks, there is nothing in between them, or, to use a metaphor from the history of physics, there is no aether in which networks should be immersed. In this sense ANT is a reductionist and relativist theory, but, as I shall demonstrate, this is the first necessary step towards an irreductionist and relationist ontology.

## II

ANT makes use of some of the simplest properties of nets and then adds to it an *actor* that does some *work*; the addition of such an ontological ingredient deeply modifies it. I will start out with the simplest properties common to all networks.

Far/close: the first advantage of thinking in terms of networks is that we get rid of "the tyranny of distance" or proximity. Elements which are close when disconnected may be infinitely remote when their connections are analyzed; conversely, elements which would appear as infinitely distant may be close when their connections are brought back into the picture. I can be one metre away from someone in the next telephone booth and nevertheless be more closely connected to my mother 6000 miles away; an Alaskan reindeer might be ten metres away from another one and they might nevertheless be cut off by a pipeline of 800 miles that makes their mating for ever impossible; my son may sit at school with a young arab of his age, but in spite of this close proximity in first grade they might drift apart in worlds that will become incommensurable later; a gas pipe may lie in the ground close to a cable television glass fiber and nearby a sewage pipe, and each of them will nevertheless continuously ignore the parallel worlds lying around them. The difficulty we have in defining all associations in terms of networks is due to the prevalence of geography. It seems obvious that we can oppose proximity and connections. However, geographical proximity is the result of a science – geography –, of a profession – geographers –, of a practice – mapping system, measuring, triangulating. Their definition of proximity and distance is useless for ANT – or it should be included as one type of connections, one type of networks, as we will see below. All definitions in terms of surface and territories come from our reading of maps drawn and filled in by geographers. Out of geographers and geography, "in between" their own networks, there is no

such thing as a proximity or a distance which would not be defined by connectibility. The geographical notion is simply another connection to a grid defining a metrics and a scale (Jacob 1992). The notion of network helps us to lift the tyranny of geographers in defining space and offers us a notion which is neither social nor “real” space, but associations.

Small scale/large scale: the notion of network allows us to dissolve the micro-macro-distinction that has plagued social theory from its inception. The whole metaphor of scales going from the individual to the nation state, through family, extended kin, groups, institutions etc. is replaced by a metaphor of connections. A network is never *bigger* than another one, it is simply *longer* or *more intensely* connected. The small scale/large scale model has three features which have proven devastating for social theory: it is tied to an order relation that goes from top to bottom or from bottom to top – as if society really had a top and a bottom; it implies that an element “b” being macro-scale is of a different nature and should thus be studied differently from an element “a” which is micro-scale; it is utterly unable to follow how an element goes from being individual – a – to collective – b – and back.

The network notion implies a deeply different social theory: it has no a priori order relation; it is not tied to the axiological myth of a top and a bottom of society; it makes absolutely no assumption whether a specific locus is macro- or micro- and does not modify the tools to study element “a” or element “b”; thus, it has no difficulty in following the transformation of a poorly connected element into a highly connected one *and back*. The network notion is ideally suited to follow the change of scales, since it does not require the analyst to partition her world with any a priori scale. The scale, that is, the type, number and topography of connections, is left to the actors themselves.

The notion of network allows us to lift the tyranny of social theorists, to regain some margin of manoeuvres between the ingredients of society – its vertical space, its hierarchy, its layering, its macro-scale, its wholeness, its overarching character – and to see how these features are achieved and what stuff they are made of. Instead of having to choose between the local and the global view, the notion of network allows us to think of a global entity – a highly connected one – which nevertheless remains continuously local ... Instead of opposing the individual level to the mass, or agency to structure, we simply follow how a given element becomes strategic through the number of connections it commands, and how it loses its importance when losing its connections.

Inside/outside: the notion of network allows us to get rid of a third spatial dimension after those of far/close and big/small. A surface has an inside and an outside separated by a boundary. A network is all boundary without inside and outside. The only question one may ask is whether or not a connection is established between two elements. The surface “in between” networks is either connected – but then the network is expanding – or non-existing. Literally, a network has no outside. It is not a foreground over a background, nor a crack onto a solid soil, it is like Deleuze’s lightning rod that creates by the same stroke the background and the foreground (Deleuze 1968). The great economy of thinking allowed by the notion of network is that we are no longer obliged to fill in the space in between the connections – to use a computer metaphor, we do not need the little paint box familiar to MacPaint users to “fill in” the interspace. A network is a positive notion which does not need negativity to be understood. It has no shadow.

The notion of network, in its barest topological outline, already allows us to reshuffle spatial metaphors that have rendered the study of society-nature so difficult: close and far, up and down, local and global, inside and outside. They are replaced by associations

and connections (which ANT does not have to qualify as being either social or natural or technical as I will show below). This is not to say that there is nothing like “macro” society or “outside” nature as ANT is often accused of, but that in order to obtain the effects of distance, proximity, hierarchies, connectedness, outsiderness and surfaces an enormous *supplementary* work has to be done (Latour 1996a). This work, however, is not captured by the topological notion of network, no matter how sophisticated we wish to make it. This is why ANT adds to the mathematical notion of network a completely foreign notion, that of actor. The new hybrid “actor-network” leads us away from mathematical properties into a world which has not yet been so neatly charted. To sketch these properties we should now move on from static and topological properties to dynamic and ontological ones.

### III

A network in mathematics or in engineering is something that is traced or inscribed by some other entity – the mathematician, the engineer. An actor-network is an entity that *does* the tracing and the inscribing. It is an ontological definition and not a piece of inert matter in the hands of others, especially of human planners or designers. It was in order to point out this essential feature that the word “actor” was added to it.

Now, the word actor has been open to the same misunderstanding as the word network. “Actor” in the Anglo-Saxon tradition is always a human intentional individual actor and is most often contrasted with mere “behaviour”. If one adds this definition of an actor to the social definition of a network, then the bottom of misunderstanding is reached: an individual human – usually male – who wishes to grab power makes a network of allies and extends his power – doing some “networking” or “liaising” as the Americans say ... Alas, this is the way ANT is most often represented, which is about as accurate as saying that the night sky is black because the astrophysicists have shown there is a big black hole in it. An “actor” in ANT is a semiotic definition – an actant –, that is something that acts or to which activity is granted by others. It implies *no* special motivation of *human individual* actors, nor of humans in general. An actant can literally be anything provided it is granted to be the source of an action. Although this point has been made over and over again, anthropocentrism and sociocentrism are so strong in social sciences (as well as in the critiques of social explanations) that each use of ANT has been construed as if it talked of a few superhumans longing for power and stopping at nothing to achieve their ruthless goals ... Even my own network study of Pasteur (Latour 1988a) – in spite of the lengthy ontological second part – has often been understood as a Madison Avenue version of science – which is unfair not only to my account but also to Madison Avenue ... If a criticism can be levelled at ANT it is, on the contrary, its complete indifference for providing a model of human competence. There is no model of (human) actor in ANT nor any basic list of competences that have to be set at the beginning, because the human, the self and the social actor of traditional social theory is not on its agenda.

So what is on its agenda? The attribution of human, unhuman, nonhuman, inhuman characteristics; the distribution of properties among these entities; the connections established between them; the circulation entailed by these attributions, distributions and connections; the transformation of those attributions, distributions and connections of the many elements that circulate, and of the few ways through which they are sent.

The difficulty of grasping ANT is that it has been made by the fusion of three hitherto unrelated strands of preoccupations:

- a semiotic definition of entity building;
- a methodological framework to record the heterogeneity of such a building;
- an ontological claim on the “networky” character of actants themselves.

ANT asserts that the limits of these three unrelated interests are solved when, and only when, they are fused into an integrated practice of study.

Semiotics is a necessary step in this venture, since when you bracket out the question of reference and that of the social conditions of productions – that is nature “out there” and society “up there” – what remains is, in a first approximation, meaning production, or discourse, or text. This is the major achievement of the sixties and of their “linguistic turn” or “semiotic turn”. Instead of being means of communications between human actors and nature, meaning productions became the only important thing to study. Instead of being unproblematic, they became opaque. The task was no longer to make them more transparent, but to recognize and relish their thick, rich, layered and complex matter. Instead of being mere *intermediaries*, they had become *mediators*. From a means, meaning has been made an end in itself. For twenty years the best minds have been busy exploring all the consequences of this major turn away from the naïve model of communication. Their often structuralist interpretations have been dismantled, but what remains is a toolbox to study meaning productions. ANT sorts out from this toolbox what is useful to understand the construction of entities. The key point is that every entity, including the self, society, nature, every relation, every action, can be understood as a “choice” or a “selection” of finer and finer embracements going from abstract structure – actants – to concrete ones – actors. The generative path that is thus retraced gives an extraordinary liberty of analysis compared to the impoverished “social vocabulary” that was used earlier – and is now in fashion again. Of course the structural rendering of these choices – differences – and embracements – dichotomies – are not kept by ANT, but essential traits of semiotics are kept. First, the *granting* of humanity to an individual actor, or the granting of collectivity, or the granting of anonymity, of a zoomorphic appearance, of amorphousness, of materiality, requires paying the *same semiotic price*. The effects will be different, the genres will be different, but not the *work* of attributing, imputing, distributing action, competences, performances and relations. Secondly, actors are not conceived as fixed entities but as flows, as circulating objects undergoing trials, and their stability, continuity, isotopy has to be obtained by other actions and other trials. Finally, what is kept from semiotics is the crucial practice to grant texts and discourses the ability to define also their context, their authors – in the text –, their readers – in fabula – and even their own demarcation and metalanguage. All the problems of the analyst are shifted to the “text itself” without ever being allowed to escape into the context (Greimas 1976). Down with interpretation! Down with the context! The slogans of the 60s and 70s “everything is a text”, “there is only discourse”, “narratives exist by themselves”, “we have no access to anything but accounts” are kept in ANT but saved from their ontological consequences. This salvation, however, does not come by falling back on the pre-deconstruction common sense – “after all, there is a social context up there and a nature out there” – but by extending the semiotic turn to this famous nature and this famous context it has bracketed out in the first place.

A major transformation of these slogans occurred when semiotics was turned to scientific and technical discourse by ANT – and especially to scientific texts. As long as one studied fictions, myths, popular cultures, fashions, religions, political discourse, one could hold to the “semiotic turn” and take them as so many “texts”. Scholars did not seriously believe in them anyway, and thus the intellectual distance and scepticism was easy to achieve while the double treasury of “scientism” and “socialism” was kept intact in their heart. But what about scientific truth and material efficiency? What about the reference “out there” in hard scientific texts? This was the real test for semiotics, and although it passed the trial a price had to be payed. In the practice of ANT semiotics was extended to define a completely empty frame that enabled to follow any assemblage of heterogeneous entities – including now the “natural” entities of science and the “material” entities of technology. This is the second strand of ANT: it is a *method* to describe the deployment of associations like semiotics; it is a method to describe the generative path of any narration. It does not say anything about the shape of entities and actions, but only what the recording device should be that would allow entities to be described in all their details. ANT places the burden of theory on the *recording*, not on the specific shape that is recorded. When it says that actors may be human or unhuman, that they are infinitely pliable, heterogeneous, that they are free associationists, know no differences of scale, that there is no inertia, no order, that they build their own temporality, this does not qualify any real *observed* actor, but is the necessary condition for the observation and the recording of actors to be possible. Instead of constantly predicting how an actor should behave and which associations are allowed *a priori*, ANT makes no assumption at all, and in order to remain uncommitted it needs to set its instrument by insisting on infinite pliability and absolute freedom. In itself ANT is *not* a theory of action, no more than cartography is a theory on the shape of coast lines and deep sea ridges; it just qualifies what the observer should suppose in order for the coast lines to be recorded in their fine fractal patterns. Any shape is possible provided it is obsessively coded as longitude and latitude. Similarly, any association is possible provided it is obsessively coded as a heterogeneous association through translations. It is more an *infralanguage* than a metalanguage. It is even less than a descriptive vocabulary; it simply opens, *against* all *a priori* reductions, the possibility of describing irreductions (Latour 1988a, part II). ANT is not merely empiricist though, since in order to define such an irreducible space in which to deploy entities sturdy theoretical commitments have to be made and a strong polemical stance has to be taken, so as to forbid the analyst to dictate actors what they should do. Such a distribution of a strong theory for the recording frame and no middle range theory for the the description is another source of many misunderstandings, since ANT is accused of either being dogmatic or of providing mere descriptions. For the same reason it is also accused of claiming that actors are “really” infinitely pliable and free or, inversely, of not telling what a human actor really is after (Lee/Brown 1994).

The first two strands – the semiotic and the methodological one – by themselves will be open to criticism. The first because there is no way to consider that bracketing out social context and reference solves the problem of meaning – in spite of the now dated claims of the swinging seventies –, and the second because merely deploying shapes of associations might be a worthwhile descriptive task but does not offer any explanation. It is only when a third strand is added to those two and ontological claims on networks are made that ANT escapes criticism. This move, however, is so devious that it has escaped the attention of many users of ANT. Which is a pity, since once it is made, ANT loses its radical character and soon appears commensensical enough.

The weakness of semiotics has always been to consider meaning production away from what the nature of entities really is; when semiotics is turned to nature however and unhuman entities are allowed to enter into the picture, it soon appears that the words “discourse” or “meaning” may be dropped altogether without any danger of going back to naïve realism or naïve naturalism. It is only because semioticians studied texts – and literary ones at that – instead of things that they felt obliged to limit themselves to “meaning”. In effect they scientifically believed in the existence of things in addition to meaning (not mentioning their belief in the existence of a good old social context whenever it suited them). But a semiotics of things is easy, one simply has to drop the meaning bit from semiotics ...

If one now translates semiotics by path-building or order-making or creation of directions, one does not have to specify if it is language or objects one is analyzing. Such a move gives a new continuity to practices that were deemed different when one dealt with language and “symbols”, or with skills, work and matter. This move can be said either to elevate things to the dignity of texts or to elevate texts to the ontological status of things. What really matters is that it is an elevation and not a reduction, and that the new hybrid status gives to all entities both the action, variety and circulating existence recognized in the study of textual characters and the reality, solidity, externality that was recognized in things “out of” our representations. What is lost is the absolute distinction between representation and things – but this is exactly what ANT wishes to redistribute through what I have called a counter-copernican revolution.

Once settled this first solution – extending semiotics to things instead of limiting it to meaning –, the second difficulty falls with it – building an empty methodological frame to register description. Actor-networks do connect, and by connecting with one another provide an explanation of themselves, the only one there is for ANT. What is an explanation? The attachment of a set of practices that control or interfere in one another. No explanation is stronger or more powerful than providing connections among unrelated elements or showing how one element holds many others. This is not a property that is *distinct* from networks but one of their essential properties (Latour 1988b). They become more or less explanable as they go and depending on what they do to one another. Actors are cleaning up their own mess, so to speak. Once you grant them everything, they also give you back the explanatory powers you abandoned. The very divide between description and explanation, hows and whys, blind empiricism and high theorizing is as meaningless for ANT as the difference between gravitation and space in relativity theory. Each network, by growing, “binds” the explanatory resources around it, and there is no way they can be detached from its growth. One does not jump outside a network to add an explanation – a cause, a factor, a set of factors, a series of co-occurrences; one simply extends the network further. Every network surrounds itself with its own frame of reference, its own definition of growth, of referring, of framing, of explaining. In this process the frame of reference of the analyst does not disappear more than the physicist’s in Einstein’s world; on the contrary, at last it is able to extend itself, but at a price: the frame becomes, as it does in General Relativity, “a mollusc of reference” instead of a detached Galilean frame, and each account has to be recalculated by the ANT equivalent of a Lorentz transformation (Latour 1988c). There is no way to provide an explanation if the network does not extend itself. This is not in contradiction with the scientific task of providing explanation and causality, since we learned from the very studies of hard sciences that no explanation of any scientific phenomenon and no causality could be provided without extending the network itself. By tying the explanation to the network

itself ANT does not abandon the goal of science, since it shows that this goal has never been achieved, at least not through the epistemological myth of explanation. ANT can't deprive itself of a resource it shows no one has ever had in the first place. Explanation is ex-pllicated, that is unfolded, like gravity in Einstein's curved space, it is still there as an effect, but it is now indistinguishable from the description, the deployment of the net.

This relativistic position – but one should prefer the less loaded term of relationist – solves two other problems: that of historicity and that of reflexivity.

The pre-relativist debate between providing an explanation and “simply” documenting the historical circumstances falls apart: there is no difference between explaining and telling how a network surrounds itself with new resources; if it “escapes socio-historical contingencies”, as critics often argue, then this simply means that other, longer lasting resources have been garnered to stay around – the etymology of circumstances. Hughes's networks of power grow (Hughes 1983), and by their very growth they become more and more of an explanation of themselves; you do not need an explanation floating over them *in addition* to their historical growth; Braudel's networks and world economics grow, and they are what the “big causes” are made of. You do not need to add to them Capitalism or *Zeitgeist* except as another summary, another punctualisation of the networks themselves. Either the cause designates a body of practices which is tied to the network under description – and this is what growth of network means –, or it is not related, and then it is just a word added to the description, literally it is the *word* “cause”. In this sense, ANT gives history its legitimate place – which is not the place prudent historians like to sit on, as safely away as possible from ontological questions. There is nothing better, sturdier than a circumstantial description of networks. “It just happens to be this way”.

But such a summary would be construed as historicism if it were not understood as a definition of the things themselves. The debate between historicism and explanation or theory was not solvable as long as there was, on the one hand, a history of people, of contingencies, of what is “in time” and, on the other hand, a theory or a science of what is timeless, eternal, necessary. For ANT there is science only of the contingent, as of necessity it is locally achieved only through the growth of a network. If there is also a history of things, then the debate between description and ex-planation, or historicity and theory, is entirely dissolved. For ANT this is not the proof of the weakness of its explanatory powers, since describing or accounting for a network is what an explanation or an explication is and what has always been the case in the so-called hard sciences – or more exactly “progressively hardened sciences” (Latour 1996b).

Although not the main goal of ANT, reflexivity is added as a bonus once the frames of reference are granted back to the actors – and once the actors are granted back the possibility of crossing the sacred dividing line between things and representations (Ashmore 1989). Reflexivity is seen as a problem in relativist theory, because it appears that either the observer requests a status it denies to others, or it is as silent as all the others to which any privileged status is denied. This “problem” falls, however, when the epistemological myth of an outside observer providing an explanation in addition to “mere description” disappears. There is no longer any privilege – but there has never been any need for it either. The observer – whatever it is – finds itself on a par with all the other frames of reference. It is not left to despair or navel-gazing, since the absence of privileged status has never limited the expansion and intelligence of any actor. World builder among world builders, it does not see a dramatic limit on knowledge in its abandonment of Galilean frames, but only resources. To extend from one frame of reference to the next it has to work and pay the price like any other actor. In order to explain, to

account, to observe, to prove, to argue, to dominate and to see it has to move around and work (I should say it has to “network”). No privilege also means no a priori limits on knowledge. If actors are able to account for others, so can it. If actors can’t, it might still try. History, risks and ventures are also in the observers’ own network building. Such is ANT’s solution to reflexivity (Stengers 1993).

Reflexivity is not a “problem”, a stumbling block along the path to knowledge, the prison in which all enterprises would be locked, it is the land of opportunity at last opened to actors which are *primus inter pares*, or strive for parity or primacy like any other. Of course reusable metalanguage is abandoned, but this is not giving up much, since observers who displayed their rich metalanguage were usually small points limited to very specific loci – campuses, studios, corporate rooms. The price ANT pays to move from one locus to the next is that there are as many metalanguages as there are frames of reference – the only metalanguage required (see above strand 2) being more adequately called an *infralanguage* which has to be poor, limited, short and simple – the equivalent of a Lorentz transformation being called “translation” in ANT (Latour 1988c). This *infralanguage* is enough to move from one net to the other, and the specific explication will always be a one-shot account exclusively tailored to the problem at hand (Lynch’s principle, Callon’s “disposable explanations”, Serres’s “cross over between explanandum and explanans” (Serres 1995)). If it is more generally applicable, it means that it is riding over a network that expands itself.

This solution becomes commonsense once it is accepted that an account or an explication or a proof is always added to the world; that it does not subtract anything from the world. Reflexivists as well as their pre-relativist enemies dream of subtracting knowledge from the things in themselves. ANT keeps adding things to the world, and its selection principle is no longer whether or not there is a fit between account and reality – this dual illusion has been dissolved away –, but whether or not one travels from a net to another. No metalanguage allows you to do this travel. By abandoning the dreams of epistemology ANT is not reduced to moral relativism, but gets back a stronger deontological commitment: either an account leads you to all the other accounts – and it is good –, or it constantly interrupts the movement, letting frames of reference distant and foreign – and it is bad. Either it multiplies the mediating points between any two elements – and it is good –, or it deletes and conflates mediators – and it is bad. Either it is reductionist – and that’s bad news –, or irreductionist – and that’s the highest ethical standard for ANT. We will see that this touchstone is much more discriminating than the quest for epistemological purity, or for foundations, or for moral norms. Demarcation is in fact an enemy of differentiation.

Building on the semiotic turn, ANT first brackets out society and nature to consider only meaning-productions; then, breaking with the limits of semiotics without losing its toolbox, it grants activity to the semiotic actors turning them into new ontological hybrids, world making entities; by doing such a counter-copernican revolution it builds a completely empty frame for describing how any entity builds its world; finally, it retains from the descriptive project only very few terms – its *infralanguage* – which are just enough to sail in between frames of reference, and grants back to the actors themselves the ability to build precise accounts of one another by the very way they behave; the goal of building an overarching explanation – that is, for ANT, a centre of calculation that would hold or replace or punctuate all the others – is displaced by the search for explications, that is for the deployment of as many elements as possible accounted for through as many metalanguages as possible.

## IV

Now that the basic topological properties of networks have been sketched – second section – and that the basic ontological features of actors have been outlined – section above –, there is no difficulty in seeing that ANT is not about *traced* networks, but about a network-*tracing* activity. As I said above, there is not a net and an actor laying down the net, but there is an actor whose definition of the world outlines, traces, delineates, describes, files, lists, records, marks or tags a trajectory that is called a network. No net exists independently of the very act of tracing it, and no tracing is done by an actor exterior to the net. A network is not a thing, but the recorded movement of a thing. The questions ANT addresses now have changed. It is no longer whether a net is a representation or a thing, a part of society or a part of discourse or a part of nature, but what moves and how this movement is recorded.

We cannot say that what moves *inside* networks are pieces of information, genes, cars, bytes, salutations, words, forces, opinions, claims, bodies, energy etc., since ANT also wants to reconstruct nets before there is any distinction between what circulates inside and what keeps them on track, so to speak, from the outside. Again, as I said at the beginning, the technical metaphor of networks is a latecomer for ANT and does not capture the tracing activity. No, what circulates has to be defined like the circulating object in the semiotics of texts – especially scientific texts (Bastide 1990). It is defined by the competence it is endowed with, the trials it undergoes, the performances it is allowed to display, the associations it is made to bear upon, the sanctions it receives, the background in which it is circulating etc. Its isotopy – that is its persistence in time and space – is not a property of its essence, but the result of the decisions taken through the narrative programmes and the narrative paths.

However, such a classic definition would limit ANT to the world of text and discourse. What happens when a circulating object leaves the boundary of a text? The traditional answer is that there is a yawning gap in between the text and the context. At the interface a dramatic trial is supposed to abruptly intervene through which the circulating object is assessed either by checking its referential fit or its social interest. Not so for ANT, which does not believe in this distinction, since it has extended meaning productions to all productions. For ANT the gap is no more than a slight bump along the net; the yawn is an artefact caused by a previous divide between nature, society and discourse. For ANT on the contrary, there is a continuity, a multiplicity of plugs between the circulating objects in the text, the claims outside the text in the “social”, and what the actants themselves really do in “nature”. The circulating object goes on circulating and goes on getting its isotopy from what other actors do to it. “Society” has the same net-like properties as have texts, and so has “nature”. But it would be more accurate for ANT to say that these three categories are arbitrary cutting points on a continuous tracing of action, and still more accurate to show how these categories themselves are part of the many trials and events and resources that are used along the paths to attribute “textuality” or “sociality” or “naturality” to this or that actor. They are part of what is distributed – not part of what makes the distribution.

There is no off-the-shelf word to describe this common movement. To say that it is a generalized narrative path would immediately mean that texts are extended to everything; to say that it is a force or an energy or a gene or a culture-gene would mean that everything would be naturalized, including society and discourse; to say that it is a social interest, a social action or labour would extend society to nature and to texts. It was to get out of this

essential difficulty that ANT played with a generalized symmetry (Callon 1986) and made a principle of using whichever words are connoted in one of the former realms to describe the others, thus showing the continuity of networks and the complete disregard for the artefactual gaps introduced by pre-relativist arguments. However, this solution is rather tricky, since it may combine all the misunderstandings – and this is indeed what happened to ANT, readers and users alike saying *at once* that it is a social constructivist argument, the return of naturalism, or a typically French belief in the overall extension of texts ... Which of course it is in a sense, but only insofar as ANT is the simultaneous rejection of naturalisation, socialisation and textualisation. ANT claims that these “(x)-isations” have to be dissolved all at once and that the job is not done better if one of them gains hegemony or if the three are carefully circumscribed. All (x)-isations are the filling in of what is “in between” the networks; and which one is chosen or rejected makes no practical difference, since nets have no “in between” to be filled in.

If choosing words for the network-tracing activity has to be done, *quasi-objects* (Serres 1987) or *tokens* might be the best candidates so far. It is crucial for the definition of the term that what circulates and what makes the circulation be both co-determined and transformed. A ball going from hand to hand is a poor example of a quasi-object, since, although it does trace the collective and although the playing team would not exist without the moving token, the latter is not modified by the passings. Conversely, what I called the first principle of science studies (Latour 1987) – that a claim is in the hands of others – is equally an approximation, since it entails human locutors endowed with hands and mouths who pass a claim without themselves undergoing dramatic changes. As a rule, a quasi-object should be thought of as a moving actant that transforms those who do the moving, because they transform the moving object. When the token remains stable or when the movers are kept intact, these are *exceptional* circumstances which have to be accounted for. This definition of what is the rule and what are the exceptions would be enough to tell ANT from all models of communications that, on the contrary, begin with well defined movers and moving objects and view obstacles to exchanges as so many exceptions to be explained. But another feature forbids any confusion of ANT with human-centered, or language-centered, or praxis-centered models. As a rule, what is doing the moving and what is moved have no specific homogeneous *morphism*. They can be anthropo-morphic, but also zoo-morphic, physi-morphic, logo-morphic, techno-morphic, ideo-morphic, that is “(x)-morphic”. It might happen that a generative path has limited actants to a homogeneous repertoire of humans or of mechanism or of signs or of ideas or of collective social entities, but these are exceptions which should be accounted for (Latour 1996c).

ANT is a powerful tool to destroy spheres and domains, to regain the sense of heterogeneity, and to bring interobjectivity back into the centre of attention (Latour 1994). Yet it is an extremely bad tool for differentiating associations. It gives a black and white picture, not a coloured and contrasted one. Thus it is necessary, after having traced the actor-networks, to specify the types of trajectories that are obtained by highly different mediations. This is a different task, and the one that will make ANT scholars busy for a number of years to come.

# CHAPTER 5

## The Animal Turn, Literary Studies, and the Academy

*Jennifer McDonell*

As the human dissolves, the animal rises in importance. That is one way of characterizing the coincident rise of animal studies as scholars also explore post-human theoretical possibilities. The human subject of Humanism has been in question since the 1960s. Animal studies takes a different route to the usual deconstruction from within of the psychological and philosophical premises of Humanism by standing with animals and imagining the world from their perspective. Jennifer McDonell teaches contemporary theory and Victorian culture at the University of New England (Australia).

The rapidly growing field of human-animal studies (HAS)<sup>1</sup> is a vibrant, varied domain of methodological convergences and divergences, united by a shared concern with studying the complex entanglement of human and animal lives. To think seriously about animals on their own terms is to begin to question the co-construction of the categories of the human and the animal that underpins human exceptionalism. Unpicking the human/animal binary, however, is no simple matter: not only is this construction unstable but as prisoners of human language we also have a tendency to reinstate it even as we think we challenge it. This paper will provide an analysis of significant developments and preoccupations in the field of literary HAS. Some of the most vexing questions within this area will be contextualised by way of reference to the Bandit and Michael Vick cases in the US and J.M. Coetzee's *Disgrace*, in particular the scenes depicting David Lurie's encounter with unwanted dogs at an animal shelter.

## I

The problem of the animal, Jacques Derrida has argued, poses definitional and practical threats to the discourse of humanism, in which authority and autonomy are ‘attributed to the man (*homo and vir*) rather than to the woman, and to the woman rather than the animal’ (1991: 114). If human sovereignty is decentred, what becomes of the autonomy and authority that has been definitive of ‘authorship’ since the seventeenth century? The concern in animal studies with such questions as nonhuman agency, the relations between subject and object, inter-species structures of feeling, emotion and affect, the function of animal metaphor and the occlusions of literary historiography necessitates a radical rethinking of core concepts that are often taken for granted in literary studies. I would go further, as other commentators such as Cary Wolfe and Susan McHugh have, and suggest that a systematic, philosophically rigorous animal studies challenges the schema of the knowing subject and its anthropocentric underpinnings that sustain the notion of disciplinarity itself (Wolfe 2009: 568).<sup>2</sup>

In discussions about the future of animal studies as a discipline, comparisons with the entry of women’s studies and ethnic studies in the academy are common. In redressing the underrepresentation and misrepresentation of these groups one strategy adopted was for women and minorities to represent themselves as subjects within existing structures of power. This analogy can be limiting and misleading: for one thing, animals cannot speak for themselves in the kind of texts that constitute animals as objects of study.<sup>3</sup> If animals cannot represent themselves in rational thought and as it is manifested in language, how can they be read or heard? As Kari Weil puts it: ‘If animal studies has come of age, it is perhaps because nonhuman animals have become a limit case for theories of difference, otherness, and power’ (2012: 5).

It is difficult to work in the area of animal studies and not be troubled by the material one encounters. One reason for this is because ‘the question of the animal’ foregrounds a mutually constitutive relationship between language and violence: violence inflicted upon animals through factory farming, laboratory testing, and through the destruction of habitats and the cultural construction of pet keeping practices, but also the violence inflicted upon animals by human language. Derrida has argued that ‘Animal’, with a capital ‘A’ in the singular, defined by way of difference to the ‘human’, is the primary means whereby the animal/human dualism has been reinforced (2008: 400).<sup>4</sup> ‘Animal’ is our abstraction for all that walks, crawls, swims and flies other than ourselves, and as Derrida goes on to argue in both ‘Eating Well’ (1991) and *The Animal That Therefore I am (More To Follow)*, the word does violence to the heterogeneous multiplicity of the living world and therefore enacts what he calls a ‘sacrificial structure’ that opens up a space for the ‘noncriminal putting to death’ of the animal – a sacrifice that allows the transcendence of the human by killing and disavowing the bodily, the materiality, the animality of the human.<sup>5</sup> ‘Noncriminal’ killing of individuals and entire certain classes of humans has of course, been justified by marking them as ‘animal’.

Construct an academic course or write an article on the subject of literature and animals, and the textual possibilities are endless, precisely because humans have long conceived of themselves through animal others across most literatures and cultures. Conceptually, such a course might begin with one of the most central questions to all teachers and scholars of literature: representation. How can attention to animals and their life worlds help us to think differently about aspects of literary form – fable, metaphor, story, say – that are shaped by ideas of human or animal being or by the logic of species?

How do texts represent the animality that resides both within nonhuman and human animals? Or affective (emotional) or relational bonds between humans and animals? Other primary concepts might include the question of anthropomorphism, the history of human perceptions of animals, the reception of evolutionary theory, or pressing contemporary issues of our age such as biomedicine, climate change, zoos, species extinction, conservation, the animal industrial complex and biopolitical power.

A major challenge in teaching and writing about animal studies is the daunting interdisciplinarity that is inseparable from its genesis. HAS courses in literature tend to include readings not only from 'cognate' disciplines such as history and feminism but also from disciplines such as philosophy, biology, ethology, ecology, comparative psychology, zoology and primatology which have been hugely influential on HAS in recent years. Contemporary research on literary understandings of animals is exceptionally diverse, and has drawn on concurrent work in various fields in the humanities and social sciences that goes as far back as the 1980s (Ritvo, 1987; Thomas, 1983; Serpell, 1986; Lansbury, 1985; Haraway, 1989). Carol J. Adams, Val Plumwood, Josephine Donovan, Brian Luke, Connie Salamone, Marti Kheel, Andrée Collard, Deane Curtin, Alice Walker, Deborah Slicer, Greta Gaard, Lori Gruen, Lynda Birke, and Karen Warren, among others embarked several decades ago on the project of challenging deeply embedded humanist assumptions concerning gender and animality. In the continental theoretical vein, Gilles Deleuze and Felix Guattari's *A Thousand Plateaus* (1987), in foundational philosophy Peter Singer's *Animal Liberation*, first published in 1975 and Tom Regan's *The Case for Animal Rights* (1983), and in cognitive ethology the public visibility of work by Jane Goodall, Diane Fossey and Diane Pepperburg also paved the way for literary scholars. In the 1990s the field continued to grow with dozens of major works appearing, including Arnold Arluke and Clinton Sanders's *Regarding Animals* (1996) and Jennifer Wolch and Jody Emel's *Animal Geographies: Place, Politics, and Identity in the Nature-Culture Borderlands* (1998).

A steady stream of important studies covering most of the major literary periods has been published in the past few decades. Joyce Salisbury (*The Beast Within*, 1994), Karl Steel (*How to Make a Human*, 2011), Lesley Kordecki (*Ecofeminist Subjectivities: Chaucer's Talking Birds*, 2011) and Susan Crane (*Animal Encounters*, 2012) have produced work on animals and the corpus of medieval writing; Laurie Shannon (*Accommodated Animal*, 2013), Erica Fudge (*Perceiving Animals*, 2002; *Brutal Reasoning*, 2006b; *Renaissance Beasts*, 2004) and Bruce Boehrer (*Shakespeare Among the Animals*, 2002) on the Early Modern period; Christine Kenyon-Jones (*Kindred Brutes*, 2001) and Laura Brown (*Homeless Dogs and Melancholy Apes*, 2010) on Eighteenth-Century and Romantic period literature; Tess Cosslett (*Talking Animals*, 2006) and Deborah Denenholz Morse and Martin Danahay's (*Victorian Animal Dreams*, 2007) on nineteenth century British literature; Margot Norris (*Beasts of the Modern Imagination*, 1985), Cary Wolfe (*Animal Rites*, 2003) and Carrie Rohman (*Stalking the Subject*, 2009) on Modernist literature; Jennifer Mason (*Civilized Creatures*, 2005) and Colleen Glenney Boggs (*Animalia Americana*, 2013) on American literature; Alice Kuzniar (*Melancholia's Dog*, 2006), Susan McHugh (*Animal Stories*, 2011) and Anat Pick (*Creaturedly Poetics*, 2011) on modern literatures; Sherry Vint (*Animal Alterity*, 2010) on Science Fiction; and Wendy Woodward (*The Animal Gaze*, 2008) on South African literature. In addition, there are studies that range beyond period boundaries such as Jennifer Ham and Matthew Senior's *Animal Acts: Configuring the Human in Western History* (1997), John Simons' *Animal Rights and the Politics of Literary Representation* (2002) and Philip Armstrong's *What*

*Animals Mean in the Fictions of Modernity* (2008), which deals with novels by Swift, Defoe, Melville and Mary Shelley along with contemporary fictions such as Timothy Findlay's *Not Wanted in the Voyage*, Yann Martel's *The Life of Pi*, and Margaret Atwood's *Oryx and Crake*. Add to this Reaktion Books's beautiful 'Animal' series, edited by Jonathan Burt, which to date has published fifty individual volumes devoted to particular animals, including the frog, ant, wolf, horse, kangaroo, dog, spider, bear, cat, elephant, oyster and penguin. These works explore the natural history of an animal alongside its historical and cultural impact on humankind, including literary representations.

This flow of landmark studies has been equalled by the growing number of conferences, symposia, publication venues and special issues of journals devoted to the topic of animal studies. There have been special issues devoted to animals by *Parallax* (2006), *Configurations* (2006), *Mosaic* (2006 and 2007), *TDR: The Journal of Performance Studies* (2007), *Oxford Literary Review* (2007), *PMLA* (2009), *The Minnesota Review* (2009–10), *Safundi: The Journal of South African and American Studies* (2010), *JAC: Journal of Rhetoric, Culture, and Politics* (2011), *Postmedieval Studies: a Journal of Medieval Cultural Studies* (2011), *New Formations* (2012), *Hypatia* (2012), *Journal of Victorian Culture* (2012), *Angelaki: Journal of the Theoretical Humanities* (2013), and in 2013 new issues are in progress with calls for papers from *Modern Fiction Studies* and the *European Journal of English Studies*. In Australia, *Southerly* (2009) and *Australian Literary Studies* (2010) similarly have produced special issues on animals, the ALS issue arising from the largest animal studies conference in the field to date, *Minding Animals I*, held at the University of Newcastle in 2009. The dedicated journals within animal studies continue to provide a stable outlet for scholars committed to the field: *Society and Animals* (<http://www.brill.com/society-animals>), *Humanimalia: a journal of human/animal interface studies* (<http://www.depauw.edu/humanimalia/>), *Journal for Critical Animal Studies* (<http://www.criticalanimalstudies.org/journal-for-critical-animal-studies/>), *Antennae* (<http://www.antennae.org.uk>) and the most recent addition, *The Animal Studies Journal*, the journal of the Australian AASG (Australian Animal Studies Group) edited by Melissa Boyde and Sally Borrell (<http://ro.uow.edu.au/asj/>). If this list is not extensive enough, you can consult Margo DeMello's *Human–Animal Studies: A Bibliography* (2012a) or Linda Kalof, Seven Mattes and Amy Fitzgerald's online bibliography (<http://www.animalstudies.msu.edu/bibliography.php>).

The archives of secondary literary criticism will yield scholarship, including occasionally unpublished theses, dealing with animal topics in the works of major literary figures: insect imagery in Robert Browning's poetry, the horse as a symbol in D.H. Lawrence's novels and so on. One literary end of animal studies is the imaginative and empathetic identification with other animals' lives, and with the philosophical and ethical questions raised by that engagement. The methodological work of animal literary studies includes deconstructing representations of animals that appropriate the animal as merely literary and mythological figures (Derrida, 2002; Haraway, 2008) as well as critiquing the tendency to observe real animals without attempting to meet their gaze. Cary Wolfe has argued that an engaged animal studies has to be more than 'mere thematics' because it 'fundamentally challenges the schema of the knowing subject and its anthropocentric underpinnings sustained and reproduced in the current disciplinary protocols of cultural studies (not to mention literary studies)' (2009: 568–569). The task of such a literary animal studies would include critiquing representations that are disrespectful to animals, redressing the occlusions of literary historiography itself (in which animals have been largely absent), and taking interspecies structures of feeling seriously,

rather than uncritically dismissing such engagements as sentimental. This work moves away from a tradition that sees animals as passive, unthinking presences in the active, thoughtful lives of humans to a tradition which conceives of humans as constructing and having been constructed by animals (Fudge 2006a: 1).

## II

As historically specific examples of human perception, use and representation of that most popular of domestic animals, the dog, I now turn to the cases of Bandit and Michael Vick in the US (with a brief foray into Dickens's *Oliver Twist*) to illustrate a number of important points relevant to any discussion of animal studies. The key contention is that the category of 'animal' is contingent and shifts according to the convenience of the dominant; and that human rights are inextricably linked to the question of the animal, making the intersectionality of the categories of the human and animal human a central starting point to any discussion of the field. I conclude with some comments on a novel featuring a protagonist with a particularly conflicted relationship to literature and the academy, J.M. Coetzee's *Disgrace* (1999b). The concluding scenes of the novel are read as being, among other things, *about* the limits of the rational thought that human animals have used to distinguish themselves from 'mere' animal life.

I begin with a 'true' story about a 'real' dog, Bandit, who in 1987 was on death row taking a rap for being naturally vicious. The most comprehensive account of the case, *Bandit: Dossier of a Dangerous Dog*, was published in 2002 by linguist, poet and animal trainer, Vicki Hearne. The bare outlines are as follows: Bandit, companion to Mr Lamon Redd, a poor, elderly black man in Stamford, Connecticut, was provoked into biting a neighbour. The neighbour had trespassed on Mr Redd's property and hit Mr Johnson, one of Mr Redd's boarders who served as Bandit's walker, with a broom. Bandit was impounded, during which time he was so ineptly handled that, on his return, his behaviour had changed for the worse – so much so that when Redd beat him for urinating on the porch, the dog bit back. This time the State canine control authority sought to have Bandit killed. Opposing the State of Connecticut's 'disposal order', Vicki Hearne, who was called in as an expert witness, convinced the court to give her permission to retrain Bandit. She discovered in the process that he was a well-mannered and obedient dog, and he was thereafter committed to her care.

This, however, was no simple 'Heart-Warming True Story of One Dog's Rescue from Death Row' as advertised on the cover of a 2007 reprint of the book. The ruling distressed Mr Redd. Having grown up in Virginia, he accused Hearne of stealing his dog: 'It's just like in the South, the black man gets something good, the white man takes it away from him' (Hearne 2002: 293). When Mr Redd rose at the hearing to testify in favour of Bandit he said, to the great distress of Hearne, 'All the ladies in the neighbourhood like him. Not just the coloured ladies. The white ladies like him too' (Hearne 2002: 49). As Hearne notes, the remark underlined the straightforward racism that was everywhere present but nowhere acknowledged in the trial (Hearne 2002: 50).

The Bandit case became the centre of a media-fuelled frenzy about whether there are irredeemably vicious dog breeds. Newspapers, canine control authorities and the courts incorrectly designated Bandit as a 'pit bull', that is, an American Pit Bull Terrier. Sounding suspiciously like a modern-day Mr Bumble, one expert said to the court: 'He has genes. Genes is what these dogs have, and their training is part of their genetics,

and it makes ‘em mean’ (Hearne 2002: 1). Discussing the phenomenon of the bad breed, and the Bandit case in particular, Harvard literature professor Marjorie Garber observes that ‘pit bull’ had become what:

... literary critics of a certain genre would call an ‘undecidable’ figure singled out for vilification by the law, yet not reliably identifiable as a breed. ‘Everyone knows’ and ‘No one knows’ what a ‘pit-bull’ is. Everyone knows and, and no one knows, that ‘they’ are dangerous. (1996: 194)

Effectively, human language becomes, for certain animals, quite literally a matter of life and death.

The foregoing discussion illustrates how a mythos of species can naturalise violence towards certain classes of animals and how classificatory language can be used to deny the species-specific traits of individual animals. Such language presents analogies with constructions of gender, race and class in human society. If today’s canine *bête noire* is the ‘pit-bull’, in post-World War II Europe it was German Shepherds and Dobermans, and in 1830s England it was dogs like Bull’s Eye, Bill Sikes’s dog, in *Oliver Twist*. Bull’s Eye is by far the most complex canine character in Dickens’s work, and his multivalent name suggests his ties to the Bull and Terrier families, which descended from fighting breeds originally used in bullbaiting and blood sports. The cover of the 2007 Random House Vintage Classics edition of *Oliver Twist* features an image of a Bull Terrier (as classified by the American Kennel Association breed standard) fitted out with a spiked collar accessory.

Just as Bandit was not a ‘pit bull’, the dog breed pictured here did not exist in 1836–7 when the novel was published. The salient point, though, is that both types of dog signify prominently in what might be called ‘dangerous dog discourse’. A Bull Terrier is

pictured on the cover of the Vintage edition because dogs of this breed are misperceived as ‘pit bulls’ and are associated with the drug lords and street gangs who use them in dog fighting and as mascots. In contemporary US culture, moreover, American Pit Bulls and other fighting dogs are routinely associated with African American men. As Meisha Rosenberg puts it in the title of her article on dog breeds and race in contemporary popular culture, ‘Golden Retrievers are white, Pit Bulls are black and Chihuahuas are Hispanic’ (Rosenberg 2011: 113). Ideological investments in this particular species-race intersection were dramatically highlighted in 2007 when Atlanta Falcons quarterback Michael Vick, a former number one pick in the 2001 NFL draft, was indicted on charges relating to a six-year long continuing criminal enterprise of an interstate dog fighting ring known as *Bad Newz* Kennels.

The kennel name refers to the Ridley Circle housing project in the primarily African American East End section of Newport News, Virginia, the economically-depressed area in which Vick grew up, known for its street gangs and drug-related violence. Allegations included Vick’s direct involvement in dog fighting, gambling, and brutal executions of dogs. Public outcry resulted from widespread media reports of details which included the hanging, drowning, electrocuting and shooting of dogs. Over seventy dogs, mostly American pit bulls, were seized, along with physical evidence during several searches of Vick’s fifteen-acre property by local, state and federal authorities. Many of the dogs bore visible signs of injury. Vick’s attorneys argued that dog fighting was an acceptable part of the black ‘culture’ in the neighbourhood where Vick had grown up, and key figures from the National Association for the Advancement of Coloured People (NAACP) argued that Vick’s treatment was illustrative of the systemic racism present in US culture and its institutions (Kim 2009: 16–17). People for the Ethical Treatment of Animals (PETA), on the other hand, characterised Vick as a sociopathic monster unfit for civil society (Broad 2013: 780). Garrett M. Broad adds: ‘The common depiction of Vick as a beast – the true animal among the dogs in his ring – undeniably played off of a history of the dehumanisation of black men in U.S. culture’ (2013: 780: see also Kim 2009: 17–18).

What was missing in popular media discussions of the Bandit and Michael Vick cases was an alternative politics based on intersectional antispeciesist and antiracist perspectives.<sup>6</sup> An important consideration overlooked in such discussions is that racial, cultural and species differences are made, not given. Like racial stereotypes, the ‘vicious breed trope’ and ‘dangerous dog discourse’ tend to rely on the view that cultures are fixed, homogeneous entities that map neatly onto particular groups and particular spaces. This is particularly true in the case of domesticated animals, as the history of dog breeding amply demonstrates. Harriet Ritvo persuasively demonstrates that breed standards, particularly in dogs, became for the Victorian middle classes ‘an index of their paradoxical willingness aggressively to re-conceive and refashion the social order in which they coveted a stable place’ (1987: 115). Prior to the founding of the Kennel Club in 1873, dogs had mainly been classed by the jobs they performed as illustrated by various taxonomies, many of which were based on sixteenth-century sources, particularly Johannes Caius’s *De Canibus Britannicus* (1570). They tended to place the ‘most generous kinds’ of dogs, notably hunting hounds and bloodhounds, at the top, and the order descended through spaniels and lapdogs to farm animals, while working mongrels such as turnspits came at the bottom. In these unforgiving typologies, the value of particular breeds is derived from their original functions, which had once closely related to the social status of their respective owners.<sup>7</sup> Behind every dog breed there is an ethnography and a social history as well as a genealogy – the story of a life in culture as well as a genetic inheritance.

Against the essentialising view of culture circulated in the Bandit and Vick cases, we might consider that species difference is not only always already in the process of being made, but that this process is not haphazard, rather it is produced as an effect of power relationships. The dualisms that form such forceful undercurrents in Western culture – master/slave, male/female, human/animal, white/nonwhite, reason/nature, culture/nature, civilised/savage, mind/body, subject/object – form an ‘interlocking structure’ (Plumwood, 1993: 43) that is recognised by theorists working in feminist, disability, postcolonial, queer, indigenous, and critical race studies as a violent hierarchy because one term of the binary is always suppressed in relation to the other, while the middle term is elided. The animal, therefore, is constituted not only through the human/animal dualism but also by other pairs as well (Adams 1994; Kappeler 1995; Haraway 1989). As Claire J. Kim graphically puts it: ‘The beast is first made – not just as animal but as savage, nature, other, body, object, alien, and slave – and then slain, affirming power and producing order’ (2009: 3).

### III

With these considerations in mind I want to turn to what has become a canonic text of animal studies literature, J.M. Coetzee’s *Disgrace*, in particular the scenes depicting David Lurie’s encounter with unwanted dogs at an animal shelter. In his response to J.M. Coetzee’s *The Lives of Animals*, published with the novel, Peter Singer not only outlines his ‘like interests’ standard (equal consideration of animals at a similar ‘mental level’ to that of ‘normal’ adult humans), but also stresses that, for him, animal ethics remains the purview of ‘philosophy,’ not of ‘literature’: ‘I prefer to keep truth and fiction clearly separate’ (1999: 86). His position suggests that while the animal studies movement may be a radical development, it continues to rely, at least in Singer’s instance, on a Kantian notion of rational philosophy. Dawn McCance extends this inference to include ‘his blueprint for the modern research university as a hierarchical, philosophical institution … with the philosopher at once dispenser of “truth” and standard-exemplar of “mental capacity”’ (McCance 2011: v). This essay has suggested that a serious animal studies as conceived of in the Humanities, and in literary studies in particular, necessarily entails a questioning of the anthropocentrism of ‘the subject’ – the author or writer constituted by philosophy and by literature. Literary texts, like animals, tend to mess with the boundaries of reason and feeling, and *Disgrace*, is, I would suggest, about the limits of the rational thought that human animals have used to distinguish themselves from animal life. The novel asserts the difference between ‘human’ and ‘animal’ not simply by foregrounding the technology by which animals are non-criminally put to death – but also because Coetzee’s chiseled Flaubertian descriptive prose refuses secure ethical positions grounded in the consolations of accepted human belief systems, including rational truth. The ending of *Disgrace* can be read as a critique of human ideas of sacrifice and redemption: Coetzee takes us through the stereotypical figurations and gestures in a way that makes their insubstantiality and emptiness self-evident. Lurie remains confused until the end, unable to escape what Agamben calls the ‘anthropological machine’, and doomed to give up both on himself and the crippled singing dog who loves him.

David Lurie resigns uncontrite from his teaching position at Cape Technical University because of an affair with a student, and moves to live with his daughter, Lucy,

on a smallholding in the Eastern Province, where she grows flowers and vegetables for the market in nearby Grahamstown and runs dog kennels. Working as a volunteer at a local animal shelter, David assists Bev Shaw in euthanising animals, mainly dogs, and in the process appears to undergo a transformation which includes an acceptance of a shared emotional life with animals. For instance, David becomes mindful of giving each dog a proper burial, ensuring their corpses ‘will not be beaten into a more convenient shape for processing’ (Coetzee 1999b: 143). Despite David’s acceptance of his own animality and his adoption of a less anthropocentric outlook, the novel seems to make an appeal to a sacrificial logic that entails his giving up on the special singing dog of whom he has become fond as a final act of renunciation. The novel ends on one of the killing Sundays; the dog is carried ‘like a lamb’ to the slaughter. Coetzee offers no rational explanation from Lurie for his decision to sacrifice the crippled dog who he knows will die for him (215). The last line of the book is ‘I am giving him up’.

It gets harder all the time, Bev Shaw once said. Harder, yet easier too. One gets used to things getting harder; one ceases to be surprised that what used to be as hard as hard can be grows harder yet. He can save the young dog, if he wishes, for another week. But a time must come, it cannot be evaded, when he will have to bring him to Bev Shaw in her operating room (perhaps he will carry him in his arms, perhaps she will do that for him) and caress him and brush back the fur so that the needle can find the vein, and whisper to him and support him in the moment when, bewilderingly, his legs buckle; and then, when the soul is out, fold him up and pack him away in his bag, and the next day wheel the bag into the flames and see that it is burnt, burnt up. He will do all that for him when his time comes. It will be little enough, less than little: nothing.

He crosses the surgery. ‘Was that the last?’ asks Bev Shaw.

‘One more.’

He opens the cage door. ‘Come,’ he says, bends, opens his arms.

The dog wags its crippled rear, sniffs his face, licks his cheeks, his lips, his ears. He does nothing to stop it. ‘Come.’

Bearing him in his arms like a lamb, he re-enters the surgery. ‘I thought you would save him for another week,’ says Bev Shaw.

‘Are you giving him up?’

‘Yes, I am giving him up.’ (Coetzee 1999b: 220).

Michael O’Sullivan argues that any author who deals with animals must necessarily ‘give up control’, including the autonomy and authority that have been definitive of ‘authorship’ since the seventeenth century. The reason for this relinquishing of control, he continues, is that it allows humans ‘to revisit moments of weakness’ that animals traditionally embody, and ‘it may raise compassion for the other’ (2011: 119). For O’Sullivan, then, Lurie’s giving up of the unnamed dog, is supported by Coetzee’s disordering of narrative temporality: it gives us back what Paul Ricoeur calls the “articulated unity of coming-towards, having-been and making-present”. The potentialities of animal and human time merge in this passage’ (2011: 131). This reading is a variation on the argument that Coetzee is representing a merging of human and pre-linguistic animal suffering. For me, however, David’s painful imagining of how he might support singing dog in his death, compared to the stark description of what he actually does in present time, represents not unity but underlines David’s multiple failures, including his final failure to save the dog. Indeed, the ‘I’ in the last sentence – ‘I am giving him up’ – draws attention to David’s final understanding that it is humans who have control over whether certain

animals live or die. The dog seems to also function as a figure for Lurie at this point: in giving up on singing dog, is he giving up on himself, on South Africa? David imagines at various points in his relationship with the dog a tentative interspecies *rapprochement*; but just as the history of canine domestication reveals a mix of moralities of control and care, there can be no simple relinquishing of mastery by Lurie.

The scene invokes two Victorian texts that work against critics who read in this scene ‘a posthumanist religiosity’ (Weil 2012: 127). Coetzee undercuts the ‘sacrificial structure’ that opens up a space for the ‘noncriminal putting to death’ of the animal of which Derrida speaks, allowing no space for the transcendence of the human spirit. Instead the act of sacrifice invokes other such acts of disgrace. When David allows singing dog to lick ‘his cheeks, his lips, his ears’ as he collects him for his death, who can fail to recall Darwin’s poignant words in *The Descent of Man* (1871):

The love of a dog for its master is notorious; in the agony of death he has been known to caress his master, and every one has heard of the dog suffering under vivisection who licked the hand of the operator; this man, unless he had a heart of stone, must have felt remorse to the last hour of his life. (1981: 40)

That David allows this characteristic canine gesture of affection from his special dog, when earlier he felt revulsion at the dogs licking him, shows he has developed a capacity for empathy with another species, and has become less selfish, perhaps. However, the shift from the personal pronoun ‘he’ to ‘it’ in the sentence indicates his emotional distance as he prepares to ‘give him up’. Deborah Bird Rose, who names the dog ‘Youngfella’, asks the entirely relevant question of the ‘structure of sacrifice’ at stake in this scene: ‘what does David save in giving up Youngfella?’:

On the face of it David is sacrificing the dog in order to save both the boundary between the human and animal and human control over that boundary. His choice furthers his infectious emptiness. This was his last fall into disgrace ... (2011: 38)

When the dogs are brought to the clinic in the first place the narrator tells us it is ‘because they are unwanted: *because we are too many*’ (146). The italicised words reference the suicide note of Little Father Time in Thomas Hardy’s *Jude the Obscure* (1895) – ‘*Done because we are too many*’ (Hardy 1974: 356; his italics) – after he has murdered his two half siblings in a tragically misguided attempt to rectify the consequences of working-class fertility. This grotesque intertextual reference underlines not Darwinian evolutionary or Malthusian thinking as it does in Hardy’s text but the anthropocentrism of Lurie’s thinking: while he may have come closer to understanding the continuity between human and animal life from a human point of view the dogs are too many and must be eliminated. Scenes like these are a powerful challenge to Singer’s faith in the dominion of the rational that informs his analysis of *The Lives of the Animals*, because what Coetzee’s fiction succeeds in registering with such devastating force are the evasions and limitations of the human rational condition, and the limitations of human language to register the ubiquity of mechanised animal killing.

Coetzee offers no rational explanation of Lurie’s dedication to surplus dogs. Lurie himself does not understand why he drives to the incinerator every Monday. To lighten the burden on Bev Shaw? For that it would be enough to drop off the bags at the dump and drive away. For the sake of the dogs? But the dogs are dead; and what do dogs know

of honour and dishonour anyway, he wonders. Coetzee's unemotional, precise prose renders the dead bodies of the dogs in kinesthetically descriptive detail (1999b: 144–45). Lurie's prevarications and deflections seem self indulgently consistent with what we already know of his character, especially when contrasted to the narratorial description of dead animal bodies in all their material excess.

Lurie, like Elizabeth Costello, is 'wounded', to use Cora Diamond's term, by various forms of mechanised animal killing. The trauma experienced by David Lurie is an ethical issue which the novel acknowledges as a kind of unspeakability – not only the unspeakability of how animals are treated in such practices as factory farming and pet shelters but also the unspeakability of confronting the limits of one's own thinking, in confronting (as Diamond puts it) the trauma of experiencing 'something in reality to be resistant to our thinking it, or possibly too painful in its inexplicability'.<sup>8</sup> How far the trope of unspeakability is an adequate critical response to the human iterability of animal suffering depicted in *Disgrace* is debatable because the novel in my view articulates so eloquently what Raymond Williams called a 'structure of feeling'. *Disgrace* represents the mixed affects – care, compassion, violence, and indifference – that characterise David's attempt to honour a human kinship between human and nonhuman species. As the Vick and Bandit cases also show, this same paradoxical mix of care, sentiment and violence typifies relationships between humans and nonhuman animals, including domestic animals, in contemporary Western societies.<sup>9</sup>

If singing dog could speak, what would his story be? In an interrogative twist on Wittgenstein's elliptical statement, Kari Weil asks: 'If it did speak ... could we understand it?' (Weil 2012: 127).

## Appendix

**Animal rights:** A philosophical position as well as a social movement that advocates for providing nonhuman animals with moral status and, thereby, basic rights.

**Animal studies:** Generally used, at least in the natural sciences, to refer to the scientific study of, or medical use of, nonhuman animals, as in medical research. In the humanities, it is the preferred term for what social sciences call HAS.

**Anthrozoology:** The scientific study of human-animal interaction, and the human-animal bond.

**Critical animal studies (CAS):** An academic field of study dedicated to the abolition of animal exploitation, oppression, and domination.

**Ethology:** The scientific study of animal behaviour.

**Human-animal studies:** The study of the interactions and relationships between human and nonhuman animals (DeMello 2012b: 5).

## Notes

1 For simplicity's sake, I will generally be using 'animal' to mean 'nonhuman animal.' I will also use *animal studies* in its broadest, contemporary sense, designating the multidisciplinary field known by some as human-animal studies (HAS) – sometimes called anthrozoology – which is not to be confused with the scientific usage which refers to laboratory studies involving animals. Sometimes the related term, critical animal studies, is used, although CAS distinguishes itself from much mainstream human-animal studies by virtue of its commitment to an advocacy agenda. For a fuller discussion

- of the relationship between critical animal studies and human-animal studies see Taylor (2013: 155–169). For brief definitions of terms see the *Appendix* at the end of this essay.
- 2 See Susan McHugh (2011 and 2006).
  - 3 See Kari Weil (2012: 3–4).
  - 4 While Derrida's work on what he calls 'the question of the animal' has been enormously important, his critique does not go far enough. I agree with Donna Haraway that Derrida fails to 'meet' the animal. See especially Haraway's analysis of the scene of Derrida's confrontation with his cat in his bathroom (2008: 19–23). For a full-blown discussion of Derrida's failure in 'The Animal That Therefore I Am (More to Follow),' to sustain a critique of sexual as well as species difference, see Guenther (2009). For a critique of Derrida's centrality in the critique of humanism in animal studies see Fraiman (2012).
  - 5 For a more detailed discussion of this point, and Derrida's positions see Wolfe (2010: 62–78).
  - 6 For a full discussion of this point in relation to the Vicks case see Broad 2013 'Vegans for Vick: Dogfighting, Intersectional Politics, and the Limits of Mainstream Discourse' 780–800. For discussion of the Bandit case see Hearne *Bandit: Dossier of a Dangerous Dog*, 2002.
  - 7 See for example, 'A Synopsis of English Dogs' in Rev. William B. Daniel, *Rural Sports*, vol. 1, p.15.

  - 9 Raymond Williams introduced the term 'structure of feeling' to describe the way shared emotional dispositions have an impact on the way societies operate and how history is constructed and experienced (Williams 1977: 133). Philip Armstrong has usefully used this term to show how intimately the emergence of certain structures of feeling is tied up with human–animal relations: for example, dispositions like sympathy, sentimentalism, nostalgia for nature (Armstrong 2008).

# CHAPTER 6

## The Aesthetics of Human Disqualification

*Tobin Siebers*

To qualify for membership in normative humanity, people have to appear a certain way. Disabilities, especially those that take the form of manifest physical differences at odds with existing majoritarian norms, permit people to be disqualified as human. Aesthetic taste, according to Tobin Siebers, by exalting an ideal of beauty, contributes to the practice of disqualification. Siebers taught English at the University of Michigan. His books include *The Mirror of Medusa* (1983), *Disability Aesthetics* (2010), and *Cold War Criticism and the Politics of Skepticism* (1993).

Smile Train, an international organization devoted to children with cleft palette, seems in many ways to be a model charity. It trains and uses local doctors. It claims to put 100 percent of contributions toward surgeries. But Smile Train is a model charity in more than one way. It promotes itself by giving a familiar and typical appearance to disability, following an aesthetic model long established for the purpose of qualifying some people and disqualifying others. The “world’s leading cleft charity” uses in-your-face, close-up portraits of disabled children, largely of color and non-Western, to encourage donations to the “modern-day medical miracle” designed “to give a desperate child not just a new smile, but a new life”.<sup>1</sup> Smile Train equates disability with loss of life, isolating the children from everyday existence and exhibiting them in a series of medical mug shots. Individuality is downplayed, and the children appear first and foremost as medical specimens of nature gone awry, displayed to elicit feelings of pity, disgust, and charity. The children’s color, non-Western origin, and disabled state stand in sharp contrast to the white, smiling, celebrity friends, such as Candice Bergen, who urge donors to be generous.<sup>2</sup> Smile Train “enfreaks” the children, to use David Hevey’s term, only to promise to whisk away their freakish nature through the magic of modern medical technology.<sup>3</sup>

*Original publication details:* Tobin Siebers, “The Aesthetics of Human Disqualification,” from *Disability Aesthetics*, pp. 21–56. University of Michigan Press, 2010. Reproduced with permission from The University of Michigan.

Let me note from the outset that I am not opposing the sharing of medical technology across the globe, the assistance of poor nations by wealthy nations, or the creation of charities and nongovernmental organizations devoted to particular world problems. These are desperate times, and many people in the world need help. Rather, what concerns me is the symbolism by which populations and individuals are established as needing help, as being inferior, and the role played by disability in that symbolism, because it has a long history of being placed in the service of discrimination, inequality, and violence. What I am calling the aesthetics of human disqualification focuses on how ideas about appearance contribute to these and other forms of oppression. My claim is that this symbolism depends on aesthetic representations that require further clarification and critique, especially with respect to how individuals are disqualified, that is, how they are found lacking, inept, incompetent, inferior, in need, incapable, degenerate, uneducated, weak, ugly, underdeveloped, diseased, immature, unskilled, frail, uncivilized, defective, and so on. My intention is less to provide a theoretical description of this problem than to review a series of analytic examples from the historical record, but I will begin by defining my theoretical vocabulary and presuppositions.

### Three Definitions

*Disqualification* as a symbolic process removes individuals from the ranks of quality human beings, putting them at risk of unequal treatment, bodily harm, and death. That people may be subjected to violence if they do not achieve a prescribed level of quality is an injustice rarely questioned. In fact, even though we may redefine what we mean by quality people, for example as historical minorities are allowed to move into their ranks, we have not yet ceased to believe that nonquality human beings do exist and that they should be treated differently from people of quality. Harriet McBryde Johnson's debate with Peter Singer provides a recent example of the widespread belief in the existence of nonquality human beings (Johnson). Johnson, a disability activist, argues that all disabled people qualify as persons who have the same rights as everyone else. Singer, a moral philosopher at Princeton University, claims to the contrary that people with certain disabilities should be euthanized, especially if they are thought to be in pain, because they do not qualify as persons. Similarly, Martha Nussbaum, the University of Chicago moral philosopher, establishes a threshold below which "a fully human life, a life worthy of human dignity," is not possible (181). In particular, she notes that the onset of certain disabilities may reduce a person to the status of former human being: "we may say of some conditions of a being, let us say a permanent vegetative state of a (former) human being, that this just is not a human life at all" (181).

Surprisingly little thought and energy have been given to disputing the belief that nonquality human beings do exist. This belief is so robust that it supports the most serious and characteristic injustices of our day. Disqualification at this moment in time justifies discrimination, servitude, imprisonment, involuntary institutionalization, euthanasia, human and civil rights violations, military intervention, compulsory sterilization, police actions, assisted suicide, capital punishment, and murder. It is my contention that disqualification finds support in the way that bodies appear and in their specific appearances – that is, disqualification is justified through the accusation of mental or physical inferiority based on aesthetic principles.

Disqualification is produced by naturalizing inferiority as the justification for unequal treatment, violence, and oppression. According to Snyder and Mitchell, disability serves in the modern period as “the master trope of human disqualification.”<sup>4</sup> They argue that disability represents a marker of otherness that establishes differences between human beings not as acceptable or valuable variations but as dangerous deviations. Douglas Baynton provides compelling examples from the modern era, explaining that during the late nineteenth and early twentieth centuries in the United States disability identity disqualified other identities defined by gender, race, class, and nationality. Women were deemed inferior because they were said to have mental and physical disabilities. People of color had fewer rights than other persons based on accusations of biological inferiority. Immigrants were excluded from entry into the United States when they were poor, sick, or failed standardized tests, even though the populations already living there were poor, sick, and failed standardized tests. In every case, disability identity served to justify oppression by amplifying ideas about inferiority already attached to other minority identities. Disability is the trope by which the assumed inferiority of these other minority identities achieved expression.

The appearance of lesser mental and physical abilities disqualifies people as inferior and justifies their oppression. Thanks to the work of Baynton and others, it is now possible to recognize disability as a trope used to posit the inferiority of certain minority populations, but it remains extremely difficult to understand that mental and physical markers of inferiority are also tropes placed in the service of disability oppression. Before disability can be used as a disqualifier disability, too, has to be disqualified. Beneath the troping of blackness as inbuilt inferiority, for example, lies the troping of disability as inferior. Beneath the troping of femininity as biological deficiency lies the troping of disability as deficiency. The mental and physical properties of bodies become the natural symbols of inferiority via a process of disqualification that seems biological, not cultural – which is why disability discrimination seems to be a medical rather than a social problem. If we consider how difficult it is at this moment to disqualify people as inferior on the basis of their racial, sexual, gender, or class characteristics, we may come to recognize the ground that we must cover in the future before we experience the same difficulty disqualifying people as inferior on the basis of disability. We might also recognize the work that disability performs at present in situations where race, sexuality, gender, and class are used to disqualify people as physically or mentally inferior. At the current time we prefer to fix, cure, or eradicate the disabled body rather than the discriminatory attitudes of society. Medicine and charity, not social justice, are the answers to the problems of the disabled body, because the disabled body is thought to be the real cause of the problems. Disability is a personal misfortune or tragedy that puts people at risk of a nonquality existence – or so most people falsely believe.

*Aesthetics* studies the way that some bodies make other bodies feel. Bodies, minimally defined, are what appear in the world. They involve manifestations of physical appearance, whether this appearance is defined as the physical manifestation itself or as the particular appearance of a given physical manifestation. Bodies include in my definition human bodies, paintings, sculpture, buildings, the entire range of human artifacts as well as animals and objects in the natural world. *Aesthetics*, moreover, has always stressed that feelings produced in bodies by other bodies are involuntary, as if they represented a form of unconscious communication between bodies, a contagious possession of one body by another. *Aesthetics* is the domain in which the sensation of otherness is felt at its most powerful, strange, and frightening. Whether the effect is beauty and pleasure,

ugliness and pain, or sublimity and terror, the emotional impact of one body on another is experienced as an assault on autonomy and a testament to the power of otherness. Aesthetics is the human science most concerned with invitations to think and feel otherwise about our own influence, interests, and imagination.

Of course, when bodies produce feelings of pleasure or pain, they also invite judgments about whether they should be accepted or rejected in the human community. People thought to experience more pleasure or pain than others or to produce unusual levels of pleasure and pain in other bodies are among the bodies most discriminated against, actively excluded, and violated on the current scene, be they disabled, sexed, gendered, or racialized bodies. Disabled people, but also sex workers, gay, lesbian, bisexual, and transgendered people, and people of color, are tortured and killed because of beliefs about their relationship to pain and pleasure (Siebers 2009). This is why aesthetic disqualification is not merely a matter for art critics or museum directors but a political process of concern to us all. An understanding of aesthetics is crucial because it reveals the operative principles of disqualification used in minority oppression.

*Oppression* is the systematic victimization of one group by another. It is a form of intergroup violence. That oppression involves “groups,” and not “individuals,” means that it concerns identities, and this means, furthermore, that oppression always focuses on how the body appears, both on how it appears as a public and physical presence and on its specific and various appearances. Oppression is justified most often by the attribution of natural inferiority – what some call “in-built” or “biological” inferiority. Natural inferiority is always somatic, focusing on the mental and physical features of the group, and it figures as disability. The prototype of biological inferiority is disability. The representation of inferiority always comes back to the appearance of the body and the way the body makes other bodies feel. This is why the study of oppression requires an understanding of aesthetics – not only because oppression uses aesthetic judgments for its violence but also because the signposts of how oppression works are visible in the history of art, where aesthetic judgments about the creation and appreciation of bodies are openly discussed.

Two additional thoughts must be noted before I treat some analytic examples from the historical record. First, despite my statement that disability now serves as the master trope of human disqualification, it is not a matter of reducing other minority identities to disability identity. Rather, it is a matter of understanding the work done by disability in oppressive systems. In disability oppression, the physical and mental properties of the body are socially constructed as disqualifying defects, but this specific type of social construction happens to be integral at the present moment to the symbolic requirements of oppression in general. In every oppressive system of our day, I want to claim, the oppressed identity is represented in some way as disabled, and although it is hard to understand, the same process obtains when disability is the oppressed identity. “Racism” disqualifies on the basis of race, providing justification for the inferiority of certain skin colors, bloodlines, and physical features. “Sexism” disqualifies on the basis of sex/gender as a direct representation of mental and physical inferiority. “Classism” disqualifies on the basis of family lineage and socioeconomic power as proof of inferior genealogical status. “Ableism” disqualifies on the basis of mental and physical differences, first selecting and then stigmatizing them as disabilities. The oppressive system occults in each case the fact that the disqualified identity is socially constructed, a mere convention, representing signs of incompetence, weakness, or inferiority as undeniable facts of nature.

Second, it is crucial to remember the lessons of intersectional theory. This theory rightly focuses on how oppressive systems affect the identity of the oppressed individual, explaining that because individuality is complex, containing many overlapping identities, the individual is vulnerable to oppressive systems that would reduce the individual to one or two identities for the purpose of maintaining power and control (Collins 208).<sup>5</sup> Intersectional theorists restore a complex view of the individual and fight against creating hierarchies between different identities. For example, the debate whether it is worse to be black or female is viewed as divisive and unproductive. My tactic here is similar. I want to look at identity not from the point of view of the oppressed individual but from the point of view – limited as it may seem and significant because limited – of oppressive systems. Disability is the master trope of human disqualification, not because disability theory is superior to race, class, or sex/gender theory, but because all oppressive systems function by reducing human variation to deviancy and inferiority defined on the mental and physical plane.

Intersectional analysis shows that disability identity provides a foundation for disqualification in cases where other minority identities fail because they are known to be socially constructed for the purposes of domination. It is not clear why disability has proven so useful a trope for maintaining oppression, but one reason may be that it has been extraordinarily difficult to separate disability from the naturalist fallacy that conceives of it as a biological defect more or less resistant to social or cultural intervention. In the modern era, of course, eugenics embodies this fallacy. Eugenics has been of signal importance to oppression because eugenics weds medical science to a disgust with mental and physical variation, but eugenics is not a new trend, only an exacerbation of old trends that invoke disease, inferiority, impairment, and deformity to disqualify one group in the service of another's rise to power. As racism, sexism, and classism fall away slowly as justifications for human inferiority – and the critiques of these prejudices prove powerful examples of how to light oppression – the prejudice against disability remains in full force, providing seemingly credible reasons for the belief in human inferiority and the oppressive systems built upon it. This usage will continue, I expect, until we reach a historical moment when we know as much about the social construction of disability as we now know about the social construction of race, class, gender, and sexuality. Disability represents at this moment in time the final frontier of justifiable human inferiority.

### Three Analytic Examples

The aesthetics of human disqualification presents in almost every sphere of human influence, but because the art world thrives on aesthetic judgments, art-making practices and debates about them provide a unique window into disqualifying and qualifying statements about human appearance, made almost always, of course, in the guise of judgments of taste. Oddly, although the source of disqualification is not the aesthetic itself, the devices of disqualification are often worked through in the aesthetic context – at museums, art shows, in literary works, music, art catalogs, magazines, and by entertainments of various kinds. My itinerary begins with a focus on the Nazi era because of its definitive and violent interpretation of modern art as part of a medical and eugenic project that disqualifies certain populations as defective. Then I jump forward in time to the controversial display in 2005 of Marc Quinn's sculpture of

Alison Lapper in London's Trafalgar Square. Here I address the debate about whether disabled bodies should be subjects of art and displayed in public spaces. Finally, I conclude by looking at a 2008 essay in *Newsweek* magazine that reproduces medical photographs from the Mütter Museum in Philadelphia in a gesture embracing the tradition of the freak show. Each analytic example demonstrates the shuttling back and forth of aesthetic judgments between the art world and the political world, providing the occasion to map the operative principles obtaining between aesthetics, disqualification, and oppression.

*Degenerate Art and Defective People.* Although the Nazis were not shy about using disability to disqualify human beings, these attitudes acquired even greater transparency in statements about the art world. Hitler's love of art and conception of himself as an artist – as preposterous as they may seem – meant that art was the preferred vehicle for the development of Nazi ideas and philosophy. It was also the domain where we see played out Nazi ideas about nonquality human beings. The competition in 1937 between the Grosse Deutsche Kunstausstellung (Great German Art Exhibition) and the exhibit of Entartete Kunst (Degenerate Art) makes the use of aesthetic disqualification by the Nazis' crystal clear by setting in opposition their positive and negative conceptions of human types. The Degenerate Art exhibition represented the Nazis' attack on modern art because of its portrayal of "defective" people, while the Great German Art Exhibition, with which Hitler inaugurated the House of German Art, was supposed to demonstrate the superiority of German bloodlines and aesthetic taste. The purposes of the two exhibitions could not have been more different, but their occurrence in the same year provides the occasion to construct from their negative and positive views of human appearance a clear conception of the Nazi system of aesthetic disqualification.<sup>6</sup>

The works included in the Great German Art Exhibition avoid representing physical imperfection and racial diversity at all costs. The Nazis staked their claim to superiority on the representation of beautiful and healthy German bodies, although the works are now indistinguishable from kitsch. The controlling design of the exhibition came directly from Hitler's ideas about art, as revealed by many public statements. Hitler embraced health and racial homogeneity as the measures of quality human beings. Disease and disability were his principal disqualifiers. "The German people," Hitler exclaimed, "with their newly awakened affirmation of life are seized with admiration for strength and beauty and therefore for what is healthy and vigorous" (Adam 76). "We only want the celebration of the healthy body in art" (Adam 149). The House of German Art was to open its doors only to ability, not disability.

In contrast, Hitler accused the modern works shown in the Entartete Kunst exhibit of reveling in "deformed cripples and cretins, women who inspire only disgust, men who are more like wild beasts, children who, if they were alive, would be regarded as God's curse!" (Sax and Kuntz 230). As evidence for Nazi claims about the biological inferiority of the subjects pictured in modern art, the catalog designed to accompany Entartete

Kunst juxtaposed modernist works and examples of facial deformities as well as works by modern artists and mental patients. The catalog claims, for example, that a painting by a "schizophrenic from a lunatic asylum" "looks more human than Paul Klee's botched effort" (Barron 383). Entartete Kunst asks beholders not only to cast the psychological sources of modern art as mentally incompetent but also to confuse modernist experiments with form with realistic depictions of disabled human beings. Paul Schultze-Naumburg, author in 1928 of *Kunst und Rasse*, provides an early example of the strategy used by

Entartete Kunst to denigrate modern art; the book compares portraits by Modigliani, Schmidt-Rottluff, and others to medical photographs of physically disabled and diseased patients.<sup>7</sup> Similarly, Entartete Kunst either interpreted artworks as medical specimens or juxtaposed artworks with medical photographs and other artifacts. The exhibition sought to tutor the public in the Nazi vision of aesthetics by suggesting the negative medical impact that disabled and racially diverse people might have on the German population. In effect, beholders were supposed to see the so-called degenerate works through Nazi eyes as picturing examples of in-built inferiority, providing an experience of disability preliminary to the extermination of more than 200,000 human beings with similar characteristics.<sup>8</sup>

*Degeneration* was principally a medical term before Max Nordau applied it to art. It referred throughout the last half of the nineteenth century to individuals who departed from norms of human health because of genetic difference, sexual habits deemed excessive, or shattered nerves. The Nazis applied these distinctions as standards of aesthetic beauty. Degenerate art deserved its name in their view because it included bodily deformities, bloodshot eyes, feebleness, and signs of nervous exhaustion – all disabling conditions supposedly brought about by racial impurity or the stress of modern life. Jews, homosexuals, and criminals were automatically assumed to be biologically inferior, and the Nazis found evidence for their assumptions in the physical traits given to people in works of modern art.

The works banned as degenerate by the Nazis are more familiar in their form and content than those approved by them. Consequently, it makes sense to focus first on the so-called Great German Art, so that we may let the full power of defamiliarization strike us when we turn to the better-known works and artists. The point of the comparison, I remind, is to gain an understanding of the aesthetics of human disqualification, not to make judgments about which objects are better works of art. This goal requires attention to the contribution of aesthetics to oppression, that is, to the choice of appearance placed in the service of intergroup or political violence.

The Great German Art works to achieve qualification for the German people by designing a specific though imaginary human type based on the healthy and able body. This type was proposed as the norm, and deviation from it tended to justify disqualification and oppression. One of the oddities revealed by a disability studies perspective on aesthetics, however, is how truly unreal and imaginary are nondisabled conceptions of the human body. Remove imperfection from the body, and one discovers the perfect recipe for what does not exist for the most part in the human universe. Disability theorists are fond of noting that nondisabled bodies are all alike, while disability takes a thousand unique and different forms. If the strength of human nature lies in its evolutionary compact with variation, then the Nazi drive toward perfection based on uniformity produces results contrary to the laws of evolution. The Great German Art refuses variation by embracing an idea of human form characterized by exaggerated perfection and striking regularity. Arno Breker's *Readiness* represents the perfect picture of health and ability, but it is deeply unreal and stumbles into pure kitsch: its pumped-up body, thought classical by the Nazis, actually swerves away from its Greek models to present a profile and shape outside the bounds of human form. Famously called Hitler's Michelangelo, Breker preferred to model his sculptures on the bodies of athletes, but his works seem more frequently to represent bodybuilders – shapes contoured by steroids rather than sport and dubious as examples of male beauty.

"There is no exquisite beauty," Francis Bacon claimed, "without some strangeness in the proportion." By these lights, the only thing beautiful about Ivo Saliger's *Diana's Rest* is the peculiar fact that the three women are all exactly the same. It is a

convention of painting to base multiple figures on the same model, but in this example the convention springs from the ideological imperative to achieve human perfection by suppressing individual variation. *Diana's Rest* provides an example of the eerie world, sought by the Nazis, in which the desire for perfection quashes individuality and variety. Josef Thorak's *Comradeship* demonstrates the masculine version of this overcharged regularity. Matched muscle for muscle, the gigantic figures twin each other, while striving to embody an impossible ideal of human health. According to Hitler's address at the opening of the Great German Art Exhibition, the Nazi eugenic project required an emphasis on beauty and health as the first step in achieving the goal of creating a new human type. "The new age of today is at work on a new human type," Hitler remarks: "Tremendous efforts are being made in countless spheres of life in order to elevate our people, to make our men, boys, lads, girls, and women more healthy and thereby stronger and more beautiful. From this strength and beauty streams forth a new feeling of life, and a new joy in life. Never before was humanity in its external appearance and perceptions closer to the ancient world than it is today" (Sax and Kuntz 230).<sup>9</sup> Strangeness in proportion in either individual human figures or among them is deliberately eschewed in Nazi art because its goal is to portray a new human being whose embodiment of beauty and health results in an almost obscene regularity of features and body parts.

The image of nature in the Great German Art mirrors its treatment of the human body in the emphasis on banal, unvarying, and exaggerated perfection. If German blood issues supposedly from the soil, the picture of meadow, pasture, and forest in Nazi art seeks an image of nature that supposedly proves the superiority and durability of the German people. Nature in Nazi art is all abundance, but the ripeness is so artificial that it seems – and there is no irony intended – to bulge with decay. It has often been noted

that Nazi artists take their image of nature from the tradition of German Romantic art, especially the paintings of Caspar David Friedrich. The influence, however, is vastly overstated. Friedrich's nature scenes possess an aura of desolation, focusing often on a lone marker in the landscape such as a cross, a solitary figure, a crumbling church, a dead tree, or a broken grave marker. There are no dead trees, ruins, or broken graves in Nazi landscapes – no hint of the weight of time or the inevitability of death blemishing nature's bounty. Rather, nature exists as an eternal plenitude resistant to decay and death. For example, Oskar Martin-Amorbach's *The Sower* displays a blond peasant, marching across a field and smiling at the good earth in satisfaction, against a backdrop of vast blue sky and other fields being prepared for planting – all of the elements united by a rainbow as if to testify to a Nazi covenant with nature. There is not a single dead tree in view, no plant that is not ready to burst into full bloom. Gisbert Palmie's *Rewards of Work* represents the same vision of nature. The figures in the foreground, all surrounded by friendly animals and involved in expressions of antiquated labor (weaving on a spinning wheel, gathering fruit in a basket, harvesting wheat in sheaves), focus their attention on a nude blond goddess, apparently work's reward personified, from whom flows an almost infinite trail of golden cloth. In the background blossoms a spectacle of unspoiled nature: a bright sky, flowing river, abundant trees, and grassy meadows. No one aware of the earth's seasons could find in Nazi art the smallest semblance of nature's passage from birth and fullness to death and rebirth. Rather, nature seems fixed in an unending summer, never displaying the slightest hint of autumn, let alone the death of winter – a testimony to the Nazi hope that the Third Reich might endure without change for a thousand years.

Compared to the Great German Art, the art labeled degenerate by the Nazis presents a startling variety of human appearances. But more startling are the suggestions, first, that this variety is an effect of including disability and, second, that the Nazis were the first to recognize the aesthetic centrality of disability to modern art. It is not merely the case that the Nazis preferred representational art to Dada or expressionism, that they disliked broken lines and unnaturalistic uses of color, that they wanted artists only and always to draw or paint or sculpt with the greatest technical skill. They preferred all these things because they interpreted their opposites as signposts of disability. The techniques of Dada and expressionism deform the bodies rendered by them, seeming to portray disabled people. The palette of modernism paints human faces in greens, yellows, and purples, embracing discoloration without rejecting attendant associations of disease. The modernist determination to flatten the canvas and to draw attention to the sculptural quality of paint often stunts figures, bending and twisting them into anagrams of disability. Moreover, the attention given by modern art to themes of alienation, violence, panic, terror, sensory overload, and distraction requires an openness to disability as a visible and potent symbolization of these themes. People quivering with anxiety, howling in fear, or cringing in silent terror populate modernist canvases, openly embracing situations and conditions thought abnormal and feared by the Nazis. The Nazis waged war against modern art because they interpreted the modern in art as disability, and they were essentially right in their interpretation, for modern art might indeed be named as the movement that finds its greatest aesthetic resource in bodies previously considered to be broken, diseased, wounded, or disabled.

If modern art has had such enormous success, it is because of its embrace of disability as a distinct version of the beautiful. The Nazis grasped the nature of this aesthetic, but they rejected it, misreading the future direction of art as they misread many other

things about human culture. Instead, they attacked modern art for the very features that give it such remarkable imaginative and transformative power to represent the human condition – be it the capacity to claim through formal experiments and new content a vast array of human emotions, thoughts, and physical appearances or be it the confidence to leave behind the imitation of nature and to represent what nature might reject or fail to conceive.

Hitler's remarks on the modernist palette exemplify the tendency to associate invention in modern art with human impairment. Hitler disqualifies artists who apply imaginative uses of color by calling their vision defective:

From the pictures submitted for exhibition, I must assume that the eye of some men shows them things different from the way they really are. They really are men who can see in the shapes of our people only decayed cretins, who feel the meadows as blue, the heavens green, clouds sulphur yellow.... I only want to prevent these pitiable unfortunates, who clearly suffer from defective vision, from attempting with their chatter to force on their contemporaries the results of their faulty observation, and indeed from presenting them as "art." (Sax and Kuntz 230)

More significant than blaming modernist techniques on disability, however, is the Nazi use of modern art to illustrate people, trends, and conditions called degenerate. This point cannot be overstated. For the Nazis, modern art provided evidence in support of the medical and eugenic rejection of disability. The modernist interest in deformation of the human body and in new techniques of representation combined to produce visions of human appearance that demonstrated to Nazi eyes the evils of miscegenation, the devastating effects of modern life on the human nervous system, and the danger of allowing disabled people and racial inferiors to reproduce themselves. The Nazi way of life, once established by total warfare against and extermination of everything not German, would presumably have existed in stark opposition to the world pictured by modern art.

Consider Emil Nolde's *Mulatto* and Ludwig Meidner's *Self-Portrait*. Although a Nazi sympathizer, Nolde found his works displayed at the Entartete Kunst exhibit because of his embrace of modernist themes and techniques. The title of *The Mulatto* serves as a red flag for Nazi disapproval, but it is finally Nolde's modernist aesthetic that marks the woman in the portrait as "degenerate". Her patchy coloration, overbite, frizzy hair, and narrow eyes suggest in-built inferiority to the Nazi medical gaze. She demonstrates for the Nazis what mixing races will produce and supplies evidence for the necessity of keeping German bloodlines pure. Ludwig Meidner, the Jewish expressionist painter who initially made a reputation for himself by producing horrific landscapes of life in the modern city, later became a prolific self-portraitist. The Nazis included his *Self-Portrait* in the "Jewish room" of Entartete Kunst as proof of the defective nature of the Jewish people, scratching above the painting the words, "Jewish, all too Jewish" and referring to the work in the catalog as one of "three specimens of Jewish sculpture and painting" (Barron 298). The curation for the Jewish room announced its purpose as the "Revelation of the Jewish racial soul" (Barron 194). What the Nazis saw in the portrait, and wanted others to see, one can only imagine. A misshaped face, elfin ears, deformed hand, and twisted body – all rendered in unnaturalistic colors – seem to attest to the biological inferiority of Jews.

Another category significant for the definition of degenerate art and its reliance on disability as a marker of disqualification touches on antiwar art. Beginning with Callot

and Goya and increasing in importance with the rise of photography, images of wounded soldiers, victims of torture, maimed civilians, and devastated cities have played a crucial role in the critique of warmongering among nations. This tradition pictures disability as the measure of the evils of warfare, and although this usage stigmatizes the wounded person as an allegorical symbol of the horrors of war, it nevertheless makes an important contribution to the inclusion of disability, injury, and disease in the history of visual culture, one that endures to this day, most recently in the photographs of torture taken at Abu Ghraib. Hitler's war machine had every reason to resist this tradition, and artists critical of warfare soon found themselves labeled as degenerate. Like Hitler, Ernest Ludwig Kirchner went to war to defend Germany, but he was horrified by what he saw in the trenches of World War I. He had a nervous breakdown and represented the cost of war in the poignant and powerful *Self-Portrait as a Soldier*, included in the Entartete Kunst exhibit. The painting shows Kirchner in full dress uniform, exhibiting the bloody stump of his severed right hand against the background of a Baconesque meaty collage and a nude woman. The attack against him as a degenerate artist threw Kirchner into despair, as more than 600 of his works were confiscated. He committed suicide on June 15, 1938. Otto Dix is another powerful critic of the war ethic. His series *War* was attacked as degenerate, both because it is antiwar and because it uses ghastly images of war victims to depict the horrors of war. *Transplant* pictures a man in a hospital bed, his face torn asunder, with brains exposed, patched up with chunks of flesh designed to stand in for his nose, cheek, and forehead. *Skull* represents a fleshless head, a scraggly crop of hair spouting from the head and the lip, mingled with worms busily devouring the residues of this former person's brain.

The aesthetic vocabulary used by the Nazis to attack their victims is the invention of modern art – stolen to support a perverse and violent cause. The casualties of war represented in modern art display fragilities of the human mind and body that the Nazis used not to denounce war but to condemn certain populations and races. The focus of modern artists on the dangers of industrialization and crowded cities was made to support the idea that human beings best inhabit the archaic landscape of Nazi homelands. The images of diverse peoples from across the globe, celebrated in modern art, represent an openness to human variation that nevertheless struck Hitler's faithful as embracing degenerate, defective, and racially inferior people. The Nazis reinterpreted what they saw in modern art and put it in the service of an aesthetics of human disqualification, setting images, shapes, and human forms to oppressive and violent ends never imagined by modern artists themselves. In no way did the direction and inclination of modern art share in the prejudices and hatreds of the Nazis, but with a brutal twist of interpretation, they turned the expansiveness of human types found in modern art into a condemnation of everything not their own. They created once and for all a system of disqualification that justifies exclusion and genocide – a system whose aesthetic principles still rationalize oppression today.

*Alison Lapper Pregnant: "Why Shouldn't My Body Be Considered Art?"* The most significant aspects of Entartete Kunst, if we listen to the Nazis who toured it, were the feelings of revulsion that the artworks were supposed to excite in beholders. These works were revolting, of course, because they used disability to prove the degeneracy of modern existence. "All around us you see the monstrous offspring of insanity, impudence, ineptitude, and sheer degeneracy," explained the introduction to the Entartete Kunst catalog; "What this exhibition offers inspires horror and disgust in us all" ("Nazi Treasure Trove"). The aesthetic disqualification of disabled people has remained remarkably consistent over time, linking the emergence of eugenics in the late nineteenth century and

its applications in Great Britain, the United States, and Nazi Germany to unproductive and inaccurate stereotypes causally expressed today in discussions about health care, civil rights, neonatal testing, euthanasia, wrongful birth, reproductive care, assisted suicide, abortion, and quality of life. Although we seem to have moved to some degree beyond the idea that certain racial, ethnic, gendered, and sexed identities represent nonquality human beings, there continues to be widespread acceptance of the prejudice that individual human beings, of whatever race, ethnicity, gender, or sexuality, might be classified as inferior on the basis of injury, illness, disability, intelligence, or genetic traits.

When incorporated into works of art, however, the forms of aesthetic appearance that disqualify individual human beings as defective produce an entirely different set of meanings and emotions. Modern art claims disability as the virtuoso sign of the aesthetic, increasingly presenting disability as an aesthetic value in itself. Far from designing representations to mark human beings as inferior, modern art turns to disability, I have been arguing, as a new and powerful resource for promoting aesthetic variation, self-transformation, and beauty. Nevertheless, the radical gesture of rooting aesthetics in the representation of the disabled body produces an interpretive dilemma, one first discovered by the Nazis and still found almost everywhere in the art world today. As modern art increasingly defines its future direction in terms of disability, artists represent disabled bodies more and more explicitly as aesthetic objects, and the beholders of these objects must choose whether to embrace or to reject the strong feelings excited by disability. On the one hand, because modern art embraces disability as an aesthetic value in itself, there seem to be few objects with greater potential than disabled bodies to qualify as works of art. The modern in art manifests itself as disability, and disabled bodies possess an aura that seems to satisfy the artistic desire for new, varied, and beautiful forms of appearance. On the other hand, aesthetic objects symbolizing disability are sufficiently disruptive that some beholders are tempted to reject modern art as "sick" and "ugly" and to call for alternative forms of art that are "healthy" and "beautiful." The alliance between modern art and disability becomes the cause for disgust, complaints, and doubts, resulting in culture wars targeting the art world itself. Disability is mustered as evidence that art as a whole has succumbed to sickness and degeneracy.

In 2004, Marc Quinn began to exhibit a series of works that advances the modern preoccupation with disability as a key aesthetic concept as well as probes the strong feelings of prejudice that disabled bodies excite in other bodies. *The Complete Marbles* revise the tradition of classical fragmentary sculpture for the modern day by representing likenesses of people who in real life have missing limbs, establishing a powerful resonance between artworks long considered beautiful because of their broken state and people whose disabilities would seem to exclude them from the category of aesthetic beauty. One marble won the competition of the Fourth Plinth Commissioning Group and was installed on Trafalgar Square in London, immediately sparking a heated debate about the kinds of bodies thought permissible to exhibit in public. *Alison Lapper Pregnant*, juxtaposed with a king, two generals, and the naval hero Admiral Nelson, depicts a nude woman, three and a half meters high, weighing thirteen tons, and carved from snow-white Carrara marble. She is also eight months pregnant and has foreshortened legs and no arms.<sup>10</sup> Quinn explained that Nelson's Column, the focal point of Trafalgar Square, is "the epitome of a phallic male monument" and that "the square needed some femininity" (Reynolds). The sculpture repulsed some beholders, while exhilarating others. Some decried the display of a disabled person in a public square, but others celebrated it, pointing out that Admiral Nelson was also disabled. All beholders,

however, had a difficult time not revealing their feelings about disability, and these feelings, negative for the most part, affected the sculpture's value and identity as a work of art, not to mention contributing to the ongoing stigmatization of disabled people.<sup>11</sup>

The negative responses by critics to Quinn's work are especially revealing because they fixate on disability as an unacceptable subject for art, while trying to justify by other means the revulsion stirring them. At the same time, the commentators often embrace illiterate positions on disability, praising or pitying the people depicted in the works merely because of their impairments. Robert Simon, editor of the *British Art Journal*, calls Lapper "very brave" but concludes that the sculpture is "just a repellent artifact" (Lyall). Theodore Dalrymple in *City Journal* praises Lapper's "admirable courage" only to mount a personal attack against her. He dismisses her as "a single mother sporting ironmongery in her nose," who "has shrewdly (and, in her circumstances, understandably) commodified her armlessness, turning it to an advantage." Dalrymple apparently accepts that disability may be represented in art – since he notes that "some of the greatest paintings by one of the greatest artists of all time, Diego Velázquez, are of dwarfs" – but he concludes that Lapper's image, given over to "narcissism, self-pity, and self-obsession," falls well short of Velázquez's "statements of his deeply felt and completely sincere humanity." Apparently, neither Quinn nor Lapper is a good example of humanity. Hilton Kramer in the *New York Observer* calls Quinn's marbles "an amazing performance," "if you have the stomach for it," accusing the artist of turning beholders into "voyeurs of a succession of personal catastrophes – an experience that bears a distinct resemblance to involuntary encounters with pornography." Finally, in an opinion piece in the *Guardian*, illustrated by a photograph of pigeons swarming over the surface of the sculpture and hatefully captioned "Pigeon Toes," Brendan O'Neill confesses "to loathe the *Alison Lapper Pregnant* statue (not Alison Lapper herself, please note, who I'm sure has overcome great challenges to become both an artist and a mother)." For O'Neill, "the statue captures much of what is rotten in the heart of new Britain.... *Alison Lapper Pregnant* is about as challenging as old underwear.... It shows that we value people for what they are rather than what they achieve.... We prefer victims to heroes".

As much as these commentators try to achieve the focus on the artwork apparently required by aesthetic judgment, they end by remarking not so much on the artistic properties of the statue as on the details of Lapper's disability. Lapper's physical features – and not necessarily those represented in the statue – become reasons for denying the status of the work as art. The commentators also attack Lapper's personality as psychopathological, although it is not clear what Lapper herself has to do with the artwork.<sup>12</sup> More important, the commentaries conclude in nearly every case that the alliance between modern art and disability provides evidence that the art world in general is in decline, rotten, inhuman, or sick. The appearance of disability somehow justifies the claim that the project of modern art is diseased.

But modern art permits no such condemnation of disability. I have been arguing that modern art makes of disability one of its defining aesthetic principles, rendering it impossible to attack disability without also rejecting modern art. The Nazis, of course, epitomize this last response. They attack the modern in art as disability and, consequently, reject all modern art as sick. The controversy over *Alison Lapper Pregnant* reinforces a similar dilemma, compelling beholders, whether friendly or not to modern art, to confront human disqualification as a facet of aesthetic judgment. Their choice is either to reject artworks that picture disabled people or to embrace disability as an aesthetic value in itself.

Many beholders choose to reject disability, but what would the other choice involve? “If the Venus de Milo had arms,” Quinn observes, “it would most probably be a very boring statue” (4). Quinn’s work trades in the bewildering idea that the same properties that strengthen works of art disqualify the actual people who possess them – the same bewildering idea on which modern art establishes itself. Modern art discovers in the eye drawn to the difference of disability one of its defining aesthetic principles. The interviews included in the catalog of *The Complete Marbles* insist again and again on this idea. Quinn repeatedly asks the subjects of his sculptures what they think about fragmentary classical statuary, whether it is beautiful and, if yes, whether their bodies are therefore beautiful as well. Lapper poses the same question: “Why shouldn’t my body be considered art?” (Freeman). The crucial point here is to recognize that Lapper’s body, once turned into an aesthetic representation, has a better chance of being accepted as art than a nondisabled body, despite the fact that disabled bodies, outside of aesthetic contexts, are still dismissed as repulsive and ugly. Disability is not merely unwanted content, political or otherwise, introduced into art but a mode of appearance that grows increasingly identifiable over time as the aesthetic itself.

Anita Silvers argues that modern art, because of its preoccupation with corporeal deformation, represents a moral resource for teaching people to accept disabled bodies as beautiful rather than rejecting them as ugly. She notices that people find beautiful Picasso’s cubist portrait, *Maya with a Doll*, while simultaneously being repulsed by a real child whose osteogenesis imperfecta produces the same features. The solution is, she argues, to embrace an aesthetic point of view in our everyday life, to tutor ourselves to look at disabled people as if they were works of art. I have no objection if modern art helps people to see disability as beautiful, although I am dubious about the possibility, but I am proposing a different dynamic between disability in art and reality. It is not a matter of being able to view disabled people as representing works of art; it is a matter of being able to view works of art as representing disability.<sup>13</sup> This fine distinction is important because it underscores that the difference ascribed to the artwork relies on the difference of disability, and as long as it remains unacknowledged, disability can be used to disqualify and oppress human beings. The distinction itself between disability in art and in reality is a function of the aesthetics of human disqualification.

*Medical Photographs: The Art of Making Strange.* The Mütter Museum of Philadelphia shows medical specimens, artifacts, and photographs to 80,000 people annually – exhibits called “disturbingly informative” on its website. The crowds streaming through the museum are not subjected to explicit captions and signs about degeneracy, as were the people who visited the Entartete Kunst exhibition, but the human subjects viewed by these crowds bear the weight nevertheless of an aesthetics of human disqualification that uses disability to represent some human beings as inferior to others. The Mütter Museum, conceived in 1849, ten years after the invention of the photograph, seems at first glance to be an archaic survival from a time before it became inappropriate to look at disabled people for education, fun, and profit. But in January 2008 *Newsweek* magazine published a visual essay that gives the lie to this theory. The essay reproduces ten sample images from the nearly 200 photographs published in the new catalog, *Mütter Museum: Historic Medical Photographs*, apparently for the distinct purpose of presenting disabled people as objects of visual pleasure. Unlike the catalog, which avoids the sensational language of medical marvels and monsters associated historically with the museum, *Newsweek* seems deliberately to mine the shock value of the medical photographs, calling its selection, in an apparent desire to rehabilitate the freak show for the modern moment, “A Century of Medical Oddities.”

There may be no better example with which to think about the aesthetics of human disqualification than the medical photograph. The medical photograph is its own aesthetic genre, an aesthetic genre determined not to be seen as one. It obeys a number of aesthetic rules, such as the use of full body profiles, changing postures, serial shots of the same subject, comparative anatomy between subjects, and close-ups, but its primary aesthetic imperative is the pretense of objectivity for the purpose of medical understanding and diagnosis. The images exist, after all, not to give pleasure but to instruct. Medical photographs cast disability as reality, not art, because their disabled subjects are exhibited first and foremost as medical specimens – examples of natural history gone bad and preserved for the advancement of science. No person in a medical photograph is a picture of health – all of which is to say that medical photographs represent medical subjects: the sick, the disabled, the injured, the deformed, those supposedly in need of a cure. The explicit ideology behind medical photographs is to promote a healthy world in which medical photography would no longer be necessary or possible as a genre, for once medical science prevails, a golden age will be upon us, and medical subjects will be gone forever.<sup>14</sup>

Until that glorious day arrives, however, people thought in need of medical rescue will be found among us. Who are they and what do they look like? What happens when doctors take their photographs and they are collected in museums, archives, and magazines? The *Newsweek* selection runs the gamut from giants and dwarfs, persons affected by polio, tuberculosis, facial deformities to parasitic insects, x-rays of objects stuck in throats, and a skeleton of conjoined twins, creating a collection, like most medical collections, in which it is not always clear why any given person might be classified as a human oddity. The problem, of course, is the instability of disability as an identity. All people, by virtue of being human, move in and out of disability identity, and people recognized as disabled in one context may not be thought disabled in another. In fact, the aesthetics of human disqualification works comparatively. Because the baseline in medicine is perfect health, medical photographs may enfreak any deviation from the baseline, however slight. Human disqualification viewed in isolation, based on individual appearance, has little meaning; its meaning emerges by association, placement in context, and aesthetic technique.

The Russian formalists define art itself as aesthetic technique, most notably as the technique of making strange. *Ostranenie* represents for them a process of “defamiliarization” by which the familiar is cast as unfamiliar and surprising (Shklovsky). Picasso’s cubist faces present superb examples, but making strange and disability are not so easily distinguished, especially because modern art relies with increasing frequency in its history on the semblance of disability to produce aesthetic effects.<sup>15</sup> The Russian formalists do not mention medical images as examples of defamiliarization, but the medical photograph offers, in fact, a remarkable vision of the art of making strange. The ability to represent a person as a medical oddity often relies on the technique of the photograph itself, on its ability to shift an appearance, create an association, or elicit a context that disqualifies the medical subject as inferior.

The art of making strange, annexed to the conventions of the freak show, is on vivid display in the *Newsweek* essay from its very first page. We also see on display the use of medical photographs to disqualify their subjects. The essay opens under the pall of a double death head, accentuating with a close-up view the malevolent associations of the two skulls of a pair of conjoined twins and juxtaposing them with the essay’s title reference to medical oddities. The essay closes with the same image in smaller scale but describes the twins in medical terms as a case of “ectopagus”.<sup>16</sup> Beginning at least with

Chang and Eng Bunker, some of whose remains are housed in the Mütter Museum, freak shows and carnivals have profited from the American love affair with conjoined twins (Wu). More than any other, this image makes it absolutely clear that the *Newsweek* essay conceives itself as a continuation of the freak-show tradition and its exhibition for fun and profit of people deemed inferior.

At least three other photographs send the same message about the freak show to *Newsweek* readers. The second image uses a sideshow convention to defamiliarize and enfreak its subjects, lining up in a row four men of varying statures from too small to too tall. The caption explains that Henry Mullins “was nearly seven feet seven inches tall, weighed 280 pounds, and performed on stage and in the movies,” but *Newsweek* leaves unnamed the person of smallest stature and those in the middle ranges, although their names are written on the photograph. Another example reveals that captions invent contexts that make medical subjects seem strange. The fourth image shows a wax model of Madame Dimanche before she experienced “one of the most unusual surgeries in history.” The Parisian “sprouted” from her forehead at age seventy-six a “horn” that grew to almost ten inches before it was surgically removed six years later by one Dr. Joseph Souberbeille. The image contains a black wax model of Madame Dimanche mounted on a board and photographed in profile to show the growth hanging down over her face. Finally, the sixth image offers an example of cultural and racial difference positioned as medical oddity. It exhibits the left hand of a Chinese nobleman, having cropped out of full view the person to focus on his extraordinary features: twisted fingernails ranging from five to six and a half inches in length.

Based on context alone, almost any image that finds itself in a collection of medical photographs will surrender its vision of human variation to the representation of medical deviance. But there are cases in which *Newsweek* seems to reach the limits of medical defamiliarization. The limit cases are important because they disabuse beholders of their inclination to accept the idea that all subjects of medical photographs deviate naturally, in and of themselves, from medical norms, while at the same time questioning the norms being imposed to create the category of oddity. The third image pictures an x-ray of a dog, “but not a real one,” caught in the throat of a little girl. The photograph reveals the “toy pooch,” nose down, against the backdrop of the girl’s throat, lung cavity, and rib cage, producing a study in abstraction, save for the black profile of the toy. The caption explains that the photograph comes from a collection of “radiographs depicting items that were successfully removed from the throats and airways of patients by a pioneering specialist.” Aside from the suggestion of injury to the girl, quickly dismissed, the image seems to appear uniquely on the basis of its aesthetic qualities – a perfect example of making strange by photographic technique – for it displays no suggestion of biological oddity.

The eighth image, depicting a young boy affected by polio, uses typical conventions of the medical photograph, making sure to place on view the entire specimen. Nevertheless, there are no signs of physical deformation, as found in the other photographs of human subjects, and except for the wary look on the boy’s face, the only indication of things gone awry is the primitive steel brace attached to the orthopedic shoe on his right leg. The justification for including the photograph among a century of medical oddities is apparently that polio, “which struck Franklin D. Roosevelt in the 1920s, is now almost unheard of in the United States.” Given the panic surrounding polio in the United States during the twentieth century, it is not surprising that its disappearance would be celebrated, but the photograph itself does not seem to bear witness to the polio

panic. Rather, the small-featured boy in a crew cut invokes gentleness and innocence rather than strangeness, his status as a human oddity being established by a huge backstory and the steel prosthesis bound to him.

Finally, the ninth image seems to break with the conventions of the medical photograph by exhibiting a mange mite magnified in size by 150 diameters – a species still in existence that preys on horses. The only apparent reason for the insect's inclusion in the collection is to display medical technology, although the magnification renders the *sarcopotes equi* monstrous ("Don't worry, that's not the actual size," the caption reassures), and the allusion to disease is not far away. The "parasitic mite," the caption elaborates, "lives within the subcutaneous tissue of a horse," causing "scabies, a transmittable, itchy skin infection that riders can pick up from a horse." But the appearance of the insect does expose in part the rationale underlying medical photography. The medical model of disability, which lodges defect in the person rather than in the person's social environment, disqualifies the unhealthy and diseased as inferior people, and they are easily grouped with other species thought inferior, such as animals and insects.<sup>17</sup> As the final photograph in the series, the parasitic mite calls for an insidious and retroactive reading of the previous images of disabled people as examples of beings existing at the lower end of the evolutionary chain, beings whose appearance is thought strange, beings therefore labeled oddities.

While the riddle of modern art is how to recognize the disability in art, the riddle of the medical photograph is how to recognize the art in disability. The aesthetics of human disqualification narrows both recognitions, asking beholders to dismiss art that shows too many signs of disability and to close their eyes to the artistic techniques used by medical photographers to disqualify their subjects. The perspective that sees in both cases the aesthetic value of disability is hard to find. Neither missing point of view will be possible in a large way until we find the motivation to represent disability aesthetically as a qualified rather than disqualified subject.

## Coda

In February 1998 *New York Press* published an essay by Norah Vincent that attacks the emerging discipline of disability studies as "yet another academic fad" (40). Nevertheless, disability studies apparently fails as a discipline not because it is too chic but because it attracts incompetent, weak, and dishonest people. Camille Paglia calls disability studies "the last refuge for pc scoundrels" (40), but if we believe Vincent, disability studies is also a refuge for ordinary scoundrels, not to mention scholars and students of poor quality. Disability studies supposedly attracts people of questionable moral character – "academic careerists" and "ambulance-chasing publishers" who want to profit from the newest fad – as well as mediocre and flawed minds – the "victim-obsessed," the "second-rate," and the psychologically dependent (40). Vincent seems especially keen to discredit disability studies by associating it with intellectually inferior and psychologically damaged scholars, and when she interviews various leading lights in the field, she is more intent on exposing their psychological weak spots than on capturing what is original about their contribution to disability studies. Lennard Davis, Vincent tells us, melts into "self-righteous goodspeak" at the mere mention of disability, while Michael Bérubé speaks in a voice that is "silky and kind"

when he argues that disability is an idea necessary to understand human rights (40). Disability studies deserves no place in the university, it seems, and no self-respecting scholar should have anything to do with it.

If there is any doubt that Vincent wants to disqualify disabled people as physically defective, morally degenerate, or psychologically damaged, the cartoon accompanying the essay should make her purpose obvious. The cartoon, drawn by Gary Leib, pictures a man in a wheelchair being pushed by a woman in a nurse's uniform. Leib overlays the drawing with a variety of disqualifying aesthetic markers: some associate the disabled with physical ugliness and lack of intelligence, while others attempt to promote the idea, despite all evidence to the contrary, that the disabled enjoy a privileged, exclusive, and wealthy lifestyle. For example, as beads of sweat run down his face, the disabled man in the wheelchair grips a cigarette holder in his mangled teeth and toasts his public with a martini. Behind him and pushing the wheelchair is his nurse attendant. Her eyes are vapid, and her breasts are bursting out of her tight-fitting uniform. Most hateful, however, is the fact that Leib draws the cartoon in a way that re-envisioned people with disabilities as Nazi soldiers. The disabled man in the wheelchair wears a monocle, summoning the image of an SS officer. The message of the cartoon is shocking and direct in its attack on disabled people; it manages to represent the disabled as poor, inferior, and undeserving creatures who have managed somehow to attain a position of wealth and power superior to other people. The cartoon asks its beholders to believe that the disabled as a group belong to the privileged few, to a dominant class, and to an infamous story of genocide and military expansionism, deserving comparison with the Nazis, some of the greatest criminals in human history.

By way of conclusion, let me pose three questions that I do not intend to answer but offer as background music to Gary Leib's cartoon and other artworks used to disqualify people with disabilities. What would it mean to call a person sick without it being a disqualification? What would it mean to call an artwork sick without it being a disqualification? What is the relationship between these two questions? Applying the aesthetics of human disqualification according to business as usual will give no satisfying answers to these questions. Rather, the way forward requires nothing less than a radical rethinking of the relationship between aesthetics, disqualification, and oppression, one in which the systemic oppression of disabled people would fail, and fail precisely, because it could no longer be based on human appearances, features, and conditions deemed inferior.

## Notes

- 1 The address for Smile Train's website is [www.smiletrain.org](http://www.smiletrain.org) (accessed February 19, 2008).
- 2 The list of celebrity friends from the West includes Christie Brinkley, Tom Brokaw, and Bette Midler, among many others, but no people of color. Thus, even when the children are cured, and their disabled status vanquished, their racial difference remains as a sign of disqualification, at once stigmatizing the children and justifying the intervention by benevolent representatives of white modernity. See <http://www.smiletrain.org/site/PageServer?pagename=special> (accessed February 19, 2009).
- 3 Smile Train also presents the threat of disability as an emotional reason to rescue unhealthy people living under inferior conditions in faraway lands. Kim and Jarman provide a brilliant discussion of this trend in the context of postcolonial studies: "we argue that Western or modern gestures to rescue people with disabilities in non-Western or 'pre-modern' locations strategically function to

produce hierarchies between different societies and nations.... Trading upon modernity's mask of benevolence, these hierarchies are often signified by one group's charitable acts scripted as the 'selfless' and 'generous' rescue of disabled people who have been exploited, mistreated, or expelled by societies defined as 'pre-modern'—that is to say, groups automatically coded by a relative 'lack' of development" (53–54).

- 4 I take this formulation from Snyder and Mitchell: "Disability as the master trope of human disqualification in modernity prefacing an understanding of inassimilable racial and ethnic differences by providing an empirical designation for 'unfit' bodies. Like discourses of national differences that, in turn, support investments in absolutist racial differences, disability may provide a key to the recognition of an underlayer of classification systems based on disqualifying bodily traits that jettison certain people from inclusion in the continuum of acceptable human variations" (127–28).
- 5 Some key texts on intersectionality relating to disability include Barbee and Little, Beale, Butler and Parr, Fawcett, Hayman and Levit, Ikemoto, Jackson-Braboy and Williams, Martin, O'Toole, Siebers (2008b), and Tyjewski.
- 6 Attendance at Entartete Kunst far outstripped the numbers at the Grosse Deutsche Kunstausstellung, raising serious doubts about Hitler's taste in art. Entartete Kunst traveled to twelve cities between 1937 and 1941 and attracted more than three million visitors. For more information on the two exhibitions, see Barron and Siebers (2000).
- 7 Carol Poore's analysis of Schultze-Naumburg is especially effective (53–55). Her analysis of disability and Nazi culture catalogs in great detail the variety of uses to which the Nazis put disability, including its propaganda and pictorial value (67–138).
- 8 From 1939 to 1945 between 200,000 and 250,000 mentally and physically disabled people were executed under T-4 and other euthanasia programs in Nazi Germany. Between 300,000 and 400,000 people were sterilized. The moral legacy of this history casts a shadow over contemporary debates about abortion, assisted suicide, the human genome project, mercy killing, and wrongful birth.
- 9 One notices here, incidentally, the influence of Winckelmann's emphasis on classical art's mimicking of the beautiful Greek body, but Winckelmann's love of corporeal perfection did not prevent him from embracing fragmentary and broken statuary, such as the *Torso Belvedere*, as the height of aesthetic beauty, while the Nazis were incapable of accepting any kind of human deformation or incompleteness as art. One searches in vain among Hitler's speeches on art for anything resembling Winckelmann's admiration of broken beauty. For a small analysis of fragmentary classical statuary in the context of disability, see Siebers (2008a).
- 10 For a superb analysis of the controversy, see Ann Millett: "Public space and its monuments," she argues, "have been gendered male and raced white traditionally, and public space is largely ableist in attitude, not to mention accessibility (or lack thereof.)"
- 11 For example, Kim Levin reviews Quinn's work positively in the *Village Voice* but describes disability in negative language:

At first sight, it looks exactly like a hall of sublime white marble antiquities.... But something, you suddenly realize, has gone terribly wrong.... Take a closer look at the embracing couple at the entrance. Titled *Kiss*, the piece harks back to Rodin and the romantic Beaux Arts sculptors. It invokes all the obsolete clichés of beauty, perfection, and idealization. Marvel at its outmoded skill, until cruel reality sinks in. The male figure has stunted thalidomide arms. The female's arm is normal but she has only one. Take a good look at the others too. Their truncated and missing parts aren't due to the vicissitudes of time but are the result of accident, genetic defect, or iatrogenic calamity. Quinn exploits the romance of classical antiquity—which depends on the mutilations of time and the notion of loss—to confront us with our own avoidance of the horrific fragility of the human condition.

- 12 Nor is it clear why Quinn's sculpture of Lapper succumbs more to "narcissism, self-pity, and self-obsession" (Dalrymple) than Velásquez's self-portraits or paintings of little people. Rather, similar to the example of the so-called degenerate art, commentators project their feelings of revulsion toward the artwork onto the artist or subject of the work.
- 13 On the one hand, it is not clear what it means, beyond metaphor, to experience a human being as an art object, but I worry that it relies on a form of objectification to which people at the extreme

poles of human beauty are especially susceptible. On the other hand, to grant to disability represented in an artwork the privilege of being aesthetically beautiful would produce a paradigm shift supportive of disabled people without the risk of objectifying them.

- 14 *Newsweek* provides a glimpse of the medical ideology at work in the essay by placing a running header at the top of each page: "To Your Health. Health for Life." Reader comments on the essay refer to a "disease free golden age" and complain that only the greed of drug companies delays its arrival.
- 15 Michael Davidson makes the case that disability should be linked formally to defamiliarization, arguing that the defamiliar body of disability creates aesthetic effects akin to those produced by formalist techniques.
- 16 The illustrations here come from the catalog, *Mütter Museum: Historic Medical Photographs*, rather than from *Newsweek*, because web images cannot be reproduced with sufficient quality. To view the images as presented by *Newsweek* visit: <http://www.newsweek.com/id/77018?GT1=10755> (accessed March 11, 2009).
- 17 This practice is characteristic of medical eugenics. Pernick notes that eugenic treatises and films in the United States highlight the "repulsive ugliness of the 'unfit'" by comparing them to cattle (94). Hitler, of course, compared "defectives" to "wild beasts" (GHDI).

# CHAPTER 7

## Ecocriticism

*Pippa Marland*

Pippa Marland teaches in the Institute of Humanities and Creative Arts at the University of Worcester, UK. Her work looks at the place of the island in our cultural imagination and, in particular, explores the idea of the island as a heightened space for the negotiation of self and world. The thesis has an interdisciplinary base which includes the emergent field of island studies, formulations of place drawn from cultural geography, archipelagic perspectives in critical and creative writing, and, as an overarching framework, contemporary ecocritical theorizations of Post-Humanism. In this essay, she reprises the history of the emergence of ecocriticism and environmental studies from the 1960s to contemporary Post-Humanist new materialism.

### Introduction

Ecocriticism is an umbrella term for a range of critical approaches that explore the representation in literature (and other cultural forms) of the relationship between the human and the non-human, largely from the perspective of anxieties around humanity's destructive impact on the biosphere. Other terms for the field include 'environmental criticism' and 'green cultural studies', the latter term reflecting the increasing diversity of the field's remit – its recent focus on film, TV, virtual worlds and popular music, for example, as well as its growing interest in representations of urban environments. How critics involved in this area choose to define themselves depends largely on their own position in relation to environmental issues and to their understanding of the implications of the individual terms. The prefix 'eco' is preferred by some for its ecological connotations – its emphasis on what Lawrence Buell calls "human and non-human webs of *interrelation*" (*The Future of Environmental Criticism*, glossary, 138, emphasis mine) – but for others it implies an overly close identification with one particular strand of scholarship that advocates a commitment to political activism (Bergthaller, *EASLCE website*).<sup>1</sup>

*Original publication details:* Pippa Marland, "Ecocriticism." *Literature Compass* 10.11, pp. 846–868. John Wiley & Sons, 2013. Reproduced with permission from John Wiley & Sons.

The multiplicity of perspectives and objects of study outlined above has perhaps contributed to an enduring perception in certain quarters of the academy that ecocriticism lacks legitimacy or coherence as an area of critical theory. Peter Barry, in his influential primer *Beginning Theory*, sees it as a field that “is still distinctly on the academic margins [...] and the movement still does not have a widely-known set of assumptions, doctrines or procedures” (239). In part this is because of the enormity of the subject. As Timothy Clark points out, “The ‘environment’, after all, is, ultimately, ‘everything’” (203), an apparently unlimited area of enquiry that is also in the process of constant change. It follows that so complex and dynamic a concern as the health of the biosphere and our place within it requires a broad range of procedures and an ability constantly to critique assumptions and doctrines. It implies, as Greg Garrard suggests, that the ecocritic must strive for a certain degree of “ecological literacy” (*Ecocriticism*, 5), which involves producing a fluid and contingent response in the face of both new forms of ecological understanding<sup>2</sup> and the ongoing and widespread sense of *deepening* environmental crisis. Clark, again, points up the magnitude of this challenge: “to try to conceptualise and engage the multiple factors behind the accelerating degradation of the planet is to reach for tools which must be remade even in the process of use” (xiii).

Lawrence Buell, whose measured views often provide a touchstone for ecocriticism, acknowledges the diversity of perspectives: “As literary ecodiscourse becomes more widely practised, more globally networked, more interdisciplinary and thus even more pluriform, the participants must become more increasingly aware of speaking from some position within or around the movement rather than for it” (*Future*, viii). For the purposes of this essay, I use the term ‘ecocriticism’ throughout to facilitate the discussion of a variety of environmental or ‘earth-centred’ critical approaches that have largely developed in the last 20 years and that represent positions from within or around the movement. In the paragraphs that follow, I give a brief history of ecocriticism from its early incarnations in the USA and Britain, through the successive ‘waves’ of its theoretical development and their relation to the enduring major strands of ecological thought – deep and social ecology – to its increasingly international platform and the emergence of the significant contemporary formulations of global *eco-cosmopolitics* and *post-humanist material ecocriticism*, which are introducing new paradigms to the field.

## The Roots of Ecocriticism

Notwithstanding its broad remit, there is a shared perception within ecocriticism that we are living in a time of environmental crisis that requires us to reassess with some urgency our modes of being in the world. Moreover, there is a general agreement that these modes of being have been, to a large degree, culturally determined. Buell, in an early formulation of the role of ecocriticism, identifies the environmental crisis as a “crisis of the imagination the amelioration of which depends on finding better ways of imaging nature and humanity’s relation to it” (*The Environmental Imagination*, 2). He believes that the ways in which we have conceived of ourselves and our relationship with the environment have contributed to our destructive impact on the planet. For Buell, then, the task of the ecocritic is both to unravel and critique the conceptualisations that have been so damaging and to identify traces of those ‘better ways of imaging’ where we find them. This remains the case for some ecocritics even in the most recent formulations of the movement.

The 1960s are largely seen as the decade that marked the beginning of the kind of environmental consciousness that provides the backdrop to ecocriticism, with the publication of Rachel Carson's *Silent Spring* in 1962 hailed as the beginning of "modern environmentalism" (Garrard, *Ecocriticism*, 1).<sup>3</sup> Although other works emerged in the 1960s and 1970s that were seen as embodying early forms of ecocritical practice, the movement was slow to establish itself.<sup>4</sup> It was not until 1992 that the first professional organisation of ecocritics, the Association for the Study of Literature and Environment, was formed in the USA, followed in 1993 by the founding of its journal, *ISLE: Interdisciplinary Studies in Literature and Environment*. A sister organisation was set up in the UK in 1998 (now encompassing the UK and Ireland), with its own publication, the journal *Green Letters*, first published in 2000.

In her introduction to the early collection of ecocritical essays *The Ecocriticism Reader*, published in 1996, Cheryll Glotfelty points up the dearth of environmental criticism existing at that time:

If your knowledge of the outside world were limited to what you could infer from the major publications of the literary profession, you would quickly discern that race, class, and gender were the hot topics of the late twentieth century, but you would never suspect that the earth's life support systems were under stress. Indeed you would never know that there was an earth at all. (xvi)

One of the factors influencing this slow progress was perhaps the uncertainty within the humanities of involving themselves with what was generally perceived to be a 'scientific' problem, the domain of the environmental sciences.<sup>5</sup> Another issue was the difficulty of speaking for the earth itself. Other areas of theory that were gathering momentum in the 1970s such as feminism and post-colonialism – both of which critiqued the political and social effects of 'othering' – had more identifiable means of locating and giving the space for articulation to those voices silenced by dominant ideologies.

But, in particular, there was a feeling in these early ecocritics that critical theory itself was thwarting their attempt to establish any kind of advocacy for the earth. John Parham rightly notes a 'belligerent' attitude to theory in first-wave ecocriticism ('The Poverty of Ecocritical Theory', 25). Rather than necessarily representing a rejection of theory per se,<sup>6</sup> this was more the result of a frustration with the particular 'linguistic' turn present in the structuralism and post-structuralism of the 1970s and 1980s that viewed language as a closed system, suggesting, at least in what Wendy Wheeler and Hugh Dunkerley call "the less subtle Anglophone interpretations of 'continental theory'" ('Introduction', *New Formations*, 7), that it is not possible to discuss the 'real' world because reality is constructed in language and 'there is nothing outside the text'.<sup>7</sup> Similarly, in the context of the New Historicism, Alan Liu made the much-contested assertion: "there is no nature except as it is constituted by acts of political definition made possible by particular forms of government" (104). Terry Gifford, responding to this statement, argued that "While Liu is right to identify the word 'nature' as 'a mediation', he is wrong to deny the general physical presence that is one side of that mediation" (*Green Voices*, 15).

The role of early ecocriticism, then, while not necessarily denying the linguistic construction of 'nature', was largely to create the theoretical space in which to discuss that 'general physical presence' on the other side of the mediation, which the proliferation and habits of consumption of the human race (albeit with an uneven global distribution of that consumption, as discussed below) were putting in jeopardy. Kate Rigby calls this

endeavour the “ecocritical reinstatement of the referent” (154) and, in an oft-quoted rebuff to extreme applications of the linguistic turn, Kate Soper reminds us: “it is not language that has a hole in its ozone layer; and the ‘real’ thing continues to be polluted and degraded even as we refine our deconstructive insights at the level of the signifier” (151).<sup>8</sup>

### The First Wave – Reinstating the ‘Real’

Accordingly, the first wave of ecocriticism, especially in the USA, focused on the representation in literature of the world beyond the text, devoting much of its energy to the search for the forms of literary expression which could best convey an environmental message. In *The Environmental Imagination*, Lawrence Buell formulated a checklist of four ‘ingredients’ of an environmentally orientated work:

1. *The nonhuman environment is present not merely as a framing device but as a presence that begins to suggest that human history is implicated in natural history. [...]*
2. *The human interest is not understood to be the only legitimate interest. [...]*
3. *Human accountability to the environment is part of the text's ethical orientation. [...]*
4. *Some sense of the environment as a process rather than as a constant or a given is at least implicit in the text. [...]* (7–8, italics in original)

Buell’s questioning of the text’s ‘ethical orientation’ in particular points up an important, though contested, element of ecocriticism, which is what Buell calls “a spirit of commitment to environmentalist praxis” (*Environmental*, 430). As a theoretical field based around concerns spreading out from the cultural to the political, there is a desire in some ecocritics to have a practical, ‘real-world’ impact – to educate our broader interactions with the non-human world and to form a ‘counter-canonical’ of texts “which are seen to model a more ecologically sustainable mode of being and dwelling in the world than that which has predominated in the lived reality of the modern era” (Rigby, 159). For others, the focus is more on interrogation than activism, though political intervention may be a (positive) outcome of that interrogation.<sup>9</sup>

Cheryll Glotfelty also provided a comprehensive checklist in her introduction to *The Ecocriticism Reader* – this time of questions reflecting the way in which an (American) ecocritic reads. As well as incorporating aspects of Buell’s ‘ingredients’, she also prefigured many of the concerns of subsequent waves of ecocriticism. For this reason, I include her full list in Appendix 1 as a still useful orientation for anyone wishing to carry out practical ecocriticism.

In the USA, despite the breadth of Glotfelty’s questioning, the first wave of ecocriticism was predominantly associated with the championing of non-fiction nature writing. Writers such as Henry David Thoreau, John Muir, Mary Austin, Edward Abbey, Wendell Berry and Annie Dillard were lauded for the quality of their environmental imagination. The landscapes they engaged with were often wilderness or semi-wilderness, and their writings reflect the legacy of American Transcendentalism, with its emphasis on the educative value of wild nature and on intense individual connection with the landscape. This approach has been described as “celebratory” (Head, ‘Ecocriticism and the Novel’, 236; Barry, 242), suggesting a relatively uncritical understanding of ‘nature’.<sup>10</sup>

First-wave British ecocriticism also concerned itself with the recuperation of forms of writing that foregrounded the non-human world and that might foster environmental

sensibility, though here the emphasis was on poetry. It was spearheaded by Jonathan Bate, who in two influential works, *Romantic Ecology: Wordsworth and the Environmental Tradition* (1991) and *The Song of the Earth* (2000), undertook the rehabilitation of the Romantic Poets, especially William Wordsworth, as poets of nature. For Bate, Romantic poetry enables us to “think fragility” (*Song*, 112) – to apprehend our ecological embeddedness and shared vulnerability with the non-human world.

Bate diverges from Buell, however, when it comes to environmental praxis. Basing his argument on Heidegger’s ideas of *dwelling* – a manner of being in the world that is receptive to the self-disclosure of nature and is revealed through poetry – Bate characterises *ecopoetry* as a *phenomenological* and pre-political form, which draws us into communion with the earth through its emphasis on ‘presencing’ rather than representation, bodying forth that presencing in part through its rhythms and sounds. He suggests that, while it might be appropriate for Marxist or feminist critics to believe that they are contributing towards social change, green critics should not approach poetry with a “set of assumptions or proposals about particular environmental issues, but as a way of reflecting upon what it might mean to dwell with the earth” (*Song*, 266). For Bate, “Ecopoetics must concern itself with consciousness. When it comes to practice, we have to speak in other discourses” (266).

Nevertheless, there is a sense in which the British landscape and its literary evocations are inextricably intertwined with the social and the political. Bate’s own discussion of the ‘peasant poet’ John Clare identifies the way in which he viewed “the ‘rights of man’ and the ‘rights of nature’ as co-extensive and co-dependent” (*Song*, 164), with his poetry foregrounding the mutual suffering of the earth and the rural poor as a result of the enclosure of common land and the ensuing destruction of ancient habitats. For Peter Barry, British ecocriticism is always ‘minatory’: “that is, it seeks to warn us of environmental threats emanating from governmental, industrial, commercial, and neo-colonial forces” (242). In the absence of vast stretches of ‘wilderness’ to evoke, in English literature “wild nature invariably co-exists with agricultural or industrial activity, or human settlement, migration or leisure patterns, each shaped, partially, by the dominant modes of production and social organisation” (Parham, ‘Two-Ply’, 113). Dominic Head, discussing the difference between, for example, the work of Thomas Hardy and D. H. Lawrence and American wilderness writing, states, “we are confronted with ‘natural’ images in which questions of social history and sexual politics are inscribed on the scene or in the landscape” (‘Ecocriticism and the Novel’, 236).

These questions of social and economic history and sexual politics began to emerge with more force on both sides of the Atlantic as ecocriticism progressed. The first wave had carried out a necessary ‘rehabilitation of the referent’ but fell short when ecocritics themselves began to challenge the theoretical limitations of the movement, thus signalling the second phase of ecocriticism.

## Deep and Social Ecology

Before moving on to discussion of the second wave, however, it is important to differentiate between two strands of thought – deep and social ecology – which exist within ecocriticism and which feature throughout the trajectory of its development.

Deep ecologists see the need for a radical reconceptualisation of humanity’s place on the planet. They adopt a *biocentric/ecocentric* perspective that proposes a “biospherical

egalitarianism” (Naess, 95) in which the interest of the biosphere overrides the interests of individual species, including the human. They believe in raising ecological awareness through an individual adjustment of values, suggesting that a change in our relationship with the environment can only come about through first “grounding ourselves in the dark of our deepest selves” (Snyder, ix) in order to rediscover our profound connection with the ‘more-than-human’ world.<sup>11</sup> Deep ecology challenges the *anthropocentrism* at the heart of modern society and the kind of ‘shallow ecological’ standpoints that see the natural world as merely a resource for humanity and that presuppose that human needs and demands override other considerations. And, put simply, it asserts that if we first address our hierarchical attitudes towards the natural world and identify ourselves within a broader circle of living things, then our societal problems may also find resolution.<sup>12</sup>

Social ecologists believe that “the very notion of the domination of nature by man stems from the very real domination of human by human” (Bookchin, 65).<sup>13</sup> Thus, in a paradigmatic reverse of deep ecology, they suggest that we must first address the problems of social inequality and oppression before we can remedy our dislocation from the environment. Both of these movements have been strongly critiqued; deep ecology for its presumed lack of a social dimension,<sup>14</sup> social ecology for its perhaps naïve underestimation of the durability of existing social systems. However, it is important not to make reductive readings of either strand,<sup>15</sup> as these are perspectives that continue to develop in complexity and receive more nuanced workings as they inform ongoing theorisations of ecocriticism. Broadly speaking, first-wave ecocriticism leaned more toward deep ecology in its emphasis on personal connection, or re-connection, with nature (though, as we have seen, the ‘minatory’ aspect running through British ecocriticism also hinted at a more social inflection), whereas the second wave owed more to social ecology. In discussion of the third and fourth waves of ecocriticism, the two areas of thought come into closer orbit.

### The Second Wave – Debating ‘Nature’

Although he was the instigator of the notion of ecocritical ‘waves’, Lawrence Buell himself qualifies this imagery, suggesting that the waves are indistinct and offering ‘palimpsest’ as a better metaphor:

No definitive map of environmental criticism in literary studies can [...] be drawn. Still, one can identify several trend-lines marking an evolution from a “first wave” of eco-criticism to a “second” or newer revisionist wave or waves increasingly evident today. This first–second wave distinction should not, however, be taken as implying a tidy, distinct succession. Most currents set in motion by early ecocriticism continue to run strong, and most forms of second-wave revisionism involve building on as well as quarreling with precursors. (*Future*, 17)

Perhaps because of this sense of indistinct succession and concurrence of perspectives, there is a lack of consensus about what actually constitutes each wave. Greta Gaard, for example, argues that the accounts of the second wave underestimate the importance of feminist thinking: “the retelling of ecocritical roots and perspectives marginalizes both feminist and ecofeminist literary perspectives” (643). In the

broad account of the second wave that follows, I include discussion of some of the developments in ecofeminism that demonstrate its significance in the ecocritical trajectory.

As Buell suggests, though the second wave revised ecocriticism, it carried through elements of the first wave, maintaining its awareness of the ‘general physical presence’ of nature and developing and refining its engagement with form and the search for the environmental imagination. Where it diverged was in its re-engagement with the critical theory it had initially pulled against. In the UK, the philosopher Kate Soper suggested in *What is Nature?* that the ‘nature-endorsing’ approach typical of early ecocriticism should be balanced with a more ‘nature-sceptical’ sensibility, able to reflect on the way in which ‘nature’ has been constructed and deployed to reinforce dominant ideologies, but that neither perspective should be allowed to dominate. In fact, they should be informed by reflection on each other. Laurence Coupe gave this dual awareness a specifically ecocritical spin in a memorable phrase in his introduction to *The Green Studies Reader* (2000): “green studies debates ‘Nature’ in order to defend nature” (5).

In the US, Dana Phillips launched a more polemical challenge to ecocriticism to re-engage with critical theory, stating that:

The first generation of ecocritics has embraced a curatorial model of literary scholarship and has spurned literary theory, apparently without having reaped the benefits of its close acquaintance. This has made ecocriticism seem overly devotional, and hostile to the intellect at times. (ix)<sup>16</sup>

Phillips also suggested a rethinking of the search for an environmental literature, questioning what the function of a ‘literary’ criticism that focused on largely *mimetic* – or directly representational – writing might be: “Realistic depiction of the world, of the sort that we can credit as reasonable and uncontroversial, is one of literature’s more pedestrian, least artful aspects” (8).<sup>17</sup> In the UK, Dominic Head also broached the question of form, specifically calling for an engagement with the novel: “If ecocriticism is to realise its full potential, it will need to find a way of appropriating novelistic form” (‘Ecocriticism and the Novel’, 236).

Ecocriticism’s second wave ushered in a more reflexive approach that provided the scope to address the complex intertwining of nature, ‘Nature’, and social and sexual politics, and that, as well as critiquing and reframing the forms that had already come under its scrutiny to reflect a more complex understanding of these interweavings (e.g. ‘post-pastoral’, ‘new nature writing’ and ‘ecopoetry’),<sup>18</sup> did indeed turn to the novel – and to new novelistic additions to the canon – to explore the ways in which its more self-conscious textuality might articulate the complex entanglement of self and world, social and environmental history.<sup>19</sup>

Two important areas of cultural theory that were already established and well placed to bring to ecocriticism an understanding of the way in which ‘nature’ had been constructed and deployed to reinforce dominant ideologies of gender, class and race were *ecofeminism* and *post-colonial ecocriticism*. They also represented a necessary corrective to ecocriticism’s previous apparently blanket apportioning of human environmental culpability, foregrounding notions of *environmental justice* that recognised the inequitable distribution of environmental benefits and risk among the global population, and challenging the predominantly (white, male) Anglo-American search for the ‘environmental

imagination'. The ecofeminist Sylvia Mayer points up the common ground between these two social ecological perspectives when she states:

Together with environmental justice scholars, ecofeminists claim that it is not humankind as such that is responsible for environmental damage. The responsibility lies predominantly with those human beings and social milieus whose position in socioeconomic power relations has enabled them to take political decisions and profit from their results – in many societies largely, but not only, a male elite. (118)

Although some ecofeminists have registered their opposition to the patriarchal domination of both women and the environment by embracing and celebrating the idea of woman as 'closer to nature',<sup>20</sup> others have resisted the implications of biological essentialism contained within this view, dubbing it as "motherhood environmentalism" (Sandilands, xiii). For the latter group, the way to address the inequities of the male/female, culture/nature divide is not by moving privilege from one side of the dichotomy to the other, in what Val Plumwood calls "uncritical reversal" (31), but by interrogating and challenging the very existence of that dichotomy. Plumwood powerfully summarises the way in which the construct of 'nature' has been wielded to legitimate both dualistic ways of thinking and the power relationships they enable.

The category of nature is a field of multiple exclusion and control, not only of non-humans, but of various groups of humans and aspects of human life which are cast as nature. Thus racism, colonialism and sexism have drawn their conceptual strength from casting sexual, racial and ethnic difference as closer to the animal and the body construed as a sphere of inferiority, as a lesser form of humanity lacking the full measure of rationality or culture. (4)

Like Plumwood, Donna Haraway has also emphasised the necessity of identifying and disrupting the hierarchies typical of western post-Enlightenment thought, which "have all been systemic to the logics and practices of domination of women, people of color, nature, workers, animals" (Haraway, 177). In fact, one of the key contributions of feminist and ecofeminist thought to contemporary ecocriticism is its unsettling of binaries such as culture/nature, male/female, mind/body, civilised/primitive, self/other, reason/matter, human/nature and so on.

Another important legacy of this process has been an apprehension of the complex entanglement of the environment and the body as the site of shared damage. Carolyn Merchant, demonstrating again the links between ecofeminism and *environmental justice* issues, refers to the disproportionate siting of environmental hazards such as landfill, incinerators and toxic waste dumps in underprivileged minority areas. She states, "Women experience the results of toxic dumping on their own bodies (sites of reproduction of the species), in their own homes (sites of the reproduction of daily life), and in their communities and schools (sites of social reproduction)" (161). While this view perhaps retains elements of the identity politics Sandilands critiques – the troubling assumption that "the fact of being a woman is understood to lie at the base of one's experience of ecological degradation" (Sandilands, 5) – it nevertheless foregrounds the notion of an interplay between environment and body, a theme to which I return in discussion of Stacy Alaimo's recent concept of 'trans-corporeality' and the development of the fourth wave of ecocriticism (discussed below).

Post-colonial criticism has also long understood the integral connection between ideological constructions of ‘nature’ and the oppression and exploitation of colonised peoples and their environments: “Postcolonial studies has come to understand environmental issues not only as central to the projects of European conquest and global domination, but also as inherent in the ideologies of imperialism and racism on which those projects historically – and persistently – depend” (Huggan and Tiffin, 6). The ‘persistently’ is significant here, since the contemporary neo-liberal era has “intensified assaults on resources” (Nixon, 4) and perpetuated the environmental and social damage suffered by the world’s poor in ever-developing forms of *neocolonialism*.

This sense of the continuation of colonialist practices in new guises has had an important impact on ecocriticism, demonstrating the need to reappraise environmentalism itself. In *Varieties of Environmentalism: Essays North and South* (1997), Ramachandra Guha and Juan Martinez Alier use the phrase ‘environmentalism of the poor’ to distinguish between the ‘rich-nation environmentalism’ of the northern hemisphere and that of the global South. This reflects the feeling that environmental discourses are all too often “neo-colonial, Western impositions inimical to the resource priorities of the poor in the global South” (Nixon, 4). Even more disturbing is the idea that the further environmental degradation of poor nations might be carried out in order to appease rich nation environmentalists who campaign against the dumping of waste and industrial effluent in their ‘own back yard’. Rob Nixon prefaces his book *Slow Violence and the Environmentalism of the Poor* (2011) with a leaked World Bank memo expressing the political expediency of dumping toxic waste in “the lowest wage country” and suggesting that the World Bank should be “encouraging more migration of the dirty industries to the Least Developed Countries” (1). These arguments have challenged ecocritics “to engage in more globally nuanced terms” (DeLoughrey and Handley, 9).

## Slow Violence – Towards a Global Ecocriticism

Nixon’s book has been extremely influential in drawing attention to the complex interplay of the local and the global in environmental terms. Describing environmental issues such as “climate change, the thawing cryosphere, toxic drift, biomagnification, deforestation, the radioactive aftermaths of wars, acidifying oceans” (2), Nixon suggests that their effects are often hard to track and quantify. He describes this as ‘slow violence’ – “a violence that occurs gradually and out of sight, a violence of delayed destruction that is dispersed across time and space, an attritional violence that is typically not viewed as violence at all” (2) – and he asks how this can be represented in a global culture that is accustomed to an ever more immediate flow of information and sensation, and that conceptualises violence as “event focused, time bound and body bound” (3). Like Lawrence Buell, he is in search of forms of writing that can adequately convey an environmental message, not this time to foreground the real, material presence of nature as such but to render the invisible visible. For Nixon, the answer lies in the work of writer activists – authors who are fuelled by rage and hunger for redress and whose imaginative writing “can help the unapparent appear, making it accessible and tangible by humanizing drawn-out threats inaccessible to the immediate senses” thus offering us “a different kind of witnessing: of sights unseen” (15). Some post-colonial ecocritics have identified this ability to make the unapparent apparent with the use of the novelistic device of *magic realism*. Upamanyu Pablo Mukherjee, for example, in *Postcolonial*

*Environments*, finds in Indra Sinha's novel *Animal's People*, which is based on the Bhopal disaster, a magic realism "fit to express the horrors of a reality that threatens to escape the ordinary boundaries of stylistics" (153).

The diffusive temporal and spatial nature of the results of slow violence and the fact that we are now living in a geological epoch informally termed 'the *anthropocene*' (Crutzen and Stoermer) to denote the magnitude of human impact on environmental change, suggest the need for an ecocritical paradigm that is not only more globally nuanced but also more globally embracing – in other words, one which, while sensitive to environmental justice issues at a local level, is also able to register the temporal and planetary implications of anthropogenic environmental destruction in a world where no act or result of damage can be seen as purely local.

A recent issue of *Green Letters* (Spring 2012) devoted to 'Global and Postcolonial Ecologies' employs broadly social ecological, Marxist constructs for discussing the global, in particular Jason Moore's term *world-ecology*, which denotes "the epochal reorganization of world ecology that marked the rise of the capitalist world-economy" (Niblett, 16). For the editor Sharae Deckard, this has enabled a tentative 'worlding' of post-colonial literary criticism which seeks:

not only to generate an understanding of the political, cultural, and aesthetic *differences* between literary and critical approaches to the environment across multiple national traditions, but *also* to detect structural *homologies* and similarities of concern, particularly in those ways in which literatures respond to the uneven development projects of global capital and their impact on local environments and subjects. (Deckard, 10–11, emphases in original)

Michael Niblett, for example, identifies the literary device of 'irrealism' (of which the magic realism discussed by Mukherjee, above, is a form) as an identifiable homology across literatures globally, used for expressing aspects of the catastrophic upheavals in ecologies brought about by the expansion of global capital that would otherwise defy representation.

### Eco-Cosmopolitics and the Third Wave

In another response to this global imperative, Scott Slovic and Joni Adamson hailed the arrival of ecocriticism's third wave in 2009 – a development which "recognises ethnic and national particularities and yet transcends ethnic and national boundaries," exploring "all facets of human experience from an environmental viewpoint" (6–7). Broadly speaking, this describes the paradigm of *eco-cosmopolitics*. In *Sense of Place and Sense of Planet: The Environmental Imagination of the Global* (2008), Ursula Heise describes the genesis of this construct in the recuperation of the term 'cosmopolitanism' in a range of fields in the late 1990s, with theorists striving to "model forms of cultural imagination and understanding that reach beyond the nation and around the globe" (6). She discusses this in terms of 'deterritorialisation', stating that "the increasing connectedness of societies around the globe entails the emergence of new forms of culture that are no longer anchored in place" (10). For her, the challenge that this deterritorialisation poses for the environmental imagination is:

to envision how ecologically-based advocacy on behalf of the non-human world as well as on behalf of greater socioenvironmental justice might be formulated in terms that are

premised no longer as primarily on ties to local places but on ties to territories and systems that are understood to encompass the planet as a whole. (10)

What she proposes is an ecologically inflected “world citizenship” (10). It is in the spirit of this world citizenship that the Universal Declaration of the Rights of Mother Earth was adopted at the World Peoples’ Conference on Climate Change in Cochabamba, Bolivia, in 2010. The declaration stresses that we are “all part of Mother Earth, an indivisible, living community of interrelated and interdependent beings with a common destiny” (<<http://pwccc.wordpress.com/programa/>>). It seeks to recognise the environmental damage wrought by global capitalism and promotes social and environmental justice but within the framework of a biospherical egalitarianism similar to that advocated by deep ecologist Arne Naess.

This advocacy for the non-human extends the notion of *environmental justice* (usually applied to human concerns relating to the environment) to the environment itself, and brings together parties whose interests might previously have been deemed separate. Joni Adamson recounts a protest in Peru in 2006 attended by a “coalition of indigenous peoples, environmentalists and academics” (148) that opposed a mining concession sited at the foot of the mountain Ausangate. The protesters argued that the mountain “should have the right to exist in a proper relationship with its surrounding mountains” (148). For Adamson (citing de la Cadena), the notable aspect of this protest was the way in which those involved, some of whom would not personally subscribe to the notion of a sentient mountain, were able to join together in a commitment to “a politics of nature that included ‘disagreement on the definition of nature itself’” (149).

Another reason for these new alliances is a realisation of the ways in which the diffusive effects of ‘slow violence’ register indiscriminately on the bodies of the human and the non-human, disrupting both the nature/culture binary and human social distinctions. Referencing the work of Stacy Alaimo and Susan Hekman in *Material Feminisms*, Adamson explains:

An oil spill, for example, studied from a cultural–natural perspective that does not separate the two realms, reveals how a toxin may affect the workers who produce it, the community in which it is produced, and the humans and animals (domesticated and wild) that ingest it. (Adamson, 148)

This notion of movement of matter across bodies in a multiple entanglement leads me to discussion of the fourth wave of ecocriticism.

### The Fourth Wave – Material Ecocriticism: Post-Human and Post-Nature

The fourth wave should be regarded as co-existent with rather than superseding the third (or indeed the other strands of ecocriticism) and has only very recently been identified. It is the emergent field of *material ecocriticism*. For Scott Slovic, it is Stacy Alaimo’s discussion of ‘*trans-corporeality*’ in *Material Feminisms* that “has helped to launch an entire new direction in contemporary ecocriticism” (443). This concept has developed out of early ecofeminist apprehensions of the impacts of environmental justice on the human body and the more recent ‘material turn’, which has found a powerful voice in

the work of feminist thinkers in a range of disciplines, including Karen Barad and Claire Colebrook, as well as Alaimo and Susan Hekman. Alaimo defines trans-corporeality as a construct that deals with “the material interchanges across human bodies, animal bodies, and the wider material world” (*‘States’*, 476) and that has engendered “a new materialist and *post-humanist* sense of the human as substantially and perpetually interconnected with the flows of substances and the agencies of environments” (*‘States’*, 476).

For Alaimo, this interconnection calls for “rich, complex modes of analysis that travel through the entangled territories of material and discursive, natural and cultural, biological and textual” (*‘Trans-corporeal’*, 238). In this, she echoes Bruno Latour’s sense in *We Have Never Been Modern* that false distinctions between the worlds of, for example, science and politics, the ‘natural’ and the social, have restricted our ability adequately to assess our manner of being in the world. Our material selves cannot be separated from “networks that are simultaneously economic, political, cultural, scientific, and substantial” (Alaimo, *‘States’*, 476). Apprehending the extent of these entanglements challenges us epistemologically and ethically:

Emphasizing the material interconnections of human corporeality with the more-than-human world, and at the same time acknowledging that material agency necessitates more capacious epistemologies, allows us to forge ethical and political positions that can contend with numerous late-twentieth-century/early-twenty-first-century realities in which “human” and “environment” can by no means be considered as separate: environmental health, environmental justice, the traffic in toxins, and genetic engineering, to name a few. (Alaimo, *‘Trans-corporeal’*, 238)

This paragraph foregrounds three key issues of material ecocriticism. First is the premise that there is a shared materiality between the human and non-human world that renders obsolete the distinctions between human and environment, moving beyond the construct of ‘nature’ altogether; second is the idea that all of this shared matter has agency; and third is the ethical and political challenges the complexity and hybridity of these material interminglings suggest. In the paragraphs below, I discuss each of these issues in turn, detailing their ongoing impacts on current ecocritical theory. Returning to Timothy Clark’s outlining of one of the challenges to ecocriticism, cited in my introduction, this paradigm is very much an example of ecocritical tools “being remade even in the process of use” (xiii).

## **Shared Materiality and Post-Humanism**

The notion of shared materiality has initially been seized on in ecocriticism to take forward and develop some ecocritical formulations of *post-humanism* in a broadly deep ecological spirit. Post-humanism de-centres and interrogates the human, challenging the construct of the Great Chain of Being, which places man at its head. Cary Wolfe states that “the ‘human’, we now know, is not now and never was itself” (*Zoontologies*, xiii). In a similar vein, Jacques Derrida has questioned the construct of the ‘animal’. His neologism *animot* (which plays on the French homophones ‘maux’ of ‘animaux’ [animals] and ‘mot’ [word]) is designed to break down the traditional semantic boundary between human and animal and encompass “the heterogeneous multiplicity of the living” (399) in which man is just one of many species. There is, in fact, a strand of *post-humanist*

enquiry specifically dedicated to ‘animal studies’, and a degree of tension exists between this strand’s exploration of the sentience, subjectivity and rights of non-human animals and ecological perspectives that see value residing in an ecosystem as a whole rather than in individual species or, indeed, individual animals. For Timothy Clark, “there is a real, intractable dispute here” (181), particularly in the apprehension that even apparently biocentric approaches may mask an inherent anthropocentrism.<sup>21</sup> Cary Wolfe contends that, in general, academic discourse remains “locked within an unexamined framework of *speciesism*” (*Animal Rites*, 1, emphasis in original), pointing up one of the fault lines of post-humanism: “most of us remain humanists to the core, even as we claim for our work an epistemological break with humanism itself” (1).

In an early discussion of the implications of *post-humanist* thought for ecocriticism, Louise Westling borrows Derrida’s term, formulating the phrase ‘*animot* post-humanism’. This attempts to blend the notion of decentring the human with an exploration of animal subjectivity and emphasises our imbrication in the “matrix of earth’s life” (*Literature*, 26). Developing ideas drawn from Maurice Merleau-Ponty and David Abram, Westling suggests that this imbrication is revealed to us through a *phenomenological* immersion in the world. She makes a deliberate distinction between *animot* post-humanism and what she terms techno- or cyborg post-humanism,<sup>22</sup> believing that the latter is less relevant to ecocriticism since it deals in the concept of the *transhuman* – the perfectible, technological human that is able to surpass its environment and its own body – a concept that perpetuates damaging dualistic modes of thinking.

For Serenella Iovino, an understanding of the shared materiality between human and non-human proposed by the new materialists makes the imbrication Westling describes all the more tangible, dissolving the human/nature binary and enabling an “ecological horizontalism and an extended moral imagination” (Iovino, ‘Material’, 52) – in other words, reaching, in part, towards the biospherical egalitarianism of deep ecology.

## The Agency of Matter

A second key theme of material ecocriticism is the notion that matter is an agentic force, again removing one of the distinctions that has traditionally been drawn between human and non-human and reinforcing the idea of horizontality rather than hierarchy. Matter is seen as manifesting an inherent creative power, a vitality “which is not that of a static being but of a generative becoming” (Iovino, ‘Material’, 53), establishing a “multiply-tiered ontology” in which “there is no definitive break between sentient and nonsentient entities or between material and spiritual phenomena” (Coole and Frost, 10).

In *biosemiotic* and *ecosemiotic* perspectives, such as those advanced by the philosopher and ecocritic Wendy Wheeler (*The Whole Creature*) and the ecophilosopher David Abram (*Becoming Animal*), one of the ways matter reveals its agency is through its production and embodiment of signs that invest the non-human world with its own systems of signification and meaning. A biosemiotic perspective also helps to bridge the culture/nature divide. In this paradigm, culture, like language, is an emanation of our material being. Wheeler describes culture and nature as “inextricably intertwined and co-dependent and co-evolving” (*Whole Creature*, 41), and Iovino talks of nature and culture as a “circulating system” (*Stories*, 454) that should better be termed (following Donna Haraway’s lead) “natureculture” (*Stories*, 454).

So far, this is a fairly harmonious picture of interrelationship and shared qualities – a broadly deep ecological notion of “agential kinships” (Iovino, ‘Material’, 66). However, as Iovino and others’ ongoing theorisations recognise, the implications of shared materiality also involve a more disorientating hybridity, for example in the traffic in toxins and genetic engineering Alaimo mentions, where the complex entanglements of human and non-human and their diffusive effects present ontological and ethical dilemmas. For Bruno Latour, the combination of the human and its technology sets in motion a mutual expansion of agentic potential where all of the component parts, both human and non-human – the ‘actants’ – “are in the process of exchanging competencies, offering one another new goals, new possibilities, new functions” (*Pandora’s Hope*, 182). But these new functions are unpredictable, with matter at times evolving “deviant agencies” (Alaimo, *Bodily*, 139) as it manifests its creative power and crosses into bodies and environments.

### ‘Thing Power’: Ethical Challenges

Jane Bennett, in *Vibrant Matter: a political ecology of things*, stresses that the “ontostory” (4) of shared materiality she proposes is not one of unproblematic interrelationship: “in contrast to some versions of deep ecology, my monism posits neither a smooth harmony of parts nor a diversity unified by a common spirit” (ix). In fact, the complex entanglement of human and non-human, biology and politics renders the terms deep and social ecology as redundant as ‘nature’. To demonstrate the more disturbing manifestations of what she calls “thing power” (2), she cites Robert Sullivan’s description of a New Jersey ‘garbage hill’ outside Manhattan, which powerfully evokes the physical agency of the dump, as toxic elements mingle and combine, warm and fresh, ready to seep into the groundwater.<sup>23</sup> This is an ongoing agency which is non-human, and yet whose genesis is in the detritus of human consumerism.

Similarly, the image below not only provides further evidence of the temporal and spatial reach of ‘slow violence’ but also graphically illustrates trans-corporeality in action, as man-made substances find new agential roles. Chris Jordan, the photographer, explains:

On Midway Atoll, a remote cluster of islands more than 2000 miles from the nearest continent, the detritus of our mass consumption surfaces in an astonishing place: inside the stomachs of thousands of dead baby albatrosses. The nesting chicks are fed lethal quantities of plastic by their parents, who mistake the floating trash for food as they forage over the vast polluted Pacific Ocean. <http://www.chrisjordan.com/gallery/midway/#about>

For Iovino, trans-corporeality entails a hybridity that blurs boundaries and distinctions such that it becomes less and less possible to differentiate between human and non-human agency. Referencing the work of feminist science critic Karen Barad, who devised the term “post-humanist performativity” (Barad, 120), she describes it as a process “where the ‘post-human’ replaces the human/nonhuman dualism and overcomes it in a more dialectic and complex dimension” (‘Stories’, 459). While this is undoubtedly the case, as the Midway image also graphically exposes, these ongoing expansions of agential possibility often begin with the technicity of the human, perhaps suggesting a need to engage with the implications of the cyborg post-humanism rejected by Westling

Figure 1 © Chris Jordan, Midway: Message from the Gyre, used with permission.

and to explore further what Cary Wolfe describes as “the embodiment and the embeddedness of the human being in not just its biological but also its technological world” (*What is Posthumanism?* xv).

This is the point at which ecocriticism now stands theoretically – investigating the complex ontological, epistemological and ethical implications of this multiple embeddedness. For Bennett, “the hope is that the [onto-]story will enhance receptivity to the impersonal life that surrounds and infuses us, will generate a more subtle awareness of the complicated web of dissonant connections between bodies, and will enable wiser interventions into that ecology” (4). Other thinkers with less interventionist perspectives are more sceptical of the notion that it is possible for a theory to offer solutions to ecological problems. John M. Meyer, in his 2001 work *Political Nature: Environmentalism and the Interpretation of Western Thought*, warned against what he saw as the common and misplaced desire in environmentalist thinkers and writers to develop a new “world-view” that could form the basis of an alternative “relationship between humanity and the rest of nature” (22). In a more recent essay, Hannes Bergthaller, drawing on Niklas Luhmann’s work on social systems theory and second-order cybernetics, stresses that modern human society is divided into *autopoietic* functional units (such as law, politics, science, religion and the economy), each of which “creates its own reality”, and none of which “is in a position to control the operations of any of the others” (‘Cybernetics and Social Systems Theory’, 225). The implication for ecocriticism is that it cannot hope to change society as a whole but should recognise its limitations in terms of praxis and focus instead on interrogating the nature – and blind spots – of environmentalism itself.<sup>24</sup> Timothy Morton’s ‘ecological thought’, which, conversely, denotes an apprehension of the complex *interrelation* of all things,<sup>25</sup> nevertheless represents a similar challenge. While not necessarily eschewing “the political radicalisms that seek to create new forms of collectivity out of the crisis of climate disruption,” Morton insists that we must at all times apply “a rigorous and remorseless theoretical radicalism that opens our minds to where we are, about the fact that we’re here” (*The Ecological Thought*, 104). These are provocative interventions and useful reminders that ecocriticism should continue to critique its own assumptions and doctrines in the course of its ‘earth-centred’ explorations.

## The Future of Ecocriticism – Despair, Excitement and ‘Slow Reading’

In its short history, ecocriticism has progressed from its initial relatively uncritical endorsement of non-fiction nature-writing to its current engagement with a wide range of cultural forms, theoretical sophistication and pluriform status. The Association for the Study of Literature and Environment now has ten affiliate organisations worldwide with more under discussion; there are a large number of ecocritical and environmental journals in existence including *Ecozon@*, *The Journal of Ecocriticism*, *Indian Journal of Ecocriticism* and *Studies in Ecocriticism* as well as *Interdisciplinary Studies in Literature and Environment* and *Green Letters*; and ecocriticism is the focus of a host of international conferences. However, it continues to be a movement that questions its own function. In a recent exchange in successive issues of the *Journal of Ecocriticism*, two different perspectives were aired on the effectiveness and future of ecocriticism. William Major and Andrew McMurry speak of a “desperate optimism” (1) in the face of what they see as our species’ “elaborate and protracted endgame” (1). They doubt the value of their work (and that of ecocriticism as a whole, by implication) and feel that the movement has become enmeshed in institutional frameworks. Somehow the original mission to reinstate the referent has been diverted, the commitment to environmental praxis dissipated. Nevertheless, “we go on, of course, even in the face of a difficult future. After all, what choice do we have?” (7).

In the subsequent issue, however, Roman Bartosch and Greg Garrard come back with a more upbeat rejoinder. Resisting what they see as the “apocalypticism” (2) of Major and McMurry, they speak of a “risky, exciting and unprecedented future” (5)<sup>26</sup> and, at the same time, express a refusal to be hurried by the urgency of environmental issues: “we believe that the contribution of ecocriticism is inherently and valuably gradual: making us think anew about the world, nature, and the place of the human animal” (2). As their methodology they propose close, slow reading, reflecting “the reticent, obdurate fragility of literature, to which critics ought to bear patient witness even to the crack of doom” (5) and echoing (at least in part) Morton’s call to action in *Ecology without Nature* to decelerate our thinking and, through painstaking attentiveness, to identify anomalies and paradoxes in received opinion in order to “go against the grain of dominant normative ideas about nature, but to do so in the name of sentient beings suffering under catastrophic environmental conditions” (12).

In the last two decades, ecocriticism has shown itself more than able to respond to the challenge of engaging with critical theory. It has established ‘environmentality’ as a permanent concern in the humanities, fostered a broader understanding of ecological responsibility and environmental justice on a global scale’ and emphasised our complex imbrication in a material world that has taken us ‘post-human’ and ‘post-nature’ but left us with the exciting challenge of continuing to untangle the coordinates of those states. Counter-intuitive though it may seem in the face of accelerating environmental degradation, perhaps Bartosch and Garrard are right. Perhaps the time has now come for a reinvigoration of slow and close reading, which, whether in the hope of generating environmental praxis or in a more purely investigative mode, applies these new paradigms in full-length engagements with cultural forms, interrogating from every possible angle the ‘imaginings’ that reflect and influence our ongoing modes of being in the world.

## Notes

- \* Correspondence: Institute of Humanities and Creative Arts, University of Worcester, Henwick Grove, Worcester, Worcestershire, United Kingdom, WR2 6AJ. Email: p.marland@worc.ac.uk
- 1 Richard Kerridge, though expressing a preference for ‘ecocriticism’ himself, suggests that ‘environmental criticism’ is considered by some to imply a more appropriate academic distance from the broader environmental movement (cited in Ramos-Pérez).
- 2 For example, some early articulations of ecocriticism were based on a view of ecological harmony and equilibrium that has now been superseded by ‘postequilibrium’ views. Daniel Botkin’s book *Discordant Harmonies: A New Ecology for the Twenty-First Century* was particularly influential in introducing a more discordant, dynamic and mutable model to ecocriticism. In this postequilibrium ecology, “The Earth is perhaps better seen as a process rather than an object” (Garrard, *Ecocriticism*, 204).
- 3 Although important work has been carried out in tracing the beginnings of ecological thought to earlier periods – for example, Richard Grove’s exploration of environmental awareness relating to colonial practices in *Green Imperialism: Colonial Expansion, Tropical Island Edens and the Origins of Environmentalism, 1600–1860*: “As colonial expansion proceeded, the environmental experiences of Europeans and indigenous peoples living at the colonial periphery played a steadily more dominant and dynamic part in the constructions of new European evaluations of nature and in the growing awareness of the destructive impact of European economic activity on the peoples and environments of the newly ‘discovered’ and colonised lands” (3); Jonathan Bate’s (and others’) discussion of ecological thought in the work of the Romantic poets; and John Parham’s detailed study of the poet Gerard Manley Hopkins, *Green Man Hopkins*, which develops a theory of the Victorian ecological imagination.
- 4 These proto-ecocritical works include Leo Marx’s *The Machine in the Garden: Technology and the Pastoral Ideal in American Culture* (1964), Raymond Williams’ *The Country and the City* (1973), Joseph Meeker’s *The Comedy of Survival* (1974) and William Ruekert’s 1978 essay ‘Literature and Ecology: An Experiment in Ecocriticism’ (which is often cited as the first use of the term ‘ecocriticism’).
- 5 Richard Kerridge hails ecocriticism as “environmentalism’s overdue move beyond science, geography and social science into ‘the humanities’” (*Writing the Environment*, 5).
- 6 As Axel Goodbody and Kate Rigby point out in their introduction to *Ecocritical Theory: New European Approaches*, the ‘rejection’ of critical theory by early ecocritics was its own “theoretical moment” (1).
- 7 As Barry notes, this quotation from Derrida’s *Grammatology* is often taken out of context “to justify an extreme textualism, whereby it is held that all reality is linguistic, so that there can be no meaningful talk of a ‘real’ world, which exists without question outside language” (68).
- 8 Though as Garrard observes, this phrase inadvertently points up the cultural construction of even the most apparently ‘empirical’ information, the ‘ozone hole’ in fact being a metaphor for the phenomenon of ozone depletion.
- 9 Roman Bartosch and Greg Garrard, for example, contend that “Ecocriticism must resist the instrumentalising of literature *even in its own interests*” (2, emphasis in original).
- 10 In fact, some first-wave ecocritics chose to reject certain conventions of critical discourse altogether and to present their work instead in the form of *narrative scholarship*, which brings autobiographical accounts of interaction with the natural world into responses to literature. This has been characterised by Michael P. Cohen as the “praise song school” of ecocriticism (21).
- 11 This phrase was devised by David Abram (*The Spell of the Sensuous*) to unsettle hierarchical conceptualisations that place man above nature, and to reinforce a deep ecological sense of the inherent value of the non-human.
- 12 The ecocentrism espoused by deep ecologists:

regards the question of our proper place in the rest of nature as logically prior to the question of what are the most appropriate social and political arrangements for human communities. That is social and political questions must proceed from, or at least be consistent with, an adequate determination of this more fundamental question. (Eckersley, 28)

- 13 In an introduction to the 1991 edition of his influential work *The Ecology of Freedom*, Murray Bookchin made the following summary of his views on the sources of our environmental dislocation:

I tried to point out that these problems originate in a hierarchical, class, and today, competitive capitalism system that nourishes view of the natural world as a mere agglomeration of “resources” for human production and consumption. This social system is especially rapacious. It has projected the domination of human by human into an ideology that “man” is destined to dominate “Nature”. (65)

- 14 It has also, on occasion, been accused of misanthropy. One of the eight points of Arne Naess and George Sessions' *Platform for Deep Ecology* (1984) is the necessity for a “substantial decrease in human population” (cited in Denton, 80). This point has sometimes been interpreted in anti-humanist ways, for example the apparent welcoming of epidemic disease and famine as forms of population control by early Earth First activists (Denton, 87). However, other deep ecologists have firmly rebuffed accusations of anti-humanism and stressed that “humans are just as entitled to live and blossom as any other species, *provided* they do so in a way that is sensitive to the needs of other human individuals, communities and cultures and other life-forms generally” (Eckersley, 56, emphasis in original), also emphasising their recognition of the fact that not all humans are equally implicated in environmental damage. For Greg Garrard, the problem of human over-population is one which ecocriticism continues to fail adequately to address ('Review of 2010').
- 15 John Clark, in particular, gives a complex and nuanced reading of social ecology in his essay 'A Social Ecology'.
- 16 This seems a particularly reductive reading of first-wave ecocritics – ignoring, for example, Buell's consciousness from the start of the power of cultural construction and the specific engagement of certain early ecocritics with contemporary theory – for example Sue-Ellen Campbell's essay 'The Land and Language of Desire: Where Deep Ecology and Poststructuralism Meet' in *The Ecocriticism Reader*.
- 17 Again, this summation does not do justice to the range of voices, complexity and, indeed, artfulness involved in examples of that non-fiction writing.
- 18 Terry Gifford devised the term post-pastoral to denote an environmentally and socially aware version of pastoral:

There are six aspects to Gifford's post-pastoral: first, an awe in response to the natural world; second, the recognition that creative and destructive forces coexist in nature; third, the realisation that inner human nature is illuminated by its relationship to external nature; fourth, a simultaneous awareness of the cultural constructions of nature, and of nature as culture; fifth, a conviction that human consciousness should produce environmental conscience; and sixth, the realisation that environmental exploitation is generated by the same mind-set that results in social exploitation. (Head, *Modern British Fiction*, 193).

'New Nature' writers aim to "see with a scientific eye and to write with literary effect" (Cowley, 9). Ecopoetry is broadly described by Scott Bryson as poetry that embodies an ecocentric stance, a humility in its relation to the non-human and a distrust of hyperrationality.

- 19 Even before these challenges were being laid down, work was emerging on both sides of the Atlantic that engaged with these issues, setting the tone for the second wave. Louise Westling, in *The Green Breast of the New World* (1996) interrogates the presence of gender in the treatment of landscape and environment in 20th century fiction; David Mazel, in *American Literary Environmentalism* (2000) delves into the ideological construction of wilderness and its implication in colonialist endeavour; and Richard Kerridge, in 'Ecological Hardy' (2001) explores the ways in which Thomas Hardy is concerned with "the multiplicity of uses – material, cultural and emotional – that human beings have for the natural environment" (126).

- 20 Timothy Clark identifies aspects of this perspective in L. Elizabeth Waller's ecofeminist reading of Virginia Woolf's *The Waves* in her essay 'Writing the Real: Virginia Woolf and an Ecology of Language' in which "Woolf's compositional method is seen to open a usually blocked path to a supposedly lost and unalienated human nature, located in the female body" (Clark, 116).
- 21 Timothy Clark, citing the work of Tom Regan, gives the example of an ecological restoration scheme in the Galápagos islands that involved the culling of feral goats, questioning what the biocentric commitment of ecologists might be in a similar situation that required the culling of human animals (181).
- 22 She associates Donna Haraway with this cyborg post-humanism, perhaps missing the point of Haraway's self-confessedly "ironic political myth" (Haraway, 191). Haraway uses the figure of the cyborg to create a focus for post-human thought by positing a radical being in which the boundaries of human and animal and machine have been erased. The cyborg, she believes, is a construct through which we can properly interrogate the human.
- 23 Robert Sullivan's description of a New Jersey garbage dump:

There had been rain the night before, so it wasn't long before I found a little leachate seep, a black ooze trickling down the slope of the hill, an espresso of refuse. In a few hours this stream would find its way down into the ... groundwater of the Meadowlands; it would mingle with toxic streams ... But in this moment, here at its birth, ... this little seep was pure pollution, a pristine stew of oil and grease, of cyanide and arsenic, of cadmium, chromium, copper, lead, nickel, silver, mercury, and zinc. I touched this fluid – my fingertip was a bluish caramel colour – and it was warm and fresh. (Sullivan, 1998, cited in Bennett, 6)

- 24 Bergthaller states:

Only to the extent that ecocriticism is something other than the academic wing of the environmental movement can it render that movement a service which is perhaps more valuable than general consciousness-raising or the recruitment of new personnel. ('Cybernetics', 227)

- 25 This has much in common with the insights of new materialism – Morton's idea of the "mesh" (*Ecological*, 8) echoing the imbrication discussed above, and his "hyperobjects" (19) (such as plutonium and styrofoam) exemplifying the disturbing agentic potential and slow violence of the products of human/non-human entanglement.
- 26 For Morton, it is a future which has, in a sense, already arrived. In a passage that provides a corrective to the elegiac tone of much environmental writing, he states:

Environmentalism is often apocalyptic. It warns of, and wards off, the end of the world. The title of Rachel Carson's *Silent Spring* says it all. But things aren't like that: the end of the world has already happened. We sprayed the DDT. We exploded the nuclear bombs. We changed the climate. This is what it looks like after the end of the world. Today is not the end of history. We're living at the beginning of history. The ecological thought thinks forward. It knows that we have only just begun, like someone waking up from a dream. (*Ecological*, 98)

# CHAPTER 8

## Eating Things: Food, Animals, and Other Life Forms in Lewis Carroll's *Alice Books*

*Michael Parrish Lee*

Michel Parrish Lee teaches nineteenth century literature, narrative theory, and animal studies at the University of Nottingham. In this essay, he applies thing theory, actor network theory, animal studies theory to *Alice in Wonderland*.

What can we learn from the Duck, this character in Lewis Carroll's *Alice's Adventures in Wonderland* (1865) who conflates things with animals and food? The Duck distinguishes itself as an emphatic "I" through its simultaneous possession of knowledge and status as an eater: "'I know what "it" means well enough, when *I* find a thing,' said the Duck: 'it's generally a frog, or a worm.'"<sup>1</sup> As an edible animal, however, the Duck resides in the very food chain of "its" and "things" upon which its subjectivity seems to rest. While, to a certain extent, this ensnarement of self and thing fits within the ontology of "thing theory" where "things seem slightly human and humans seem slightly thing-like,"<sup>2</sup> these *Wonderland* animal-things hint at an anthropomorphism lurking in thing theory. By the Duck's definition, things are not objects that appear uncannily human, but edible life-forms that presumably have appetites of their own. As Lewis Carroll's Alice puts it, "how confusing it is all the things being alive" (*Alice's Adventures in Wonderland*, p. 75). Of course, thing theory has produced some fascinating discussions of the liveliness of things, but when we extend this field of discussion to *eating* things, we must take the "life" of things more literally and think seriously about their corporeality and survival. Moreover, we find that the realm of things now enlarges to include nonhuman animals, those things that eating so often positions at the contact point between agent and object, living and dead. Attempting to expand the investigation of things beyond a human/thing dichotomy, this essay draws on the actor-network-theory (ANT) of Bruno Latour

*Original publication details:* Michael Parrish Lee, "Eating Things: Food, Animals, and Other Life Forms in Lewis Carroll's *Alice Books*." *Nineteenth-Century Literature* 68.4, pp. 484–512. University of California Press, 2014. Reproduced with permission from University of California Press.

to explore the entanglement of humans, objects, animals, and appetites that generates so much of the wonder in Lewis Carroll's *Alice* books. I argue that these texts attempt to reconcile the Victorian destabilization of discrete "human" and "animal" categories facilitated by evolutionary theory with an increasingly commodified culture where everything and everyone seem potentially consumable. Carroll presents a world that is both fully social and thoroughly objectified, where humans, animals, and objects trade, share, and fight for positions in a network of edible things.

I therefore hope, through reading the *Alice* books, to complicate thing theory by using eating as an invitation – although potentially a violent one – to the world of nonhuman animals. To do this is also to put a bit of pressure on the two main strands of thinking about things that have taken hold of current literary studies. The first is the Heideggerian model of thing theory, articulated most famously by Bill Brown. This strand of thought concerns itself with, in the words of Jonathan Lamb, "the difference between objects that serve human purposes and things that don't."<sup>3</sup> Such theory is, for Brown, invested in "sacrific[ing] the clarity of thinking about things as objects of consumption, on the one hand, in order to see how, on the other, our relation to things cannot be explained by the cultural logic of capitalism" (*A Sense of Things*, pp. 5–6). In order to differentiate the seemingly reductive "object" from the more uncanny, or even sublime, "thing," thing theorists attempt to remove the thing from any kind of circulation or exchange that seems capitalist or human. According to Brown:

As they circulate through our lives, we look *through* objects (to see what they disclose about history, society, nature, or culture.... We begin to confront the thingness of objects when they stop working for us ..., when their flow within the circuits of production and distribution, consumption and exhibition, has been arrested, however momentarily.<sup>4</sup>

But although, for thing theory, capitalist logic is too narrow to contain the liveliness of things, Catherine Gallagher has more recently argued that nineteenth-century conceptions of capitalism were foundationally concerned with "organic 'Life' itself" as "the ultimate desideratum and the energy or force that circulates through organic and inorganic nature."<sup>5</sup> An investigation of Victorian things in particular, then, might lose more than it gains by granting the life of things a status of exception from the nineteenth-century economic concerns with "issues of life and death" stemming "from the thought of Thomas Robert Malthus" (Gallagher, *The Body Economic*, pp. 4,3) – developed initially in *An Essay on the Principle of Population* (1798)<sup>6</sup> – and concentrating not only on "modes of production and exchange" but also on "the interconnections among populations, the food supply," and "their impact on life forms generally" (Gallagher, *The Body Economic*, p. 3).

Moreover, for all the efforts of thing theory to outrun the human, it operates, as Steven Connor suggests, through a "covert anthropomorphism."<sup>7</sup> It is only by escaping from the realm of human circulation that these things become themselves – as if human circulation were the only kind. I would suggest that the focus of such theory on the singularity and alterity of things causes it to miss out on the networks that things form, networks that mid-Victorians like Lewis Carroll, haunted by Charles Darwin's "tangled bank" of interspecies relations,<sup>8</sup> found it difficult to ignore. It is important to remember that the Victorian rise of commodity capitalism was a rise that occurred in the age of evolutionary theory, when concerns about human/object relations would have been enmeshed with concerns about the entanglements between humans and other life forms.<sup>9</sup> According to Andrew H. Miller, with the nineteenth-century triumph of capitalism,

there was a mid-Victorian anxiety that the “social and moral world was being reduced to a warehouse of goods and commodities, a display window in which people, their actions, and their convictions were exhibited for the economic appetites of others” (*Novels Behind Glass*, p. 6). And as Nancy Armstrong notes, “objects” in *Alice’s Adventures in Wonderland* “are neither inert nor speechless” (“The Occidental Alice,” p. 559). But for Carroll, in the midst of the Darwin debates, the experience of this world of “economic appetites” could not be severed from the bodily appetites of the biological “Struggle for Life” between creatures “remote in the scale of nature, [but] bound together by a web of complex relations,” “all feeding on each other” (Darwin, *Origin of Species*, pp. 648, 101, 102).<sup>10</sup> For Carroll, capitalist circulation was not simply a matter of ownership and property; it was also about surprising interspecies affiliations and relations, in which all parties can slip between the roles of subject, object, predator, and prey. In the *Alice* books, to be a thing is not to transcend circulation, interconnection, or the condition of being potentially utilizable or consumable by others; rather, it is to be part of such networks when these networks reach beyond the domain of the human.

Of course, Brown is not a Victorianist, and in fact the second, more object- and circulation-friendly strand of thinking about things in literary studies has strong Victorianist representation by scholars such as John Plotz and Elaine Freedgood.<sup>11</sup> These thinkers represent a looser thing trajectory influenced less by Martin Heidegger than by Arjun Appadurai’s edited volume *The Social Life of Things* (1986).<sup>12</sup> They are more comfortable with things as property, as objects of consumption, and as telling stories about human history and culture. These thinkers, however, risk looking through things to what Freedgood calls “the ideas in things” (*The Ideas in Things*, p. 76), and their things are very much *objects* in the way that Lamb and Brown describe objects, remaining quite human, or at least circumscribed by human identifications, values, and use values. I want to suggest that, without quite letting us have our things and eat them too, Lewis Carroll’s *Alice* books can productively mediate these two strands of thought. They give us the surprise, the strangeness, the irreducible excess, and the tangled relationship between subjects and objects of thing theory’s uncanny “things,” but without throwing circulation or consumption out the window or falling back on humanist objects. While thing theory remains rooted in Heidegger’s vision of things as “independent” and “self-supporting,”<sup>13</sup> the *Alice* books give us things in networks, but networks that supersede, and have utility beyond, the human. Eating, I propose, is our way into these networks.

What kind of a thing is food? According to E. M. Forster, “food in fiction is mainly social. It draws characters together, but they seldom require it physiologically, seldom enjoy it.”<sup>14</sup> Forster’s assertion, I have suggested elsewhere, points to the way in which nineteenth-century British novels “often obscure the material side of eating linked to bodily appetite and sensory pleasure in favor of a version of eating” that is more purely, or narrowly, “social,” usually at the service of the marriage plot.<sup>15</sup> Lewis Carroll, however, in focusing on childhood – which earlier nineteenth-century novels tended to marginalize as an uninteresting space of alimentary appetite<sup>16</sup> – and entering fully into the subject/object merging occasioned by nascent commodity culture and the human/animal slippage hinted at by evolutionary theory, pries open the conventional novelistic social to discover a world animated by the foods and eating processes that might otherwise function as background, symbols, or structuring devices. Alice occupies a world that makes her confident that “something interesting is sure to happen … whenever I eat or drink anything” (*Alice’s Adventures in Wonderland*, p. 32; emphasis in original) and asks us to consider the narrative

implications of it being “always tea-time” (p. 64) – always mealtime for someone or something. Following Alice’s lead, critics of Carroll’s texts have “always t[aken] a great interest in questions of eating and drinking” (p. 65). And while I am closer to critics such as Nina Auerbach, James R. Kincaid, Margaret Boe Birns, and Rose Lovell-Smith who read Wonderland eating as expressing a vision of predation than to those such as Armstrong, Carina Garland, and Carol Mavor who read it as reflecting anxieties about control,<sup>17</sup> I want to suggest that the *Alice* books deploy eating more radically to remap the novelistic social, merging literary character, and indeed “the human,” with “the things” that, for Brown, “comprise the stage on which human action, including the action of thought, unfolds” (*A Sense of Things*, p. 3). *Alice’s Adventures in Wonderland* and *Through the Looking-Glass, and What Alice Found There* (1871) open up a space in which food and eating refuse to behave themselves as stage, backdrop, symbols, or empty vessels for any kind of preexisting social. Instead, Carroll offers us the opportunity to see the social itself as something that is assembled, at least in part, so that we, and others, might eat – but also, if paradoxically, as something that is assembled by food.

So, first and foremost, food in *Alice* is social – but not in the way that Forster means. Food is not simply an object utilized by social subjects. Anticipating Jane Bennett’s theorization of food as a form of “agency,”<sup>18</sup> Wonderland foods are cocreators of human character, as hinted by Alice’s contemplation: “Maybe it’s always pepper that makes people hot-tempered … and vinegar that makes them sour – and camomile that makes them bitter – and – and barley-sugar and such things that make children sweet-tempered” (*Alice’s Adventures in Wonderland*, p. 78). Moreover, Carroll gives us a world in which subjects and objects are not essentially different and where everything and everyone is potentially on the menu. For Carroll, food is a social *thing* – a thing that associates and socializes. For instance, near the beginning of *Wonderland*, Alice drinks from a bottle labeled “DRINK ME” (p. 13) and eats a cake “on which the words ‘EAT ME’ [are] beautifully marked in currants” (p. 14). These food-things function both partly as objects and partly as subjects. They can be picked up and consumed as objects, but they also make the requests that lead to their ingestion, making them the partial agents of their own consumption. I say “partial” agents because Alice, who eats and drinks them (pp. 15, 13–14), must also be a partial agent of their consumption. But the very acts of ingestion that might seemingly secure Alice’s status as a consuming subject over and against consumable objects render Alice object-like, making her a tool through which the food-things realize their consumption. Such ingestion also causes Alice to experience herself as an object, first “shutting up like a telescope!” (p. 14), and then “opening out like the largest telescope that ever was!” (p. 16). The meeting of Alice and the edibles thus makes each party inhabit and overflow the position of subject and object at once, becoming uncanny “things,” but hardly independent or self-sufficient ones. They become things through association and collaboration, things operating together as both partial agents and partial objects to form a network of consumption. In *Alice*, one never eats alone.

Eating, for Carroll, is a particularly vivid intersection of multiple agencies, bearing resemblance to the theory of action put forth by Bruno Latour. Action, Latour suggests, is “not transparent” and “is not done under the full control of consciousness; action should rather be felt as a node, a knot, and a conglomerate of many surprising sets of agencies,” or “actors,” forming an “actor-network.”<sup>19</sup> In the instance above, Alice forms a network with the following actors:

1. The “DRINK ME” drink constituted by the bottle and the liquid within that relies on Alice to drink it and causes her to shrink. (When Alice tastes the liquid, we encounter a resulting sub-network of “mixed flavour” consisting of still more actors: “cherry-tart,

- custard, pine-apple, roast turkey, toffy, and hot buttered toast" [*Alice's Adventures in Wonderland*, pp. 13, 14].)
2. The "EAT ME" cake that relies on both the drink to shrink Alice to a size where she can find the cake under the table and Alice to eat the cake, causing Alice to grow.

But as Alice grows, this network expands to include another pair of actors:

3. Alice's feet. Growing taller upon eating the cake, Alice experiences her feet as separate actors, bidding them "Goodbye"; wondering "who will put on your shoes and stockings for you now, dears?"; worrying that if she is not "kind to them" they "wo'n't walk the way I want to go" (p. 16); and contemplating sending them presents (pp. 16–17).

Rather than giving evidence of "s spiteful attempts of the male author to suppress and control Alice's agency" (Garland, "Curious Appetites," p. 22) or being part of an effort to represent "the body as something already out of control, something always in need of regulation" (Armstrong, "The Occidental Alice," p. 551), the consumption of the "DRINK ME"- "EAT ME" items dramatizes Alice as an actor reassembling, dividing, and realigning through her incorporation of other actors that are themselves presumably reconfigured through Alice's ingestion and digestion of them. Latour's actors have more ontological flexibility than either conventional objects or the things of thing theory. They can include humans, animals, objects, concepts, and, in the case of Alice, food and body parts. But with such versatile actors at hand, why hold onto "things" at all? First, I would suggest, because Carroll himself makes frequent and imaginative use of the term "thing." Second, because, while the *Alice* books anticipate Latour's sense of the multiplicity and "*dislocated*" nature of agency (*Reassembling the Social*, p. 46; emphasis in original), Carroll's things are actors caught up in a historically specific imagining of objects, people, and animals trading positions – actors embodied within a social network of Darwinian commodities mobilized by eating.

Upending the conventional nineteenth-century novelistic model that defines deep human character and narrative interest against the interest in food,<sup>20</sup> this sequence shows Carroll reworking literary form. Alice's consumption of other actors simultaneously moves the story along and quite literally transforms her. Undoing distinctions between eating and reading,<sup>21</sup> the sequence also stands as a particularly self-reflexive instance of the text's participation in the mid- to late-nineteenth-century conceptualizations of reading as a bodily experience discussed by recent criticism concerned with the relationship between aesthetics and corporeality.<sup>22</sup> But the tendency for such criticism to underplay the alimentary dimensions of embodiment<sup>23</sup> points to the enduring relegation of gustatory taste to the lower rungs of what Carolyn Korsmeyer describes as the "hierarchy of the senses," a hierarchy informing the modern aesthetic models<sup>24</sup> that influence so much nineteenth-century narrative.<sup>25</sup> Carroll breaks with these models, grounding literary form and reading alike not simply in the body, but in the potentially animalistic domain of bodily appetite. Alice's network with the "EAT ME"- "DRINK ME" things – at once objects, characters, edibles, and texts – presents appetite eliciting and shaping literary interest, which functions here not as a demonstration of deep interiority<sup>26</sup> but as a bodily vector of association with heterogeneous things in Carroll's expansion of the social.

We see a more aggressive example of the social life of food near the end of *Through the Looking-Glass*, when Alice attends a coronation feast where she is to be officially recognized as a queen, surely the top position in the Looking-Glass food chain, a position defined as "all feasting and fun!"<sup>27</sup> But "the feast enacts a radical and pervasive unraveling of the

division of the human and the inhuman,”<sup>28</sup> and the would-be objects of consumption turn the tables on their would-be consumers. Alice is “introduce[d]” to a leg of mutton that “ma[kes] a little bow to” her (*Through the Looking-Glass*, p. 229), and upon announcing her wish to slice the leg, Alice is informed that “it isn’t etiquette to cut any one you’ve been introduced to” (pp. 229–30). She is then introduced to a Pudding, and must “conquer[r] her shyness by a great effort” to “cut a slice” of it, after which the Pudding says, “in a thick, suety sort of voice,” “What impertinence! … I wonder how you’d like it, if I were to cut a slice out of *you*, you creature!” (p. 230). Soon consumers and objects of consumption trade positions – the leg of mutton sitting in the White Queen’s chair, and the White Queen “disappear[ing] into the soup” (pp. 232–33), the guests “lying down in the dishes,” and the soup-ladle “walking up the table towards Alice’s chair, and beckoning to her impatiently to get out of its way” (p. 233). This revolt of food-things puts pressure on Brown’s claim that “the tale” of “possession – of being possessed by possessions – is something stranger than the history of a culture of consumption. It is … a tale not just of thinking with things but also of trying to render thought thing-like” (*A Sense of Things*, p. 5). Possession, *Alice* shows us, is richer and stranger than consumption only if we take consumption in a rarefied economic sense. What if we don’t, as Carroll doesn’t, separate “consumption” from the condition of having a body, of needing or wanting to eat and survive – and, perhaps inevitably, to “cut,” to kill – of being part of a food chain? Alice occupies worlds in which both subjectivity can become thing-like and the things she would consume are already subjects.

The coronation scene also shows how the “thingness” of food – that which makes it overflow the category of “object” – is at least in part due to its position at the border between life and death, and to its evocation of the *violence* of consumption. For Carroll, consumption is haunted by animals and the violence done or always on the verge of being done to animals. As Sara Guyer notes, the leg of mutton and the suety Pudding respectively are and bear the remains of “slaughtered and cooked animals” (“The Girl with the Open Mouth,” p. 162). And even some of the less-fleshy inhabitants of the table assemble into animal form: “As to the bottles, they each took a pair of plates, which they hastily fitted on as wings, and so, with forks for legs, went fluttering about in all directions: ‘and very like birds they look,’ Alice thought to herself, as well as she could in the dreadful confusion that was beginning” (*Through the Looking-Glass*, p. 232). This “confusion” that nearly overwhelms Alice’s subject-defining ability to “think” is as much a rebellion of animals as of food, which is perhaps fitting for a feast consisting mainly of animal products and attended by “animals” and “birds” (p. 229). Lewis Carroll’s things override the status of mere objects not only through becoming (human) subject-like but also through being or becoming animal-like, or simply through being animals, as in the case of the Wonderland croquet-ground where “the croquet balls were live hedgehogs, and the mallets live flamingoes” (*Alice’s Adventures in Wonderland*, p. 73).

If Carroll’s lively things are partly a response to the subject/object “confusion” resulting from the sense of a commodified human world under Victorian capitalism, then they also suggest that this confusion was interwoven with concerns about the commodification of animals. Besides bearing witness to the evolutionary theories that blurred the boundaries between humans and animals, the nineteenth century saw an accelerated objectification of animals through the advent of “zoos, realistic animal toys and the widespread commercial diffusion of animal imagery,”<sup>29</sup> along with the “more abstract process of [animal] domination implicit in both popular zoology and the scientific work

it reflected and distilled.”<sup>30</sup> The Victorian period also saw the very visceral objectification of animals by the meat-canning industry and vivisection,<sup>31</sup> a practice that, as Jed Mayer notes, Carroll himself became an outspoken critic of.<sup>32</sup> In the *Alice* books, animals frequently occupy the positions of objects for use and consumption while simultaneously troubling their role as objects through their very animalism in a world where animals often command the subject-announcing power of speech. As we have seen, the “things” that the Duck designates are animals that it – another animal – regards as edibles. The Queen of Hearts describes the Mock Turtle as “the *thing* Mock Turtle Soup is made from” (*Alice's Adventures in Wonderland*, p. 81; emphasis added). The Mock Turtle in turn sings a song in which one of the central characters is a whiting, and when the Turtle asks Alice if she can describe whiting, she responds by describing them as food, with “their tails in their mouths – and they’re all over crumbs” (p. 90). In *Through the Looking-Glass*, well before the animal-food-things of the coronation feast, a talking Gnat shows Alice a “Snap-dragon-fly” with a body “made of plum-pudding,” “wings of holly-leaves, and its head” a “raisin burning in brandy” and a “Bread-and-butter-fly” whose “wings are thin slices of bread-and-butter, its body is a crust, and its head is a lump of sugar” (*Through the Looking-Glass*, pp. 150, 151) – both at once living creatures and novel objects of consumption.

Yet more elusive things seem to trouble this world of animal objects in a *Looking-Glass* shop run by a Sheep. Alice finds:

The shop seemed to be full of all manner of curious things – but the oddest part of it all was that, whenever she looked hard at any shelf, to make out exactly what it had on it, that particular shelf was always quite empty, though the others round it were crowded as full as they could hold.

“Things flow about so here!” she said at last in a plaintive tone, after she had spent a minute or so in vainly pursuing a large bright thing, that looked sometimes like a doll and sometimes like a work-box, and was always in the shelf next above the one she was looking at. “And this one is the most provoking of all – but I’ll tell you what –” she added, as a sudden thought struck her. “I’ll follow it up to the very top shelf of all. It’ll puzzle it to go through the ceiling, I expect!”

But even this plan failed: the ‘thing’ went through the ceiling as quietly as possible, as if it were quite used to it. (*Through the Looking-Glass*, p. 176)

I quote at length because this scene seems to present things at their most Heideggerian. Much to a prospective thing theorist’s delight, Alice faces the refusal of these “things” to be pinned down and reduced to concretely identifiable objects of consumption. The things seem uncannily alive precisely in their ability to evade human categorization and use and their consequent ability to render Alice thing-like. For, as Alice turns about to try and see these things, the Sheep asks if she is a “teetotum” (p. 176) or spinning top.<sup>33</sup> We find, however, that the elusive, metamorphic qualities of these things are not due to their transcendence of capitalism, but rather to their embodiment of it. The Sheep says to Alice: “plenty of choice, only make up your mind. Now, what *do* you want to buy?” (*Through the Looking-Glass*, p. 178; emphasis in original). The dream logic of these things that refuse to stay still or hold a single form reflects the dizzying phantasmagoria of overwhelming consumer choice and desire more than it reflects pure thingish alterity. Once Alice learns that the things are for sale, she decides that she “should like to buy an egg” to eat (p. 179), bringing us back into a domain of bodily consumption where the “thing” to be consumed is an animal product (and potential source). Yet the egg

resists easy consumption. Alice finds that “the egg seems to get further away the more [she] walk[s] towards it” (p. 180), and then that it grows “larger and larger, and more and more human” (p. 181), until it becomes “HUMPTY DUMPTY” (p. 181). This humanized egg thus occupies the intersection between food, person, animal, and purchasable object that a Darwinian consumer culture made available to an imagination as vivid as Carroll’s. And if Humpty Dumpty’s desire “to be master” of words and their meanings (p. 186) seems to place him insistently on the subject side of the subject/object dichotomy, then the shattering “fall” of his well-known story, played out here in “a heavy crash” (p. 193), reaffirms the Wonderland slippage between subject and object as well as the fragile corporeality that haunts all of Carroll’s actors, whether human, animal, object, or some combination of the three. In the end, the shop of elusive things shows us how animals produce and animate Carroll’s objects. Not only do things materialize as eggs, but the shop is, of course, presided over by a Sheep who sells these consumable goods and whose persistent knitting (pp. 175–78) drives home the objectification of animals.

This is not to say that all of the things or even all of the food-things in the *Alice* books are animals or directly bear animal remains, but rather that animals mobilize the networks of things, especially when eating is at stake. It is, after all, while chasing a White Rabbit down a rabbit-hole that Alice encounters the “EAT ME” cake and “DRINK ME” bottle, the “burning” “curiosity” that initially motivates her adventure (*Alice’s Adventures in Wonderland*, p. 10) arising in relation to an animal and quickly becoming indistinguishable from the appetite she shows during her interaction with the edibles. And what prompts Alice’s “curiosity” about the White Rabbit is its waistcoat-pocket and its watch (p. 10), *objects* for human use that render the Rabbit a novel *thing* that blurs the boundaries between human and animal.<sup>34</sup> Alice’s response to this thing is to blur her own species’ boundaries and take to the rather predatory animalistic activity of chasing a rabbit down a hole.

The network of actors that we began to trace in the previous section now grows more complex. Even before Alice enters into association with the “DRINK ME” drink, she forms a network that consists of her and the Rabbit. And while she loses sight of the Rabbit during her interactions with the food and drink, the Rabbit soon reappears to help further multiply actors. To our provisional list of: 1. The “DRINK ME” drink, 2. The “EAT ME” cake, and 3. Alice’s feet, we can now add the following:

4. The White Rabbit. The initial animal-thing that Alice chases into the rabbit-hole now reappears. Alice attempts to address the Rabbit who – possibly alarmed by the advances of a creature that has been chasing him and has now grown in size dramatically – responds by “start[ing] violently,” dropping its gloves and fan, and “skurr[ying] away into the darkness as hard as he could go” (*Alice’s Adventures in Wonderland*, p. 17).
5. Mabel. After growing and reencountering the White Rabbit, Alice has an identity crisis and is no longer able to tell if she is herself or someone else. She wonders if she has “been changed in the night” (p. 17); asks, “Who in the world am I? Ah, *that’s* the great puzzle!” (pp. 17–18; emphasis in original); and worries that she has “been changed for Mabel!” (p. 19).
6. The little crocodile. Worrying that she has been changed for Mabel, Alice tries to remember “all the things [she] used to know” (p. 18). She attempts to recite Isaac Watts’s 1715 poem “Against Idleness and Mischief,”<sup>35</sup> but it comes out as a poem about a “little crocodile” (*Alice’s Adventures in Wonderland*, p. 19; emphasis in original).
7. Little fishes. In the poem, the little crocodile “welcomes little fishes in, / With gently smiling jaws” (p. 19; emphasis in original).

If Alice's initial consumption of the edibles is an example of cooperative network building, then the reintroduction of the White Rabbit expands this network to include the more violent (if smilingly social) consumption of fish by crocodile, replaying but inverting the initial invitation from the "EAT ME"-“DRINK ME” things to Alice to ingest them. This entry and reentry of animals into an apparent human/thing-only club shows animals – even when forgotten – mobilizing and making possible the interactions between humans and things, especially the things that people eat.

Alice's identity crisis and inability to remember accurately the “things” she “used to know” opens up another dimension of Wonderland things. As she later tells a hookah-smoking Caterpillar, Alice's sense that she is “not [her]self” is due to the fact that she does not “keep the same size for ten minutes together!” and that she “ca’n’t remember things as [she] used” (*Alice's Adventures in Wonderland*, pp. 41, 42; emphasis added). Alice's sense of selfhood is thus reliant on things: the edible things that change her size and the “things” that she cannot quite remember. And similarly to the case of the Duck's “thing,” these latter denoted “things” turn out to be animals.<sup>36</sup> When the Caterpillar asks Alice, “Ca’n’t remember *what* things?” she replies: “Well, I've tried to say ‘*How doth the little busy bee*,’ but it all came different!” (*Alice's Adventures in Wonderland*, p. 42; emphasis in original). Alice is referring to her earlier recitation of the poem about the little crocodile (beginning “*How doth the little crocodile*” [p. 19]). Her feeling of not being herself, then, comes from forgetting “things” not so much as abstract entities or units of information but as specific animals with specific relations to food. Alice has forgotten the productive bee and remembered instead the predatory, consuming crocodile. The text thus experiments with a model of identity that is not based on a recallable human self-hood or body of knowledge but configured by re-membering: by participating in the assembling and reassembling of a diverse network of actors, including animals and foods – by accepting membership within what Latour calls the “Parliament of Things.”<sup>37</sup> Alice feels as though she has “been changed” for someone else (*Alice's Adventures in Wonderland*, p. 17) because she has entered into association with an unfamiliar network comprising the White Rabbit and the “EAT ME”-“DRINK ME” items and cannot, through memory, align herself with the correct animal-“things.” As Lovell-Smith suggests, “in Wonderland humans are the creations of animals, it appears, just as much as animals are the creations of humans” (“Eggs and Serpents,” p. 43). But is Alice's alignment with the fish-eating crocodile instead of the bee really a mistake? After all, critics like Edmund Wilson, Auerbach, and Kincaid have regarded Alice as predatory and aggressive.<sup>38</sup> And this little crocodile might indeed mirror the hungry Alice. But I think that its appetite points instead to another misremembered fish-loving predator: Alice's cat, Dinah.

I want to suggest that the most crucial “things” in the *Alice* books are Alice's cats. In conjunction with Alice, they are the pivotal actors assembling the network of Wonderland. For Latour, “action is borrowed, distributed,” “influenced, dominated,” and “translated” (*Reassembling the Social*, p. 46), and Alice, I would argue, similarly borrows and translates the appetite and predatory aspects of her cats. Several critics have touched on Alice's “conspicuous affinity with cats” (Nicholson, “Food and Power,” p. 50) and the “somewhat puzzling centrality of Dinah and the Cheshire Cat” in *Wonderland* (Lovell-Smith, “The Animals of Wonderland,” p. 408). For example, noting the Cheshire Cat's “long claws and a great many teeth,” Empson argues that “Alice is particularly at home with [the Cheshire Cat]; she is the same sort of thing” (*Some Versions of Pastoral*,

pp. 273–74). Gilles Deleuze writes that Alice “identifie[s] herself with the Cheshire Cat” (*The Logic of Sense*, p. 235). Auerbach points out that the Cheshire Cat is “the only creature in Wonderland whom [Alice] calls her ‘friend,’” and suggests that he is “the only figure other than Alice who encompasses all the others” (“Alice and Wonderland,” p. 38). Auerbach also makes telling connections between the Cat’s ability to dissolve “into his own grinning mouth,” the grinning crocodile, and the centrality of Alice’s appetite (“Alice and Wonderland,” p. 39). The fleeting critical comments on Alice’s pet cats bring us even closer to the mark. Florence Becker Lennon opened up the possibility of thinking about the significance of the “real” cats of the *Alice* books to the world of Wonderland by suggesting that the Cheshire Cat “is Dinah’s dream-self” and “a sort of guardian imp and liaison officer between the two worlds.”<sup>39</sup> Kincaid writes: “In Alice’s world, which frames both books, Dinah is a warm symbol of friendly cuddliness, but in Wonderland she is a monster” (“Alice’s Invasion of Wonderland,” p. 97). More recently, Mavor connects cats to “memory,” suggesting that “it is the cat – perhaps only the cat, whether it takes the form of Dinah, or the metamorphosed form of the Cheshire Cat, or the form of a black kitten or a white kitten as birthed by Mother Dinah – that Alice misses” (“For-getting to Eat,” p. 101). Most evocatively, Auerbach picks up on Lennon’s connection between the Cheshire Cat and Dinah but claims an additional “shift of identities between Alice and Dinah,” noting that Dinah “is the only above-ground character whom Alice mentions repeatedly, almost always in terms of her eating some smaller animal,” and positing that Dinah “seems finally to function as a personification of Alice’s own subtly cannibalistic hunger” (“Alice and Wonderland,” pp. 38, 36). Yet even Auerbach underestimates the central role that Alice’s cats play in structuring the world of Wonderland. And while there is indeed an entanglement of identity between Alice and Dinah, the text avoids reducing Dinah to a personification. Rather than making this animal stand in for an aspect of this human, Carroll explores an interspecies model of identity in which humans and animals are each other’s co-creators and mediators, borrowing from, translating, feeding, and feeding off each other.

If the “burning curiosity” that drives Alice to chase the White Rabbit at the beginning of *Alice’s Adventures in Wonderland* seems to borrow and translate the exploratory and predatory instincts of her cat (that most notoriously curious species), then her entry into the world below is marked by her concern for Dinah’s food supply. As she falls down the rabbit-hole, Alice wonders if, in her absence, anyone will “remember [Dinah’s] saucer of milk at tea-time,” and she muses: “Dinah, my dear! I wish you were down here with me! There are no mice in the air, I’m afraid, but you might catch a bat, and that’s very like a mouse, you know” (*Alice’s Adventures in Wonderland*, p. 11). This only seemingly absent feline appetite becomes a palpable presence when Alice, attempting to communicate with a mouse, says, “Où est ma chatte?”, causing the mouse to give a “sudden leap” and “quiver all over with fright” (p. 21) – a reaction not wholly different from the White Rabbit’s fright at Alice. Alice’s response – “I quite forgot you didn’t like cats” – is met with the mouse’s reply, which at once makes explicit a version of the social that is a predatory food chain and invites Alice to imagine herself occupying the mouse’s place within this chain: “Not like cats! … Would *you* like cats, if you were me?” (p. 21; emphasis in original). But Alice continues to evoke her cat’s appetite. Among an assorted group of creatures (including birds), Alice says: “Dinah’s our cat. And she’s such a capital one for catching mice, you ca’n’t think! And oh, I wish you could see her after the birds! Why, she’ll eat a little bird as soon as look at it!” (p. 29), a speech that sends the creatures hurrying away. Lovell-Smith has noted that “it is through her series of size changes that

Alice finds herself continually being repositioned in the food chain" ("The Animals of Wonderland," p. 406), but Alice's position in this chain also depends on her association with Dinah. Alice's references to Dinah modify her social relations with the creatures of Wonderland, putting them in the position of potential food objects. And just as Alice eventually learns to eat and manipulate her size more strategically, she also begins to use her references to Dinah more deliberately to vie for power among the creatures of Wonderland. After Alice gets stuck in the White Rabbit's house, the Rabbit concludes that he "must burn the house down," and Alice responds: "If you do, I'll set Dinah at you!" (*Alice's Adventures in Wonderland*, p. 36). That said, Dinah hardly insures Alice a secure position at the top of the Wonderland food chain, as we see when Alice shrinks and participates in the rather cat-like fear of becoming prey for a relatively "enormous" puppy (p. 37).

Alice's journey through Wonderland thus develops a model of being in which identity is less a fixed essence than a position on a food chain that varies through association and diet. After her run-in with the puppy, Alice's earlier, "Who in the world am I? Ah, that's the great puzzle!" (pp. 17–18; emphasis in original), soon gives way to her comment: "I'd nearly forgotten that I've got to grow up again! Let me see – how is it to be managed? I suppose I ought to eat or drink something or other; but the great question is 'What?'" (pp. 38–39; emphasis in original). And upon eating a bit of Caterpillar-given mushroom that makes her grow tall, Alice meets a Pigeon, who further asserts that questions of fixed identity are secondary to questions of what one eats and eats like. The Pigeon identifies Alice as a "Serpent" trying to steal its eggs (pp. 47–48). Alice's protests that she is "a little girl" rather than a serpent prove irrelevant when the Pigeon points out that if, as Alice says, "little girls eat eggs quite as much as serpents do," then little girls are "a kind of serpent," a notion that is "such a new idea to Alice, that she [is] quite silent for a minute or two" (p. 48).

If Alice's silence signals some recognition of her role as an animalistic eater, then we should recognize that such a role does not simply mark Alice as an individual consumer, but as a node in an interspecies network of consumption. We should not read Alice's references to Dinah's appetite and hunting skills as mere evocations of Dinah or personifications of Alice's hunger, but rather as extensions of and forms of contact with Dinah. While Alice deploys Dinah as a kind of tool to help her move through the social world of Wonderland, she also imagines herself becoming a tool for Dinah, that Dinah might begin "sending [Alice] on messages," or errands, including watching a "mouse-hole" (*Alice's Adventures in Wonderland*, pp. 31, 32). Such thinking invites us to imagine humans as servants or instruments in animal meals and hints that Alice's adventures are not just her own, but also act as "messages" for Dinah and Dinah's kittens.

Utilizing Dinah's appetite to effect her position on the food chain of Wonderland, Alice also functions as a kind of feline prosthesis, imagining meals on behalf of her cats and returning to feed them. Much as Alice's descent into Wonderland is marked by her concern about when Dinah will be fed (*Alice's Adventures in Wonderland*, p. 11), her journey through the looking-glass is brought on by Alice's conversation with Dinah's black kitten and her desire to pretend that the kitten is the Red Queen and marked by her concern over whether the kitten will get milk through the looking-glass (*Through the Looking-Glass*, pp. 124, 127). Once Alice is through the glass, it is the Red Queen who proposes to her that they be queens together, a position that, as we have seen, she defines as "all feasting and fun!" (p. 144). And at her royal coronation, Alice remarks to the Red Queen: "it's a very curious thing, I think – every poem [in the Looking-Glass world] was

about fishes in some way” (pp. 230–231; emphasis added), a point that could also be made about most of the poems in *Wonderland*. When Alice asks the Red Queen, “Do you know why they’re so fond of fishes, all about here?”, the Queen somewhat evasively but tellingly responds, “As to fishes,” and suggests another poem about fishes (p. 231). Once the feast has turned against the Queens, Alice shakes the Red Queen (who she supposes is “the cause of all the mischief” [p. 234]), turning her back into a kitten and waking from her dream.

As Jacques Derrida notes, the entire penultimate chapter of *Looking-Glass* “consists in a single [partial] sentence”: “— and it really *was* a kitten, after all.”<sup>40</sup> Critics of the *Alice* books tend to pass over this emphatic commitment to the revelation of the kitten’s identity, and even Derrida points it out mainly to oppose his contemplation of the potential responsiveness of animals to Alice’s apparent certainty “that one cannot speak with a cat on the pretext that it doesn’t reply or that it always replies the same thing” (Derrida, “The Animal That Therefore I Am,” p. 8; see Carroll, *Through the Looking-Glass*, p. 238). Alice’s frustration that “whatever you say to [kittens], they *always purr*,” however, does not in fact stop her from talking to her kitten (*Through the Looking-Glass*, p. 238; emphasis in original). Now awake, Alice says to her kitten: “You woke me out of oh! such a nice dream! And you’ve been along with me, Kitty – all through the Looking-Glass world. Did you know it, dear?” (p. 238). But when the kitten only purrs in response, Alice not only keeps talking but also moves from asking for language as response to offering it as a gift: “if only you’d been really with me in my dream, there was one thing you *would* have enjoyed – I had such a quantity of poetry said to me, all about fishes! To-morrow morning you shall have a real treat. All the time you’re eating your breakfast, I’ll repeat ‘The Walrus and the Carpenter’ to you; and then you can make believe it’s oysters, dear!” (p. 239; emphasis in original). Alice’s inability to differentiate her kitten’s vocal responses and thus to know the extent to which the two of them share a language does not drive Alice to contemplate philosophy (as Donna J. Haraway notes that Derrida does under the silent gaze of his own small black cat),<sup>41</sup> but rather moves her to reshape her language into a form that she knows her kitten will enjoy if not understand in human terms. Instead of continuing to inquire about the truth behind identity (“Confess that [the Red Queen] was what you turned into!” [*Through the Looking-Glass*, p. 238]), Alice offers a narrative about food that she translates into the material food that she feeds her kitten.

The animals in *Alice* at once do and do not fit Ivan Kreilkamp’s claim that “animal characters are fundamentally ‘minor,’ in the sense defined by Alex Woloch,”<sup>42</sup> functioning as “subordinate beings who are delimited in themselves while performing a function for someone else.”<sup>43</sup> On one hand, Wonderland animals can be even more explicitly functional than Woloch’s minor human characters, sometimes occupying the positions of objects and meat. But on the other hand, the human Alice, ostensibly the narrative’s central protagonist, herself performs functions for and acts as an extension of her cats, who are only delimited in a superficial way. Her cats trouble Woloch’s concept of minor characters; without occupying much obvious narrative space, they crucially structure the dream worlds of Wonderland and Alice’s own character, to the point where it is never quite clear where they end and Alice begins. Instead of a “character-system,” or a “distributional matrix” in which “the discrete representation of any specific individual is intertwined with the narrative’s continual apportioning of attention to different characters who jostle for limited space within the same fictive universe” (Woloch, *The One vs. the Many*, pp. 17, 13), Carroll brings us tangled interspecies networks assembling andreassembling as humans, objects, and animals exchange, share, and create new

positions. Fictional “space” in these texts cannot be dominated by the human or mapped with accuracy by human-centered reading practices; instead, the nonhuman territories of things and animals extend beneath and beyond the conventional spaces of readerly attention. Shaping the networks of Wonderland are animal bodies and appetites that draw us in not simply as readers but as social things inhabiting a food chain.

Alice’s interaction with her kitten also takes us beyond Derrida’s concerns with animal alterity and human/animal slippage – concerns that have become touchstones for the field of “animal studies”<sup>44</sup> – toward something closer to Haraway’s concept of “becoming with,” a mode of “species interdependence” in which “the partners do not precede the meeting; species of all kinds, living and not, are consequent on a subject-and object-shaping dance of encounters” (*When Species Meet*, pp. 3, 19, 4). Far from Gilles Deleuze and Félix Guattari’s ecstatic notion of “becoming-animal”<sup>45</sup> (which Haraway argues shows a “profound absence of curiosity about or respect for and with actual animals” [*When Species Meet*, p. 27]), “becoming with” resembles Latour’s actor-networks, involving interspecies “beings-in-encounter” that “gather up those who respond to them into unpredictable kinds of ‘we’” (Haraway, *When Species Meet*, p. 5). The “we” assembled by Alice and her kitten is a network strengthened rather than weakened or brought into crisis by the gaps in communication created when human speech provokes feline purring. Whether or not Alice’s extension of “make believe” to her kitten is itself an anthropomorphic fantasy, such extension is an offer rather than a demand, and it has both the material consequence of enhancing Alice’s enthusiasm for feeding the kitten and the narrative-shaping effect of animalizing Alice’s fantasy life. The edible sea life in both *Alice* books seems at least as much a feline fantasy as a human one, even if such a fantasy is the product of eating practices and appetites that develop through cats’ association and cohabitation with humans. And what is “The Walrus and the Carpenter” – in which the eponymous characters “*talk of many things: / ... / Of cabbages – and kings – / And why the sea is boiling hot – / And whether pigs have wings*” in order to lure oysters to their culinary deaths (*Through the Looking-Glass*, p. 161; emphasis in original) – but the story of an interspecies alliance between a human and an animal using language and “make believe” in order to eat together? Fantasy and fiction, for Carroll, are not human tools for writing over animals or animal necessity, but coinventions *with* animals – modes of “becoming with” that remain rooted in bodily needs and pleasures and that shape the identities of human and animal inventors together.

After offering to repeat “The Walrus and the Carpenter,” Alice further draws our attention to the question of make-believe and invention by asking her kitten to help her understand the origin of Wonderland, saying, “Now, Kitty, let’s consider who it was that dreamed it all” (*Through the Looking-Glass*, p. 239). Alice is referring back to something that occurs after she first hears this poem (pp. 158–63) from the mouth of the sometimes “fish”-resembling Tweedledee (p. 167), when Tweedledee says that Alice is “only a sort of thing in [the Red King’s] dream!” (p. 165). The text follows up this idea in a chapter titled “It’s My Own Invention” in which Alice wonders whether “we’re all part of the same dream,” adding: “Only I do hope it’s *my* dream, and not the Red King’s! I don’t like belonging to another person’s dream” (p. 205; emphasis in original). But Alice’s anthropocentric contemplation of the potential dream-owners is “interrupted” by two battling Knights and their horses (p. 205). The victorious White Knight – a self-declared “great hand at inventing things” (p. 211) – proceeds to show and describe his “inventions” to Alice. These inventions mainly include “things” that come into being at the intersection of humans and animals. They include an upside-down box emptied of the

“things” (“clothes and sandwiches”) it is designed to hold (p. 207) and hung on a tree “in hopes some bees may make a nest in it” and create “honey” (p. 208); “anklets” that the Knight puts around the feet of his horse “to guard against the bites of sharks” (p. 208); a helmet “like a sugar-loaf” used in case the Knight falls off his horse (p. 211); and a song in which the speaker makes “*butterflies*” into “*mutton-pies*” and “*haddock’s eyes*” into “*waistcoat-buttons*” (pp. 215, 216; emphasis in original). We learn that, “of all the strange things that Alice saw in her journey Through The Looking-Glass,” the sight of the Knight singing this song and “the horse quietly moving about, with the reins hanging loose on his neck, cropping the grass” is “the one that she always remembered most clearly” (p. 214). In other words, when it comes to reassembling Looking-Glass networks, it is not just the Knight who invents with and for animals that makes such a memorable impression on Alice, but “the strange pair” of man and horse (p. 214). The question of who is dreaming the dream thus lodges between a poem about one human-animal alliance and the spectacle of another, and reemerges when Alice offers to repeat the poem to her kitten. In this way, the text hints that we all might be “things” in a dream, inventions “becoming with” and belonging to one another in an interspecies network. The returning oysters of “The Walrus and the Carpenter” remind us, however, that “becoming with” has its victims; networks have their prey. Like so many other Wonderland animals, the oysters are at once food objects and social things, the never fully digested remains of fiction and invention.

Thing theory is fascinated with the irreducibility of things, as is Carroll. Brown, imagining things “as what is excessive in objects,” makes a point that is as inescapable as it is evocative (“Thing Theory,” p. 5). But Brown, looking for this excess of things in “the void constituted by the jug” and “the emptiness at the center of the Real” (*A Sense of Things*, p. 7), gets so sidetracked by the allure of *nothing* that he misses out on the living things that teem within and behind the seemingly empty spaces of the human world. One way to remember things is to forget animals, but this is not the remembering that Carroll has in mind. As I have been suggesting, Wonderland things do not exceed object status by concealing a mute unknowable core of pure potential but rather through the networks they create with other objects and life forms. What might at first seem like “the amorphousness out of which objects are materialized by the (ap)perceiving subject” (Brown, “Thing Theory,” p. 5) in the *Looking-Glass* shop of elusive things is already a network of consumable goods mobilized by a Sheep, and it is only invisible to the human Alice because she has not yet learned how to join it. For Carroll, the main things that make “things” excessive are animals. And, whether in the form of food, or companions, or some combination of the two, when the networks of Wonderland begin to unravel, animals are what remain.

*Alice’s Adventures in Wonderland* approaches its end with a trial over stolen tarts (*Alice’s Adventures in Wonderland*, p. 96) during which the Queen of Hearts sentences Alice to beheading, uttering her famous cry, “Off with her head!” (p. 108). The Queen, a card woman, is a particular kind of Wonderland thing: a human-object hybrid. Her sovereign power over life and death seemingly suggests a world in which commodity objects have taken control over human existence.<sup>46</sup> Yet Alice in turn seems able to reduce the Queen and her card men minions to objects for human use. Alice escapes the trial and wakes up from Wonderland by declaring, “You’re nothing but a pack of cards!” (*Alice’s Adventures in Wonderland*, p. 108), ostensibly turning these subject/objects into mere objects and reaffirming the power of human imagination to animate and control the object world.

The card men now become a pack of cards that “r[ise] up into the air” and “fl[y] down upon” Alice (p. 108) but resolve into even more innocuous “dead leaves” when Alice wakes “with her head in the lap of her sister” (p. 109). But in the end, human imagination proves as much a failed tyrant as the Queen of Hearts. After Alice tells her older sister of her “curious dream” and then exits the narrative to have her “tea,” her sister experiences “the whole place around her bec[oming] alive with the strange creatures of her little sister’s dream,” including “the White Rabbit,” the “Mock Turtle,” the “frightened Mouse,” and the “rattle of the teacups as the March Hare and his friends shared their never-ending meal” (p. 109). Despite this contagious immersion in the life of Wonderland, Alice’s sister “kn[ows] she ha[s] but to open [her eyes] again, and all would change to dull reality” (p. 110). Such “reality,” however, is not a strictly human world: “the rattling teacups would change to tinkling sheep-bells, and the Queen’s shrill cries to the voice of the shepherd-boy …, and all the other queer noises, would change (she knew) to the confused clamour of the busy farm-yard – while the lowing of the cattle in the distance would take the place of the Mock Turtle’s heavy sobs” (p. 110). In other words, what remains of the curious things of Wonderland is a reality assembled by the traces of animals and human-animal relations.

Such traces are all the more visible in *Through the Looking-Glass*, which ends with Alice waking from the revolt of food-things as she shakes the Red Queen – this time a human-chess piece hybrid – into her kitten (*Through the Looking Glass*, pp. 234–37). In the wake of the dissolving meal, Alice offers her remaining animal the narrative animal remains of “The Walrus and the Carpenter” and tries to persuade her kitten to help her solve the riddle of “who it was that dreamed it all”:

“This is a serious question, my dear, and you should *not* go on licking your paw like that – as if Dinah hadn’t washed you this morning! You see, Kitty, it *must* have been either me or the Red King. He was part of my dream, of course – but then I was part of his dream, too! *Was* it the Red King, Kitty? You were his wife, my dear, so you ought to know – Oh, Kitty, *do* help to settle it! I’m sure your paw can wait!” (pp. 239–40; emphasis in original)

But the “provoking kitten” responds with what looks like coy silence, “beg[inning] on the other paw, and pretend[ing] it hadn’t heard the question” (p. 240). The text then turns the question of the dream to the reader, asking, “Which do *you* think it was?” (p. 239; emphasis in original). I take the fact that the text here places the silent reader in a similar position to Alice’s kitten as an invitation to think beyond the human options that Alice provides. To the question of who dreamed the Wonderland worlds, I would venture that the answer is Alice and cats together, forming a network, a food chain in which everyone is edible and every thing is social.

- 35 See Haughton, note to *Through the Looking-Glass*, p. 302, n. 6.
- 36 Gilles Deleuze understands "denoted objects" in Carroll's work as "always consumable or recipients of consumption" (Deleuze, *The Logic of Sense*, ed. Constantin V. Boundas, trans. Mark Lester with Charles Stivale [New York: Columbia Univ. Press, 1990], p. 26). He points out that the Duck "understands 'it' as a denoting term for all things, state of affairs and possible qualities (an indicator). It specifies even that the denoted thing is essentially something which is (or may be) eaten. Everything denoted or capable of denotation is, in principle, consumable and penetrable" (*The Logic of Sense*, p. 26). While Deleuze is right about the consumable – and usually edible – nature of Carroll's things, he seems to forget their animal dimension, a dimension that the Duck insists on.

# CHAPTER 9

## Theory in Practice

### *The Autumn King: Remembering the Land in King Lear*

*Jayne Elisabeth Archer, Richard Marggraf Turley,  
and Howard Thomas*

Jayne Elisabeth Archer's research interests include alchemy, science, and the pseudo-sciences in early modern literature. Richard Marggraf Turley writes on Romanticism and teaches at the University of Aberystwyth. Howard Thomas's research is on genetics, evolution, and food plants. Their book, *Food and the Literary Imagination* (2014), is an examination of the presence of food plants in literature from Chaucer to the nineteenth century.

Returned from France, Cordelia reports a sighting of her father:

he was met even now,  
As mad as the racked sea, singing aloud,  
Crowned with rank fumitor and furrow-weeds,  
With burdocks, hemlock, nettles, cuckoo-flowers,  
Darnel, and all the idle weeds that grow  
In our sustaining corn.

(18.2–6)<sup>1</sup>

Cordelia's description takes its power from its resonances with other myths, stories, and rituals of death usually followed by resurrection: Christ crowned with thorns; the Green Man or "wild man," whose yearly sacrifice ensures the fertility of the land and its people; and the Biblical Job.<sup>2</sup> But for Shakespeare and his first audiences, this power would have been amplified and inflected by knowledge of the characteristics and properties of the "idle weeds" so carefully and deliberately itemized by Cordelia, and because

*Original publication details:* Jayne Elisabeth Archer, Richard Marggraf Turley, and Howard Thomas, "The Autumn King: Remembering the Land in King Lear" from *Shakespeare Quarterly* 63.4, pp. 518–543. Folger Shakespeare Library, 2012. Reproduced with permission from Johns Hopkins University Press.

this image of a neglected harvest fulfills the prophecy of “dearth” made by Edmund in scene 2 of the play.<sup>3</sup>

The food shortages of the late sixteenth and early seventeenth centuries resulted in a heightened awareness among the populace of the dangers of, and their vulnerability to, failing harvests and corrupted food. *King Lear*’s engagement with such themes enables us to perceive the ways in which the shift to early agrarian capitalism involved a concomitant shift in ecological relations. Using a synthesis of ecocritical and historicist methodologies, this essay argues that Shakespeare deploys images of crop contamination in this and other history plays to register and articulate enduring anxieties over relations between court and country, legitimacy and bastardy, and elite power and popular resistance. In particular, *King Lear*’s emphasis on the politics of food supply, encompassing land ownership, the management of natural resources, and the relationship between the monarch and his or her land, is articulated through recurring tropes of mimicry and subversion. Insisting on the ecocritical dimension that is so often written out of historicist interpretations, we argue that the inclusion of weeds in Cordelia’s description of her father opens up a political reading of *King Lear* that would have been clearly legible to Shakespeare’s own audience members, many of whom were, like the playwright from Warwickshire, recent arrivals in London from surrounding grain-supplying regions.

The first part of this essay scrutinizes a tradition of textual editing and stagings that ignores the arable setting of the play’s climax. The significance of that arable setting, which provides a meaningful context for the weeds in Lear’s crown, is then established within a reading sensitive to the closely interwoven botanical, medical, and political debates present not just in *King Lear*, but also in other Shakespeare histories and tragedies. The image of a mad and dispossessed king wearing weeds for a crown is used to contextualize King James’s fashioning, at the beginning of his reign, as a “landlord,” both in terms of contemporary concerns over sustenance and food distribution, and in light of Shakespeare’s own activities as a landowner and convicted grain hoarder. Shakespeare’s close interest in the resonant image and conceit of crop infestation, and in the equally overdetermined concept of “pure” wheat, leads us via a wheat-laden coat of arms to reassess the significance of Gerard Legh’s *Accedens of Armory* (printed in six editions between 1562 and 1612) – a neglected source for the story of King Lear – for what it reveals about Shakespeare’s presentation of changing patterns of land ownership, inheritance, and sovereignty.

Renewed emphasis on material culture, including the domestic and wider environments, and on the intersection of literary and medical discourses in early modern studies has contributed to the emergence of recent scholarship on Shakespeare’s portrayal of the production and consumption of food.<sup>4</sup> This work is an important corrective to earlier criticism, in which Shakespeare’s allusions to plants were read primarily for their aesthetic and folkloric associations. It overlaps with new historicist readings of the influence of food unrest (particularly the 1607–8 Midlands Uprising) on the portrayal of themes of grain supply and civil war in plays such as *Coriolanus*, as well as with recent trends in ecocritical readings of Shakespeare.<sup>5</sup> Nevertheless, scholarship continues to overlook the ecological contexts that are central to the politics of Shakespeare’s plays. A consideration of Cordelia’s description of her father in scene 18 enables us to see how this context has been distorted, both textually and in performance.

Among the most potent misprisions of the description is Peter Brook’s seminal 1962 production of *King Lear*. Filmed in 1970, Paul Scofield’s abdicating monarch is situated amid stark, bare sets that suggest a postapocalyptic winter landscape. Brook’s staging was typical of the post-World War II shift toward desiccated, psychologized dramatizations of *King Lear* that registered the paranoid climate and denuded mental landscapes

of the Cold War. This nihilistic interpretation found critical support in Jan Kott's *Shakespeare Our Contemporary* (1964), which presented the play as an absurdist drama, a Shakespearean "Endgame."<sup>6</sup> Brook's influence (and through Brook, Brecht, Beckett, and Kott) continues to be felt. Indeed, his is largely the image of the world of *King Lear* inherited by modern audiences. More recent productions, including Adrian Noble's 1982 and 1993 Royal Shakespeare Company productions and Trevor Nunn's 2007 ground-zero version, which starred Ian McKellen as a ludic Lear, find the mental disintegration of the lonely king reflected in and enhanced by a barren, dead set. Today's audiences could be forgiven for thinking that in *King Lear* Shakespeare was wholly uninterested in the worked land as a meaningful context for his drama.

However, closer scrutiny reveals that the blasted vision of Lear's play world actually derives from a series of unauthorized editorial inventions. The erroneous idea of the mad and dispossessed king in scene 18 cavorting on a "blasted heath" – a phrase which, as Ogden notes, comes from *Macbeth*, not *Lear*<sup>7</sup> – was established by Nahum Tate in his 1681 rendering of the play, when he used "*Desert Heath*" to describe the setting for scenes in Act 3.<sup>8</sup> Nicholas Rowe picked up the term for his 1709 edition.<sup>9</sup> But as the 1608 quarto clearly states, the climax of the play and of Lear's madness takes place in a "high-grown field" full of "sustaining corn" (18.7, 6). The king's weaving of a crown that incorporates weeds, including "furrow-weeds," "rank fumitory," and "darnel," only makes sense if this is arable, worked land.<sup>10</sup> Lear's movement from the storm and hovel of the middle portion of the play to this lush and fertile landscape has a powerful dramatic function, heightening (only to frustrate) the audience's expectations of redemption in the final scenes.

The reference to a "high-grown field" encodes knowledge that, although forgotten by the twenty-first century, would have been second nature to early modern audiences.<sup>11</sup> It is vital to recover this knowledge in order to clarify textual details that otherwise seem puzzling. For instance, in modern fields of wheat or barley, mature plants stand less than a meter tall. These so-called "dwarf" cereals are a product of twentieth-century plant breeding and biotechnology.<sup>12</sup> In Shakespeare's time, you could get lost in a wheat field, among crop plants (and their weeds) two meters and more in height.<sup>13</sup> This explains why Cordelia's scout glimpses and then quickly loses sight of Lear: he can hear him singing, but all he can see of the former king is the crown of "idle weeds" as it skims across the tops of the wheat.

The image of a heath, with its accrued layers of resonance as a psychological waste land in *King Lear*, is misleading. Further, despite the fact that the description in scene 18 clearly, and in a very particular manner, describes a crown of arable weeds, we tend to think of Lear as being adorned with a crown of wild flowers – as portrayed, for example, in Trevor Nunn's 2007 production and as found on the striking cover of the Arden2 edition, where the crown is a garland woven with daisies and clover. As with the "blasted heath," this error of representation results from editorial distortions of the play text and through conflation with another of Shakespeare's tragedies. Late seventeenth-century stage directions have Lear entering in Act 4 "fantastically dressed with wild flowers" – a phrase fashioned from *Hamlet*, 4.7.140–41, in which Ophelia weaves "fantastic garlands" from "crow-flowers, nettles, daisies, and long purples."<sup>14</sup> This corruption of the play text erases memories of Cordelia's careful list of "idle weeds" and ameliorates the deeply unsettling nature and political implications of Lear's madness by reimagining the former king in the guise of a childlike and innocent Ophelia.

It wouldn't have been as easy for Shakespeare's first audiences to overlook the significance of the "high-grown field" with its "idle weeds." Recovering this knowledge has important consequences for the way in which time, as well as space, operates in the play. That the field is "high-grown" suggests that the climax of the play takes place in high

summer or early autumn, that is, mid- to late August. This time frame is confirmed by the “idle weeds” themselves: hemlock and darnel mature with the corn in mid-August and September.<sup>15</sup> The final scenes are set in harvest time – at least, it *should* be harvest time. “Ripeness is all” (23.11), Edgar states, a remark both literal and figurative and desperately ironic. At the moment when farmers and laborers should be reaping the fields and laying store for the long winter ahead, the land and its people are embroiled in civil war and foreign invasion, and the best that the former king can do is to pick poisonous weeds and leave the “sustaining corn” to rot. In a pun that plays on “weeds” as both plants and apparel, and on “crown” as a political, physical, and botanical term, Lear’s head is adorned with a crown crafted *from* the land – and, notably, its “idle weeds” rather than its “sustaining corn” – when he should be wearing the crown symbolic *of* the land. Lear as described in scene 18 is a mockery of the mystical and political doctrine of the king’s two bodies and the intertwining of the body politic and the body natural: in dividing the land and bringing forward his own personal autumn, Lear has thrown the country into temporal confusion and his people are doomed to produce crops that they cannot harvest. In this time of national crisis, the “sustaining corn” is just as “idle” as the “weeds” that grow among it.

But reinforcing the sense that, as in *Hamlet*, time is out of joint, the season also seems to be late spring.<sup>16</sup> Desperate to aid her father, Cordelia asks that the “blest secrets” and “unpublished virtues of the earth” might “Spring with my tears” (ll. 16–18, emphasis added); indeed, one of the “idle weeds” in Lear’s crown suggests that her prayer to turn back the calendar will bear fruit. “Cuckooflowers” were known as lady’s smock, a delicate flower that, according to John Gerard’s *Herball* (1597), blossoms in spring: “These flower for the most part in Aprill and Maie, when the Cuckowe doth begin to sing her pleasant notes without stammering.”<sup>17</sup> Shakespeare relies on the popular association between cuckoo flowers and spring in a song from the final scene of *Love’s Labor’s Lost* (5.2.879–87).<sup>18</sup> Shakespeare alludes to the cuckoo’s habit of laying its eggs in another’s nest throughout his plays; in *King Lear*, the Fool compares Goneril to the cuckoo.<sup>19</sup> But it is the associated notion of treachery from within – as cuckoldry, illegitimacy, and familial deception – that is most pertinent to *King Lear* and that aligns this flower to the other weeds in Lear’s crown. The presence of cuckoo flowers seems to promise the hope of spring and a happy ending, while reiterating the betrayals that have led – and will lead – to tragedy. The coupling of death (or sacrifice) with hope of resurrection and restoration in Cordelia’s description of the “crowned” Lear is thus signaled by a temporal confusion that is encoded in the land and its plants.

The consequence of Lear’s division of the kingdoms is a land in which its subjects no longer know how to feed themselves or each other. As Pascale Drouet has observed, the world of *King Lear* is one of hunger.<sup>20</sup> The fields of wheat go unharvested and are overgrown with weeds – they are, as the Fool states, “wild” (11.100) and fit only for burning. There is “no food” for “Hoppedance,” who “cries in Tom’s belly for two white herring” (13.26–27); the Captain in scene 24 “cannot … eat dried oats” (ll. 37–38); the “white wheat” is “mildew[ed]” (11.105–6); and Albany challenges Edmund to fight “Ere I taste bread” (24.91), deferring the moment of eating. Whether as a result of possession by “the foul fiend Flibbertigibbet” (11.103) or, more likely, the madness and desperation induced by hunger, the population is compelled to consume poisons and waste rather than nourishing food: a citizen “eats cowdung for salads; swallows the old rat and the ditch-dog; [and] drinks the green mantle of the standing pool” (ll. 117–19). Even Lear is reduced to requesting “raiment, bed, and food” from his daughters (7.313), and there is evidence to suggest that contemporary audiences associated Lear’s “madness” with the deliberate consumption of food waste: in *The Ballad of King Lear*, first published in 1620, Lear eats “What scullion boys set by” and is “glad to feed on beggars’ food.”<sup>21</sup>

Whatever their motivation, Goneril and Regan's decision to reduce their father's entourage during a time of dearth may have been seen by contemporary audiences as judicious. According to a sermon published in 1596 ("this time of our Dearth"), "Kings and Princes" must share some of the blame for famine, "who though their charge bee to prouide for the good of the people ... vtterly neglect them, rather impouerishing their subiectes ... burthening them with taxes and subsidies" so that the royal court can be maintained with its "horses, hounds, hauks, harlots, [and] iesters."<sup>22</sup> The image of Lear wearing a crown of weeds amid a field of unharvested corn is symptomatic of a disastrous and seemingly irrevocable breakdown in the production, distribution, and consumption of food within the kingdom. But in order to appreciate the subtlety of this image and its action as a prism for the play's political and familial conflicts, we need to consider the valences for an early modern audience of the most noisome and rancorous of those "idle weeds," the toxic wheat-mimicker darnel.

The appearance of darnel in a litany of plants is a classical, specifically Virgilian, convention.<sup>23</sup> In book 1 of the *Georgics*, the growth of darnel and other weeds is a sign of the end of the Golden Age: henceforth, man must plough the soil and weed his crops to keep hunger at bay. This *topos* was appropriated by Christian writers to add color and detail to accounts of the fallen world: Du Bartas, for example, tells how the "grieved Earth" turns "our seed-Wheat-kernel / To burn-grain Thistle, and to vapourie Darnel, / Cockle, wilde Oats, rough Burs, Corn-cumbring Tares."<sup>24</sup> This postlapsarian world, in which the creation of new life is attended with pain and uncertainty, is what Lear invokes when he calls on the "goddess" nature to curse Goneril and make her barren (4.265–80). However, it is possible that in Shakespeare's play Cordelia's iteration of the classical-Christian convention is inflected by a passage from the anonymous *True Chronicle History of King Leir* (1605). Accompanied by his faithful courtier Perillus (Shakespeare's Kent), Leir reflects on the ingratitude and treachery he has suffered at the hands of his eldest daughters, Gonorill and Ragan:

LEIR      Can kindnesse spring out of ingratitude?  
Or loue be reapt, where hatred hath bin sowne?  
Can Henbane ioyne in league with Methridate?  
Or Sugar grow in Wormwoods bitter stalke?  
It cannot be, they are too opposite:  
And so am I to any kindnesse here.  
I haue throwne Wormwood on the sugred youth,  
And like to Henbane poysoned the Fount,  
Whence flowed the Methridate of a childs goodwil:  
I, like an envious thorne, haue prickt the heart,  
And turnd sweet Grapes, to sowre vnrelisht Sloes:  
The causelesse ire of my respectlesse brest,  
Hath sowrd the sweet milk of dame Natures paps:  
My bitter words haue gauld her hony thoughts,  
And weeds of rancour chokt the flower of grace.<sup>25</sup>

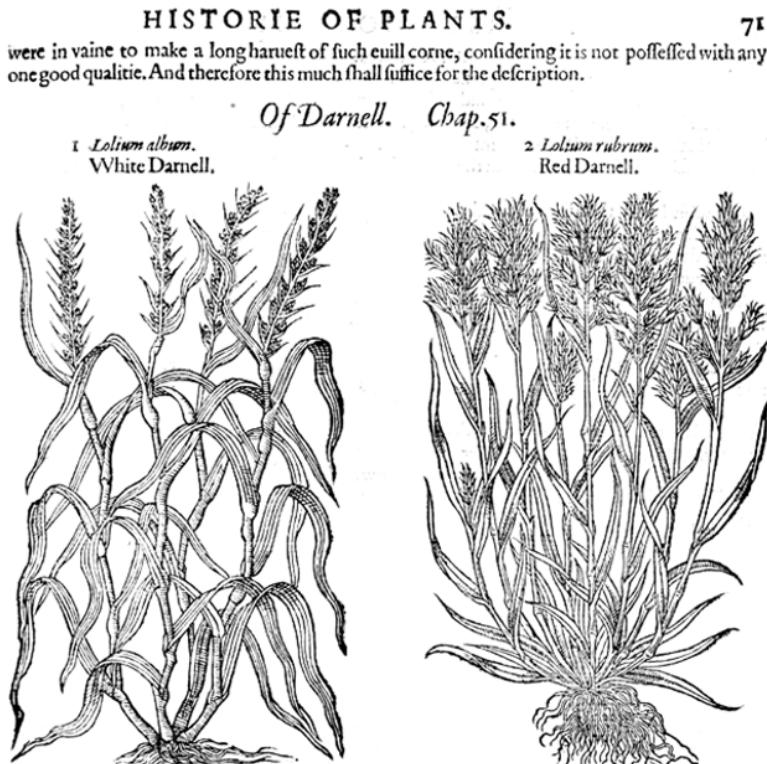

Using metaphors of corruption and poison, Leir blames himself for having converted that which is wholesome and nourishing into something that spreads disease, pain, and death. He is responsible for poisoning Nature's pure offspring. Developing Leir's botanical-medical metaphor, Perillus contends that "perfit good" simples ("hony, milke, Grape, Sugar, Methridate") cannot be corrupted by the presence of the "bad" ("the thorn, / The weed, the gall, the henbane & and wormewood").<sup>26</sup> Like *King Lear*'s "idle weeds," the *True Chronicle History*'s "weeds of rancour" symbolize the disastrous effects of the king's "unnatural" decision to divide the land and reject his one true daughter. Both lists include

“henbane.” In the latter play, the weeds are balanced by a list of “perfit good simples,” each one of which was credited in early modern dietaries with nourishing and healing powers (or “virtues”) and was used figuratively in political treatises as a remedy for heresy, schism, and insurrection.<sup>27</sup> Mithridate, for example, was believed to be a universal antidote, with particular powers against plague. For the preacher Thomas White, however, it was a panacea “against all treasons, seditions, alterations, [and] warres”; for Francis Trigge, writing in 1604, only mithridate could heal the destruction suffered by farmers and families as a result of enclosures.<sup>28</sup> The botanical-medical world of *King Lear* is markedly more complex. The Doctor prescribes sleep: “That to provoke in him / Are many simples operative, whose power / Will close the eye of anguish” (18.14–16). But in contrast to *The True Chronicle History*, with its comparatively unsophisticated set of “good” and “bad” simples, the land in scene 18 of *King Lear* is no longer capable of nurturing the “good simples” that might counteract the effects of “idle weeds.” It is for this reason that Cordelia has to call on the “blest secrets” and “unpublished virtues of the earth” to “Spring with my tears” (ll. 17–19). Such “simples,” it is implied, must be grown afresh, since they no longer live in this cursed land.

The inclusion of darnel in Lear’s crown adds to the Virgilian allusion a Christian framework that is otherwise strikingly absent from the play. In early modern exegesis, darnel was identified with the “tares” found among wheat in Christ’s parable (Matt. 13:24–30, 36–43). On both sides of the confessional divide, the parable of the wheat and tares was used to warn of the difficulties of discriminating between true doctrine and heresy. In a chapter about cockle and darnel, Levinus Lemnius notes that in the Gospels Christ uses “the nature and qualitie of these noisome weedes” as a metaphor for “dangerous, hurtfull, pernicious, corrupt and vnsincere doctrine.”<sup>29</sup> The parable, Lemnius states, reminds Christians of the necessity in a well-ordered state of measured and judicious governors: “yet for due punishment doth he [Christ] subiect and referre to the authoritie of the magistrate, all those that be factious disturbers of the peace and tranquillitie, both of the Church and Commonwealth.”<sup>30</sup> For the king, then, as head of “Church and Commonwealth,” to wear darnel, an emblem of the machinations of “sathan,” is truly shocking. Rebellious subjects like Edmund, Goneril, and Regan can be checked only by the presence of figures of authority and discernment; Lear, despite his feeble attempt to gather weeds at harvest time,<sup>31</sup> is clearly not up to the job and moreover is associated with the very forces of insurrection he should oppose. He is part of the sickness rather than the cure.

In another way, the inclusion of darnel in the crown of “idle weeds” draws on communal memories and experiences that add texture to the portrayal of Lear’s condition, as well as to the errors of political judgment that have led him to this state. When darnel infiltrated the food chain, most often in bread or beer, the results were symptoms resembling madness. Gerard, for example, notes that it causes “drunkennes” and “hurteth the eies and maketh them dim”; Thomas Cooper, using the Latin name for darnel, observes that “*loliū*,” consumed in “hote bread … maketh the heade giddie”; and Du Bartas calls it “dizzie Darnell” (Figure 1).<sup>32</sup> As T. J. King has argued, Cordelia’s mention of darnel “may serve to reinforce the themes of madness and blindness found elsewhere in the play.”<sup>33</sup> The harmful effects of darnel and the other “idle weeds” in Lear’s crown are acknowledged by Cordelia and the Doctor in scene 18, who diagnose “aidant and remediate” and narcotic herbs, “simples operative, whose power / Will close the eye of anguish,” to counteract them (18.18, 15–16). In fashioning a crown out of darnel, Lear has selected a plant that is not simply associated with the physical, mental, and sensory confusion he (and, in different ways, the blinded Gloucester) has exhibited throughout the play, but actually causes this derangement. However, Lear’s selection of plants is more subtle, more sophisticated than critics have hitherto acknowledged. Like an animal that, having eaten something detrimental to its health, instinctively

ingests something that will cause vomiting, Lear has plucked weeds that both catalyze his disease and point toward its remedy. Recalling the Paracelsian principle of using known poisons to counteract disease, the crown of “idle weeds” contains plants that expel toxins from the body: fumitory was used as a diuretic to cleanse the skin, liver, and spleen; hemlock and darnel were taken as purgatives and for their narcotic powers – precisely the properties prescribed by Cordelia and the Doctor.<sup>34</sup> In *King Lear*, a Virgilian literary convention is refracted through contemporary debates in botany, husbandry, politics, religion, and medicine.

\* The description.

1 Among the hurtful weedes, Darnell is the first. It bringeth soorth leaues and stalks like those of wheate or barley, yet rougher, with a long care made vp of many little ones, every particular one whereof containeth two or three graines, lesser than those of wheate, scarcely any chaffie huske to couer them with, by reason wherof they are easily shaken out and scattered abrode.

2 Red Darnell is likewise an vnprofitable corne or grasse, hauing leaues like barley. The ioints of the straw or stalke are of a reddish colour, bearing at the top a small and tender eare, pike fashion.

\* The place.

They grow in fields among wheate and barley, of the corrupt and bad seede as Galen saith, especially in a moist and dankish soile.

\* The time.

They spring and flourish with the come, and in August the seede is ripe.

\* The names.

1 Darnell is called in Greeke ζίζανη: in the Arabian toong *Zizanias* and *Sceylen*: in French *Turay*: in Italian *Loglio*: in low Dutch *Dollick*: in English Darnell, of some Iuray and Raye, and of some of the Latines *Triticum Temulentum*.

2 Red Darnell is called in Greeke φενίξ: or *Phœnix*, of red crimson colour in Latin *Lolium rubrum*; and *Lolium Murinum*: in English Wall Barly, and Waine Bennet: of some *Hordeum murinum*, and *Triticum murinum*: in Dutch *Huyse cozen*.

\* The temperature.

Darnell is hot in the third degree, and drie in the seconde. Red Darnell drieth without sharpnes, as Galen saith.

Figure 1 Red and white darnell, from John Gerard, *The Herball or Generall Historie of Plantes* (London, 1597), 71. General Reference Collection 449.k.4. © British Library Board. All rights reserved.

The special significance of references to weeds in the literature of ages more attuned to the fragility of food supply than our own is now understandable. The presence of crop contaminants in the food chain was at best undesirable, at worst disastrous. It would not have escaped the attention of the audience for whom *King Lear* was written that a play about identity, corruption, and betrayal from within employs an allusion to darnel, a toxic interloper indistinguishable from the wheat it infests until it is too late. Although the contemporary languages of botany and genetics can help explain why and how this happens, early moderns had their own subtle terminology. Gerard, for example, distinguishes three types of relationship between field plants: “fools,” “kin” (or “kinde”), and “bastardes.” “Fools” denote plants that are often mistaken for one another; “kin” indicates plants that are closely related; and “bastardes” describes plants that imitate, but are inferior to, and which exploit – to its detriment – another plant. The terminology is particularly suggestive in the context of *King Lear*. We have proper wheat, and we have fool’s wheat: darnel. We have an Edgar, and we have a fool’s Edgar: Edmund, who is referred to as “*Bastard*” from the opening stage direction of the 1608 quarto and who plays and puns at length on that word.<sup>35</sup> And so in this brief description of Lear’s crown of “idle weeds” and in the king’s choice of “darnel” in place of “wheat,” Shakespeare distils the personal and political issues at the heart of his tragedy: a father’s privileging of a subversive “bastard” child, Edmund, over a loyal and legitimate son, Edgar; the potential for subversion to arise from within; and the devastating effects on the living landscape and its people when a king abdicates his responsibilities in the autumn of his life.

The “high-grown field” of scene 18 invites us to perceive Lear’s Britain as simultaneously mythic and historical, symbolic and actual. Indeed, as Richard Dutton has argued, the play’s tendency to “ignore the laws of time” and its “quasimiraculous shifts from myth to history” alert the audience to the here and now and ask them to draw contemporary parallels.<sup>36</sup> The contemporaneity of *King Lear*, Dutton asserts, resides in its movement between history – specifically, those foundation myths that embody “cherished truths about the origins of the island’s political culture” – and elements of romance and fantasy. The motifs of mimicry and subversion from within and the crisis of sustenance we have identified in *King Lear* resonate throughout Shakespeare’s history plays of the 1590s, which trace the emergence of the Tudor dynasty, and the tragedies of the early 1600s, specifically, *Hamlet* (1600–1601) and *Macbeth* (1606), which in different ways scrutinize the legitimacy of the Stuart dynasty.

Following *1 Henry VI* (1592) and *Henry V* (1598–99), *King Lear* (1605–6) is the third and final of Shakespeare’s plays to include an allusion to darnel. The first two plays, from the first and second tetralogies, use darnel and related imagery to underline the correspondences between good husbandry and good government, and to interrogate contemporary issues of food supply and national security. In *1 Henry VI*, the vilified Joan of Arc (*La Pucelle*) is associated with the treacherous qualities of darnel. She taunts the English at Rouen:

PUCELLE	Good Morrow gallants. Want ye corn for bread? I think the Duke of Burgundy will fast Before he’ll buy again at such a rate. 'Twas full of darnel. Do you like the taste?
BURGUNDY	Scoff on, vile fiend and shameless courtesan. I trust ere long to choke thee with thine own And make thee curse the harvest of that corn.
CHARLES	Your grace may starve, perhaps, before that time.
BEDFORD	O let no words, but deeds, revenge this treason.

Here, the taste of darnel is a metaphor for the bitter flavor of defeat – significantly, a defeat wrought by deception. A French war party has infiltrated the city by pretending to be a group of corn merchants and defeated the garrison, neatly mimicking the mimicry by which darnel insinuates itself into the food chain. The capture of Rouen is one of the few points where Shakespeare deviates from his sources in this play,<sup>37</sup> perhaps because it chimes with public anxieties in the 1590s over the price and purity of corn, especially imported corn. These anxieties are likely to have been exacerbated by reports that Parisians, besieged by Henri IV's forces between May and August 1590, resorted to eating bread made from “pease, tares, oates and acorns,” sawdust, and eventually the ground-up bones of the dead.<sup>38</sup> The failed harvests of that decade heightened concerns about the nation’s ability to feed itself and its reliance on imported supplies that were often contaminated and sold at inflated prices (hence, La Pucelle’s reference to “buy[ing] at such a rate”).<sup>39</sup> As R. B. Outhwaite points out, “dearth” had two meanings: lack of food and its costliness, specifically “sharp elevation in the prices of … bread and beer – and the grainstuff from which they derived.”<sup>40</sup> In a series of proclamations, Queen Elizabeth attempted to control the price, purity, and distribution of corn and to limit foreign imports.<sup>41</sup> For Francis Trigge, addressing the incoming King James, fewer people meant fewer soldiers, rendering the nation vulnerable to foreign invasion: “[Camden] writes, that England *for corne was the onely storehouse of all the west Empire*.... In those daies *England* was able to relieu other countries with corne: but sometime now she is glad to buie corne of other countries her selfe … tillage of the earth surpassteth all, and … euen the King thereby is maintained: by the foode that it ministreth, to strengthen his people; and by the multitude of valiant soulidars it affordeth for his warres.”<sup>42</sup> Whether the reason was war or failed harvests, cities were especially vulnerable to interruptions to their food supplies, and citizens were at the mercy of millers and purveyors who were often less than scrupulous in the measures and purity of the grain they sold.<sup>43</sup> In *1 Henry VI*, the Rouen compromised by “corrupted” imported corn resonates with England in the 1590s, an island made vulnerable by hunger. So too Lear’s Britain, unable to feed itself or be governed peacefully, requires foreign forces to restore order.

This insistence on national security through good husbandry is reiterated in the Duke of Burgundy’s speech in Shakespeare’s *Henry V*(5.2.33–62). “Fertile France,” he laments, has gone to ruin during the recent warfare, and weeds grow unchecked in its cornfields. His imagery anticipates the language of *Hamlet*, in which the Danish prince complains of the world: “‘tis an unweeded garden / That grows to seed; things rank and gross in nature / Possess it merely” (1.2.135–37). It echoes the language of the garden scene in *Richard II* (3.4) and John of Gaunt’s speech in the same play (2.1.31–68), substituting “this best garden of the world” for “this blessed garden” and “Dear nurse of arts, plenties, and joyful births” for “This nurse, this teeming womb of royal kings.”<sup>44</sup> But in *Henry V*, as in *King Lear*, the weeds are associated not simply with the garden as a metaphor for the state but with “fallow leas” and arable land. Sustained conflict means that the “sciences” (5.2.58) by which the land can be made to feed its people have been forgotten:

Alas, she hath from France too long been chased,  
And all her husbandry doth lie on heaps,  
Corrupting in its own fertility.  
Her vine, the merry cheerer of the heart,  
Unpruned dies; her hedges even-plashed  
Like prisoners wildly overgrown with hair

Put forth disordered twigs; her fallow leas  
 The darnel, hemlock, and rank fumitory  
 Doth root upon, while that the coulter rusts  
 That should deracinate such savagery.  
 The even mead – that erst brought sweetly forth  
 The freckled cowslip, burnet, and green clover –  
 Wanting the scythe, all uncorrected, rank,  
 Conceives by idleness, and nothing teems  
 But hateful docks, rough thistles, kecksies, burs,  
 Losing both beauty and utility.

(5.2.38–53)

“[D]arnel, hemlock, and rank fumitory” resurface in Cordelia’s description of her father in scene 18 of *King Lear*; the “docks,” “burs,” and “idleness” in Burgundy’s speech anticipate Cordelia’s “burdocks” and “idle weeds.” This is not just Shakespeare repeating himself or recycling material from earlier works. It is a careful echoing that conjures memories and invites comparisons between the plays in the light of ongoing experiences of the decline in arable farming and dearth in England. John of Gaunt’s England, which “Is now leased out … / Like to a tenement or pelting farm” (2.1.59, 60), is also Burgundy’s France, and both lands are mapped onto Lear’s Britain. For the latter world, for all its pagan antiquity, is a surprisingly ordinary place of “low farms, / Poor pelting villages, sheep-cotes and mills” (7.182–83), peopled by “tenant” farmers such as the “Old Man” who meets Gloucester and Edgar on the way to Dover (15.10) – in other words, a world very familiar to Shakespeare’s first audiences.

This botanical-political discourse, indicating sophisticated knowledge of arable plants on the part of Shakespeare’s audiences, echoes throughout the plays that in different ways examine the succession of James VI and I, *Macbeth* and *Hamlet*. Such a discourse insists that we reinterpret these plays in light of one another. Like darnel, cockle was a weed that grew in corn fields, its name derived from the Anglo-Saxon *ceocan*, meaning “choke,” so called because it chokes the life from the corn.<sup>45</sup> Levinus Lemnius notes, “Vnder the name of Cockle and Darnell is comprehended all vicious, noisome and vnprofitable graine, encombring & hindring good Corne; which, being heerby choaked and despoiled of conuenient moisture … prospereth not as it should.”<sup>46</sup> Traditions of biblical translation, scriptural exegesis, husbandry manuals, and literature in the Georgic tradition<sup>47</sup> meant that cockle and darnel came to symbolize revolt, civil discord, and political corruption. Thus, Coriolanus argues that by distributing corn to plebeians, as well as patricians, the ruling class has “nourish[ed] ’gainst our Senate / The cockle of rebellion, insolence, sedition, / Which we ourselves have ploughed for, sowed, and scattered.”<sup>48</sup> In this Roman play, which dates from 1608, problems with food purity and the state’s distribution of grain are used literally as a cause of suffering and civil unrest and metaphorically, with bastardized grain symbolizing the mixing of “pure” with “impure” Romans. Likewise, as a consequence of Lear’s mismanagement of the land and his error in judging the love test, “idle weeds” have been left to choke the life from “sustaining corn,” treacherous subjects like Goneril, Regan, and Edmund have gained ascendency, and “true” subjects such as Cordelia and the Fool will be choked to death by hanging.

Like “choke,” “blast,” which similarly implies death by tainted breath or breathlessness, is an infectious disease of cereal crops. But where “choke” is used by Shakespeare to indicate rebellion from within, “blast” points to the wide-reaching effects of such actions. Although, as we have seen, *King Lear* does not feature a “blasted heath,” *Macbeth* does

(1.3.77), and Lear, when cursing Goneril, wishes on his eldest daughter “worst blasts and fogs” (4.290). “Blast,” denoting a disease of arable plants, was in use by at least 1577; in Barnabe Googe’s translation of Conrad Heresbach’s *Four Books of Husbandry*, the farmer is advised to sow his corn “in hollowe Furrowes, because it is very subiect to blasting, thinking thereby to preserue it both from blast and mildewe.”<sup>49</sup> The phrase “blasted heath” could also describe a blighted landscape as one subject to the depredations of the weather. Such infection is a symbol of the effects on the land of political corruption from within the inner circles of the court and its consequent effects upon the natural order, including, of course, the cycles of nature.<sup>50</sup> Googe couples “blast” with “mildew.”<sup>51</sup> While the “mil” (or, in early modern orthography, “mel”) of “mildew” was thought to derive from honey (because of its supposed sweetness), the fungus, like “blast,” was also associated with cereal crops (with “mil” meaning “meal”). And so Edgar, as Poor Tom in *King Lear*, imagines that the fiends who persecute him have “mildew[ed] the white wheat” (11.105–6).<sup>52</sup>

Suggestive for *King Lear* and, as we will see, *Hamlet*, is John Lyly’s use in 1578 of meal or mil “deaw” and “blast” in a passage that uses the relationship between darnel and wheat as a metaphor for the difference between two male twins. Nature produces pairs of opposites: “As the breath of the Lyon engendreth as well the Serpent as the Ant, and as the selfe same deaw forceth the earth to yeeld both the Darnell and Wheate: or as the Easterly winde maketh the blossomes to blast, and the buddes to blowe, so one wombe nourisheth contrary wits, and one milke diuers manners, which argueth somthing in Nature I knowe not what, to be meruailous, I dare not say monstrous.”<sup>53</sup> While in *King Lear* the bond between wheat and darnel is a metaphor for the relationship between a legitimate child and his “bastard” brother, in Lyly it describes twins born with opposing natures. In *Hamlet*, the difference between the two brothers, Hamlet Senior and Claudius, is figured as “wholesome” wheat contaminated by its “mildewed” sibling. Berating his mother for allowing Claudius to replace (or mimic) Hamlet Senior, Hamlet cries, “Here is your husband, like a mildewed ear / Blasting his wholesome brother” (3.4.63–64). The combination of mildew and blast in this couplet suggests that “blast” signifies the cereal crop disease, thereby echoing the metaphors of plague and corruption that rebound in the play.<sup>54</sup> Hamlet’s description of his father as a “mildewed ear” of wheat carried echoes of Hamlet Senior’s account of his poisoning: “With juice of cursèd hebenon in a vial, / And in the porches of my ears did pour / The leperous distilment” (1.5.62–64).<sup>55</sup>

This is the only mention of “hebenon” by Shakespeare, and critics remain uncertain what this name means.<sup>56</sup> Given the precision we have identified in Shakespeare’s treatment of the properties of poisonous plants elsewhere, the imprecision of the name “hebenon” is likely to be deliberate. Because of the parallels between the deaths of Hamlet Senior and James VI/I’s father, it is possible that the obscurity of the poison signals a diplomatic uncertainty on Shakespeare’s part as to the identity of Darnley’s murderer.<sup>57</sup> But the parallels between darnel and “hebenon” invite a reading of *King Lear* in Scene 18 that encodes complex contemporary political messages for and about the new King James I, who, as Dan Brayton points out, styled himself as a “landlord.”<sup>58</sup> For if James’s father, Henry Stuart, Lord Darnley, is shadowed in Hamlet Senior, his name is also whispered in Lear’s darnel.<sup>59</sup> The House of Stuart was, properly, the House of Darnley and Stuart; although standardized in modern orthography, Darnley and Darnel(l) were variant early modern spellings, with “ley” another version of “lea,” or a field (“lea”) of darnel. In John Stow’s *Chronicles* (1580), his name is spelt “Darnley” and “Darneley”; and in the second volume of Raphael Holinshed’s *Chronicles* (1586), it is spelt “Darneleie.”<sup>60</sup> In *King Lear*, which interrogates the Union of the Crowns and, like *Hamlet* and *Macbeth*, the rise of the House of Stuart as it

eclipses the House of Tudor, the image of the former king in the high-grown field wearing a crown of weeds, among which “Darnel” – with a capital “D” from its placement, with full emphasis and accent, at the beginning of the line – is prominent. That image invites James to consider his own problematic inheritance and his present and future role in managing the land and its resources. Like the selection of the white and red roses in the Temple Garden in *1 Henry VI*, 2.4, this moment provides England’s royal House of Stuart with a very ambivalent emblem. Darnel, like wheat, was thought to have two main varieties: red and white.<sup>61</sup> The red and white roses of the Tudors, forged in civil war, have become the red and white darnel of Lear’s crown. Depopulation, dearth, religious and social divisions, a depleted treasury – James’s inheritance could not be more poisonous.

Work on *King Lear* probably began in or around 1604, during King James’s protracted journey to London for his coronation and the commencement of the long-anticipated negotiations that would eventually result in the Union of the Crowns. In 1604, Shakespeare was forty, and he seems to have started making provision for his eventual retirement.<sup>62</sup> But what should have promised peace and prosperity delivered a period of sustained civil and social unrest fueled by a series of bad harvests, death by starvation and malnutrition, and land enclosures. The riots which broke out in the Midlands in 1607–8 have been identified as a contemporary context for *Coriolanus*.<sup>63</sup> However, as we have seen, concerns about the harvest and the purity and price of grain supplies were ongoing throughout the latter half of the sixteenth century and provide an important context not simply for the Roman play, but also for Shakespeare’s plays of the 1590s and early 1600s. One of the complicating factors in such periods of food shortage was the illegal hoarding of grain. Shakespeare himself was guilty of this activity. Although living in London, he retained substantial properties in and around Stratford,<sup>64</sup> where during the late 1590s and the first few years of the seventeenth century, he stockpiled grain for sale at inflated prices to the local brewing trade<sup>65</sup> and in July 1605 paid a large sum, £440, for a half interest in a lease of “tithes of corn, grain, blade, and hay.”<sup>66</sup>

At approximately the same time, Shakespeare was making a different kind of attempt to secure his legacy that may have contributed to the world of *King Lear*. On 20 October 1596, the College of Arms approved his application for a coat of arms.<sup>67</sup> It is likely that Shakespeare consulted the most popular guide to heraldry of the day, Gerard Legh’s *The Accedens of Armory*.<sup>68</sup> It is possible that Shakespeare referred to *The Accedens of Armory* because it contains an account of the Inner Temple revels of 1561–62, which accompanied Norton and Sackville’s *Gorboduc* (1561–62), the latter a source for *King Lear* and a potential inspiration for its images of corruption and pollution.<sup>69</sup> What scholars have failed to notice, however, is that Legh’s treatise is also a source for the story of King Lear.<sup>70</sup> Legh’s rendering predates Holinshed, and is therefore likely to have informed Shakespeare’s play through that intermediary source. Certainly, Legh’s account is quite close to the version that appears in book 2 of Geoffrey of Monmouth’s *Historia Regum Britanniae*.<sup>71</sup> However, what makes Legh’s version pertinent to an ecocritical reading of Shakespeare’s play, and to an analysis of *King Lear*’s engagement with the politics of food supply, is that Legh uses the story of “leyr” and his “doughter and heire” Cordeilla to justify the right of women to rule, a right that he associates with the fertility of the land. The coat of arms Legh identifies for Cordeilla and other landowning women features a wheat sheaf.<sup>72</sup> This coat of arms, called a “Garbe,” shows a golden “sheafe of wheate” on a “field Azure” (Figure 2).<sup>73</sup> As an exemplary female sovereign who inherits through her father, Cordeilla justifies the legitimacy of Queen Elizabeth, whose lineage is traced in the same volume.<sup>74</sup> The right of royal women such as Cordeilla and Elizabeth to represent and, in a mystical sense, become the land is symbolized through their association with a coat of arms linking them to Ceres, the goddess of agriculture and fertility

who was associated with wheat. The “*Garbe*” coat of arms needs no further “*commendacion*,” Legh declares, “*for all people prayse it, that cannot live without it.*”<sup>75</sup> The woman bearing this coat of arms is as essential to the lives of the people as their daily bread and beer, and her continuing presence ensures the land’s fruitfulness.

Reading *King Lear* in light of Legh’s *Accedens of Armory* confirms that Shakespeare’s play is a chorographical text, which is to say, it concerns man’s embeddedness in the land and the importance of land in the inscription and dissemination of shared memory and knowledge. The importance of the land in Shakespeare’s play is announced by the presence of the map of Britain at 1.37. One of the few props mentioned in this play or in any play by Shakespeare, Lear’s map might have looked something like the frontispiece to William Camden’s *Britannia* (Figure 3). With Neptune representing the sea on the left and Ceres presenting the land on the right, the map reminds us of the symbolic and political meanings of the “high-grown field” in scene 18 of *King Lear*. As in the frontispiece to Michael Drayton’s 1612 *Poly-Olbion*, the land, Britannia, is represented by Ceres. Ceres was associated with Virgo-Astrea, goddess of the

Golden Age and representative of justice, and her emblem was wheat; Spica, the brightest star in the constellation Virgo, is Latin for “the ear of wheat.”<sup>76</sup> In the early modern imagination, corn and wheat represented the life force and identity of the nation, and harvest time (late August, as the Sun enters Virgo) was crucial in determining her future. This tradition would have been familiar to Shakespeare, not only

from *The Accedens of Armory*, but also from Spenser's *Mutability Cantos*, in which the month of August is accompanied by Virgo-Astraea, wearing "eares of corne":

That was the righteous Virgin, which of old  
Liv'd here on earth, and plenty made abound;  
But, after Wrong was lov'd and Justice sold,  
She left th'vnrighteous world and was to heauen extold.<sup>77</sup>

The death of Queen Elizabeth, who was so often identified with the goddess of justice Virgo-Astraea,<sup>78</sup> signifies for Spenser and Shakespeare the end of the Golden Age, and, with it – as we have seen in Virgil's *Georgics* – the emergence of darnel and other "idle weeds" that threaten the harvest.<sup>79</sup> The autumn of *King Lear*'s scene 18 is a crucial moment, for in its botanical-political field of imagery, it brings together the departure of Queen Elizabeth (as goddess of wheat) with the very ambivalent presence of King James I (as king of darnel). For James, witnessing this scene, the question is clear: will he manage the nation's resources in a way that is just, responsible, and above all sustainable?

In scene 1 of *King Lear*, a father asks his three daughters to declare their love for him. The winner will win "our largest bounty" (l. 46). In the context of dividing land, the meaning of "bounty" suggests natural resources and, specifically, food. Goneril, receiving Scotland, and Regan, receiving Wales and the West Country, are assigned very similar lands, by Lear's estimation, "shady forests and wide-skirted meads" (l. 58).<sup>80</sup> Forests and pasture do not produce corn. For Cordelia, Lear has reserved the corn-rich lands of central and southern England. Although British soil is, as William Harrison remarked, more "inclined to the feeding and grasing of the cattell, then profitable for tillage, & bearing of corn," England is more "fruitfull" than Wales and both are more "bountifull" than Scotland.<sup>81</sup> When Goneril and Regan are compared to serpents and wolves, as they are throughout the play, it is for a very good reason: they do not own lands that produce arable crops.

Food unrest and botanical-political discourse open up new ways of reading *King Lear*. The struggle for Cordelia's portion involves a battle for corn and, with it, sustenance, security, and legitimacy. There is an inevitable logic to the fact that Goneril and Regan, in their struggle for land, harness the energies of Edmund, whose mimicry, bastardy, and treachery are the play's personifications of darnel and other "idle weeds" that threaten to blind and choke those who are "legitimate." Restoring ecocritical concerns to historicist methods of interpretation sheds new light on the importance of the politics of food supply not simply in *King Lear*, but in Shakespeare's history plays and tragedies more generally. The properties and behavior of plants and plant disease provide a complex web of metaphors through which Shakespeare, across his plays of the 1590s and early 1600s, interrogates questions of political legitimacy, treachery, treason, and the relationship between the (gendered) body of the monarch and his or her land. That these metaphors can be traced not simply in plays, but also in husbandry manuals, prose fiction, heraldry books, religious treatises, and works of natural philosophy, as well as in the symbolism of the Houses of Tudor and Stuart, shows that food insecurity and botanical-political tropes are deeply embedded in the discourses of early modern Britain. This discursive emphasis is intimately related to the fact that the succession crisis of the 1590s and early 1600s came at a time of heightened food insecurity and unrest. Shakespeare's plays, the profits from which he used to help secure himself and his family from the consequences of failing harvests and dearth, respond to these twin crises by interrogating

the problems of ensuring the equitable and sustainable management of natural resources together with a reliable, affordable, and uncorrupted supply of food. In Shakespeare's history plays and tragedies, as for us in the second decade of the twenty-first century, food security is inseparable from national security.

## Notes

- 1 *The History of King Lear*, ed. Stanley Wells (Oxford: Oxford UP, 2008); all quotations from the play will be taken from this edition and cited in the text by act, scene, and line. “[B]urdocks” is a textual emendation: the 1608 quarto has “hor-docks” and the 1623 folio has “Hardokes,” neither of which are known as plant names (18.4n).

# CHAPTER 10

## Theory in Practice *Elizabeth Bishop's "Pink Dog"*

*Kim Fortuny*

Elizabeth Bishop is probably most well-known for her poems about animals such as "The Fish" and "The Moose." Those poems record moments of exalted contact between human and animal. Humans in each poem learn something from the beauty of the animal and from the vividness of the encounter. "Pink Dog" is a different kettle of fish. As Kim Fortuny humorously remarks of this strange ugly deformed creature that wanders fur-less through Rio de Janeiro, she is "nobody's bitch." This odd doggerel poem seems much too playful and is written in a light silly style, but as Fortuny notes, the pink dog of the poem shows us what is so remarkable about Bishop's animals – that they make us see the world from an a-human perspective and shake the self-assurance of human-centeredness.

The popular ballad, one of the oldest forms of literary expression, historically draws its material from humble sections of a culture. It often concerns itself with abject social conditions and those who struggle to survive them. Characters resisting authority, hiding out on the margins of society, are given the status of folk anti-heroes. The primary audience is the unlettered: the diction is simple. Like the 'Burglar of Babylon', a more traditional Rio ballad collected in *Questions of Travel*, Elizabeth Bishop's later poem, 'Pink Dog', features a marginalised subject. Here, however, the social underdog is embodied in an actual dog living on the edges of civilised society. A pun thus frames and launches the poem's dark humour. An underdog, a metonymic figure for a predicted loser, a victim of social injustice or persecution, returns to its source as a poetic figure. The dog is not only a vehicle for the human subject as tenor here: it is itself the subject of the poem. And like the burglar of Babylon, one of the 'million sparrows' of a 'confused migration' from the provinces to Rio, its troubles also stem from its outsider status.<sup>1</sup>

*Original publication details:* Kim Fortuny, "Elizabeth Bishop's 'Pink Dog' and Other Non-human Animals." *Textual Practice* 29.6 (2015), pp. 1099–1116. Taylor & Francis, 2015.

The pink dog as underdog trots along in rhythmic iambs. The tercet stanzas display, rather than camouflage the initial tetrameter, then two pentameter lines. Questions posed sound funny or absurd: ‘scabies’ rhymes with ‘babies’ (pp. 8–9). The perfect masculine end rhymes strike the modern urban ear as childish. ‘The light-verse end rhymes of the tercets of “Pink Dog”,’ writes C.K. Doreski in *Elizabeth Bishop: The Restraints of Language*, ‘rather than intensifying and unifying the poem, render it comical and tasteless’.<sup>2</sup> The poem is certainly doggerel dressed up just enough to be presentable as a popular song, and one reason, perhaps, *The New Yorker* initially hesitated to publish it. The poem was finally included in the 26 February 1979 issue with the subheading ‘Rio de Janeiro’. It is ‘the closest to Carnival on the one hand and to Ash Wednesday on the other’ writes Howard Moss to Bishop in a letter dated January of the same year.<sup>3</sup>

Yet while the poem strikes us as a running joke due to the punning and the light, comical nature of the verse, and while the poem threatens to collapse under the weight of so much silliness, the subject at hand is far from trivial, as most commentators, including Doreski, have noted, though for reasons different from those that will be argued here. There are elements at work that prevent the poem from going under. An animal in the form of a dirty urban street dog, guides the poem off the page to questions that, like her questions of travel in other poems, are also questions about identity. Human identity, however, is not necessarily the only question at hand here.

By teasing out the inter-workings of ‘underdog’ as a pun, the a-historical function of the dog as exclusively a metonym for a human condition is partially cancelled out. By returning a figurative dog back to its literal source, Bishop guides the urban street dog to signify other things beyond the persecuted human poor in the poem. Like all of Bishop’s poems which concern or include animals – and many of her better poems do – the animal becomes a sight of productive tension which will lead to something like a momentary state of clarity for the speaker. As grotesque as she may appear, the pink dog, ‘a nursing mother, by those hanging teats’, is poised to be another one of Bishop’s enigmatic subjects, those inscrutable ones covered in fur or wrapped in scales that appear, and then disappear, taking the trajectory of the poem with them into the mist or the sea (p. 10). But this animal seems a parody of the other animals that populate her oeuvre. Here the animal is neither awe-inspiring, nor remote as Bishop’s other animals often are: this common canine is diseased and denuded and living in close proximity to men, feeding on their daily rubbish. If we consider this dog in the context of Bishop’s penchant for enigmatic animals in her poems, we are led to wonder what possible mystery such a corrupted animal can offer. And if the dog is no longer only a figurative animal as will be argued here, what might its denotative function be?

The poem begins by contrasting a beach in Rio, ‘clothed’ in colourful umbrellas, with the dog who ‘naked and pink’ in the sun, ‘trot[s]’ along, assumedly indifferent to effect (pp. 5, 3).

Of course they are mortally afraid of rabies.  
 You are not mad; you have a case of scabies  
 but look intelligent. Where are your babies?  
 (pp. 7–9)

Out scavenging for the puppies she has hidden in a favela, the bitch, ‘intelligent’, ‘living by her wits’, is exposed to the same dangers as those undesirables in the human community whom she most resembles (pp. 9–12).

Didn't you know? It's been in all the papers,  
 To solve this problem, how they deal with beggars?  
 They take and throw them in the tidal rivers.

Yes, idiots, paralytics, parasites  
 go bobbing in the ebbing sewage, nights  
 out in the suburbs, where there are no lights.

(pp. 13–8)

In the name of progress, the urban municipalities, or those who do the dirtier work for them, dispose of those beings that, living on the edge of society, do not contribute to it in constructive ways. Like the mentally and physically ill, or the socially deviant, the street dog has no use-value to the culture at large. Neither pet, nor employed in the various sentinel functions that a dog performs for humans, be it herding, property control or law enforcement, the street dog has no authorised livelihood. Like other useless undesirables, she too is thus at risk:

If they do this to anyone who begs,  
 drugged, drunk, or sober, with or without legs,  
 what would they do to sick, four-legged dogs?  
 (pp. 19–21)

Exaggerated by the absurd split in the indefinite article 'a/n' to maintain the less than perfect end rhyme, the narrator's black-humoured response to her own rhetorical question is camouflage: dress up for Carnival, blend in: 'Tonight you simply can't afford to be a-/n eyesore' (pp. 29–30).

Doreski dismisses the poem as 'a series of tropes of the grotesque' that 'may attempt to echo the less-than-acute political satire of the Brazilian Sambas ... and simultaneously record the trials of the dog and the brutalized narrator' but ultimately fail to 'engender ... interest' in either (p. 131). She also criticises the poem for its 'tone of humorous indifference' towards human suffering: 'Surely she would recognize that the speaker of this poem is as much a victim of a cruel age as the dog' (p. 131). Because the poem fails the human, though not necessarily the animal, as its controlling subject both stylistically and ethically, it thus 'lack[s] the sting of political narrative' (p. 131). Other scholarship on 'Pink Dog' has focused primarily on the postpartum dog as a figure for various human, mostly female conditions. She is often read as a grotesque female body, marginalised, yet subversive in her resistance to patriarchy and heterosexual norms.<sup>4</sup> More recently, Catherine Cucinella in "Dress up! Dress up and Dance at Carnival!": The Body in Elizabeth Bishop's "Pink Dog", focuses on the marked high visibility of the dog in the poem, suggesting that 'the representation of the body in "Pink Dog" ... places that female body in all its grotesqueness in plain sight'.<sup>5</sup> Rather than inhabiting the margins of culture, the dog is a figure for dangerous female excess that by refusing invisibility goes beyond 'the limits of the grotesque and into the realm of abjection' (p. 74). Offering 'a metaphoric connection between the female body and the body of a female dog' that 'challenges cultural and social conventions', if only temporarily, the poem suggests that the marginal 'always already exists within the center' (pp. 75–6).

Just as the animal of the poem is most often read as the embodiment of Bishop's own feelings of estrangement from the culture around her, either as a lesbian, a foreigner, an

artist or all three, Helen Vendler too relies on a metaphorical reading of the dog in order to make sense of the poem in human terms. In *Last Looks, Last Books*, Vendler makes a passing reference to 'Pink Dog' in her close analysis of Bishop's villanelle 'One Art'.<sup>6</sup> Reading the temporary cover-up of Carnival in the poem as an illusory and superficial response to adversity, Vendler likens the *fantasia* the dog is advised to wear to a 'socially deceptive' art that is 'Rio's mask to overcome social unacceptability' (p. 110). The 'art of losing' is read as 'a form of constantly increasing mastery' in 'One Art', as opposed to the 'one-time fantasia' in 'Pink Dog' (p. 110).

While 'Pink Dog' is a poem that certainly registers the human tribulations, existential as well as social and political, which have been the focus of Bishop scholarship on this poem to the present, it can be argued that in the rhetoric of the poem, human beings are necessary to, but not necessarily central to the poem's grammatical structure. Dispossessed humans are compared through association to street dogs who beg: humans function as the vehicles in similes for dogs. The concrete dog is like an abstract person, not the other way around. Suggestive of an ode as well as a ballad, the poet directly addresses its subject throughout as 'you'. Other subjects who appear are illustrative, but parenthetical in the long run. The poem's subject, from beginning to end, is the animal.

The productive tensions that result from punning and play with the grammatical function of the dog are further reinforced by the cultural status of dogs in the poem. Familiar with her North American audience, Bishop knows that the reader may be relatively unfamiliar with her subject, the urban street dog. The fact that so much criticism on the poem has focused on the grotesque body of the dog attests to this continued unfamiliarity, and partly explains why many readers naturally assume that the animal in the poem is a metaphorical one, a vehicle for signifying the human condition. And this staged assumption is part of the poem's sleight of hand. Because feral animals were no longer permanent fixtures in the street life of Northern European and North American cities by the time the poem was published in 1979, they would not be read as a daily reality. By the early twentieth century, first-world urban streets were cleansed of feral and small animal farm life. Dogs were taken into homes as family pets or continued to work outdoors; canines that did not serve either of these functions tended to disappear. While dogs were one of the first animals to enter into domestic relations with humans, and Donna Haraway suggests that 'wolves on their way to becoming dogs might have selected themselves for tameness', it is useful for the reading of this poem to note that dogs have not always existed to serve man and still do not.<sup>7</sup> Though feral dogs continue to haunt human communities as they have for at least twelve millennia, surviving on 'garbage middens and human waste', and while many live with people voluntarily, the larger fact remains that in most parts of the world in the twentieth and twenty-first centuries, urban dogs are more often feral than domesticated (p. 365). Bishop, who lived in Rio de Janeiro and other parts of Brazil, experienced street dogs on a daily basis. Read biographically, her 'underdog' is thus not a metonymic animal only, but also a real one. The poem's tone can be read as light and 'indifferent', or singularly tragic by those who do not extend Bishop's characteristic reticence in her depiction of everyday suffering to animals as well as humans.

As in all of Bishop's poems, the appearance of an animal signals something that is not readily accessible to the human. This is because familiar human-centred assumptions concerning man's dominance over animals are not honoured in her poems. A 'light' poem like 'Pink Dog' can be seen to do similar work to that of more sophisticated poems

that feature animals such as 'The Moose' or 'The Fish'. Reading the poem with emphasis on the material and historical dog we understand that Bishop once again, though in an apparently alternative format, is directing the reader to step outside her own human frame of reference. To live like a dog, in this case, means suspending assumptions of what it means to be human; learning something about how to be human means temporarily becoming a dog.

### Other Animals in Bishop

Though survival methods of the pink dog such as begging and foraging are associated in the poem with those of other beings whose social status most resembles her own, animals in Bishop's poems are more often associated with humans by how they differ from them. Various species approach, or come close to people in the poems, but they are not made to resemble them. Animals are rarely possessed by humans even as functions of metaphor. In 'The Moose', one of her most famous poems featuring an animal, a female moose steps out from 'the impenetrable wood' to conclude a poem that has featured a small community of local people travelling west in a bus. In the small world moving along, stories of birth and living and death are being shared, the reported speech is punctuated with ways to read it:

'Yes ...' that peculiar  
affirmative. 'Yes ...'  
A sharp indrawn breath,  
half groan, half acceptance,  
that means 'Life's like that.  
We know *it* (also death').  
(pp. 115–20)

Because the poem involves the reader in the vivid hum of casual human conversation, when the bus suddenly stops and the moose 'stands there, looms, rather, / in the middle of the road', we experience something strange or other-worldly as commentaries on the poem have long noted (pp. 141–2).

More recent, or more markedly post-modern, accounts of the encounter between humans and the animal in the poem resist metaphysical interpretations and expose metaphorical processes. Reading the moose as 'an embodiment of primal nature', a 'figuration ... naturalized by the whole tradition of nature poetry', that 'audibly recalls a number of American poets' such as Walt Whitman, Robert Frost, and Hart Crane, Mutlu Konak Blasing suggests that Bishop recuperates and exposes the animal's role as a figure.<sup>8</sup> Blasing scrutinises the 'rhetorical and syntactic processes' that have 'enabled the vision', and countering Alicia Ostriker's feminist discussion of 'The Moose' in *Stealing the Language: The Emergence of Women's Poetry in America*, argues that 'it would be a mistake to read the moose as a figure of a special female harmony with nature ... or of a poetic source or community specific to women writers' (p. 10). The moose appears and then immediately disappears into similes, 'the world of churches and houses', which 'openly exercise power over what they figure' (p. 19). Blasing locates a post-structuralist self-consciousness in Bishop's efforts 'to call attention to the rhetorical processes that "right"' the experience of the discursive animal by making it fit into

the shared historical, formal, and figurative meaning ‘common to the language of poetry’ (pp. 19–23, 18–23).

Other commentators on Bishop’s ‘The Moose’ have concentrated on the interaction between nature and the mind in the poem. Peggy Samuels in ‘Verse as Deep Surface: Elizabeth Bishop’s New Poetics, 1938–39’, does not comment directly on ‘The Moose’, but her reading of Bishop through the aesthetic theory of John Dewey argues that Bishop’s depictions of encounters between man and nature allow for a ‘space for interaction, a large zone of in-betweenness’ that does not prioritise one over the other.<sup>9</sup> Applying a similar concern with the interaction between beings in nature and human beings to ‘the Moose’, both Heather Cass White and Willard Spiegelman compare Bishop’s depictions of nature to Wordsworth’s, each citing Bishop’s own reference to herself as a ‘minor female Wordsworth’ in a letter to Lowell.<sup>10</sup> White and Spiegelman note that Bishop is interested, like Wordsworth, in the fringes of experience where the human imagination encounters a sublime nature. ‘The issue of how to hear the world rather than simply drown it out with the sound of one’s own voice is one of the main questions in “Questions of Travel”, suggests White, and in those poems where man and nature draw ‘imperceptibly, gently, closer’, ‘our sense for “margins” or intermediate horizons is increased’ (pp. 11, 4–34). Silencing or isolating hyperconscious human presences in the poems allows other forms of life and other ways of meaning to emerge. Quoting the Preface to *Lyrical Ballads*, Spiegelman argues that Bishop, like Wordsworth, proves the ‘pleasure which the mind derives from the perception of similitude in dissimilitude’.<sup>11</sup> Human unity with nature is recognised, but only rarely in the poems: ‘Separateness is the central fact of experience for both Wordsworth and Bishop’ (p. 31).

In these readings, the moose, like other beings or events in the natural world, is thus historically and rhetorically inscribed, phenomenologically distinct from the human, rather than analogous in Bishop’s poems. These critical discussions give us intricate and provocative ways to think about some non-contingent aspects of the relationship between species. But because thinking man continues to dominate the humanist assumptions at the epistemological and ontological centres of the readings, the moose is, in fact, overshadowed by the processes of anthropomorphism and personification, regardless of how antithetical or antiquated these rhetorical devices may strike the contemporary sensibility. I would argue that this is a process that Bishop herself ardently avoids.

The moose’s actions reinforce her liminal presence, ‘It approaches; it sniffs at / the bus’s hot hood’ (pp. 143–4). The bus is as strange a creature to her as she is to the people within. And as they examine her through language, ‘Sure are big creatures’, she examines them, ‘[T]aking her time’, through scent (pp. 159, 162). It can be argued that Bishop allows the animal a more powerful final presence than the human in the poem. While the moose physically approaches humans, the people on the bus can only approach the animal through imprecise expressions of awe. Though White argues, as others have, that the moose functions as a ‘talismanic animal’, in this case ‘to figure the successful call of the poet to the answering world’, this reading subordinates the animal to human use-value (pp. 24–34). Existing outside or beyond the clichéd expressions the people use to describe her, the moose instead leaves her own mark, ‘a dim / smell of moose’, on the poem (pp. 177–8). The ‘acrid / smell of gasoline’, is the concomitant territorial marking of the industrial culture that has briefly come into contact with something wild in nature (pp. 178–9). The poem ends with corresponding animal gestures. In the last line of the poem the bus is made to resemble the animal, and not the other way around.

Like 'The Moose', the earlier poem 'The Fish' ends with a form of collision and collusion of culture and nature that does not end in terms that suggest the reification of the animal by the human. The prismatic '... pool of bilge / where oil had spread a rainbow' is physically more colourful than the 'tremendous fish' whose 'brown skin hung in strips / like ancient wallpaper' (pp. 68–9, 1, 10–11). The great fish does not outshine industrial waste: it does not signify in predictable pastoral ways. The speaker as hunter admires the history of her catch hanging from its mouth in the form of hooks, fish-line, leaders and swivels. She anatomises its objective body. Earlier, when she attempts to look subjectively into the eyes of her prey, she parodies her own humanising gesture, and its romantic overtones, by gendering the possessive pronoun 'his' and making the 'eyes' plural: it is impossible to look simultaneously into both eyes of most species of fish because they are located on opposite sides of the body. As if to reinforce the poem's anti-anthropomorphic constraint further, the speaker's gaze is rebuffed by the non-reciprocal glaze in the eyes of the fish: 'They shifted a little, but not / to return my stare' (pp. 34, 41–2).

Reading Bishop's poetry in light of Bakhtin's theory of the creative process and the 'ethical I-Other relation' in 'Author and Hero in Aesthetic Activity', Anastasia Graf argues in 'Representing the Other: A Conversation among Mikhail Bakhtin, Elizabeth Bishop, and Wisława Szymborska', that Bishop's objectivity, 'the intense vigilance and self-restraint' that Marianne Moore observed in the poems, is a 'relation between self and world that is based on distance and epistemological self-restraint'.<sup>12</sup> At the end of Bishop's 'The Fish', notes Graf, the speaker gives the object her 'full attention' while suspending the 'desire to know' (p. 12). Bishop's poems guide the reader to pay intimate attention, to be 'quiet and still enough to see the object rather than one's reaction to it' (p. 12). And this is not easy because it also entails surmounting the desire to impose meaning: 'The difficulty is not discovering the best, or correct, interpretation; rather, it is declining to interpret at all' (p. 12). Sustained attention, or a process of 'living-into' a subject as opposed to empathising with it, 'ensures that a contingent conquest' in language, 'does not turn into an occupation' of the Other (p. 14).

As in 'The Moose', 'The Fish' builds to a dramatic end, but in diction stripped of any clear human relevance. Despite the lack of direct communication between the species, the poem celebrates in the final repeated 'rainbow, rainbow, rainbow' a coming together of the human and the non-human that does not end in a union that can be readily registered in human terms (p. 75). Rather, the speaker recognises that the fish, 'battered and venerable / and homely', is a fellow creature with a lived and living history (pp. 8–9). The final release of the catch is not a gesture of pity following triumph, but a gesture of veneration. Although she has envisaged the 'coarse white flesh', she is not hungry enough to consume a fellow survivor, literally or through personifying metaphors (p. 27). Though 'victory' has 'filled up the little rented boat', it is not confined to human victory alone (pp. 66–7). It has something to do with a larger reality of eating and being eaten that came so close she touched it before letting it go.

The rigorous avoidance of anthropomorphic projections onto animals in Bishop's poems is what prevents them from being exploited as metaphors or metonyms in the service of human enlightenment only. More often than not, animal behaviour is juxtaposed with human behaviour in order to defamiliarise the latter. Associations of humans and animals are not distorted by pathetic fallacy. And if animals do not display human kinds of feeling or behaviour, neither are they made to share human emotions in the poems. When 'an owner's voice arises, stern', in 'Five Flights Up', 'You ought to be ashamed', the dog who is the target of her moral consternation, 'bounces cheerfully up

and down' (pp. 16–17, 19). 'Obviously', says the poem's speaker, 'he has no shame' (p. 21). Shame is identified as a human complication, an obstacle to living in the moment that animals have no concept of because even pets, as the poem suggests, do not necessarily share their masters' anxieties. Again the animal and its corresponding qualities are not simply relegated to metaphors for human problems. And the poem does not re-circulate a tired idealisation of the animal in the service of popular understandings of romantic nature. The knowledge these animals have is different from the owner's, as well as, the speaker's: 'He and the bird know everything is answered / all taken care of, / no need to ask again' (pp. 22–3). It is knowledge that transcends the human urge to control the behaviour of other animals. In the final lines, the speaker is burdened by a yesterday she finds 'almost impossible to lift' (p. 26). She is crippled by human forms of cognition. That which ostensibly makes humans superior to the lower animals appears to lack the advanced vitality of animals in the poem.

Bishop's attraction not only to the emotional indifference of animals, but to the pleasures that result from man's recognition of his own animal nature comes through in a poem by Vinícius de Moraes entitled 'Sonnet of Intimacy' which she translated but did not publish. The speaker, relishing 'farm afternoons', concludes with the following scene:

The smell of manure is delicious.  
 The cattle look at me unenviously  
 And when there comes a sudden stream and hiss  
  
 Accompanied by a look not unmalicious,  
 All of us, animals, unemotionally  
 Partake together of a pleasant piss.

(pp. 1, 9–14)

Bishop communicates the stripping away of human emotion by playfully adding a prefix to an adverb that negates it ('unenviously') and a double negative to an adjective ('not unmalicious') that isolates it as misplaced, thus absurd in her translation. Envy and malice have no place in the animal world and once these human motions are identified and cancelled out in the poem, man is free to do what comes naturally to him, and side by side with his fellow animals. The verb 'Partake' with its ecclesiastical connotations suggests that something holy is being shared. But in order for this to happen the human subject must recover his own animal nature, which is to recover something honest in himself, something stripped of fussy qualifiers. The poem may be funny, light and slightly scatological, but the emotional indifference of the animals puts the human body and its natural functions into balanced perspective. The speaker is only one creature among many. He is unexceptional.

Because animals do not share human emotions in Bishop's poems, animals are often made to challenge the systems that guide and direct human responses to, or attitudes towards, the world around them. Human systems of belief, for example, are made to suffer aesthetically in comparison with the practices of animals. In the poem 'Seascape', white herons and fish are presented as performing alternative forms of devotion.

This celestial seascape, with white herons got up as angels,  
 flying as high as they want and as far as they want sidewise  
 in tiers and tiers of immaculate reflections.

(pp. 1–3)

When 'occasionally a fish jumps' it is 'like a wild-flower / in an ornamental spray of spray' (p. 10). While the presentation of the animals is stylised, the fundamental design of the poem contrasts the man-made and the natural. The 'skeletal lighthouse' becomes a figure for a severe theology, one that can move neither literally as an intransitive verb, nor emotionally as a transitive one. Unlike the animals that fly and swim with beauty and grace in a natural scene that resembles heaven, the lighthouse as unnatural moral arbiter has condemned the fallen world in which they move to a 'hell that rages below his iron feet' (pp. 14, 17).

Heaven is not like flying or swimming,  
But has something to do with blackness and a strong glare.  
(pp. 20–1)

A puritanical monotheistic version of existence is represented not only as unattractive when compared to the colours and configurations of animals, but also as arrogant: the lighthouse

... standing there  
in black and white clerical dress,  
who lives on his nerves, thinks he knows better.  
(pp. 13–6)

Ecclesiastical word play and riddle give the poem a light, playful air: the 'reflections' of the herons on the water are rhythmically and syntactically equivalent to 'conception' in the traditional noun phrase that begins with the adjective 'immaculate'. But the argument in the poem is philosophically acute. Flying and swimming, the natural activity of birds and fish, offer a more moving image of heaven because they are presented as dynamic and physically attractive when compared to the lighthouse with its very physical, but immovable 'iron feet'.

Writing of transcendental meaning in Bishop's descriptive poems, Bonnie Costello notes in 'Vision and Mastery in Elizabeth Bishop' that while landscapes often provide a 'vision of God's work', humans do not figure centrally in the poems' seascapes.<sup>13</sup> Though the meanings of landscapes are 'in one sense highly specified and focused (sights, sounds, smells) but partly because these meanings are specified in a context relatively empty of human content, they offer a broad range of suggestion and more room for association' (p. 352). The poems appeal to human sensibilities, but the spaces depicted exceed or resist human-centred signification. The overt application of descriptive language that borrows from the lexicons of religion and art allows the animals in the case of 'Seascape' to transcend the human. Again, man is directed to reflect on the example of animals for the sake of his own salvation.

Animals thus tend to share space with humans in Bishop's poems, yet exist simultaneously in non-human centred realms. And it is what they do not share with us that generates the enigmatic in their presence. Bishop has often been called a master of endings. Her endings often thrust the reader, and suddenly, into the unfamiliar. It is often the departure from human reference that makes her conclusions powerfully inconclusive and it is thus no coincidence that the unfamiliar is embodied in animals in many poems. The information they convey is not useful in familiar human terms. And it is precisely this uselessness that lends to their value.

### ‘Pink Dog’ and Non-human Knowledge

‘Pink Dog’ is a dark-humoured commentary on use-value. Bishop reinforces this point at various levels in the poem. After recounting a running joke about beggars and lifejackets, a joke whose comic thrust is powered by the tragedy that lies just under the surface, the speaker offers her own comic solution to the ‘depilated’ dog’s predicament. Hers is a similar absurd appeal to function.

In your condition you would not be able  
even to float, much less to dog-paddle.  
Now look, the practical, the sensible  
solution is to wear a *fantasia*.

(pp. 25–8)

Because the urban street dog has no recognisable dog function in the culture, the speaker suggests that she disguise herself as a human being. But she must not masquerade as those humans whom she resembles most naturally, and who, like her, threaten the comfort of the middle and upper classes, as well as the North American tourists. Like all poor people in Rio she must take temporary advantage of Carnival and upgrade her appearance. In the name of practicality and sensibility, she must disguise herself as a Carnival character.

Like almost all of Bishop’s poems that feature animals, with the exception perhaps of ‘A Word With You’ whose human-like, allegorical animals resemble some of those of Marianne Moore, the dog is not applied as a stand-in for human beings. She is not metaphorically pink in the poem, but pink due to scabies. The poem is not a bestiary, an allegory that uses animals for the moral instruction of humans. The fact that street dogs suffer the same fate as street people in ‘developing’ economies is certainly a central theme in the poem. But the value of the dogs does not stop or rest there. And therein lies a second level of commentary on use-value that the poem sports with. By suggesting that the dog wear a *fantasia* or a Carnival costume, put on *máscara*, and dance a samba, in other words, masquerade as a human woman, the poem parodies the anthropomorphic reification of animals by taking the tendency to an absurd extreme. Although the parody appears comical and light in this poem, the ‘use’ of a derelict urban street dog to expose the processes of personification puts a dark twist on the humour. To represent the dog in human terms in the conclusion of the poem has the effect of adding insult to a being that is already injured.

As with the animals in her other poems, Bishop does not represent the dog, however pink, in human terms. Despite all her outward appearances, and notwithstanding the four stanzas dedicated to dressing her up, the dog is qualified early on in the poem as ‘intelligent’ in her own right. The word is enjambed. It contrasts dramatically in register with the ‘rabies’, ‘scabies’, and ‘babies’ it shares the stanza with. It calls attention to itself. The dog is the wily survivor of human occupation. As she trots figuratively into the exaggerated anthropomorphic conceit of the poem, her historical self travels on a daily basis through the urban fallout of a stressed ecosystem. She exists on the hand-outs of those who kindly share, or on discarded human garbage. In either case this dog, like urban street animals all over the world, survives on human excess. But she is ‘intelligent’; so while human debris may sustain her, she simultaneously remains on her guard against those hands that may feed her, but do not share her territory. She hides her babies in the

slums where they are safer because they are less susceptible to the municipal projects that clean-up the better neighbourhoods by disposing of their vagrant populations. Intelligence here means calculating the patterns of men and resisting them simultaneously. Human terms are what she must negotiate everyday in order to survive them. The distant relation between the animal and the human in the poem is therefore reinforced.

The pink dog may be the least poetical of Bishop's animals. The poem does not terminate with non-human beings that create the kind of crowning sublime erasure we experience in a poem like 'Over 2,000 Illustrations and a Complete Concordance', a poem in which the manger scene at the birth of Christ is casually yet hauntingly reduced to 'a family with pets' (p. 73). The urban street dog does not rise to the wild heights of the moose or fish. It can be nonetheless argued that this tragic-comical animal reflects the general profile of Bishop's animals. While she approaches humans, securing her offspring with those classes who statistically provide her with her most consistent diet, she is no one's domesticated pet. She is poor, but roams freely beyond the confines of an apartment, a leash, or a chain, the only 'legitimate' options for dogs living in progressive cities. Bishop does not refer to the urban animals' larger story, but knowledge of the zoological history not included in the poem sharpens one's reading of it as social commentary.

The speaker directly addresses the dog, but there is no attempt to represent the dog as responding to human attention. The implicit background of the subject also highlights the fact that street animals do not necessarily reciprocate human feelings because they have not been trained to respond to them like their domestic betters. Like the fish in the wild who does not return the speaker's stare, the feral dog is indifferent to the stares of the passersby whom she frightens. The indifference of the dog serves to empower her in the poem by preventing her from eliciting facile varieties of sympathy or pity. Her distance is maintained.<sup>14</sup> She has a survival system of her own which is not the same as human survival. Stepping outside of oneself or temporarily becoming another within the cultural parentheses of bacchanalia may be an ancient human mechanism for coping with the restraints of daily life, particularly for women. Human traditions or practices, whether grounded in love or war, are questioned and criticised, however, by the presence of animals in the poems. Like the armadillo that raises its 'weak mailed fist' against the 'illegal fire balloons' prompting Robert Lowell to 'see the bomb in a delicate way' in the poem 'Armadillo', the diseased dog underscores what Bakhtin has guided us to recognise as the fundamentally conservative nature of Carnival.<sup>15</sup> Applied literally to the local animal life in the form of makeup and skirts, the cover-up that Carnival is in poor parts of the world is seen as funny and absurd, but also as conspiratorial when it masks basic animal needs.

Progress in the form of North American influence is offered, albeit off-handedly in the poem, as part of the problem rather than a solution to it.

They say that Carnival's degenerating  
– radios, Americans, or something,  
have ruined it completely. They're just talking.  
Carnival is always wonderful!

(pp. 34–7)

The commercialisation of carnival aggravates the social conditions that it is meant temporarily to allay. What had begun as a poor ex-African slave community festival in

Bahia is now an economically profitable event, but not for all. Neither the dog nor the poor profit from the wealth generated by corporate tourism in any long-term sustainable way. The former are in fact problems to be solved so that celebrations are not hindered by the presence of the unsightly poverty they reveal in their unadorned physical bodies. The dressing up of the dog is thus an acting-out of socio-political tension. But the historical animal, like other animals in Bishop's poems, also signals us to think beyond the human problem towards an animal 'solution' to it.

Animal life, even on urban streets, goes on with or without human systems. Cycles of birth and death, feast and fasting continue in a parallel existence that is the natural world. Or so they do if and when sanctioned by the cultures that share their geography. As in other cities all over the world, Rio de Janeiro has a long history of solving its street dog problem. When favelas are raised it is not only human communities that are displaced or destroyed. In the name of progress street animals are regularly poisoned or otherwise destroyed *en masse* all over the world. Grass roots organisations agitate in all major cities of the globe for legislation that acknowledges and protects the historical existence of feral urban animals.<sup>16</sup> If the dog in Bishop's poem is inscribed in the tradition of the folk ballad, it is because she understands the larger context of the dog's survival. By making the dog a female with offspring she accentuates the struggle; she knows that the natural cycles her instincts live by are under severe duress.

The pink dog fits the bill of a traditional rural folk hero because she does not live according to the rules and regulations of the dominate authority, but rather survives or defies them, at least for the present. She is nobody's bitch. She is useless to progressive man, unavailable to him in terms he condones, unless of course she dresses up like a woman, becomes his puppet and pet. Thus like other animals in Bishop's menagerie she exists outside human frames of reference. And as in the other poems, this gap provides a door of discovery. What then might be the knowledge this battered beast brings to us? She is another animal intermediary, but not one that reaches out or communicates with humans. She is a being to be reached out to, or, rather, must be reached out to with no expectations of return or gain if we are to push the ethical boundaries on what it can mean to be human.

In the poem 'Manners', subtitled 'For a Child of 1918', the etiquette taught to the speaker as a child by her grandfather transcends the borders that separate species human from species animal. The grandfather instructs the child on good manners as they ride side by side on his wagon. A 'big pet crow' is 'well brought up' because 'he answers / nicely when he's spoken to' (pp. 10, 26–7). The grandfather and grandchild shout 'Good day! Good day!' to the passing vehicles that leave their wagon in the dust (p. 27). The poem terminates with an act of humility that concludes the lesson.

When we came to Hustler Hill,  
he said that the mare was tired,  
so we all got down and walked,  
as our good manners required.  
(pp. 29–32)

We are again offered animal ethics packaged in what appears to be light verse. This is an animal ethics that does not differ greatly from a traditional humanist ethics that borrowed from the best of theological truisms: it is one that suggests that humans be taught to respect the integrity and well being of others as they would wish for

themselves. 'Others' is understood here in a full biological understanding of that term, however. Post-humanism in this context does not have to be read as a new post-postmodern position. Animal ethics is central to a humanist ethics that does not confine itself to human-centred definitions of being when this ontology infringes on the welfare of other life forms.

'Manners' is another simple poem, a bitter sweet, undemanding poem. The basic kindness preached by the rural man feels anachronistic, left behind in the dirty wake of the automobile. If the child takes her grandfather's lesson to heart she may risk losing her way in the wider world. One is guided in the poem to wonder of her what she wonders of the crow that flies off the boy's shoulder when the wagon stops to give him a ride, 'How would he know where to go?' (p. 16). The lessons are simple and because they are simple they require the greatest effort. 'Pink Dog' does not make the challenge posed in 'Manners' any easier. The canine protagonist is ugly and appears to be dangerous to human beings. The ironic rhyming of 'rabies', 'scabies', and 'babies' makes a phonetic joke of the poem's problem. The reader need not take the matter to heart. But no change of heart is simple or easy. That is because most change hinges on a transformation of consciousness. But 'Man or beast, that's good manners' says the grandfather (p. 23). Bishop's animals are not important for their use-value alone; and therein lies their worth.

# Glossary of Terms<sup>1</sup>

**Abjection** The action of expelling from consciousness material pertaining to bodily life that is at odds with the imaginary integrity of the ego. The term “abject” also refers to the mother’s body, the connection with which has to be severed if ego identity is to be established.

**Actant** A term in narratology for the roles characters play in fiction such as sender/receiver or helper/opponent. Now used more broadly in the social sciences to name any agent of action.

**Actor Network Theory** From Bruno Latour who argues that the world is made up of agents (both human and non-human) in constant negotiation with one another. None possesses an essential identity that allows it to transcend the field in which it exists in a concrete and immanent (inserted, immersed) fashion. The theory assumes culture is not separate from nature, and that there is no hierarchy of actants such that the human is more privileged.

**Adaptation, Adaptive** In the course of biological evolution, organisms, through genetic mutation, acquire new traits that assist them in surviving adversity in the environment. Such adaptations allow the organism to survive in its new circumstances.

**Aesthetics, Aestheticism** The doctrine of the beautiful in philosophy or the study of what constitutes beauty in a work of art. From the Greek word *aesthetikos*, which means sentient or feeling. For some, aesthetics concerns the techniques and forms of art, for others, the pleasure of appreciating art. Aestheticism was a movement in England in the late nineteenth century of artists and theorists who were devoted to the ideal of the beautiful in art and in life. See Walter Pater’s Conclusion to *Studies in the Renaissance*.

**Affect** An involuntary bodily response to stimuli that is often outside the control of the person experiencing it. Affect therefore differs from emotion which has both conscious and unconscious aspects and is more easily regulated.

**Affective Fallacy** The tendency in readers to think their own emotional responses constitute the meaning of a literary work. The New Critics thought meaning resided in the literary work itself. Its language and imagery were therefore the proper objects and concerns of literary analysis, not the emotional response of readers or audiences.

**Alienation (Reification)** Karl Marx's term for the taking of the product of labor from workers by the owners of capital. Workers put their life energy into the things they make. Under capitalist relations of production, those things or commodities belong to the owners of the means of production. The life energy of workers is therefore alienated – or made-other and taken away – from them when what they make becomes the private property of the owner or capitalist.

**Alienation Effect** A term conceived by German twentieth-century playwright Bertolt Brecht to describe what his work sought to accomplish. Traditional theater sought to enlist audience identification with characters and stories. Brecht sought instead to distance audiences from characters and to oblige audiences to think more critically about the impersonal, historical themes of the work.

**Allegory** An older literary form in which characters and events have explicit meanings such as “Fancy,” “Occasion,” and “Courage” as in, for example, Edmund Spenser’s *Faerie Queen*. The term is also used to describe any narrative whose meaning derives from a well-known code rather than from the specific circumstances of the story.

**Alliteration** The repetition of syllables in poetry. As in Shakespeare’s sonnet: “When to the sessions of sweet silent thought.”

**Allusion** A reference generally to another literary work. As in the allusions to the Bible in Dante’s *Divine Comedy*.

**Alterity** Literally “otherness.” The idea that for something to possess an identity, it must be in relation to something other. Its identity is relational.

**Aporia** An irresolvable dilemma of thought or action in which, for example, to choose one of two paths is to lose something either way. Originally a term in rhetoric for an irresolvable proposition (“All men are liars; I am a man”), it was used by Paul de Man to name the impossibility of moving from figural language to a non-figural revelation of meaning.

**Apparatus (*Dispositif*)** Michel Foucault’s term for the complex of methods, discourses, institutions, laws, administrative structures, etc. that maintain power in a society.

**Archaeology** Michel Foucault used this metaphor to describe his work of unearthing the hidden assumptions of discourses.

**Archetype** Little used any longer, this term refers to narrative and thematic patterns derived from mythology and religion such as the descent into hell or the cycle of death and rebirth.

**Assemblage** A term proposed by Gilles Deleuze and Felix Guattari to name entities without identities that bring diverse elements together. Our own bodies are assemblages, as are our minds.

**Autonomy** A social movement primarily in Italy that aspired to separate the working class from capitalism. Initially a strategy of the radical leftwing labor movement, it meant refusing the work discipline of capitalism as well as the reformist aspirations of the institutional labor movement and asserting the independence or autonomy of workers in relation to their employers. Because capitalism depends on the creative labor of workers, workers themselves, according to the theory of autonomy advanced by Carlo Tronti, Antonio Negri, and others, possess power in relation to capital. They should assert that power by refusing to work. Wildcat strikes not condoned by labor unions were a favorite strategy of the autonomy movement, as was industrial sabotage. The idea of autonomy was also embraced by anarchists who advocated the creation of autonomous zones or spaces where non-capitalist life forms could be incubated and

developed such as squatting and other non-market, non-commodified life relations, both personal and economic.

**Base, Superstructure** In Marxist theory, the base refers to the material underpinnings of society such as the way food and goods are produced through labor usually in exploitative work relations. Superstructure refers to all the other institutional, personal, and cultural forms of life that arise on top of that fundamental material basis such as government, social relationships, schools, the media, government, culture, etc.

**Binary Opposition** Deconstructive analysis studies the way philosophy creates hierarchical orders that make one term axiomatic, foundational, and normative while relegating related and often opposed terms to a subordinate, derivative status. “Presence” is the criterion of truthfulness for idealism, for example. True ideas are present fully and completely as a living entity in the mind. That positing of a norm results in the assigning of a subordinate and negative status to terms connoting qualities such as absence that seem outside and at odds with the norm of presence, things such as spacing, articulation between terms, writing, technique, etc.

**Biopower/Biopolitics** According to Michel Foucault, those with sovereign power in society often have power over people’s lives and over their bodies. Power over *bios* can be exercised through the violent destruction of bodies (as in the practice of drawing and quartering) or it can assume more subtle forms in modern life such as scientific studies or governmental supervision that use knowledge to pinpoint and control people. The most famous example would be the naming and categorizing of the so-called sexual “perversions” such as homosexuality. Contemporary queer theorists advance a counter biopolitics that rejects heteronormative categories, notices the perverse, sadomasochistic character of much heterosexuality, and argues for a progressive, post-normative politics of the body.

**Body** A cultural effect of performativity within the sex-gender regime or a biological organism that encompasses human culture as one of its effects. Or both.

**Bricolage** Anthropologist Claude Lévi-Strauss coined this phrase to describe a method of assembling knowledge from pieces rather than exercising a more rigorous method such as logical deduction.

**Canon** The body of literary works that is widely acknowledged to represent the field. Obviously a debatable and contested notion, canon nevertheless allows for distinctions between works that are frequently taught and studied such as *The Great Gatsby* or Nella Larsen’s *Passing* and books from the same period that are now less valued or recognized as manifesting high levels of technical skill, sociological insight, and philosophical acumen such as John Dos Passos’s *Manhattan Transfer*.

**Capital, Capitalism** A way of conducting economic life that makes irrational self-interest paramount in human affairs, allows a small group to lay claim to the accumulated resources of the society, and exploits the work of the majority for the sake of increasing the privately accumulated wealth of the minority. Capitalism relies on the subordination of workers to the will of the wealthy. That subordination is enabled by ideology (word ideas such as “freedom” that license the chaotic irrationality of the so-called market), vocational education to reinforce class distinctions, a legal regime that enforces inequality within the guise of formal equality, and police force. Capitalism resides on the myth of the “private” “free” “individual” and requires the erasure of all the public, social, communal ingredients of supposedly private economic activity such as money, roads, schools, language, and the like. Anti-capitalist socialists advocate

a change to an economy in which economic activity would be more publicly regulated and administered so that prices would be set at reasonable levels and compensation for labor would be set at high enough levels to assure a reasonable standard of living. The goal of the economy would not be the enrichment of the few but the overall good of the many.

**Carnival, Carnivalesque** In his well-known work, *Rabelais and His World*, Mikhail Bakhtin examines medieval culture in the works of François Rabelais, whose mocking satiric style of writing in such works as *Gargantua* and *Pantagruel*, according to Bakhtin, is “carnivalesque.” It imitates the mocking forms and tropes of the medieval carnival. Medieval culture was dominated by the Catholic Church, which enforced constraints on bodily life in favor of the ideal of the spiritual afterlife. The sexual body had to be controlled so that the afterlife in heaven could be enjoyed. But during carnival season, official strictures were suspended and people were allowed to indulge bodily urges, mock the authority of the Church, and overturn existing hierarchies – at least in play form. Rabelais’ novels celebrate the material life of the body and make fun of the reigning authorities of the time. A literary work therefore has carnivalesque elements if it mocks authoritative hierarchies, rejects the repression of bodily life, and celebrates the cyclical nature of natural physical existence.

**Castration** For Sigmund Freud, all male children experience sexual feelings for their mother, and when those feelings are blunted by the encounter with the conventions of human culture, the child experiences that frustration as a fear of castration. Jacques Lacan gave that fear a semiotic twist. He describes the male child’s encounter with the rule against incest as a passage into the Symbolic Order, the realm of cultural conventions and signs that determine who we are as civilized beings (names, roles, rules, etc.). Male children repress the desire for the mother and it enters the unconscious, where it is no longer available to consciousness except in the form of signs such as symptoms. The bar that separates the signifier from the signified in the algorithm s/S (with small s equaling symptom and big S equaling unconscious meaning) is like the one that separates unconscious content from manifest symptoms such as dreams. The lack of the desired m(Other) is the motive of all male desire in so much as it seeks an imaginary reunification with the mother’s body. The entry into the Symbolic Order and the acceptance of the need for repression is akin to castration, albeit a symbolic one. One sacrifices access to the Phallus, the token of male sexual power, and acknowledges it is the property of the father whose “Law” separates male child from mother in patriarchal human culture (so far).

**Center, Decentered** Post-Structuralist thinkers such as Jacques Derrida noticed that philosophy has implicit norms that function as centers or anchors for value systems. His work undid those value systems and so “decentered” the norms. Often, he found elements that were at the margins of philosophic texts such as metaphors that seemed unimportant, but that he showed were in fact essential.

**Chronotope** Mikhail Bakhtin’s term for the way the spatial and temporal dimensions of a novel’s world are represented in the discourse of the novel. *Chronos* is the Greek word for time, and *topos* the Greek word for place or spatial location.

**Coevolution** When two organisms affect each other’s evolutionary development, as when a parasite and a host change how the other evolves in a mutually beneficial manner.

**Colonialism, Post-Colonialism** Colonialism usually refers to the era from the fifteenth century onward when European nations conquered other lands and peoples

and converted them into satellite colonies usually for the purpose of extracting natural resources such as sugar, cocoa, lumber, and animal skins. By the end of the twentieth century, most formerly colonial nations and peoples had attained independence. The study of the cultural changes from colony to post-colony is often referred to as “post-colonial studies.”

**Commodity** Marx’s term for a product manufactured by labor such as a pair of shoes that is sold on the market under capitalism. He argued that commodities seem to be a magical source of profit due entirely to market exchange, but in fact, commodities conceal the fact that the value they bear comes from the labor of people whose work is under-rewarded. Profit arises from the underpayment of workers. See “Fetishism of Commodities.”

**Competence** The ability to understand statements in a particular language.

**Condensation** In dreams, images often condense or bring together several strands of feeling or of thought. A single name might condense several unconscious causes or referents. Freud found that a dream about a dry leaf in a book condensed several referents such as a woman’s name (“Flora”) and the German word for “garden.”

**Constative (see Performative)** According to speech act theory, language acts that bring about change in the world such as “I now pronounce you man and wife” are called “performative utterances,” while statements that simply record facts (“You look like a man and a wife”) are “constative utterances.”

**Constellation** Walter Benjamin, in his study of German tragedy of the Baroque era, studies the fragments of the era in relation to one another while resisting conceptualizing them in our modern terms. Benjamin focused on the fragment that gave access to understanding an era as opposed to the concept that sums it up clearly. His method of analysis is therefore immanent, historical, and materialist. Rather than place a work of literature within the totality of an era (as Gyorgy Lukács was inclined to do in his historical materialist method of analyzing literature), Benjamin instead studied each unique individual element of the constellation.

**Context** The surrounding or environment in which something exists and which usually is required in order for it to be complete or to be understood fully. Often applied to literary works whose historical surrounding is important.

**Counter-Hegemonic** Hegemony refers to a dominant position. Something that is counter-hegemonic operates against domination or power.

**Cultural Capital** The symbolic goods and benefits (such as access to a particular kind of training in good taste) that accrue to different economic class positions. According to Pierre Bourdieu, these goods are as unevenly developed as financial capital and help distinguish one socio-economic class from another according to how well they exercise aesthetic judgment.

**Cultural Materialism** The movement in literary study launched by Raymond Williams that shifted emphasis away from the specific literary work and towards the cultural history in which it was located. The approach is materialist because it shares with Marxism a concern for the fundamental physical elements and processes of life such as work as well as for the reality of economic classes and their effects in our lives. In perhaps his most famous study, Williams examined the difference between English literature that arose in or was concerned with life in the country and literature concerning city life.

**Dasein** From Martin Heidegger, the specific state of individual human existence as opposed to the more general state of Being or *Sein*.

**Deconstruction** The method of critique developed by French twentieth-century philosopher Jacques Derrida. Derrida analyzed different ways that metaphysical philosophers have conceived of truth. He found that they posited an ideal and unattainable limit or ideal (such as a purely formal idea in the mind) and constructed a hierarchical axiology around that ideal limit consisting of ethical and ontological distinctions between terms in which one set is subordinate to and derivative in relation to another. Hence presence as a criterion of truthfulness is better than, prior to, and superior to absence. Metaphysical philosophy, from Plato to Husserl, assigned positive values such as authenticity, presence, vividness, nature, fullness, substance, self-identity, moral goodness, seriousness, and the living voice of consciousness to truth while assigning to non-truth negative values such as technology, representation, absence, death, artifice, repetition, difference, play, writing, etc. Derrida found that these hierarchies did not hold under critical scrutiny. Indeed, the negative terms could be shown to encompass the positive terms in such a way that no hierarchy of terms was really possible. For example, to even begin to talk about truth as distinct from non-truth, one has to make a differentiation. One cannot therefore say that difference is a negative term that is alien to truth if truth cannot be conceived outside difference. In a similar way, Derrida noticed that philosophers such as Edmund Husserl, while defining truth as a pure formal idea that was aloof from the mechanics of signification in language, nevertheless had to define the idea of truth in such a way that the characteristics of signification that were so negative – repetition especially – were necessary for truth as a pure idea to be determined. Ideal truth had to last forever, which is to say it had to repeat itself, with each repetition introducing a bit of spatial difference at odds with the idea of a full truth grasped as a living presence in the mind that is purely temporal and aloof from the spatial form of the sign. All the ideal limits or transcendental values that define truth in the metaphysical tradition can be shown to be derived. They cannot exist outside the complex relations they aspire to comprehend and to describe.

**Defamiliarization (Estrangement, *Ostranenie*)** From Viktor Shklovsky, the Russian Formalist critic, this term (*ostranenie*) describes the way poetry upsets normal patterns of perception and of thought. Poetry roughens up our rote or habitual ways of seeing the world and renders familiar things unfamiliar. Shklovsky alludes to Tolstoy's narrative strategy of telling a story in the voice of a horse.

**Denotation/Connotation** A denotation is the meaning directly intended by a word, while a connotation is a secondary meaning. A particular gesture in a magazine cover such as a salute on the part of an African soldier under French colonial rule might denote "salute," but it connotes colonial domination.

**Desiring Machine** From Gilles Deleuze and Felix Guattari, the idea that the human psyche is largely impersonal and not under the control of the conscious self or subject. Desire operates like a machine that is on automatic.

**Diachrony, Diachronic** A term from structural linguistics that describes the temporal axis of speech.

**Dialectic** Georg Hegel developed the dialectical method of analysis. Classical Greek dialectic consisted of a form of argument that moved from specific propositions (such as "Socrates is a man") to general or universal propositions ("All men are mortal") and then put the two together to arrive at a synthetic proposition ("Therefore Socrates must be mortal"). The conclusion is a necessary logical consequence of the propositions that precede it, and it combines both the universal and the specific.

Hegel thought the mind worked the same way when it tried to determine truth, and he felt social history and the material world were similarly logical. Philosophical truth evolves from simple propositions that were concrete and specific (or determinate, to use his word) and moved by a necessity inherent to them to more general or universal ideas that were implied by the simple initial proposition. Eventually, through a process of logical evolution, the mind arrives at a more synthetic conclusion that combined the specific concrete premise with the universal or general idea.

For example, empiricists claimed before Hegel that sensory perceptions allowed the mind to build up ideas. Sense came first. Immanuel Kant countered that the mind's implicit rational categories allowed it to grasp sensory experience. The mind came first. Hegel combined the two. In his *Phenomenology of Mind*, he begins with sensory experience (our way of perceiving the world every day). Sensory experience, he argued, is like a concrete, specific proposition in classical logic. But like all such simple observations, it is lacking something; it is not complete in itself. It implies necessarily a universal idea that it is not (that it negates). To be specific and concrete, it must *not* be universal and abstract. Negation is implied in any determination – any specific concrete proposition. The universal is therefore a necessary component of the identity of the specific, determinate, concrete perception by the mind. In itself, sense perception is incomplete. It is not the whole of human cognitive experience. It leaves out universality. But if you examine universality, a similar negation emerges: the universal is too abstract; it lacks concreteness and specificity. The idea of Justice is empty without concrete laws and courts that make it real in society. Therefore, the ideal form of truth and of knowledge is, according to Hegel, a combination of the two, the universal abstract idea and the specific, determinate concrete instance. So, for example, the real truth of justice consists of both the abstract universal idea as well as the concrete, specific, determinate laws and courts that embody the ideal in action. He went on to apply these same ideas to culture, society, aesthetics, politics, and human history. Human society begins with the equivalent of simple concrete logical propositions. It is concerned with food and shelter. But as it evolves, it is able to integrate universal ideas into its constitution by developing the idea of government and of justice in laws which combine the concrete and the universal and that allow large human societies to exist.

Karl Marx used the dialectical method to analyze capitalism. He felt it was characterized by the same sense of logical necessity (by virtue of which simple propositions led necessarily to universals). Workers and capitalists are like logical propositions in that they presuppose one another (to be a worker is to *not* be a capitalist). But Marx felt the relationship would also evolve logically so that workers would eventually liberate themselves from the limitations of wage labor and achieve a new social universality in which wealth would be distributed more equally and equitably. He called that ideal “communism.”

**Dialogic, Dialogism** Russian critic Mikhail Bakhtin invented these terms to describe the multi-voiced quality of novels. Novels contain characters from different walks of life, and each inserts a different dialect into the novel's discourse. For example, a novel might contain lawyerly discourse, a variety of gender discourses, various social class discourses, etc. Each of these enters into dialogue with the other – mixing, clashing, interacting, etc. And the meaning of the novel arises from these dialogic relations between voices. Bakhtin contrasted this multi-vocality of the novel with monologic Romantic poetry in which a single speaker announces meaning.

**Diegesis** The interior story as told or depicted especially in film. Diegesis refers to the interiority of the fictional world and its portrayal. Used most frequently in discussing film where a distinction is made between music that emerges from the story events and is filmed (as in the famous piano sequence in *Casablanca*) and music that is an aural accompaniment added from outside the story events as in a film such as *Best Years of Our Lives*. One is intra-diegetic, the other extra-diegetic.

**Différance, Difference** Ferdinand de Saussure noticed that there are no identities in language. Language is constructed from relations between parts each of which has an identity only in so much as it is in relation to other parts of the language system. This notion of relational identity was helpful to feminist, gender, and race theorists who posited difference as an alternative to existing normative and hierarchical ideals of racial and gender identity that were unaware of their origin in acts of subordinative differentiation. Understood from the perspective of difference theory, “White” is less a norm than the expulsion, denigration, and refusal of color. Understood in terms of difference, “White” is merely one shade of color (differentiated along a spectrum from others) and is not an absolute in itself that can qualify as a norm or standard by which to measure other more deficient hues. Similarly, heterosexual male identity, long taken as a norm and standard for understanding gender, is a delusion, according to difference theory. Not a norm or standard that stands apart from and above other gender flavors and inflections, it is just one more possible flavor on a spectrum of shades of differentiated possibilities.

Jacques Derrida argued that the concepts and ideas of philosophy are characterized by a similar differentiability – nature/culture, physicality/technology, presence/repetition, etc. Each major concept requires its other to define itself. He posited a primordial process of space and time whereby things differ from each other spatially and simultaneously exist in time in such a way that their full and complete presence at any one moment of perception by the mind is perpetually deferred. What he called *différance* names the spatial and temporal movement that makes it impossible to arrive at a complete, final determination of the truth of something (understood as its full and complete presence to the mind).

**Disavowal** According to Sigmund Freud, the male child sometimes mistakes the mother’s lack of a penis as castration and feels anxiety that provokes a desire to disavow that possible castration through the seeking of fetish objects.

**Discourse** A body of statements concerning some object such as law, art, or madness. Discourses are characterized by axiomatic assumptions and rules of operation that determine what statements make sense within the discourse. The rules of the discourse determine what the legitimate objects of the discourse are. For example, Michel Foucault noticed that madness was differently defined in discourses over time. In one era, it was considered a form of sainthood. In another, it became a form of pathology meriting ostracism and incarceration. Foucault posited the idea of a “discursive formation,” a systematic and coherent body of rules and procedures for generating statements that maintained the apparent truthfulness of the discourse by regulating possible statements within it.

**Disidentification** A refusal and displacement of the subjective identity assigned one by existing regimes of economic, ideological, and gender power.

**Displacement** Freud described the dream work as consisting of ways the unconscious achieves expression. Dream images often consist of indirect expressions of feelings that have been displaced away from direct expression by the defensive action of the ego.

***Dispositif* (see Apparatus)**

**Dissemination** Jacques Derrida's term for the way signs refer endlessly to other signs in any literary work and in any language system so that it is difficult to declare an end to signification and an arrival at a final determination of meaning that does leave a "remainder," a relation to an other (sign) that awaits grasping or conceptualizing, endlessly.

**Distinction** Pierre Bourdieu's term for the way cultural tastes differentiate between people along economic class lines.

**Dominant** A term from formalist and linguistic literary criticism that describes how one literary device or technique is ascendant in a literary work. In Dostoevsky, according to Mikhail Bakhtin, the dominant element is polyphony, the incorporation of many voices that are not subordinated to an authorial voice.

***Écriture, Écriture Féminine*** The French word for "writing" became popular after Jacques Derrida used the metaphor of writing to name the process of spatial and temporal differentiation (*differance*) that he saw underlying and producing all sensible experience in the mind. Feminist theorists in France especially suggested that women were more connected to a kind of writing that embodied that disturbing process of differentiation that seemed to make all the traditional male quests for absolute truth founded on the perception of clear identities seem misguided. Those models of truth privileged male cognitive processes and relegated female qualities to secondary status. Thus, Reason was always superior to mere sensation and emotion. Some feminist theorists such as Luce Irigaray and Hélène Cixous reversed this hierarchy and assigned a superior value to a "feminine" and "maternal" sensation, emotion, and differentiation that undermined male ideals of abstract, conceptual, identitarian absoluteness.

**Epigenetics** The study of traits that result not from DNA but from how DNA is affected by external factors that alter how it is expressed. Genes can be affected by factors outside the nucleotide sequence of the DNA that change how they are expressed and what form they assume without altering the DNA sequence. Methylation, for example, attaches a strand of methyl that can silence a gene and prevent it from expressing itself. All organic development requires the epigenetic regulation of basic stem cells that are transformed by regulation and express themselves differently as the various parts of the organism.

**Epiphany** A moment of great insight or revelation.

**Épistémè** According to Michel Foucault, each historical era is characterized by a mode of knowledge that arranges the world in a particular way according to its categories and its procedures for processing objects. The medieval *épistémè*, which was decidedly religious, categorized the world in a way that was very different from that of the more "rational" eighteenth century, for example.

**Epistemology** The branch of philosophy dealing with knowledge.

**Epoché** From Edmund Husserl's phenomenological philosophy, this refers to the putting aside or suspension of all assumptions. The "reduction" or putting in brackets of all pre-existing attitudes in conducting phenomenological philosophy allows one to attain a clearer perception of the object in the mind.

**Essentialism** Essentialism takes two forms: the assumption that identities are internal and expressive rather than assigned and imprinted from without and the assumption that there are truths that inhere in nature or in the world and are not the effect or result of acts of social or cultural construction.

Feminists and gender theorists challenged the long-standing assumptions of heterosexual patriarchy that women and queers possessed essential identities that were subordinate, marginal, and of lesser normative value than that of the dominant heterosexual male. In patriarchal discourse and ideology, women were passive, dependent, weak, secondary, and functionally supportive of men, while queers were deviant, aberrant, non-normative, and perverse. These essences were ordained for many centuries, and that essentialism has been successfully critiqued over recent decades. A similar critique of ethnic or racial essentialism has occurred, which overturned and displaced white normative assumptions regarding the secondary status of people of color.

Essentialism works by inverting cause and effect and thereby converting external imprinting into an apparent internal quality. It reverses cause and effect by understanding the psychological characteristics that in the past were externally imprinted on women by patriarchal domination (dependency, passivity, etc.) as internal qualities. The effect of domination in this way becomes a justification for continued domination.

When Jacques Derrida launched his critique of metaphysics in the 1960s, he noticed that Western philosophy pictured the world hierarchically so that when truth was defined, certain terms such as “presence” were assigned a positive value and made central and essential in relation to other terms such as “absence,” “repetition,” “difference,” and the like that were characterized negatively and banished often to the margins of the value system the philosophy constructed. Those negative terms were not essential or central or foundational. They were more likely to subvert or endanger truthfulness and upset the values system of the philosophy. Derrida’s point ultimately was that it is not possible to justify the positing of superior terms that are more central or essential to truth. There is no locatable center or essence, no firm foundational criterion of truthfulness that is not disturbed by relations to other terms on which it depends (hence it can’t be central or essential alone or independently) or that is not determined by the structure that it supposedly supervises (hence it cannot be foundational since something prior or other is in a position of determination in relation to it). There are in effect no centers, essences, or foundations. The quest to establish a formal standard of truthfulness on the usual terms (presence, identity, etc.) is like trying to locate the center of the ocean. Our systems of philosophy reside on webs or networks of relations between terms none of which is central or essential and all of which depend on the others for support in maintaining their appearance of an identity that is not entirely differential and relational. It is not possible therefore to posit “identities” that are not simultaneously displaced into networks of relations that undermine the very possibility of an essential identity.

The necessity of continuing to pursue the political critique of structures of power from identity positions such as “woman” or “person of color” or “queer” led some theorists to posit the necessity of a “strategic essentialism” that would allow critique to proceed without having to constantly acknowledge its groundlessness, its absence of a firm footing in a universally recognized standard of true essential identity.

**Event** As opposed to structure. An event occurs once, is unique, and evaporates. Its being is singular and non-repeatable. It has no presence. In contrast, structure endures and is repeatable and permanent. This concept was part of the Post-Structuralist argument that existence is inherently unstable and eludes the traditional philosophic concepts of knowing subject and known object whose truth can be conceived as a presence that is easily discerned.

**Existentialism** A philosophy concerned not with large questions such as “Being” but with the more small-scale questions provoked by considering philosophy from the perspective of each individual existence. Concern focused on the question of choice especially and the possibility that existence might have no meaning or purpose.

**Expressionism** A movement in Germany (in art, theater, film, and literature) that broke with the protocols of realist representation and sought instead to express meaning in non-realist forms, using strongly contrasted colors and grotesque figures in painting, for example, or stage and film sets that exaggerate qualities such as corruption, irrationality, and evil. The Expressionists were leftist critics of German society, and often, their works depict capitalism and the ruling economic class quite negatively. See, for example, Fritz Lang’s *Metropolis* and Robert Wiene’s *The Cabinet of Dr. Caligari*.

**Fabula/Syzuhet (also Discourse/Story)** In the study of narrative, a distinction is made between the supposedly real events (*syzuhet* or *story*) and the selective telling of those events in narrative form (*fabula* or *discourse*). The actual life told may last ten years, but the *fabula* or narrative will select just a few moments to recount.

**Feral** A term from bioregional criticism for a state halfway between domestic and wild.

**Fetish** In Freudian theory, desire can be shifted onto another object if it encounters repression. A desire for sexual satisfaction can be displaced onto an adjacent object that becomes a fetish substitute for the original object of desire.

**Fetishism of Commodities** Karl Marx’s idea that under capitalism, there is the belief that wealth arises magically from the sale of goods on the market. No one notices that in fact it is the labor of workers that puts value into those goods, and because that labor is underpaid, wealth is generated. Workers add a “surplus value” to goods that becomes wealth when market exchange occurs.

**Fordism** Prior to the era of globalization, capitalism was organized nationally around large-scale industrial production using assembly methods invented by Henry Ford such as the “assembly line” and the use of large numbers of unskilled laborers.

**Formalism** The study of the technical aspects of a work of art such as metaphors in poetry and narrative perspective in fiction.

**Fort/Da** Sigmund Freud observed a child play a game with a string and an object tied to the end. The child would fling the object out of sight and exclaim “Fort!” (or “Gone!”) only to call out “Da!” or “There!” when he tugged the object back into view. Freud speculated that the child was using play to master his distress at the disappearance of his mother.

**Function** In narrative theory, a function is a typical repetitive event in narrative such as “the hero leaves home.” The term was used first by Vladimir Propp in his *Morphology of the Folk Tale*.

**Gaze** In film theory, this describes the way heterosexual women are posited as scopophilic objects of heterosexual male desire. Heterosexual women become a fetish that allows the heterosexual male to make up for the experience of having to give up the mother, an experience that is tantamount to castration. Scopophilia allows the heterosexual male to engage in “disavowal” of the possibility of castration, of a loss of a feeling of sexual power. His desire for the mother is displaced onto a fetish that makes up for his lack, and this fetish is the image of the heterosexual woman on screen.

**General Economy (as opposed to a Restrained Economy)** Terms from Georges Bataille that were developed by Jacques Derrida in *Writing and Difference* and used to distinguish between philosophic discourses that were closed (such as the dialectic in

which initial premises were justified by the method's conclusions) and those such as Derrida's deconstruction that explored the fringes at the edges of systematic philosophy where exceptions could be found that put the systematic character of the philosophy in doubt (so that the conclusions did not justify the initial premises).

**Genotype** The inherited genetic make-up of an organism. It is distinct from the phenotype, which is the ultimate form an organism assumes as a result of environmental influences and developmental changes in the way the genotype is expressed.

**Genre** A type of literature defined by shared characteristics and conventions such as comedy, tragedy, or lyric verse.

**Globalization** In the 1980s, conservatives lobbied for the end of restrictions of world trade in order to increase their wealth. As a result of the elimination of trade rules that protected workers and domestic industries, a new era of transnational commerce began. Goods could now be manufactured by low-wage workers for very little money in places like Mexico, China, and Vietnam because differences in living standards meant that labor in those countries cost very little compared to more industrially developed countries such as the US. Those with wealth in the US were therefore able to shift jobs overseas, spend much less on labor, receive the same income for sales, and earn much higher profits. Globalization had the effect of reducing workers in countries such as the US to a lower income level and a lower standard of living while greatly augmenting the wealth of the minority of capital holders. Inequality greatly increased as a result. At the same time, countries such as China saw the emergence for the first time and for similar reasons of a new class of wealthy investor industrialists who benefitted greatly from the new international trade system. Living standards for workers in places such as China rose but at the expense of workers in places such as the US. Wages that in the past would have been paid to American workers were now paid to Chinese workers. A great shifting of wealth eastward occurred as well as a great shifting of wealth upward towards the upper segments of society.

**Grand Narrative** From Jean-François Lyotard's *The Postmodern Condition*, this term refers to the "big" stories we use to map human history such as Humanism. Opposed to micro-narratives of specific population segments such as gender minorities or people of color who do not fit the big narratives that were enunciated largely by white heterosexual males.

**Habitus** Pierre Bourdieu coined this word to describe the practices of everyday life that reproduce the material conditions of the society. Originally, Bourdieu studied practices such as cooking or weaving or other aspects of household life that embodied the implicit hierarchies of a society as well as its division of labor. Those practices had the effect of making those hierarchies and divisions seem natural, a part of the texture of the world. That in turn helped reproduce those hierarchies and divisions. Later, Bourdieu would apply the same model to education which he saw as reproducing class divisions and class cultural hierarchies.

**Hegemony** Hegemony is soft power exercised through institutions such as schools and churches rather than through coercion or force. According to Italian Marxist Antonio Gramsci, ruling groups in a society maintain their dominant position not by the exercise of direct force but instead through cultural mechanisms such as education and religion, political mechanisms such as democracy (which tend to elect only those who endorse inequality), judicial mechanisms that make the incarceration of economic victims seem a logical expression of morality, and economic mechanisms such as the "free market," which reproduce income inequalities and distribute wealth

upwards in a society. Domination occurs automatically and without violent exertion, and the dominated, because educated and indoctrinated, acquiesce to their own domination.

**Hermeneutics** Another name for interpretation, converting the language of a text into the meanings implied by that language.

**Heteroglossia** Related to dialogic, this term names the multiplicity of voice that, according to Mikhail Bakhtin, distinguishes novelistic discourse from poetic discourse.

**Heteronormative, Heteronormativity** All existing cultures assume heterosexuality is the norm and the normal. Such assumptions seep into all aspects of life and all dimensions of language, culture, and thought.

**Heterotopia** From Michel Foucault, a space outside society such as a camp, a barracks, or a prison where different kinds of social relations and practices exist.

**Historical Materialism** In Marxism, the idea that human life is best understood as a physical process enacted over historical time. A materialist understanding emphasizes the real social, political, and economic conditions that characterize human existence. The method differs from an idealist approach that would see human history and society as embodying ideas such as “freedom” or “liberty.” Such ideas are often at odds with the actual forms of social existence, especially under capitalism, which, for Marxists, is a form of wage slavery that denies freedom to workers.

**Homosocial** Eve Sedgwick’s term for alliance relations between heterosexual men.

**Hybridity** Related to dialogics and heteroglossia, this refers to the way discourses merge and combine both in life and in the novel. A hybrid discourse is one that adopts another discourse and integrates it. An example would be satire that mocks the way a character thinks and speaks.

**Hyperreal** A term to describe cultural institutions such as museums or theme parks that bear a strong resemblance to reality yet are artificial.

**Icon** Semiotician Charles Sanders Peirce defined iconic signs as resembling the thing signified – a map or a portrait.

**Idealism** A now lapsed school of philosophy that believed ideas existed in a separate sphere from the physical world.

**Identification** From Freud, the idea that one’s self is in part constructed through the incorporation of images of other people towards whom one has strong feelings and who one wishes to emulate. One builds an ideal image of that person in one’s mind and shapes one’s own self around the imitation of that ideal.

**Ideology** For Karl Marx, the ruling ideas of the ruling class. As human economic life has changed over time, the ideas that justify the unequal distribution of wealth and power have also changed. In the distant past, religious ideas that mandated a sense of duty within hierarchy legitimated the rule of a priestly caste allied with a supposed “noble” social group. Later, the idea of liberty or freedom made legitimate the over-accumulation of wealth by a small group of merchants and industrialists. Ideology was characterized by French philosopher Louis Althusser as a quality of personal identity (the illusion that one was a free individual rather than someone who imbibes roles and rules of behavior from the society and the culture around one through such institutions and practices as schools and education, rules that subject one to capitalism as one feels most free as a human subject).

**Imaginary, Real, Symbolic** For psychoanalyst Jacques Lacan, the ego is delusional. It cannot grasp its determination by the unconscious. Yet, despite its being shaped by

forces that are also entirely other to it, the ego maintains the illusion it is an “identity” that directs its own behavior. For Lacan, that illusion is “imaginary.” Because that imaginary delusion of possessing a fully integrated self is so powerful in all of us, we cannot touch the “Real,” that deep well of unconscious forces that shape our lives, driving our desires. The term “imaginary” has since been generalized to name any delusional cultural system. For example, the “imaginary of the nation state.” The other key term in Lacan’s vocabulary, the “Symbolic,” refers to the realm of social and cultural signs that make up our identities and assign us roles in life. The male child enters the Symbolic Order when his desire for the mother is curtailed by the father’s threat of castration and he learns to sacrifice the union he experienced with her, repress the desire for her into the unconscious, and replace the mother with a sign (which is always the sign of the absence of the thing signified). His life is defined henceforward by a never-to-succeed yearning to once again have that union, a yearning that skips along metonymically and metaphorically from sign to sign, never moving from sign to real thing, never arriving at *jouissance* or blissful reunion with the mother. (A matching model for female experience was not developed by Lacan.) The Symbolic is also the model for the psychic repression we all engage in, according to Freud and Lacan. In order to live in a social world of conventional, rule-bound behavior, we must accept and execute the repression of many of our instinctual urges for pleasure and our impulses towards violence. That repression is symbolic for Lacan because the sign or symbol connotes the absence of the thing signified. Signification thus provides a model for the distinction between consciousness and the unconscious (where all repressed elements of our psyche reside), but it is also a mechanism for executing repression since we focus on signs and symbols in our lives. They embody our desires, fears, and yearnings. To own a particular car becomes a symbol of an emotional state characterized inevitably by repressed elements to which we may not have conscious access.

**Immanence, Transcendence** To be immanent is to be contained within something.

In philosophy, it means within the material world. Transcendent means to be outside or beyond. In philosophy, it refers to a position outside or beyond the material world.

**Implied Reader** A writer assumes a particular kind of reader that is competent to receive the work as it is intended.

**Index, Indexicality** An index is a sign that points directly to some state of affairs, such as the word “now” that indicates the moment of speaking. Clothing is an index often of social class or professional position. A judge’s robe is an index of an institutional identity.

**Indigenous** Pertaining to the lives of native, first, or original peoples such as the first inhabitants of the Americas before European settlement.

**Intentional Fallacy** The idea that the meaning of a work of literature consists of the intention of the author as determined by evidence outside the work. For example, Shakespeare’s allusions to certain merchant vessels was thought by historicist scholars to imply a secret intention to comment on then-current political events.

**Interpellation** Louis Althusser’s term for the way one is made to feel like an individual in a capitalist society in which one’s identity is largely given by the economic class one belongs to. The illusion of being “hailed,” called out to as a singular person worthy of individual recognition, diminishes the likelihood one will perceive oneself as socially determined and as assigned a prescribed role in a lower economic class especially. One can, if interpellated as an individual, be poor and dominated yet feel

free and happy. One therefore “misrecognizes” one’s very non-individual location and identity under capitalism. One fails to see the real material conditions of one’s existence and comes instead to mistake slavery for freedom.

**Interpretive Community** The group of readers who have competence or are especially qualified to understand a particular work of literature and whose reading helps to complete the text. An example would be the initial audience of Milton’s *Paradise Lost*.

**Intersectional, Intersectionality** A mode of analysis in feminism and critical race theory that emphasizes the non-singularity and necessary relatedness and complexity of the critical projects of women, queers, gender minorities, and people of color.

**ISA or Ideological State Apparatus** According to Louis Althusser, ideology is invested in institutions such as schools and churches and workplaces that train people to be good subjects of capitalism.

**Lack** Originally a term from English object relations psychology, where it was called the “basic fault,” this term used by Jacques Lacan (“manque à être”) refers to the sense of absence that results from separation from the mother’s body during the individuation process.

**Langue/Parole** A distinction in Saussure’s linguistics between the language system and language as spoken.

**Law of the Father** In Jacques Lacan’s patrocentric psychoanalytic theory, the male child must learn to accept that the mother is forbidden as an object of sexual desire. He must submit to the symbolic Law of the Father. For Lacan, this means the male child must accept symbolic castration. The “Name of the Father” embodies the incest taboo that supposedly founds human social existence. That taboo meant that marriage had to be exogamous rather than endogamous. In patrocentric psychoanalysis, the taboo takes the form of the father’s interdiction that forbids the male child from having sexual access to the mother.

**Logocentrism** A term Jacques Derrida uses to characterize the tendency to make the mind the standard of truthfulness in the Western Continental European tradition in philosophy. In the idealist tradition from Plato down to Husserl, the mind or *logos* is portrayed as able to grasp truth as a pure idea that is aloof from signification.

**Materialism** The philosophic position that there is nothing outside the material world – especially no spirit world.

**Mediation** In dialectical analysis, all things exist in relation to other things. A thing that one perceives with one’s mind appears immediate (or just there by itself on its own). Dialectical analysis reveals it is mediated in that it exists in relation to other things or is the negation of other things (as a specific proposition is the negation of a universal one). A courtroom seems a simple thing, but in fact it is mediated by its relations to a written body of law, a long legal tradition of principles and concepts, an entire society that provides it with its identity and its function, and the like. Hegel thought the specific instance is always only understandable in terms of the universal or the totality, and the same is true of the totality or universal: it is comprehensible only as it is mediated by the particular, determinate instance.

**Mestizo, Mestizaje** A person of mixed ethnic heritage that usually combines elements of Hispanic, Indigenous, and White identities.

**Metalepsis** Taking an effect for a cause. For example, poverty makes many people eat food filled with starch and sugar, which makes them large-bodied. Conservatives then characterize the poor as irresponsible and self-indulgent; they deserve their poverty. Their bodily condition reflects a lack of moral fiber. In this way, an effect of poverty is

turned into a cause justifying poverty. Conversely, wealthy people can afford excellent educations and good training in the management of various aspects of capitalism. The result is that they are quite successful. That success then becomes an effect retroactively justifying their wealth. An effect – superiority of professional accomplishment resulting from good education – comes to appear to be a cause justifying wealth.

**Metaphysics** The philosophy of ultimate foundational questions such as “what is Being?” Also the assumption that ideas exist outside the realm of matter.

**Metonymy/Metaphor** In rhetoric a metaphor is an image substituted for a thing (ship of state). In linguistics, it is associated with the vertical axis that allows different terms to be substituted at any one point in a linguistic chain. Metonymy is a figure created by a link to an adjacent term (a thousand sails approached). In linguistics, it names the horizontal axis whereby parts of speech are combined one with the other in a chain.

**Mimesis** The imitation of the real world in art or literature.

**Mirror Stage** According to Jacques Lacan, we all experience a moment of blissful union with our mothers that is then shattered through the process of separation and individuation. One feature of that united stage is a mirroring process whereby the child imitates the mother. Psychological identity is fabricated through imitation and imprinting.

**Misrecognition (*Meconnaissance*)** A term in Marxism to describe how people do not see the real material conditions in which they live. Rather than see working-class life as a form of exploitation by those with capital or wealth, people in that social and economic location instead perceive their lives as characterized by “freedom.”

**Mode of Production** For Marxists, each society is a mode of production. It consists of a particular way of organizing the production of the necessities of life. The ancient mode of production relied on slavery, the medieval economy on a system of fealty and obligation, and capitalism on wage labor that results in an unequal distribution of wealth such that the economic class system of the mode of production is likely to reproduce itself and remain constant. Each mode of production is founded on an unequal distribution of roles and rewards, and each has a specific class character defined by those social relations of production.

**Modern, Modernity, Modernism** In literary history, “early modern” refers to the period after the Renaissance from roughly 1500 to 1750. It is succeeded by Romanticism. “Modernism” refers to the literature of the early twentieth century and to a literary movement especially in Europe that sought to make everything “new” by departing radically in form and content from the literature of the nineteenth century and especially from the “Victorian” paradigm. For some, this meant exploring so-called “primitive” life; for some, it meant writing in a more journalistic manner; and for some it meant exploring forms of consciousness in first-person form that departed from the third-person narrative paradigm of nineteenth-century “realism.” “Modernity” is the historical period since the Middle Ages. It also names the institutions such as capitalism and representative democracy that developed during this period as well as the shift from the dominance of religion in human life to an emphasis on science and secular rationalism.

**Narratology** The study of narrative was launched by Vladimir Propp’s *Morphology of the Folktale* (1927). Propp analyzed the story structure of numerous folktales and concluded that most shared the same story elements such as “the hero leaves home,” “the hero receives a gift,” etc. Usually, the story elements or “functions” were roughly

arranged in the same order. In the 1960s and 1970s, European Structuralist critics (*see Structuralism*) such as Tzvetan Todorov, Gerard Genette, and Claude Bremond continued the study and theorization of narrative. Specific elements of narrative were isolated such as the “narratee,” or implied person in the text to whom the narrator speaks when s/he narrates.

**Negation** A term in dialectical analysis. Negation refers to the logical development of ideas and of entities. Sense perception implies universal ideas that are its negation. To say, “I will focus only on determinate sense perception” is simultaneously to say “I will *not* focus on universal ideas.” Every determination contains its own negation, according to Hegel.

**Negative Dialectics** Theodor Adorno argued that philosophy had sided too much with the urge to find a universal concept that would define the truth of the world in a systematic way. Sacrificed was the differentiated, contingent, material side of existence where things existed in their specificity without any reference to a conceptual meaning. Their existence was not explainable as an identity with a concept. Adorno felt philosophy should turn to an examination of the contingent, groundless, vertiginous material reality of things without any reference to conceptual coherence, unity, totality, or identity.

**Neoliberalism** The economic doctrine of free trade or “liberty” (hence “liberal”) which originally held sway in the nineteenth century (hence “neo”), when it was posed against mercantilism, or the use of state or governmental power to manage parts of the economy using monopolies. The doctrine of an absolutely free economic market was revived from the 1970s on and entailed curtailing government regulation of capitalism, creating international trade agreements that removed tariffs that protected domestic industries, and the weakening of unionized protections for workers.

**New Criticism** An approach to literature that favored the close analysis of literary texts, especially poems, for their complex image patterns, meter, and the like. Opposed to seeing literature in sociological and historical terms, the New Critics such as Cleanth Brooks and W. K. Wimsatt argued that the literary work itself was the sole source of meaning and should be the sole object of study. They believed particular kinds of literary works – poems especially – embodied in their form universal meanings that often were characterized in quasi-spiritual terms.

**Non-Linear Biology** Non-linearity in biology means that biological entities are dynamically robust and in a constant stochastic (random) process of change, development, and evolution. Complex organisms such as the human body assume a hierarchical structure between diverse elements. Any biological entity is an aggregate (DNA, for example) that contains too many possibilities to be predicted or mapped in advance. Complexity emerges from simplicity, as simple things aggregate and produce new entities. Such emergence shatters symmetry and is not describable using traditional linear cause/effect models as in thermodynamics. Biological life is not a fixed homologous order that is immune to further transformation. The object of knowledge in the life sciences is therefore heterogeneous rather than homogenous. The goal of knowledge cannot be a tree or a map. It is at best a probabilistic mathematical model.

**Novum** From Ernst Bloch, this word describes something entirely new in comparison to existing society. Often used to characterize utopias by science fiction scholars.

**Object Relations** A school of psychology that de-emphasizes the role of instincts or drives and focuses instead on the self’s relations with its environment, especially with primary caregivers such as the mother.

***Objet petit a*** Jacques Lacan's term for desire in as much as it always has an object that is merely a substitute for a more ultimate kind of fulfillment that would restore an original feeling of narcissistic plenitude associated with union with the mother. Desire is always metaphoric (a substitute for an unconscious object – the mother, or “big A” Other (*Autre* in French)), and it is also always metonymic in that, because no single object can satisfy the true unconscious yearning for union with the mother, desire constantly flits from one object to the next along a metonymic chain of associations akin to the way a metonym is constituted by referring to an adjacent object (ships become “sails” or part of the whole, just as the “petit a” object is part of the whole Mother (*Autre*)).

**Ontology** The philosophy of being. It is often associated with a conservative urge to establish structure, order, and the like as opposed to embracing transformation, emergence, change, etc. “To ontologize” thus has a negative meaning in critical discussions because it refers to the way we impute nature to socially constructed entities such as gender identity.

**Onto-Theology** A word coined by Jacques Derrida to name the almost religious sense of belief that characterizes philosophic notions of truth defined as the being present of a thing or of an idea. Such belief ignores the spatio-temporal movement that gives rise to all presence and simultaneously de-ontologizes it or prevents it from having the status of a stable thing-in-itself that simply is without support from anything else or determination by anything prior to it.

**Orientalism** Edward Said's term for the body of knowledge that grew up regarding colonized lands such as India in colonizing countries such as England. It also refers to the attitudes embedded in the scholarly attitude, which necessarily telescoped the foreign other into stereotypes.

**Other, Alterity** The “other” is a term used by two major French thinkers – Jacques Lacan and Jacques Derrida. Lacan used the term to name several psychoanalytic entities, from the mother, the unconscious, and the well of cultural symbols that define us. Derrida used the term to describe the way things exist in networks of relations one to the other as well as for the way the seemingly unique, originary, and absolutely self-identical values of metaphysical philosophy such as presence are contaminated by the very things they declare external to their make-up. His term for the “otherness” that necessarily inhabits all identity is “alterity.” For example, “presence” is a positive term for what counts as true and it is usually opposed to absence and a host of terms that bear connotations of absence such as representation, repetition, and difference. But presence exists in time; it must repeat itself constantly through time, from moment to moment, if it is to remain present. Its other – representation – is negative because it is a mere repetition, not the real original thing it represents, yet the negative characteristic of representation – repetition – inheres in presence itself. Its “other,” in other words, is part of its make-up. Derrida offers the example of the ghost effect whereby one flips cards quickly to see an illusion of movement (a bridge going up and down, for example). The presence of the image of the bridge is made possible by a flickering motion of numerous cards, each dependent on the other to achieve the effect of presence.

**Overdetermination, Overdetermined** From Sigmund Freud, this refers to the way an event in the mind might have multiple contributory causes. Freud found in analyzing dreams that dream segments often referred to a number of different sources. The term is used more generally to mean “multiply determined.”

**Panopticon** Michel Foucault used this model of an ideal prison to characterize modern societies in which citizens internalize norms of behavior and no longer need to be policed in order to behave in accordance with the requirements of capitalism especially. In Jeremy Bentham's ideal panoptic prison, one guard sat at the center of a circle of cells and could observe all the prisoners in turn. Because the prisoners never knew when they were being observed, they all sought to behave well, as if they were being observed. Similarly, in modern capitalist society, we internalize the rules that accord with the norms of the society around us and police ourselves.

**Paradigm, Paradigmatic** In linguistics, a set of words that can substitute for one another.

**Performative, Performativity** The term invented by British philosopher John Austin to name phrases that make something happen in the world, such as "I now pronounce you man and wife." The words create a social institution. He called the larger class of such statements "speech acts." Judith Butler noted that gender identity is founded on identification with cultural gender ideals. Gender is in some sense the performance of an ideal that is performative in the speech act sense of the term: it makes something happen, and that something is gender identity.

**Phallus** For some feminist and queer theorists, a few ounces of useless flesh, but for Jacques Lacan much much more. The cultural figure for the penis, the phallus is a symbol of sexual potency that is essential to male heterosexuals' psychological identity in a patrocentric sex–gender *imperium*. To acquire the phallus through identification with the father is the goal of all heterosexual boys. By doing so, they model their behavior on what psychoanalysts call "phallicity," a quality of behavior that emphasizes a denial of emotional vulnerability and the striving for an ideal of personal strength.

**Phenomenology** A philosophy that sought to arrive at knowledge of objects in consciousness without reference either to assumptions about the foundations of knowledge or reference to the external world. Phenomenology originated in Germany in the work of Edmund Husserl. In France and Switzerland, in the work of Maurice Merleau-Ponty and George Poulet, it became a philosophy of consciousness that studied how we experience the world around us. It is carried on by philosophers such as Alfonso Lingis.

**Phenotype** The form an organism assumes as a result of a mixture of gene expression and environmental influence. Distinct from the genotype, or the inherited genetic make-up of the organism.

**Postmodernism** Both a historical period and another name for Post-Structuralism. During the period in US culture after World War II, artists and writers broke down the boundaries between high and popular culture (making paintings of soup cans, for example) and experimented with a variety of non-representational styles and with highly conceptual forms of art. In literature, postmodern writing was characterized by self-consciousness regarding literary technique, non-linear narratives, and parodic exaggeration. Notable examples are Thomas Pynchon's *The Crying of Lot 49*, John Barthes' *Giles Goat Boy*, and Don DeLillo's *White Noise*. Some Marxists use the term Postmodernism to name a period in capitalism characterized by a shift away from mass production and towards finance capitalism in the very advanced capitalist countries such as the US. Culture supposedly went along with this and became less substantial and more ephemeral.

**Post-Structuralism** A movement in French thought from the late 1960s down through the end of the century that emphasized discontinuity, difference, the overturning of

traditional identities, the dissolution of hierarchy, and the productive splintering of semantic possibilities as alternatives to the traditional search for authoritative truth in philosophy. The primary mover was philosopher Jacques Derrida, whose arguments regarding the instability of the core concepts of Continental philosophy had a pronounced effect on thinkers around him such as Julia Kristeva, Luce Irigaray, Hélène Cixous, Jean-François Lyotard, Roland Barthes, and Gilles Deleuze.

**Public Sphere** From Jürgen Habermas, this term refers to a realm of public discussion in which citizens engage in debate and exchange opinions in a way that affects the political operations of society. Habermas suggests the late eighteenth century in Western Europe was a time when such public discussion is especially evident in newspapers, coffee shops, journals, etc.

**Queer** Initially used in the 1980s to differentiate activist queers from more mainstream gays, Queer is now used to designate the gray-scale variety of gender. Queer names scalar shades of sexual experience and gender identity that are both other to the heteronormative world and that put its normativity in question. A core idea of Queer Theory is that queer is not minoritarian, and one project of queer criticism is to challenge heteronormativity by exposing the queer elements of heterosexual culture. In literary criticism, “to queer” a text means to draw out the non-heterosexual sexual and gender possibilities that are latent in all literary texts (as in all humans). Psychological studies suggest that most people are queer to an extent and experience feelings of desire or attraction at odds with heterosexual mandates. Without cultural enforcement that restricts divergence and enforces reproductive norms, gender and sexuality would likely be much more freeform and diverse, multiple and poly. In the ambient natural world, heterosexual reproduction is the minority form. To a certain extent, the biological norm is queer, and reproductive heterosexuality is an aberration, not the other way around.

**Reader Response** A theory of literature that focuses on the way readers receive texts and also on the aspects of texts that are addressed to readers or to an implied reader. Stanley Fish argued that Milton’s long poem *Paradise Lost* lured the reader into taking positions in relation to the characters and events of the story. The lessons of the poem were conveyed not just as ideas but as acts of induction into the text that obliged the reader to read, think, and feel in certain ways. Fish went on to argue that all works of literature presuppose a literate community of readers who are qualified to respond appropriately to the cues addressed to readers in the text. Wolfgang Iser argued that literary texts contain “gaps” that impel the reader to respond to the text’s cues and to ask questions that fill in the gaps. Reading is therefore a dynamic, interactive process. Roman Ingarden theorized that a work is not fully realized until a reader “concretizes” it in his/her reading/fantasy. Other critics such as Jane Tompkins took a more socio-historical approach to readership and studied the reading formations that arose in relation to literary texts at specific historical moments.

**Reification (see Alienation)** A term from Marxism that refers to the way the life energies of workers are converted through their labor into commodities which belong to capitalists. Workers’ lives are thereby made into objects (*res* is the Latin word for thing or object) and taken away from them for ownership by others. The lives of workers are reified.

**Remainder (Incalculability)** A term first used by Jacques Derrida in *Glas* (1974) that refers to the semantic references that any text generates that remain outside any full and complete calculation of meaning, since such calculations must differentiate

themselves at the boundary or limit of their calculation from what is not included in the calculation. That “remainder” is constitutive yet impossible to internalize. It remains outside the calculus.

**Repetition Compulsion** According to Sigmund Freud, because unconscious desires and fears never go away entirely, someone with unresolved psychological issues will engage in behavior that is repetitive and that manifests repetitively the same unconscious material.

**Repression** According to Freud, a child must, as a condition of entry into civilized life, deny certain desires access to expression. They are repressed and become part of the unconscious.

**Restrained Economy** (*see General Economy*)

**Rhizome** An underground root system that disperses laterally just beneath the surface. Used by Gilles Deleuze and Felix Guattari as a metaphor for how material reality operates and for how writing works. Writing does not restore a truth intention but instead proliferates semantic, affective, and material effects.

**Semiology, Semiotics** The study of signs and how they work.

**Sign, Signifier, Signified** A sign is anything whose purpose and function is to refer to something else. All language consists of signs such as sounds and written symbols. Swiss linguist Ferdinand de Saussure distinguishes between two aspects of the verbal sign – the signifier or sound image and the signified or mental concept. All signs in language are arbitrary, which means the sound can refer to anything. “Tree” might have meant furry four-legged creature that bleats. All meaning is therefore conventional in that it is a matter of agreement. All signs in language have a function and a value. The value and function of “sheep” is to designate that particular creature and not another. Other signs in other languages such as “mouton” in French have a similar value and perform a similar function. All signifiers and signifieds exist in chains, in that they acquire an identity by their differences from adjacent elements. “Hat,” “rat,” and “cat” are given identities in language by virtue of their differences from each other. In and of themselves, they are meaningless and would remain meaningless without the entire system of relations in language that endow them with an identity, function, and value. This is the “diacritical principle.”

**Simulacrum** The Greek word for copy. Jean Baudrillard argued that modern culture replaces reality with images, so that war is no longer directly experienced in its pain and horror. Rather, images have so insinuated themselves into reality that we are more likely to know war as images in the media and to develop a “hyperreal” sense of the world.

**Social Construction/Cultural Construction** Since the Progressive Era in the late nineteenth century, progressives have been arguing that environment determines character. They did so initially to counter the claims of mid-nineteenth-century Social Darwinism, which held that poor people lacked moral qualities that wealthy people possessed, qualities that destined them to be wealthy. Character distinguished rich from poor. The progressives believed the environment played a role in determining people’s life chances at success. In the twentieth century, the environmental theory was supplemented by anthropological theories that held that people learn from their culture and acquire roles in life from cultural models and from education. Feminists after the 1950s became especially aware of the way a culture can impose norms of docility on women, prescribing acceptable and unacceptable behavior, for example. Women’s identities in the 1950s seemed clearly to be “constructed” for them by a

male-dominated culture that wanted women in the home as domestic laborers to the benefit of men. Marxists made a further contribution to the theory of social construction by arguing that economic class position either limited or expanded one's range of opportunities in life and shaped one's resulting identity. People from working-class backgrounds imprinted with the cultural assumptions of their world were less likely to succeed in life when compared with children born into upper-class homes in which different cultural assumptions regarding such things as education reigned. Gender theorists took the ideas a step further. They contended that gender identity in general was a matter of external imprinting as much as it was of natural expression. Heterosexuality was offered to everyone as a singular norm rather than being seen as one among many gender possibilities. Many queers felt forced to obey those norms in the past. Their gender identity was constructed for them.

**Society of the Spectacle** Guy Debord's term for contemporary capitalist society which he sees as saturated with consumer images that create a sense of spectacle that helps conceal the true oppressive nature of the society.

**Sovereign Exception** A term used by Giorgio Agamben to characterize the structure of sovereign rule-bound governments that define the realm of legitimate rule-guided action by creating exceptions – camps, prisons, populations such as refugees and the homeless – that are refused participation in sovereign realm. They have no status and do not belong. They are reduced to “bare life,” the natural state of existence prior to the imposition of a social order premised on rule-bound behavior.

**Specters, Spectrology** Jacques Derrida coined the term “specters” to name the way the other inheres necessarily in the seemingly self-identical or selfsame (*see Différance*). The past inhabits or haunts the present, and the present points forward towards a future. Others inhabit us in a variety of ways, from the communicative to the psychological. Feminists invented the term “spectrology” for the study of the material instability of gender.

**Structuralism** A school of criticism that drew on the ideas of Swiss linguist Ferdinand de Saussure. Structural linguistics focused on the relations between parts of language that allow words to function as parts of speech. Structuralist literary critics favored seeing literature as a system that, like language, operates through the relations between parts. For example, narrative fiction has both a diachronic or temporal axis and a synchronic or spatial axis. Each moment of narrative consists of choices between possibilities (which might be said to constitute a paradigm set or group of choices between, for example, possible actions).

**Subaltern** A term invented by Indian scholars to characterize subordinated peoples such as members of lower castes or social strata in countries such as India.

**Symbolic Order** Jacques Lacan distinguished between the Real of our physiological nature consisting of instincts and drives that is inaccessible to consciousness (such as drives and instincts that shape our lives but which manifest themselves through behavioral signs such as neurotic symptoms), the imaginary realm of consciousness that is narcissistic and resistant to perceptions that diminish the ego's sense of integrity and grandeur, and the symbolic realm where our inner lives are expressed in signs and where our identities and ways of living are shaped by conventions, rules, roles, and expectations that come from outside us. In that rule-bound order, our behavior is limited by prescriptions and proscriptions, licenses and taboos such as the rule against incest or the terms of assigned gender identity. The term Symbolic Order merged in critical writing over the years with both Marxist and gender theoretical models of how society operates

in relation to individual members and came to describe the mix of facilitatingly expressive and debilitatingly repressive elements of a world organized largely according to the mandates of the white heterosexual pro-capitalist population.

**Synchrony, Synchronic** In linguistics, the spatial dimension of language. At any one moment, the entire language is implied in actual speech. The term also applies to the range of possibilities that can fill any one function in a diachronic speech event.

**Syntagm, Syntagmatic** Syntagm refers to the linear or temporal dimension of language. A syntagm is a string of syntactically combined words, and syntagmatic refers to the combination of words according to the rules of syntax.

**Telos, Teleology** Telos means end or purpose, and teleology means the quality of having an end or purpose. Used often in a negative or critical sense, it suggests a disrespect for the uniqueness of the thing studied, a tendency to see it in terms of a meaning, for example, that is distant from what it is.

**Territorialization (Deterritorialization)** Territorialization is a term from Gilles Deleuze and Felix Guattari that refers to the way ideological and institutional regimes such as the state exercise control over the fluid, unfixed flow of human desire and human life. Molecular counter-movements deterritorialize such regimes of power through liberatory lines of flight that can be reterritorialized in new captured forms such as Freud's scenario of the Oedipal drama.

**Text, Textuality** Jacques Derrida argued that when one moves from the verbal texture of a literary text to an idea or meaning or referent (such as the life of the author) that seems to sum up the text in a meaning and put an end to reference, one in fact moves from one kind of texture to another, one realm of referentiality to another. We assume that the structures and processes of signification end at the boundaries of a literary text, and what lies outside is "real," "substantial," "material," "historical," "social," "semantic," "conceptual," "biographical," and the like. But all of these things have a texture of their own that is not that different from the texture of a literary text. They are all, like texts, made up of parts that refer to one another, and each in turn refers to other things that are essential to its make-up. The world is not that different from a literary text. It possesses "textuality." We mistakenly think there is a "real" that is present to consciousness in a way that is immune from further differential relationality.

**Totality** A term from Marxism that refers to the result of a dialectical process whereby specific things take on meaning only when seen as part of larger aggregates that abut in a "totality," a complete whole that encompasses all the discrete elements and gives them an ultimate or final meaning. Each novel by Honoré de Balzac provides a small local picture of French life in the early nineteenth century, but they also provide access to a more total or complete picture of that society.

**Trace** A term borrowed from Immanuel Levinas by Jacques Lacan, it refers to the "trace of the other," the way relations to other things inhere in any identity.

**Uncanny** Sigmund Freud's term for the way the unconscious constitutes a double self within us. It inhabits us and is close to us, and we are aware of it as something ghostly that haunts us. We become aware of its effects especially when we engage in actions that seem out of our control – as when we cannot help repeating actions and behaviors, returning over and over to the same kinds of relationships with others. The word "uncanny" is a translation of the German word "*unheimlich*," and Freud notes that the German word contains the word "home" or "*Heim*" within it. The word therefore has two connotations. It refers to what is most close to us, our home or self.

And it refers to something strange that might make us uneasy and appear to come from outside us.

**Undecidability** Originally a term in computational mathematics for problems for which there is no algorithm that gives rise to a simple yes/no answer. The term is also used for sets for which enumerated results are endless and as a result both within the set and outside. The set is therefore inherently incomplete. Jacques Derrida borrowed the term to refer to the way signification cannot be contained by any formal semantic logic without itself becoming an act of signification that requires a further semantic logic to contain it. For example, most philosophies differentiate between terms and values, often seeking to establish a first or foundational term such as Reason that is often described as an identity that is present to the mind and that is superior to mere difference, which is an unstable play of presence and absence. But no philosophy takes into account the act of differentiation that allows such axiological distinctions to be made in the first place. Those philosophies are as a result of this recursiveness inherently incomplete or undecidable. No single philosophical algorithm can give rise to a simple right answer regarding whether difference belongs inside or outside the philosophy's field of jurisdiction.

In a similar manner, the techniques of representation are consistently characterized in philosophy as non-serious, secondary, derivative, merely supplementary, and the like in relation to ideas that are felt as living presences in consciousness. The techniques of representation are empty repetitions, articulations of presence and absence in space that can never be a living plenitude, an idea that endures through time and transcends mere spatial representation. Yet to present these ideas requires writing, a mere repetition that is secondary and derivative. No ideas can be announced without recourse to some form of technical, graphic representation, some version of writing-as-signification. Writing is a possibility within the living presence of ideation that is therefore undecidably both inside philosophy and outside it as the thing it cannot tolerate if its ideas are to be pure ideas and as the thing without which those ideas could not be formulated and articulated.

Moreover, a certain amount of spatialization and articulation is necessary for ideas to appear in the mind in the first place. The determination of any idea differentiates it from some other idea. The characteristics of external technical representation inhere in the very substance of thought as its condition of possibility. One cannot therefore declare decisively in favor of an ideal model of truthfulness as ideas clearly and decisively grasped by the mind without exposing the fundamental undecidability of one's own propositions. Presence can only be present by differentiating itself from absence – by absenting itself from presence. A living present idea can only be declared such by distancing death in the form of the articulations of signification – by signifying death-in-signification. It is therefore both at once. It is articulation and difference.

**Universal** New Critics believed that individual works of literature provided access to principles and ideas that were universal in that they applied to everyone on the planet and to every geographic situation. Other critics – especially feminists and ethnic critics – challenged such “universalism” as a symptom of white, male, imperial, heterosexual hubris. The only universal is that there is no universal, according to these critics, and each specific situation should be studied for its unique characteristics. More recently, cognitive and evolutionary critics have argued that there are cross-culturally recurring narrative and other patterns that are empirically ascertainable and may be explained by human cognitive and emotional, often biological and evolved properties.

**Use Value/Exchange Value/Surplus Value** According to Karl Marx, goods sold on the market have a use value (a car can be driven, for example), but they also have an exchange value. They can be traded for money, and that allows market exchange to function. Goods have a monetary equivalent that lends them an exchange value. Surplus value refers to the fact that goods, according to Marx, are the products of labor, and in order for capitalism to work, labor must be paid less than the value it puts into goods. By paying the workers less than the value their labor places in commodities or goods for sale, capitalists capture that surplus value for themselves. Surplus value is the excess value in goods that results from the underpayment of workers. This is Marx's "labor theory of value." He felt that a more democratic and egalitarian post-capitalist society would be one in which workers would themselves fully benefit from the value of their labor. It would be restored to them as their private property and cease to be the private property of the capitalist. Communism, which is often seen as the abolition of private property (largely as a result of a literal-minded translation of Marx into Soviet-era Russian), would in fact restore private property to those who should actually own it.
